PART A

Introduction

December 2013
Project No. 13-1118-0010
Hammond Reef Gold Project

ATMOSPHERIC ENVIRONMENT TECHNICAL SUPPORT DOCUMENT VERSION 2 PART A: INTRODUCTION

Version 1 of the Atmospheric Environment Technical Support Document (TSD) was published on February 15, 2013 as part of Osisko Hammond Reef Gold's (OHRG) Draft Environmental Impact Statement/Environmental Assessment (EIS/EA) Report.

The Draft EIS/EA Report underwent a seven-week public review comment period after which, on April 5, 2013 OHRG received comments from the public, Aboriginal groups and the Government Review Team (GRT) seeking clarification and requesting new information.

Approximately 30 comments regarding the Atmospheric TSD and the Atmospheric component of the EIS/EA Report were received from the GRT. The Atmospheric environment was not a key concern identified by the public. One comment about the Atmospheric environment was received from the Lac de Mille Lacs First Nation. Written responses were prepared for each comment and are provided in Appendix 1.IV of the EIS/EA Report.

Version 1 of the Atmospheric TSD has not been revised. The methods used to define baseline atmospheric conditions and predict potential changes to the atmospheric environment are technically defensible and based on standard industry practices. The conclusions and results presented in the Atmospheric TSD are sound and have remained the same after consideration of comments received.

The EIS/EA Report has been revised and updated based on comments received. Version 2 of the Atmospheric Environment TSD is comprised of the following:

- Part A: Introduction
- Part B: Supplemental Information Package (attached) that provides additional detail related to the Atmospheric Environment component and the information presented in Atmospheric Environment TSD.
- Part C: Version 1 of Atmospheric Environment TSD. Part C was issued in February 2013, and is available online on OHRG's website; it has not been reprinted as part of this Version 2 of the Atmospheric Environment TSD. The Version 1 document should be reviewed within the context of this Version 2 document, and associated updated information as presented in Part A or Part B should be considered as correct should it differ from the information presented in Version 1.

A summary of the information found in Part B is provided below. Throughout the EIS/EA Report, unless otherwise noted, all references made to the Atmospheric Environment TSD are to Part C.

Figure Update

The Version 1 Atmospheric TSD assumed that "designated campsites" identified in the MNR land use data map layer were part of a commercial camping operation (i.e., campers would be assigned locations and amenities would be available) and, therefore, these campsites were identified as points of reception for air and noise emissions from the Project.

However, based on clarification from the Ministry of Natural Resources, OHRG now understands that these sites are simply suggested camping areas, which just like any other Crown land, can be used for camping by anyone that chooses to do so. Based on this new understanding, the designated campsites have been removed as points of reception under the air and noise assessment as they are simply Crown land.

Figure 3-5 of the Atmospheric Environment TSD has been revised to reflect the updated points of reception locations.

Mitigation Measures

The Version 1 Atmospheric TSD included a proposed mitigation measure to restrict access to identified designated campsites due to changes in noise levels and potential increase in particulate matter. OHRG was advised by MNR that restricting access to Crown Land would not be appropriate. Additionally, the designated campsites to which access was to be restricted have been removed as points of reception. Therefore, restriction of access to designated campsites has been removed as a mitigation measure from the EIS/EA Report and replaced with a commitment to post signs advising potential campers of the mine operations and the potential for elevated noise levels should they chose to camp at those locations.

Appendix 3.II Update

One comment received from the Ontario Ministry of the Environment as part of the comment period requested clarification of specific components in Appendix 3.II of the TSD. This IR MOE-John Liu is attached in Part B.

Supplemental Information – Air Quality

On October 10, 2013 OHRG met with representatives from Environment Canada (EC) to present and discuss responses to the EC comments on the Draft EIS/EA Report. During this meeting, EC raised concerns relating to the Atmospheric TSD. These concerns have been addressed in a technical memo as provided in the attached Supplemental Information Package.

The information provided is additional detail and justification of the assessment approach as it relates to:

- The selection of the operations phase as the bounding scenario for the air quality assessment;
- The rationale for selection of the air quality Regional Study Area;
- The presentation of emissions from mobile sources; and
- The consideration of federal air quality guidelines.

Supplemental Information – Noise

In response to a request from the Ministry of the Environment, sample model configurations have been provided from the CADNA noise predictive software. This information is provided in the response to information request MOE-Noise-10 in the attached Supplemental Information Package.

Supplemental Information Provided in Part B

- Revised Figure 3-5
- Technical Memorandum: Additional Environment Canada Comments on the Air Quality Assessment Approach (Rev 0, December 4, 2013)
  - Appendix 3.IV complete with all data
- Response to Information Request MOE-Noise-10
- Response to Information Request MOE-John Liu

OSISKO HAMMOND REEF GOLD (OHRG) PROJECT – ADDITIONAL ENVIRONMENT CANADA COMMENTS ON THE AIR QUALITY ASSESSMENT APPROACH

Additional comments from Environment Canada regarding the air quality assessment approach and assumptions were received at the October 10, 2013 meeting and in an email subsequent to the meeting. A summary of EC's comments and Osisko's responses are provided below.

Topic	EC Comment	Osisko Response
Bounding Scenario	The analysis should include an assessment of emissions and short-term air quality impacts from site preparation and construction-related activities	A preliminary assessment of the Project details and design concluded that air emissions during the construction phase (including site preparation and construction-related activities) would be lower than air emissions during the Operations Phase. In an effort to carry out a conservative assessment of potential effects, a complete air quality model with design assumptions and meteorological data was run for the Project's worst-case scenario – the Operations Phase.
	Prove that emissions from mobile sources during construction are lower than operations and don't exceed guidelines	In order to estimate emissions associated with mobile vehicles, the number of trucks, the number of vehicle kilometers traveled (VKT) and fuel consumption are used as inputs into the emission rate calculations. The air quality assessment (and bounding scenario) is based on the worst case operating year as described in Appendix 3.I of the TSD. For both the Construction and Operations phases of the Project, the activities that will generate the most emissions are as follows: ■ fugitive dust from hauling materials which is based on distance travelled; ■ tailpipe exhaust emissions from mobile vehicles which is based on fuel consumption; and ■ primary power generation (during Construction Phase only) which is also based on fuel consumption. These input parameters have been estimated based on equipment fleet information and fuel consumption estimates for both Project phases. Although the Construction Phase fuel consumption estimates and kilometres travelled were provided for each construction activity

Golder, Golder Associates and the GA globe design are trademarks of Golder Associates Corporation.

<table>
<tr><th>Topic</th><th>EC Comment</th><th>Osisko Response</th></tr>
<tr><td></td><td></td><td>occurring at different times over a 2-3 year time span, the estimates provided in the table below are conservative as they assume all activities are occurring simultaneously within the same year; the table also provides a comparison between these input parameters for the Construction Phase and Operations phases.
<table>
<tr><th>Parameter</th><th>Construction Phase</th><th>Operations Phase</th></tr>
<tr><td>No. of trucks greater 2,000 HP</td><td>10</td><td>20</td></tr>
<tr><td>Total distance travelled (VKT/day) (indicator for fugitive dust emissions)</td><td>4,332</td><td>8,248</td></tr>
<tr><td>Diesel fuel consumption (L/yr) mobile sources (indicator for mobile vehicle exhaust gases emissions)</td><td>12,849,208</td><td>61,773,535</td></tr>
<tr><td>Diesel fuel consumption (L/yr) stationary sources (indicator for power generation equipment exhaust gases emissions)</td><td>7,078,080</td><td>Emergency testing only</td></tr>
<tr><td>Total diesel fuel consumption (L/yr)</td><td>19,927,288</td><td>61,773,535</td></tr>
</table>
As shown in the table, for each input parameter, the values for the Operations Phase are higher than those for the Construction Phase. Based on this comparison, it can be reasonably assumed that the modelled concentrations, if predicted for the Construction Phase, would be lower than the values reported in the TSD. This is consistent with the original assumptions presented in the TSD.</td></tr>
<tr><td>Study Areas</td><td>Provide justification as to why the Atikokan generating station is not included in the air quality RSA.</td><td>The Atikokan Generating Station (AGS) is an historic power production site that previously was a coal burning plant. The AGS was recently shut down and is undergoing construction to retrofit the plant to burn biofuel. Construction is planned to be completed in 2014. Since the future status of the plant as a peaking power supply is not known at this time, it is not possible to estimate the emissions that may overlap in time with the Project.

