(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-5 Aqua Regia Metals

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-5 Aqua Regia Metals

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-5 Aqua Regia Metals

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-5 Aqua Regia Metals

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-5 Aqua Regia Metals

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-5 Aqua Regia Metals

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-5 Aqua Regia Metals

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-5 Aqua Regia Metals

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-5 Aqua Regia Metals

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

"Other" lithology refers to the following minor lithologies: Metasediment 1, Ultramafic, Calcite Vein, Intrusive Breccia, Felsic Fragmental, Rhyolite, and Sericite Schist.

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

"Other" lithology refers to the following minor lithologies: Metasediment 1, Ultramafic, Calcite Vein, Intrusive Breccia, Felsic Fragmental, Rhyolite, and Sericite Schist.

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

(1) Ten times average crustal abundance values presented in Price (1997).

Blue highlighting indicates samples with metal concentrations greater than the ten times crustal abundance screening value are present in the analyzed group.

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

"Other" lithology refers to the following minor lithologies: Metasediment 1, Ultramafic, Calcite Vein, Intrusive Breccia, Felsic Fragmental, Rhyolite, and Sericite Schist.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Screening values are for qualitative assessment only and hold no regulatory significance.

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-7 Four Acid Metals

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-7 Four Acid Metals

Classification as mine rock or ore-grade materials was based on gold content.

A value of "--" indicates metal was not measured for the given sample; the variation in elements analyzed is due to measurement at two different laboratories (see text).

Table B-7 Four Acid Metals

Sample ID	Drillhole ID	From	To	Lithology	Area	Class	Copper	Iron	Gallium	Germanium	Potassium	Lanthanum	Lithium	Magnesium	Manganese	Molybdenum
		m	*m*				*ppm*	*%*	*ppm*	*ppm*	*%*	*ppm*	*ppm*	*%*	*ppm*	*ppm*
10x Crustal Abundance (Price 1997) [(1)]							--	--	--	--	--	--	--	--	--	--
