OSISKO HAMMOND REEF GOLD PROJECT EIS/EA
INFORMATION REQUEST RESPONSES

INFORMATION REQUEST – MOE_NOISE-10

Source: Ministry of Environment

Summary of Comment

The Atmospheric Environment TSD, while referencing the results of acoustic modelling via the CADNA software program, does not provide any sample calculations such as will be required at the provincial Environmental Compliance Approval stage.

Potential Environmental Effects

It is difficult for the reviewer to confirm the accuracy of the modelling results upon which the claims of environmental noise compliance are made without sample calculation printouts having been made available.

Proposed Action

Include sample output printouts, used to generate the sound level predictions in the EIS, from the CADNA noise predictive software.

Reference to EIS

Atmospheric Environment TSD

Response

Sample model configurations are attached to this IR.

INFORMATION REQUEST RESPONSES

INFORMATION REQUEST – MOE – JOHN LIU

Source: Ministry of the Environment - EMRB

Summary of Comment

1. Ozone limiting method option listed in Table 10, page 37, Appendix 3.II is identified as "No" (which means it was not turned on) is inconsistent with the description on page 39, Appendix 3.II which indicates that the project was "…modelled by AERMOD using OLM"
2. The no dry depletion (NODRYDPLT) and no wet depletion (NOWETDPLT) options listed in Table 10, page 37, Appendix 3.II are identified as "No" (which means it was not turned off and this the wet and dry depletion were turned on). Turing on the wet and dry deposition is not the setting typically selected.
3. Provide the modelling input files.

Response

1. The wording on page 39 of Appendix 3.II should read as follows:

> *"Oxides of nitrogen (expressed as NO_2), one of the indicator compounds for the air quality assessment, was modelled assuming full conversion from NO_X to NO_2, following MOE accepted practice to demonstrate compliance with O.Reg. 419/05. However for the purposes of the health assessment, specific information about the NO_2 portion of NO_X was required. Therefore the ambient predictions of NO_X that were modelled by AERMOD were then converted to NO_2 using the ozone limiting method (OLM) suggested by Cole and Summerhays (Cole et al. 1979). This method is widely accepted as being a reasonable approach that recognizes the most important mechanism for NO_X conversion, namely reactions with ozone. The conversion of NO_X to NO_2 was calculated using the 90^{th} percentile of the eight-hour ground-level ozone concentrations from the Pickle Lake, Ontario station for the years 2000 to 2008. The calculated ambient NO_2 predictions were passed along to the health team for assessment."*

There are no changes to the predicted modelling results as a result of this update to the wording.

2. Table 10 on page 37 in Appendix 3.II has been updated as follows:

Table 10: Options Used in the AERMOD Model

Modelling Parameter	Description	Used in concentration modelling?	Used in particle deposition modelling?
DDEP	Specifies that dry deposition will be calculated	No	Yes
NODRYDPLT	Option to disable dry depletion (removal) processes	*No – for all compounds except particulates, depletion is not included as default since particle parameters were not specified* *Yes – for particulates since particle parameters were specified due to the OPENPIT source algorithm therefore depletion must be removed*	*No – Depletion was included for deposition modelling that was completed for other disciplines*
WDEP	Specifies that wet deposition will be calculated	No	Yes
NOWETDPLT	Option to disable wet depletion (removal) processes	*No – for all compounds except particulates, depletion is not included as default since particle parameters were not specified* *Yes – for particulates since particle parameters were specified due to the OPENPIT source algorithm therefore depletion must be removed*	*No – Depletion was included for deposition modelling that was completed for other disciplines*

For the purposes of the dispersion modelling assessment two modelling options were used:

- Depletion was disabled as default in the modelling to provide conservative predictions of concentrations. The exception to this was for particulates since the OPENPIT source algorithm was used and therefore delpletion must be manually removed.
- Depletion was included in the modelling to provide accurate particle deposition values.

There are no changes to the predicted modellign results as a result of this update to the table.

1.0 INTRODUCTION

Osisko Hammond Reef Gold Ltd. (OHRG) proposes the development of an open pit gold mine in northwestern Ontario, herein referred to as the Hammond Reef Gold Project (Project). This Atmospheric Environment Technical Support Document (TSD) is one of a series of reports in support of the Project's Environmental Impact Statement/Environmental Assessment Report (EIS/EA Report).

The following reports have been prepared to support the EIS/EA Report:

- **Atmospheric Environment TSD.**
- Geochemistry, Geology and Soil TSD.
- Hydrogeology TSD.
- Hydrology TSD.
- Water and Sediment Quality TSD.
- Site Water Quality TSD.
- Lake Water Quality TSD.
- Aquatic Environment TSD.
- Terrestrial Ecology TSD.
- Aboriginal Interests TSD.
- Cultural Heritage Resources TSD.
- Human Health and Ecological Risk Assessment TSD.
- Socio-economic Environment TSD.
- Alternatives Assessment Report.
- Conceptual Closure and Rehabilitation Plan.