The AGS is located about 15 km southwest of the Project site outside the air quality LSA, see updated Figure 3-1 of the Atmospheric Environment TSD, located in the TSD's Supplemental Information package. Due to the distance between the AGS and the Project, there will likely be limited interaction between the AGS and the Project activities. As a precaution, air quality predictions were provided at the Town of Atikokan, which is further away from the Project than the AGS, and results showed that limited interaction or changes to air quality would occur at that location. It should be noted that these separation distances are greater than the recommended distances for accuracy when using the AERMOD model and that the model will tend to overestimate emissions at these distances. Given the separation distance between the Project and the AGS, they can be considered not to overlap in space.</td></tr>
</table>

Topic	EC Comment	Osisko Response
		The air quality assessment firstly focused on demonstrating that the Project would be capable of meeting the air quality regulatory permitting requirements in Ontario (i.e., O.Reg. 419/05). This assessment only considers specific Project related emissions at off property receptors. A second modelling assessment was completed that considered all significant Project related emissions. The results of which were provided to other disciplines that assessed the effects of changes in air quality on the receiving environment (e.g., Human Health). This assessment noted that air quality would meet regulatory limits within the Air Quality and Human Health LSA. Therefore, there is no predicted interaction with future emissions from the AGS which is situated outside of the LSA. In addition, similar to the Project, under all stages of its retrofitting and operation, the AGS will be required to meet Ontario air quality guidelines that are protective of human health and the environment. This provides additional assurance that no significant impacts will occur.
Mobile Sources	Table in air quality assessment should include mobile sources. These sources shouldn't be moved forward to human health assessment only.	The emissions from mobile sources are included in the daily emission rates presented in Appendix 3.I of the Atmospheric TSD (attached). In addition, Table 15: Daily Emission Rates for the Human Health and Ecological Risk Assessment TSD includes vehicle exhaust emissions and fugitive dust emissions from haul vehicles in the open pit as well as those on the surface access road. Detailed air quality predictions using these emission rates were completed for a large number of receptors. Appendix 3.IV from Atmospheric TSD that was published as part of the Draft EIS/EA Report did not include the actual data due to the size of the data files. These data are attached in electronic form. In addition, Golder has prepared a new data table for your consideration. The attached table includes the predicted concentrations at the human heath receptors that were modeled previously, which incorporate emissions from both the mobile and stationary sources, and compares the values to the appropriate National Ambient Air Quality Objectives (NAAQO) or Canadian Ambient Air Quality Standards (CAAQS). These parameters include a prediction of $PM_{2.5}$ and NO_2 as discussed with Environment Canada. The model predicts concentrations that are below the appropriate NAAQO or CAAQS criteria at all of the receptors. Forty Points of Reception (POR) were originally identified in the air quality and noise assessment. Twenty of these PORs (POR 5-19, POR 34, POR36-38 and POR 40) were identified in the MNR mapping data as designated campsites. The meaning of the term "designated campsite" was misunderstood by OHRG. These locations are simply suggested areas on Crown Land that could be used for camping by the public. No amenities or services are provided and no payment is required to camp there, just as is the case with all Crown Land. OHRG does not have the ability to restrict access to Crown Land, and these identified PORs are not considered specific sites that are required to be included in air and noise modeling predictions. Based on this new understanding, the number of PORs considered in the air quality and noise assessment has been reduced from 40 to

Topic	EC Comment	Osisko Response
		20. The PORs considered in the revised air quality and noise conclusions are now the Town of Atikokan, local tourism establishments, trapper's cabins and cottages. Of the 20 designated campsites that were originally considered in the air quality and noise assessment, three locations were identified as having potentially high noise levels and six were identified as potentially exceeding Provincial particulate matter guidelines. OHRG plans to post signs around the general area(s) commonly used for campsites indicating the potential for campers to be exposed to high noise levels. A further assessment on health effects due to the potential increase in particulate matter is presented in the Human Health Risk Assessment TSD. Human health risks are not considered to be increased significantly by the Project. This modelling incorporated conservative emission estimates, especially for the 24-hour and 1-hour averaging times, and AERMOD itself over-predicts at distances far away from emission sources (i.e. > 10 km). Since the predictions are conservative and the human health risk assessment revealed no concerns, refinement of the emission estimates or consideration of a less conservative modelling approach (which would have added significant costs to the assessment) was not required.
	A prioritized list of significant sources of fugitive dust emissions from the transportation of ore, mine rock and overburden	Appendix 3.I (attached) provides a list of the significant sources and assumptions used in all the emission rate calculations, including the fugitive dust emissions from transportation. The Appendix includes a number of assumptions relating to dust sources, and the calculation methodology for fugitive dust emissions from unpaved roadways and haul trucks in the open pit.
	A source emissions inventory table for the mine site describing the source, operating contaminants and predicted concentrations.	Appendix 3.I (attached) provides a list of all sources of emissions and the corresponding contaminants associated with the Project. Table 1 of the Appendix provides Significant Activities and Compounds Released at the Mine Site. The Appendix also includes emission rate calculations for all significant Project activities. The modelled concentrations resulting from the source emission rates are summarized in Section 3.2.3 of the TSD for the air quality assessment and Appendix 3.IV for the human health risk assessment.

We trust the above meets your requirements. Please do not hesitate to contact the undersigned if you need any further information.

1.0 INTRODUCTION

This appendix documents the methods, input parameters and assumptions that were used to estimate the air emission rates for the Hammond Reef Gold Project (Project) works and activities. These emission rates were then used as inputs for the dispersion modelling that provided estimates of maximum ground-level concentrations resulting from the Project. The emission estimation methods described within follow generally accepted practices for conducting environmental assessments and, where appropriate, guidance in the Ontario Ministry of the Environment (MOE) document "Procedure for Preparing an Emission Summary and Dispersion Modelling Report" Version 3.0 (March 2009) (ESDM Procedure Document).

Emissions were calculated for significant mining, gold processing and supporting activities at the Mine Site. A bounding condition scenario was considered to represent the emissions throughout the Operation Phase of the Project. Sources of emissions for this scenario included:

- Open pit extraction including blasting and material handling.
- Fugitive dust emissions from stockpiling and material handling activities on the surface.
- Fugitive dust emissions from haul routes (unpaved roads).
- Vehicle tailpipe exhaust emissions.
- Emissions from gold refining process.
- Emissions from auxiliary processes including emergency power and comfort heating.

This bounding condition scenario corresponds most closely to years 6-9, when both pits are being mined simultaneously. In years 0-5 only the east pit will be mined at a shallower depth than the bounding condition. In the final years of the project only the west pit will be mined up to the depth assumed in the bounding condition. This approach is considered conservative, with a low likelihood to underestimate the emissions from the Project because it is unlikely that all of these assumptions may be true at any one given time, (i.e., maximum productions rates may not be occurring at the same time as the longest haul truck routes).

Emissions were also calculated for the Access Road (Hardtack/Sawbill) which includes the following sources:

- Fugitive dust emissions from unpaved roads.
- Vehicle tailpipe exhaust emissions.

Some Project activities were considered insignificant and were not assessed. These are discussed in more detail in Section 2.1. The physical parameters and assumptions that were used in the emission rate calculations for each Project component are discussed in Section 3.0 and sample calculations for each activity are provided in Section 4.0.

2.0 ASSESSMENT OF SIGNIFICANT COMPOUNDS AND ACTIVITIES

Emissions were calculated using activity and equipment specifications provided in the Project Description (Chapter 5 of the EIS/EA Report) and based on the Site Layout provided by Osisko Hammond Reef Gold Ltd. (OHRG) dated August 8, 2012 (Figure 1). Internationally accepted emission factors, most notably AP-42 (U.S. EPA 1995) were also used.

Compounds that are discharged from the Project in negligible amounts and/or activities that discharge a compound in a negligible amount were excluded from further analysis. The rationale for these exclusions is provided in Section 2.1. Table 1 provides a summary of the activities for which emissions were calculated in the air quality assessment of the Mine site as well as a summary of the compounds released.

Note:

— emissions not released from this source

In any activity where ore could be a component of the particulate, the particulate emissions were speciated into metals (denoted as Metals in Table 1) using an ore assay that was representative of the ore found at the Project Site. The following table illustrates the ore assay that was used.

Table 2: Osisko Hammond Reef Gold Ltd. Typical Ore Assay

Compound	Concentration in Ore
Aluminum	6.44087%
Antimony	0.00002%
Arsenic	0.00024%
Barium	0.04322%
Beryllium	0.00010%
Bismuth	0.00002%
Cadmium	0.00001%
Calcium	2.38284%
Chromium	0.00363%
Cobalt	0.00090%
Copper	0.00206%
Iron	2.45307%
Lead	0.00205%
Lithium	0.00071%
Magnesium	0.65091%
Manganese	0.04152%
Molybdenum	0.00043%
Nickel	0.00252%
Potassium	2.20338%
Selenium	0.00013%
Silver	0.00005%
Sodium	2.01303%
Strontium	0.01372%
Thallium	0.00003%
Tin	0.00012%
Titanium	0.15043%
Uranium	0.00011%
Vanadium	0.00388%
Yttrium	0.00063%

Waste rock produced by the Project will contain lower concentrations of metals than the ore. To simplify the calculations, the metal speciation for all movement that may contain metals was speciated as ore.

Parameters assessed for the Access Road (Hardtack/Sawbill) include the following:

- Fugitive road dust (i.e., TSP, PM_{10}, $PM_{2.5}$).
- Exhaust gases (i.e., NO_X, SO_2, and CO).

2.1 Assessment of Insignificant Activities

There are many activities at the Project Site that produce emissions; however, not all activities produce emissions for any or all compounds that are significant in comparison to the overall emissions from the Project.

The following lists possible reasons certain activities and/or emissions of certain compounds may be excluded from the assessment:

- The emission rates of certain compounds are very small relative to the overall emissions at the Project Site.
- The emissions of certain sources are not known to be significant due to the type of operations in the assessment.
- The location of the source relative to the rest of the sources onsite (i.e., the source is located far away from any receptors).

Table 3 lists the activities and/or compounds that were not assessed and the accompanying rationale.

Table 3: Insignificant Emissions Associated with the Project

Activity/Compound	Rationale for Excluding from the Assessment
Wet drilling	Emissions from wet drilling were not assessed. Emissions from the activity are expected to be minimal since the drilling is occurring with wet suppression at all times.
Tailpipe exhaust from surface vehicles (not including haul trucks)	Tailpipe emissions from surface dozers and graders, etc. (which have smaller relative HP ratings) are small in comparison to the haul truck fleet as they don't operate continuously since most are used for repair and maintenance.
Wind erosion from stockpiles	Due to the moisture content and the size of the material being stockpiled (i.e., waste rock and low grade ore prior to primary crushing), wind erosion emissions will not be significant.
Operational support activities, such as maintenance welding	The emissions are insignificant relative to the overall emissions from the Project.

3.0 EMISSION RATE CALCULATION ASSUMPTIONS

For each Project component, parameters were used to calculate the emissions. All parameters are documented in Sections 3.1 through 3.9 and any assumptions made are also stated in the "Notes" column in Tables 4 through 11.

3.1 Open Pit Extraction

The following table outlines the parameters used to calculate emissions related to Open Pit Extraction.

Table 4: Open Pit Extraction Emission Calculation Parameters

Parameter		Notes
Blasts per day per pit	2	Assumed duration of each blast is 1 hour and blasting occurs 365 days a year.
Pit volumes	744 m x 722 m x 96 m deep for east pit 806 m x 1282 m x 130 m deep for west pit	Total pit volume is used to scale emissions between the two pits.
Daily Throughput	45,920 tonnes – east pit 119,080 tonnes – west pit	Based on 100,000 tonnes/day waste rock and 65,000 tonnes/day ore divided between the pits based on pit volumes.
Tonnes of Material per Blast	22,960 tonnes – east pit 59,540 tonnes – west pit	Based on daily throughput and the number of blasts per day for each pit.
Specific Gravity of Material	1.5	—
Blast Hole Depth	14.8 m	—
Tonnes of Emulsion per Blast	13 tonnes – east pit 33 tonnes – west pit	Based on 46 tonnes/blast divided between the pits based on pit volumes.
Ore Hauling	754 tonnes/hr – east pit 1,955 tonnes/hr – west pit	Based on 65,000 tonnes/day, 24-hour hauling divided between the pits based on pit volumes.
Waste Rock Hauling	1,160 tonnes/hr – east pit 3,007 tonnes/hr – west pit	Based on 100,000 tonnes/day, 24-hour hauling divided between the pits based on pit volumes.
Equipment dedicated to Pits	6 Drill Rigs – 800 HP each 2 Loaders – 2000 HP each 1 Track Dozer – 646 HP 1 Grader – 297 HP 1 Wheel Dozer – 904 HP	Exhaust emissions divided based on kilometers travelled. Dust emissions based on 24-7 bulldozing (5% surface moisture content, 9.14% surface silt content) and daily grading (5.4 km of roads in east pit and 7.1 km of roads in the west pit) at 5 km/hr occurring in each pit simultaneously.

Notes:
— = No additional assumptions.

3.2 Low-grade Ore Stockpile

Table 5 outlines the parameters used to calculate emissions related to the low-grade ore stockpile.

Table 5: Low-grade Ore Stockpile Emission Calculation Parameters

Parameter		Notes
Daily Throughput	27,400 tonnes/day	24 hr/day, 365 days/year.
Bulldozing	24 hr/day, 365 days/year, 5% surface moisture content, 9.14% surface silt content.	Exhaust emissions from dozer not considered significant compared to emissions from haul trucks.
Grading	1.31 km of roads graded daily at 5 km/hr.	Exhaust emissions from grader not considered significant compared to emissions from haul trucks.

3.3 Waste Rock Stockpile

Table 6 outlines the parameters used to calculate emissions related to the waste rock stockpile.

Table 6: Waste Rock Stockpile Emission Calculation Parameters

Parameter		Notes
Daily Throughput	100,000 tonnes/day	—
Bulldozing	24 hr/day, 365 days/year, 5% surface moisture content, 9.14% surface silt content.	Exhaust emissions from dozer not considered significant compared to emissions from haul trucks.
Grading	3.32 km of roads graded daily at 5 km/hr.	Exhaust emissions from grader not considered significant compared to emissions from haul trucks.

Notes:
— = No additional assumptions.

3.4 Surface Roads

Table 7 outlines the parameters used to calculate emissions related to the on-site surface roads.

Table 7: Surface Roads Emission Calculation Parameters

Parameter		Notes
No. of trucks	20	—
Engines	Tier 2	Vehicles with greater than 750 HP use Tier 2 standards.
Speed limit	25 km/hr	—
Truck capacity	227 tonnes	—
Hauling capacity	65,000 tonnes/day ore to crusher. 100,000 tonnes/day waste rock to stockpile 27,400 tonnes/day low grade ore to stockpile.	Exhaust and fugitive emissions divided based on kilometers travelled. Assumed 10% of roadway dust is ore.

Notes:
— = No additional assumptions.

3.5 Ore Crushing and Screening

The following table outlines the parameters used to calculate emissions related to ore crushing and screening.

Table 8: Ore Crushing and Screening Emission Calculation Parameters

Parameter		Notes
Material Throughput	65,000 tonnes/day 24 hr/day 365 days/year	—
Primary Crushing	Drop to crusher occurs in an enclosure, therefore 75% control efficiency applied. Gyratory crusher controlled via scrubber therefore 99% control efficiency applied.	—
Material transfer to Bin	Controlled via fabric filter therefore 99.5% control efficiency applied.	—
Screening	Controlled via fabric filter therefore 99.5% control efficiency applied.	—
Secondary Crushing	Controlled via scrubber therefore 99% control efficiency applied.	—
Reclaim material transfer	Controlled via fabric filter therefore 99.5% control efficiency applied.	—
Final Crushing	Controlled via scrubber therefore 99% control efficiency applied.	—

Notes:
— = No additional assumptions.

3.6 Ore Processing and Refining

There are no international emission factors relating specifically to gold ore processing and refining which the exception of hydrogen cyanide emissions. For all other compounds, sites typically conduct stack testing in order to characterize emissions from different process activities. Based on Golder's experience with various gold mining operations, as well as Osisko Mining Corporation[1] (Osisko) Malartic operations, emission estimates were prepared for each of the different processes based on the amount of ore processed so that these factors can be scaled accordingly for the Project. Table 9 outlines the parameters used to calculate emissions related to ore processing and refining.

[1] Osisko Hammond Reef Gold Ltd. (OHRG) is a subsidiary of Osisko Mining Corporation (Osisko), a mid-tier gold producer based in Montreal, Quebec. Osisko operates the Canadian Malartic Gold Mine in the Abitibi-Temiscamingue region of Quebec.

Table 9: Ore Processing and Refining Emission Calculation Parameters

Parameter		Notes
Annual Ore Processing Rate	22,000,000 tonnes/year	Used to scale source testing from other sites.
Carbon in Pulp Adsorption	Emissions based on other sites scaled based on annual ore processing rate. 24-7 operation.	—
Acid Wash	Emissions based on other sites scaled based on annual ore processing rate. 24-7 operation.	HCl emissions exhausting from a stack (4.0 m above roof, 11.64 m/s exit velocity, 0.2 m exit diameter, 20°C exit temperature).
Carbon Regeneration	Emissions based on Malartic scaled based on annual ore processing rate. 24-7 operation.	—
Regeneration Furnace	Propane combustion. ~31.5 MBtu/day. 24-7 operation.	—
Cyanide Destruction	Emissions based on other sites scaled based on annual ore processing rate. 24-7 operation.	SO_2 emissions exhausting from a stack (10 m above roof, 12 m/s exit velocity, 1 m exit diameter, 20°C exit temperature).
Electrowinning	Emissions based on other sites scaled based on annual ore processing rate. 24-7 operation.	—
Smelting Furnace	Emissions based on Malartic scaled based on annual ore processing rate. Assumed 12 hours/day totally 700 hours/year.	—
Hydrogen Cyanide	Based on 2.64 tonnes of NaCN per year. The NaCN decomposes forming HCN.	NaCN usages based on 0.12 kg/tonne of ore.

Notes:

— = No additional assumptions.

3.7 Emergency Power Generators

Table 10 outlines the parameters used to calculate emissions related to emergency power generation.

Table 10: Emergency Power Generators Emission Calculation Parameters

Parameter		Notes
Fuel Type	Diesel	—
Capacity	2 x 2,500 kW 2 x 800 kW 4 x 250 kW	Assumes simultaneous weekly 1-hour testing.

Notes:
— = No additional assumptions.

3.8 Comfort Heating

Table 11 outlines the parameters used to calculate emissions related to comfort heating.

Table 11: Comfort Heating Emission Calculation Parameters

Parameter		Notes
Fuel Type	Propane	—
Hours of Operation	24 hr/day 242 days/year (not including summer months)	—
Residential Building Heating per Square foot	54 Btu/ft^2	Assumes one air exchange per hour. Applied to Accommodation Camp buildings.
Plant Building Heating per Square foot	200 Btu/ft^2	Assumed six air exchanges per hour. Applied to all buildings except the Accommodation Camp buildings.
Hot Water Boilers	5 MBtu/hr	Divided between the Accommodation Camp buildings based on square footage.

Notes:
— = No additional assumptions.

3.9 Access Road

The following outlines the key assumptions that were made and used throughout the assessment to establish the bounding case scenario for the Access road (Hardtack/Sawbill):

- A 1-km stretch of the road was assessed to determine the distance from the road at which emissions from the road are negligible.

- A 50% control for natural road dust mitigation (i.e., precipitation) and best management practices such as watering, etc.

Based on the information provided by OHRG, the vehicle fleet will not change with season or day of the week. A summary of the daily access road (Hardtack/Sawbill) fleet traffic is provided in Table 12.

Table 12: Access Road (Hardtack/Sawbill) Fleet Traffic

Vehicle Type	Number of Trips per Day (1-way)
Pickup	3
Passenger Car	85
Passenger Van	1
Transport Truck	18

4.0 SAMPLE CALCULATIONS

The following sample calculations for selected activities demonstrate how the emissions for the Project were developed. The results are in units of g/s, consistent with the model inputs described in Appendix 3.II. The emission rates in g/s were averaged hourly, daily and annually based on the activity/process operating times outlined in Section 3.0.

4.1 Blasting

4.1.1 Fugitive Dust

An equation from Table 11.9-2, U.S. EPA AP-42 Chapter 11.9 "*Western Surface Coal Mining*" (October 1998) was used to calculate the fugitive dust emissions associated with blasting activities. The equation is as follows:

$$EF = 0.00022 \times \mathrm{A}^{1.5} \times \mathrm{SF}$$

where: *EF = emission factor (kg/blast)*
A = horizontal area (m²)
SF = scaling factor

The blast surface area was determined using the amount of material blasted, the material specific gravity and the hole depth.

$$A = \frac{tonnage}{SG \times h}$$

where: *A = horizontal area (m²)*
SG = specific gravity
tonnage = amount of material blasted (Mg)
h =blast hole depth (m)

The following is a sample calculation for the fugitive $PM_{2.5}$ from blasting in the east pit using the following values:

Amount of material blasted (Mg)	22,960
SG	1.5
Blast hole depth (m)	14.8
Number of blasts per day	2
TSP scaling factor	1
PM_{10} scaling factor	0.52
$PM_{2.5}$ scaling factor	0.03

The horizontal area blasted is calculated as follows:

$$A = \frac{22{,}960}{1.5 \times 14.8}$$

$$A = 1{,}034\ m^2$$

The $PM_{2.5}$ predictive emission factor for the blast area above is calculated as follows:

$$EF = 0.00022 \times 1{,}034^{1.5} \times 0.03$$

$$EF = 0.22\ kg/blast$$

The daily $PM_{2.5}$ emission rate is calculated as follows:

$$ER = EF\ \times Daily\ Number\ of\ Blasts \times \frac{1{,}000\ g}{kg} \times \frac{1\ day}{24\ hr}\ \frac{1\ hr}{3{,}600\ s}$$

$$ER = \frac{0.22\ kg}{blast} \times \frac{2\ blasts}{day} \times \frac{1{,}000\ g}{kg} \times \frac{1\ day}{24\ hr}\ \frac{1\ hr}{3{,}600\ s}$$

$$ER = 0.005\ g/s$$

The emissions of PM_{10} and TSP were calculated in the same manner presented above.

The emissions of metals from blasting ore were calculated using the amount of ore blasted and the typical ore assay for the Project Site, as follows.

$$ER = ER_{TSP}\ from\ blasting \times the\ fraction\ of\ ore\ blasted \times concentration\ of\ the\ metal\ in\ the\ ore$$

The emissions of manganese from the east pit are as follows:

ER of TSP from blasting (g/s)	0.169
Amount of ore blasted per day (tonnes)	18,090
Total amount blasted per day (tonnes)	45,920
Concentration of manganese in ore (%)	0.04

$$ER = \frac{0.169g}{s} \times \frac{18{,}090\ tonnes}{45{,}920\ tonnes} \times 0.04\%$$

$$ER = 0.000027\ g/s$$

4.1.2 Explosives

Emission factors from Australia NPI "*Explosives Detonation and Firing Ranges 3.0*" (January 2012) were used to calculate the NOx and CO emissions associated with blasting activities. The emission rate is then calculated as follows:

$$ER = EF \times usage$$

where: *ER = emission rate (kg)*
EF = emission factor (kg/Mg)
usage = amount of explosive usage per blast (Mg)

A sample calculation for the West Pit and the emission factors used follows:

Amount of emulsion used per blast (Mg)	33
CO emission factor (kg/Mg)	2.3
NOx emission factor (kg/Mg)	0.2
Hours per blast	1
Number of blasts per day	2

Assuming the emissions from each blast are averaged over one hour, the following is the daily emission rate for CO from blasting out of the west pit.

$$ER = EF \times usage \times \frac{hours\ per\ blast\ x\ number\ of\ blasts\ per\ day}{24\ hr} \times \frac{1{,}000g}{kg} \times \frac{1hr}{3{,}600s}$$

$$ER_{CO} = 2.3\frac{kg}{Mg} x\ 33\ Mg \times \frac{\frac{1hr}{blast} x\ 2\ blasts}{24\ hr} \times \frac{1{,}000g}{kg} \times \frac{1hr}{3{,}600s}$$

$$ER_{CO} = 1.77\ g/s$$

The NOx emissions are calculated in a similar manner.

4.2 Material Handling

The material handling emissions associated with ore and waste rock handling were estimated using the emission factors from Section 11.24 "*Metallic Minerals Processing*" of the AP 42 document (revised January 1995). Material handling emissions are estimated when the ore and waste rock are moved, dropped or conveyed (e.g., unloading of ore at stockpiles).

Table 11.24-1 provides TSP emission factors in kg/Mg for material handling and transfers for low moisture and high moisture ore. High moisture ore is considered to have a moisture content greater than 4%. The TSP

emission rate would then be calculated by multiplying the emission factor by the amount of material being moved.

$$ER = EF \times tonnage$$

where: *ER = emission rate (kg)*
EF = emission factor (kg/Mg)
tonnage = amount of material being moved (Mg/day)

The following is a sample calculation for the TSP emissions from dropping the low-grade ore at the low-grade ore stockpile using the following values:

Amount of material handled (Mg/day)	27,400
Hours per day (hr/day)	24
Days per year (days/year)	365
TSP EF for high moisture ore (kg/Mg)	0.005

$$ER = 0.005\ \frac{kg}{Mg} \times 27{,}400\ \frac{Mg}{day} \times \frac{1\ day}{24\ hr} \times \frac{1\ hr}{3{,}600 s} \times \frac{1{,}000 g}{kg}$$

$$ER = 1.59\ g/s$$

The emissions of PM_{10} and $PM_{2.5}$ were calculated in a consistent manner. The emissions of metals were calculated as described in Section 4.1.1.

4.3 Bulldozing

An equation from U.S. EPA AP-42 Chapter 11.9 "*Western Surface Coal Mining*" (October 1998) was used to calculate the fugitive dust emission factors associated with bulldozing activities. The equation for TSP is as follows:

$$EF = 2.6 \times \frac{s^{1.2}}{M^{1.3}}$$

where: *EF = particulate emission factor (kg/hr),*
s = silt content of material (%), and
M =moisture content of material (%)

The emission factors for PM_{10} and $PM_{2.5}$ are based on the TSP and PM_{15} emission factors. The following is a sample calculation for the TSP emissions for bulldozing activities at the waste rock stockpile using the following values:

Silt content (%)[(a)]	9.14
Moisture content (%)	5

[(a)] Typical value for Ontario mining operations as outlined in the CEMI Fugitive Dust Guidance Document, August 2010

$$EF = 2.6 \times \frac{9.14^{1.2}}{5^{1.3}}$$

$$EF = 4.57\ kg/hr$$

The following is a sample calculation for the TSP emission rate:

$$ER = EF \times \frac{1\ hr}{3{,}600\ s} \times \frac{1{,}000\ g}{kg}$$

$$ER = \frac{4{,}57 kg}{hr} \times \frac{1\ hr}{3{,}600\ s} \times \frac{1{,}000\ g}{kg}$$

$$ER = 1.27\ g/s$$

The emissions of PM_{10} and $PM_{2.5}$ were calculated in a similar manner to that presented above using the appropriate scaling factors from the U.S. EPA AP-42 Chapter 11.9. For bulldozing activities that involves the movement of ore, the emissions of metals were calculated as described in Section 4.1.1.

4.4 Grading

An equation from U.S. EPA AP-42 Chapter 11.9 "*Western Surface Coal Mining*" (October 1998) was used to calculate the fugitive dust emission factors associated with grading activities. The equation for TSP is as follows:

$$EF = 0.0034 \times S^{2.5}$$

where: EF = particulate emission factor (kg/km),and
S = vehicle speed (km/hr)

The emission factors for PM_{10} and $PM_{2.5}$ are based on the TSP and PM_{15} emission factors. The following is a sample calculation for the TSP emissions for grading activities at the waste rock stockpile using the following values:

Vehicle speed (km/hr)	5
VKT (km/day)	3.32

$$EF = 0.0034 \times 5^{2.5}$$

$$EF = 0.19\ kg/km$$

The following is a sample calculation for the TSP emission rate:

$$ER = EF \times VKT \times \frac{1\ day}{24\ hr} \times \frac{1\ hr}{3{,}600\ s} \times \frac{1{,}000\ g}{kg} \times hr\ operating\ in\ 24\ hr$$

$$ER = \frac{0.19 kg}{km} \times 3.32\ \frac{km}{day} \times \frac{1\ day}{24\ hr} \times \frac{1\ hr}{3{,}600\ s} \times \frac{1{,}000\ g}{kg} \times \frac{\frac{3.32\ km}{5\ km/hr}}{24\ hr}$$

$$ER = 0.0002\ g/s$$

The emissions of PM_{10} and $PM_{2.5}$ were calculated in a similar manner to that presented above using the appropriate scaling factors from the U.S. EPA AP-42 Chapter 11.9.

4.5 Vehicles – Exhaust Emissions

Crank case emission standards from Nonroad Engine Modelling (Compression Ignition) – U.S. EPA 009d (Report No. NR-009d) (July 2010) were used to calculate the exhaust emissions from the Project mobile vehicles. It was assumed that all on-site vehicles with a horsepower less than 750 comply with at least Tier 3 emission standards. For the vehicles with a horsepower greater than 750, Tier 2 emission standards were used.

Emission standards were not provided for PM_{10} and $PM_{2.5}$; therefore, it was assumed that all TSP emissions consist of PM_{10} and that $PM_{2.5}$ emissions are 97% of PM_{10} emissions. Load factors are provided based on vehicle type as per Table F4 and F6 in Appendix F Report No. NR-009d.

The following equation was used to determine the emission rates for on-site vehicles:

$$ER = EF \times Engine\ Horsepower\ Rating \times LF \times \frac{Hours\ of\ Operation}{24\ hr} \times \frac{1\ hr}{3600\ s}$$

where: *ER = emission rate (g/s)*
EF = emission factor (g/HP-hr)
LF = load factor

The sample calculation for the TSP emission rate for the track dozer which is dedicated to the Pits is below and uses the following:

Vehicle HP	646
Hours of operation in 24 hours	24
Emission Standard (g/HP-hr)	0.15
Load factor	0.58

$$ER = \frac{0.15\ g}{hp - hr} \times 646hp \times 0.58 \times \frac{24\ hr\ of\ operation}{24\ hr} \times \frac{1\ hr}{3600\ s}$$

$$ER = 0.016\ g/s$$

The emissions of DPM, CO, NOx, HC, PM_{10} and $PM_{2.5}$ were calculated in the same manner presented above.

Sulphur dioxide (SO_2) emissions were estimated using fuel consumption data for the non-road engines. The sulphur content of fuel was assumed to be 15 parts per million (ppm). The following equation was used to determine the SO_2 emission factor:

$$EF = Fuel\ Density \times Sulphur\ Content \times \frac{MM\ SO_2}{MM\ Sulphur}$$

where: *EF = particulate emission factor (g/L)*
MM = molar mass (g/mol)

The following is a sample calculation for the SO_2 emissions from the same track dozer using the following values:

Fuel density (g/L)	845
Sulphur content (ppm)	15
MM SO_2 (g/mol)	64
MM S (g/mol)	32
BSFC (lb/HP-hr)[(a)]	0.367

[(a)] For all HPs greater than 100 as per Table A4 of Report No. NR-009D.

$$EF = \frac{845\ g}{L} \times \frac{15}{1000000} \times \frac{64\frac{g}{mol}}{32\frac{g}{mol}}$$

$$EF = 0.025\ g/\mathrm{L}$$

The fuel consumption can be calculated using the steady state brake specific fuel consumption (BSFC) conversion in Table A4 of Report No. NR-009D and is as follows:

$$Fuel\ Consumption = BSFC\ (\frac{lb}{HP - hr}) \times HP \times \frac{LF}{fuel\ density}$$

$$Fuel\ Consumption = 0.367\frac{lb}{HP - hr} \times 646\ HP \times \frac{0.58}{0.845kg/L} \times \frac{0.45359kg}{lb}$$

$$Fuel\ Consumption = 73.81\ L/hr$$

The SO_2 emission rate can be calculated as follows:

$$ER = EF\ \times Fuel\ Consumption\ \times \frac{Hours\ of\ Operation}{24\ hr} \times \frac{1\ hr}{3600\ s}$$

where: *ER = emission rate (g/s)*
EF = emission factor (g/L)

$$ER = \frac{0.025\ g}{L} \times \frac{73.81\ L}{hr} \times \frac{24\ hr\ of\ operation}{24\ hr} \times \frac{1\ hr}{3{,}600\ s}$$

$$ER = 0.001\ g/s$$

4.6 Vehicles – Unpaved Fugitive Road Dust

The predictive equation in U.S. EPA AP-42 Chapter 13.2.2 "*Unpaved Roads*" (November 2006) was used to calculate the fugitive dust emissions from the unpaved roadways. The equation is as follows:

$$EF = k\left(\frac{s}{12}\right)^{a} \times \left(\frac{W}{3}\right)^{b} \times 281.9 \times (1 - 80\%)$$

where: EF = particulate emission factor (g/VKT),
k = empirical constant for particle size range (pounds per vehicle mile travelled) (Table 4-1),
s = road surface silt content (%),
W = average weight (tons) of the vehicles traveling the road,
a= empirical constant for particle size range (dimensionless) (Table 4-1),
b= empirical constant for particle size range (dimensionless) (Table 4-1),
281.9 = conversion from pounds per vehicle miles travelled to grams per vehicle kilometres travelled,
80% = reduction of fugitive dust emissions due to best management practices to control fugitive dust.

Table 13 shows the constants used for the unpaved roadways fugitive dust emissions.

Table 13: Particle Size Constants for Unpaved Road Dust – Industrial Roads

Size Range	k (lb/VMT)	a	b
$PM_{2.5}$	0.15	0.9	0.45
PM_{10}	1.5	0.9	0.45
TSP	4.9	0.7	0.45

Unpaved road dust emissions were conservatively calculated without an adjustment for natural mitigation.

The following is a sample calculation for the TSP emission factor using the following values for the section of roadway from the east pit to the gyratory crusher:

Silt content (%)	9.14
Average weight of vehicles (tons)[(a)]	304.9
Length of road segment (km)	2.95
Number of one-way vehicle passes per day	80

(a) Average weight assumes a full truck weighs 390 tonnes and an empty truck weighs 163 tonnes and the truck drives there and back in one trip.

$$EF = 4.9\left(\frac{9.14}{12}\right)^{0.7} \times \left(\frac{304.9}{3}\right)^{0.45} \times 281.9$$

$$EF = 9134.43\ g/VKT$$

The following is a sample calculation for the TSP emission rate:

$$ER = EF \times Daily\ Vehicle\ Kilometres\ Travelled \times (1 - Control\ Efficiency) \times \frac{1\ day}{24\ hr} \times \frac{1\ hr}{3600\ s}$$

$$ER = \frac{1934.43 g}{km} \times \frac{\left(2.95 \frac{\text{km}}{\text{trip}} (\text{one way}) \times 2\ (\text{return}) \times 80\ \text{trips}\right) \text{km}}{1\ \text{day}} \times (1 - 80\%) \times \frac{1\ \text{day}}{24\ hr} \times \frac{1\ hr}{3600\ s}$$

$$ER = 9.94\ g/s$$

The emissions of TSP and PM_{10} were calculated in a similar manner.

The metals in the fugitive road dust were calculated based on the conservative assumption that 10% of the surface road silt is ore. Therefore 10% of the emissions were then speciated using an assay to represent typical ore found at the site. The emission rate for each metal was derived from the following equation.

$$ER = ER\ on\ the\ road\ segment \times 10\% \times concentration\ of\ the\ metal\ in\ the\ ore$$

The following is a calculation for manganese on the roadway from the East pit to the gyratory crusher using the ore assay illustrated in Section 1.0.

$$ER = \frac{9.94 g}{s} \times 10\% \times 0.04\%$$

$$ER = 0.0004\ g/s$$

4.7 Ore Crushing and Screening

Table 11.24-1 in Section 11.24 "*Metallic Minerals Processing*" of the AP 42 document (revised January 1995) provides TSP emission factors in kg/Mg for crushing for low moisture and high moisture ore. High moisture ore is considered to have a moisture content greater than 4%. The TSP emission rate would then be calculated by multiplying the emission factor by the amount of material being moved. The crushing is controlled via wet scrubber so a control efficiency is also applied. A sample calculation is as follows:

$$ER = EF \times material\ throughput \times (1 - control\ efficiency)$$

For the gyratory crusher with a wet scrubber the calculation is as follows:

Primary crushing EF (kg/Mg)	0.01
Material throughput (Mg/day)	65,000
Wet scrubber control efficiency (%)	99
Concentration of manganese in ore (%)	0.04

$$ER = 0.01 kg/Mg \times 65{,}000 Mg/day \times (1 - 99\%) \times \frac{1\ day}{24\ hr} \times \frac{1 hr}{3{,}600 s} \times \frac{1{,}000 g}{kg}$$

$$ER = 0.075\ g/s$$

The emissions of PM_{10} were calculated in a consistent manner. Since there is not an emission factor for $PM_{2.5}$, the emissions of $PM_{2.5}$ were assumed to be in the same fraction as they are in the AP-42 Chapter 11.19 for a controlled conveyor transfer point.

The emissions of metals were calculated as follows.

$$ER = ER_{TSP} \times concentration\ of\ the\ metal\ in\ the\ ore$$

$$ER = \frac{0.075 g}{s} \times 0.04\%$$

$$ER = 0.00003\ g/s$$

There are no emission factors for ore screening in Table 11.24-1; therefore, Section 11.19 must be used to determine the TSP emissions. Table 11.19.2-1 provides emission factors in kg/Mg for controlled and uncontrolled screening. Screening is considered controlled when the operation is equipped with a wet suppression system. The emission factor for uncontrolled screening was used with a control efficiency since the screening operation is controlled via a fabric filter. A sample calculation is as follows:

$$ER = EF \times material\ throughput \times (1 - control\ efficiency)$$

For the screening with a fabric filter the calculation is as follows:

Screening EF (kg/Mg)	0.0125
Material throughput (Mg/day)	65,000
Fabric filter control efficiency (%)	99.5
Concentration of manganese in ore (%)	0.04

$$ER = 0.0125 kg/Mg \times 65{,}000 Mg/day \times (1 - 99.5\%) \times \frac{1\ day}{24\ hr} \times \frac{1 hr}{3{,}600 s} \times \frac{1{,}000 g}{kg}$$

$$ER = 0.047 g/s$$

The emissions of PM_{10} were calculated in a consistent manner. Since there is not an uncontrolled emission factor for $PM_{2.5}$, the emissions of $PM_{2.5}$ were assumed to be in the same fraction as they are for controlled screening.

The emissions of metals were calculated as follows.

$$ER = ER_{TSP} \times concentration\ of\ the\ metal\ in\ the\ ore$$

$$ER = \frac{0.047g}{s} \times 0.04\%$$

$$ER = 0.000019g/s$$

4.8 Ore Processing and Refining

Based on Golder's experience with various gold mining operations that includes Osisko's Malartic operations, emission estimates were created for each of the different processes based on the amount of ore processed so that these estimates can be scaled accordingly for the Project.

The following table lists the emission factors that were used in the calculations.

Table 14: Ore processing emission factors

Contaminants	Emission Rates [g/s/tonne of ore processed]					
	CIP Adsorption	Acid Wash	Carbon Regeneration (a)	Cyanide Destruction	Electrowinning	Smelting Furnace(a)
Ammonia	2.13×10^{-8}	—	—	8.99×10^{-11}	2.68×10^{-8}	—
Carbon Monoxide	—	—	1.75×10^{-9}	—	—	—
Hydrochloric Acid	—	8.97×10^{-8}	—	—	—	—
NO_X	—	—	—	—	—	—
TSP(b)	—	—	4.71×10^{-9}	—	—	1.49×10^{-9}
PM_{10}	—	—	4.71×10^{-9}	—	—	1.49×10^{-9}
$PM_{2.5}$	—	—	4.71×10^{-9}	—	—	1.49×10^{-9}
SO_2	—	—	—	9.01×10^{-7}	—	—
Sodium Hydroxide	1.22×10^{-8}	—	—	—	9.73×10^{-9}	—
Zinc	—	—	—	3.44×10^{-9}	—	2.67×10^{-11}

(a) Emissions taken from Osisko Malartic operations'

(b) All TSP was conservatively assumed to be $PM_{2.5}$

— Emissions not released from this source

The emission from each compound for each process was calculated as follows:

$$ER = EF \times amount\ of\ ore\ processed$$

For ammonia emissions from the CIP Adsorption process, the calculation is as follows:

EF (g/s/tonne of ore processed)	2.13×10^{-8}
Annual ore processing rate (tonnes/year)	22,000,000

$$ER = \frac{2.13E-08 g/s}{tonne} \times 22{,}000{,}000 tonnes$$

$$ER = 0.469 g/s$$

All other compounds were calculated in a similar manner.

The regeneration furnace uses propane therefore its emissions were calculated using the methods outlined in Section 4.10.

The Australian National Pollutant Inventory's "*Emission Estimation Technique Manual for Gold Ore Processing Version 2.0*" (December 2006) was used to estimate hydrogen cyanide emissions from the mill process area. This document states that 1% of the ionic cyanide used in the process can be assumed to be lost through volatilization as hydrogen cyanide (HCN) within the processing area. These emissions are not associated with any single emission source and therefore act as a summation of source emissions. Molar ratios along with Osisko's sodium cyanide usage data have been used to estimate annual hydrogen cyanide emissions.

$$ER = usage\ of\ NaCN \times mol\ ratio \frac{CN}{NaCN} \times mol\ ratio \frac{HCN}{CN} \times 1\%$$

The following data and calculation was used to determine the hydrogen cyanide emissions.

NaCN usage (kg/tonne of ore processed)	0.12
Annual ore processing rate (tonnes/year)	22,000,000
MW NaCN (g/mol)	49.01
MW CN (g/mol)	26.02
MW HCN (g/mol)	27.03

$$ER = \frac{0.12kg}{tonne} \times 22{,}000{,}000 \frac{tonnes}{year} \times \frac{26.02g/mol}{49.01g/mol} \times \frac{27.03g/mol}{26.02g/mol} \times 1\% \times \frac{1\ year}{365\ days} \times \frac{1\ day}{24\ hr} \times \frac{1\ hour}{3{,}600s} \times \frac{1{,}000g}{kg}$$

$$ER = 0.462\ g/s$$

4.9 Stationary Diesel Combustion

The emission factors in AP-42 Chapter 3.4 "*Large Stationary Diesel and all Stationary Dual Fuel Engines*" (October 1996) were used to calculate the emissions from the emergency diesel power generators using the following calculation.

$$ER = EF \times power\ rating$$

The NOx emission rate calculation for one of the generators is as follows.

NOx EF (lb/HP-hr)	0.024
Power rating (kW)	2,500

$$ER = 0.024\frac{lb}{HP-hr} \times 2{,}500kW \times \frac{hp}{0.7457kW} \times \frac{g}{0.0022lb} \times \frac{hr}{3{,}600s}$$

$$ER = 10.1g/s$$

The other compounds were calculated in a similar manner.

4.10 Propane Combustion

The emission factors in AP-42 Chapter 1.5 "*Liquefied Petroleum Gas Combustion*" (July 2008) for industrial boilers, assuming a sulphur content of 0.18 gr/100 ft³, were used to calculate the emissions from the propane heaters and boilers using the following calculation.

$$ER = EF \times thermal\ input\ rating$$

The thermal input ratings were determined using the building square footages and standard HVAC practices for plant and residential buildings. The following is a sample calculation for NOx from the Concentrator building.

NOx EF (lb/Btu)	1.42×10^{-7}
Building square footage (ft^2)	43,983
Residential building heating factor ($Btu/ft^2/hr$)	54
Plant building heating factor ($Btu/ft^2/hr$)	200

$$ER = 1.42E-07lb/Btu \times \frac{\frac{200Btu}{hr}}{ft^2} \times 43{,}983ft^2 \times \frac{g}{0.0022lb} \times \frac{hr}{3{,}600s}$$

$$ER = 0.157\ g/s$$

All other compounds were calculated in a similar manner. All TSP was assumed to be $PM_{2.5}$.

4.11 Access Road

Fugitive road dust (i.e., TSP, PM_{10}, $PM_{2.5}$) emissions were calculated using the emission factors presented in Sections 13.2.2 of AP-42 (U.S. EPA 2010a) using equation 1b and the vehicle activity levels in Table 12. Inputs to the calculation included an assumed vehicle speed of 80 km/hr, silt content of 10% and a moisture content of 6.5%.

Exhaust emissions were calculated using the U.S. EPA MOBILE6 emissions model and the vehicle activity levels in Table 3-9.

5.0 EMISSION RATES

Emission rates, in g/s, were calculated for each activity as described in the previous section. The metals emissions from each activity were speciated as described in Section 1.0 according the assay provided as Table 2.

5.1 Human Health and Ecological Risk Assessment

Table 15 displays the daily emission rates for each activity that requires assessment for the Human Health and Ecological Risk TSDs.

Table 15: Daily Emission Rates for the Human Health and Ecological Risk Assessment

Project Component	Activity	Daily Emission Rates (g/s)												
		TSP	PM_{10}	$PM_{2.5}$	DPM	Metals	NO_X	CO	SO_2	HC	HCN	HCl	NH_3	NaOH

Notes:
— = Compound not emitted from that activity.

5.1.1 Percentage Contributions

The following table illustrates what percentage each component contributes to the overall emissions for the Project for the Human Health and Ecological Risk Assessment.

Table 16: Percentage contributions for daily emission rates for the Human Health and Ecological Risk Assessment

Project Component	Percentage Contributions for Daily Emission Rates (%)												
	TSP	PM_{10}	$PM_{2.5}$	DPM	Metals	NOx	CO	SO_2	HC	HCN	HCl	NH_3	NaOH
Open Pit Extraction	48%	48%	47%	46%	50%	42%	48%	<1%	47%	—	—	—	—
Low Grade Ore Stockpile	1%	1%	4%	—	10%	—	—	—	—	—	—	—	—
Waste Rock Stockpile	3%	4%	10%	—	—	—	—	—	—	—	—	—	—
Surface Roads	46%	45%	32%	52%	33%	48%	45%	<1%	53%	—	—	—	—

Comfort Heating	<1%	<1%	2%	—	—	7%	6%	<1%	—	—	—	—	—

Notes:

— = Compound not emitted from that component.

5.2 Air Quality Assessment

Ontario Regulation 419/05 (O. Reg. 419/05) considers the emissions from selected stationary sources only. Ontario exempts emission sources associated with construction activities or mobile sources from evaluation (O. Reg. 524/98 [MOE 1998]). Therefore, certain emissions that are part of the Project are not included in the O. Reg. 419/05 assessment. The following emissions associated with the Project are not included in the Air Quality Assessment:

- The surface mobile vehicle exhaust emissions.
- Fugitive dust emissions if a best management practices plan is implemented however the metals emissions with POI Limits associated with the dust must still be included.
- Emergency power systems.

Table 17 illustrates which Project activities are not included in Air Quality Assessment.

Table 17: Activities Included in the Air Quality Assessment

Project Component	Activity	Included in Ontario Compliance Assessment?
Open Pit Extraction	Blasting – fugitive dust and explosives	Yes
	Material Handling	Only metals with POI Limits
	Bulldozing	Only metals with POI Limits
	Grading	Only metals with POI Limits
	Vehicles – Exhaust Emissions	No
	Vehicles – Unpaved Fugitive Road Dust	Only metals with POI Limits
Low-grade Ore Stockpile	Material Handling	Only metals with POI Limits
	Bulldozing	Only metals with POI Limits
	Grading	Only metals with POI Limits
Waste Rock Stockpile	Material Handling	No
	Bulldozing	No
	Grading	No
Surface Roads	Vehicles – Exhaust Emissions	No
	Vehicles – Unpaved Fugitive Road Dust	Only metals with POI Limits
Ore Crushing and Screening	Material Handling	Only metals with POI Limits
	Ore Crushing	Yes
	Ore Screening	Yes
Ore Processing and Refining	CIP Adsorption	Yes

Table 17: Activities Included in Ontario Compliance Assessment (Continued)

	Acid Wash	Yes
	Carbon Regeneration	Yes
	Regeneration Furnace	Yes
	Cyanide Destruction	Yes
	Electrowinning	Yes
	Smelting Furnace	Yes
	Sodium Cyanide Use	Yes
Emergency Power Generators	Stationary Diesel Combustion	No
Comfort Heating	Propane Combustion	Only NO_x

The daily emission rates outlined in Table 15 are adjusted to remove the activities that are not assessed under O.Reg.419/05. Table 18 displays the daily emission rates for each activity that is included for the Air Quality Assessment.

Table 18: Daily Emission Rates for the Air Quality Assessment

Project Component	Activity	Daily Emission Rates (g/s)

Ore Processing and Refining	17%	31%	44%	—	1%	<1%	2%	100%	—	100%	100%	100%	100%
Emergency Power Generators	—	—	—	—	—	—	—	—	—	—	—	—	—
Comfort Heating	—	—	—	—	—	93%	—	—	—	—	—	—	—

Notes:

— = Compound not emitted from that component.

5.3 Averaging Periods

A detailed operation schedule is not available at this time; therefore, most activities were assumed to be operating 24 hours a day and 365 days a year except for the activities that are outlined below.

- Blasting since it occurs for only two hours per day.
- Road grading occurs less than 24 hours per day.
- The smelting furnace since it only operates for 12 hours per day, 58 days of the year.
- The emergency generators since they are only tested for one hour per week.
- The comfort heating since they only operate during the summer months.

Since the federal and provincial air quality limits are expressed for different averaging periods, the daily emission rates can be adjusted to match the appropriate averaging period using the formulas below.

$$hourly\ ER = dailyER \times \frac{24\ hr}{number\ of\ hours\ activity\ occurs\ within\ 24\ hr}$$

$$annual\ ER = dailyER \times \frac{number\ of\ days\ activity\ occurs\ within\ the\ year}{365\ days}$$

The following calculation for the hourly $PM_{2.5}$ emission rate from blasting is an example.

Daily $PM_{2.5}$ emission rate (g/s)	0.005
Hours blasting occurs within 24 hours (hr)	2

$$hourly\ ER = 0.005 g/s \times \frac{24\ hr}{2\ hr}$$

$$hourly\ ER = 0.06\ g/s$$

The following table summarizes the hourly, daily and annual emission rates for the activities that vary based on operating hours.

Table 20: Emission Rates that Vary by Averaging Period

Activity	Compound	Emission Rate (g/s)		
		Hourly	Daily	Annual
Blasting	TSP	10.521	0.877	0.877
	PM_{10}	5.471	0.456	0.456
	$PM_{2.5}$	0.316	0.026	0.026

Table 20: Emission Rates that Vary by Averaging Period (Continued)

Activity	Compound	Emission Rate (g/s)		
		Hourly	Daily	Annual
	Metals	4.144	0.345	0.345
	CO	29.389	2.449	2.449
	NO_X	2.556	0.213	0.213
Grading	TSP	0.028	0.001	0.000

All other activities operate 24 hr/day, 365 days/year therefore the emission rates, in g/s, are the same for all averaging periods.

5.4 Access Road

Based on the assumptions discussed in Section 3.9, Table 21 summarizes the emissions associated with the Access Road (Hardtack/Sawbill).

Table 21: Daily Emission Rates for the Access Road (Hardtack/Sawbill)

Vehicle Type	Emission Rate (g/s)					
	TSP	PM_{10}	$PM_{2.5}$	NO_X	SO_2	CO
Pickup	0.79	0.34	0.03	0.003	0.00001	0.01
Passenger Car	22.42	9.62	0.96	0.026	0.00025	0.87
Passenger Van	0.26	0.11	0.01	0.001	0.00000	0.02
Transport Truck	4.75	2.04	0.20	0.052	0.00011	0.01

Traffic along the access road (Hardtack/Sawbill) was assumed to be the same every day of the week, year-round.

6.0 CONSERVATISM IN EMISSION RATE CALCULATIONS

Table 22 outlines the areas where conservatism was assumed in the emission rate calculations which results in an assessment that is not likely to under-predict the emissions associated with the Project.

Table 22: Areas of Conservatism in the Emission Rate Calculations

Area	Conservatism
Blasting	Emissions from the largest blast possible, based on the amount of material blasted, are calculated. Emissions are calculated using a SG that is likely lower than the actual SG. A higher SG would result in lower emissions.
Waste rock handling	The emission factors for metallic minerals were used as opposed to crushed stone which typically gives lower emissions.
Ore crushing and screening	The emission calculations are based on the maximum possible material throughput. Also the emission factors used also account for a material transfer to and from the equipment which for the Project would overestimate the actual emissions since individual drops were accounted for separately.
Propane combustion for comfort heating	Osisko has identified that some building heating will be electric however all buildings were assumed to be heated through propane combustion. Assumed year round emissions?

6.1 Fugitive Dust from Unpaved Roads

Unpaved roadway segments were assessed based on the type of roadway and traffic data. Chapter 13.2.1 of the AP-42 Emission Factor (U.S. EPA 1995) emission estimation equations were used for fugitive road dust from paved and unpaved roads. These emission estimates are conservative and will significantly overestimate emissions from facility roadways for the following reasons:

- The U.S. EPA AP-42 equations were developed from measured emissions from public roadways and as a result will tend to over-estimate low speed vehicle traffic from construction sites.
- All roadways are modelled assuming simultaneous and continuous use, this situation cannot occur in reality as the same trucks drive over multiple road segments sequentially.
- The assumed silt loading used to calculate emission rates are based on the typical expected from a construction site (see EIS-04-148) (U.S. EPA 1995: Section 11.9). As the best management practices outlined above are revised through continuous improvements, the emissions from the on-site roadways are likely to decrease.

The AERMOD dispersion model was used to predict the changes to air quality. The parameters that were required for modelling include the locations of the roadway segments, base elevations, effective heights of the emissions, and the initial plume size in the lateral and vertical directions. It is recognized that this modelling approach will result in higher predicted concentrations close to the roadways than actual values for the following reasons:

- The layout of the Facility is such that many roads are located in areas where there are large structures (buildings, equipment and other physical obstructions such as waste rock piles) located between the roads and the property line. These structures physically block the transport of dust off-site. There has been extensive research on the estimation of the "transportable fraction" of fugitive dust, based on different urban settings. Recent research by the U.S. EPA (U.S. EPA 2005) provides ranges of "capture fraction" (i.e., percentage of dust captured by structures and consequently not transported off-site) for various land use types. For an urban setting, with structures ranging from 5 to 50 m in height, the estimated range of capture fraction is 25% to 75%.
- The model has not been run to account for depletion of the plumb due to deposition. AERMOD has the capability to account for various mechanisms including wet and dry deposition, and chemical transformation of substances that would reduce ground level concentrations at points of interest. However, the deposition and chemical transformation algorithms were not implemented in this assessment to calculate the concentration at point of impingement. There has been extensive research on the estimation of the "transportable fraction" of fugitive dust from roadways. Based on studies done by the Desert Research Institute in Nevada and in the San Joaquin Valley, CA (Watson et al. 1996) showed a large (i.e., greater than 90%) decrease in dust concentration within 100 m of an unpaved road (Watson et al. 1996; Watson et al. 2000). A value of 75% reduction has been suggested beyond 50 m for unpaved roadway emissions. This value would increase at greater distances.

When the roads are wet or snow-covered, the emissions will be reduced or eliminated. AERMOD has the capacity to have a variable emission rate that could account for actual meteorological emissions; however the work to set up such a variable emission rate would be significant. Review of historical normals for the Atikokan meteorological station (Climate ID 6020379) found that on average there are 160 days with measurable precipitation (greater than 0.2 mm) and 149 days with greater than one cm of snow on the ground. Therefore, roads can be considered wet or snow covered for a significant portion of the year.

Despite the limitations of the emission rate estimates and dispersion modelling they are the best estimates available. The above noted biases and emission estimates are cumulative, that is to say they would work together to reduce emissions and the reductions should be multiplied to estimate a total reduction. To account for the above biases in both the emission estimates and the model itself, a conservative correction factor to reduce the emissions by 75% was incorporated into the emission rates; in reality the natural reduction would be higher.

In addition the best management practices outlined above will further reduce emissions; specifically watering will be used on dry days to decrease emissions from roads.