The EIS/EA Report will summarize the findings of this TSD and of the above-listed supporting reports.

1.1 Purpose and Scope

The purpose of this TSD is to fulfill the assessment scope outlined in the Project's Terms of Reference (ToR) approved by the Ontario Minister of the Environment (July 2012), and in the Environmental Impact Statement Guidelines (EIS Guidelines) published by the Canadian Environmental Assessment Agency (CEA Agency) (December 2011).

This TSD provides a description of the existing conditions of the atmospheric environment including environmental processes, interrelations and interactions of atmospheric components, and their predicted

variability over Project phases. The assessment of atmospheric environment is broken down into the following components:

- Meteorology and climate.
- Air quality.
- Noise.
- Vibrations from blasting.
- Climate change assessment.

The overall objective of the programs completed and described in this TSD is to provide specific information at a level sufficient for inclusion in the EIS/EA Report in order to guide decision making regarding the potential for environmental effects of the Project, or to allow for further analyses as part of other TSDs or work related to the environmental assessment. This TSD describes the potential changes in the atmospheric environment resulting from activities associated with the Project. The assessment of environmental effects, due to changes in the atmospheric environment, the determination of significance of these effects, and the proposed mitigation measures will be addressed in the EIS/EA Report, Human Health and Ecological Risk Assessment TSD, Aquatic Environment TSD, Terrestrial Ecology TSD, and Socio-economic Environment TSD. An explanation of this approach is provided in Section 1.4 of this report.

1.2 Report Organization

This TSD is structured as follows:

- Section 1 presents the purpose and scope of the TSD, an overview of the Project, the general assessment approach, incorporation of traditional knowledge, Valued Ecosystem Components and assessment boundaries of the TSD.
- Sections 2 through 6 describe the existing conditions and predict potential changes to the respective atmospheric environment components of meteorology and climate, air quality, noise, vibrations from blasting and climate change.
- Section 7 outlines the requirements for the monitoring of the atmospheric environment during the Project's life cycle.
- Section 8 summarizes the findings of this report.

1.3 Project Overview

The Project overview and Project description is provided in Chapter 5 of the EIS/EA Report. Project aspects that influence the atmospheric evaluation are described in Sections 1.3 to 1.8.

1.3.1 Project Location

The Project is located within the Thunder Bay Mining District in northwestern Ontario, approximately 170 kilometres (km) west of Thunder Bay and 23 km northeast of the town of Atikokan (Figure 1-1).

Access to the Hammond Reef property is presently via two routes: the Premier Lake Road, a gravel road that intersects Highway 623 near Sapawe and the Hardtack-Sawbill Road, a gravel road that intersects Highway 622 northwest of the Town of Atikokan. The property is also accessible by water from the southwest end of the Marmion Reservoir at its access point from Highway 622. The existing Hardtack-Sawbill road located to the north of Finlayson Lake has been upgraded to provide an improved and more direct linkage to the Project Site in support of the expanded exploration program.

The Hammond Reef deposit is located mainly on a peninsula of land extending into the north end of the Upper Marmion Reservoir. The peninsula containing the deposit is surrounded by the Marmion Reservoir on three sides with Sawbill Bay to the northwest and Lynxhead Bay to the southeast. The property also contains a number of smaller lakes. Mitta Lake is a small, steep-sided waterbody located atop mineralized zones of the deposit. Due to its location, the open pit mining activities require the draining of Mitta Lake.

1.3.2 Climate Overview

The Project is located in a typical boreal climate region, which is characterized by long, usually very cold winters, and short, cool to mild summers. The annual temperature average is 1.6 degrees Celsius (°C) for Atikokan with a seasonal maximum of 16.2°C (average) for summer and a minimum of minus 15.4°C (average) for winter. Temperatures lower than minus 37°C have been recorded during the fall and winter. The annual normal total for precipitation is 788 millimetres (mm) (568 mm of rainfall and 220 mm of snowfall) for Atikokan with a seasonal maximum of 299 mm for the summer period.

Meteorology and climate are discussed further in Section 2.

1.3.3 Project Phases

The Project comprises four phases: construction, operations, closure and post-closure.

Activities that may influence the atmospheric environment are expected to be similar in the construction, operations and closure phases. However, the phase that will have the greatest activity levels is the operations phase. Activities that may affect the atmospheric environment are expected to be minimal during the post-closure phase,

Additional details regarding activities planned to take place in each phase of the Project are provided in Chapter 5 of the EIS/EA Report.

1.3.4 Project Components

The Project consists of the following eight main components:

- Mine, including two open pits (i.e., east pit and west pit).
- Waste Rock Management Facility (WRMF).
- Ore Processing Facility.
- Tailings Management Facility (TMF).
- Support and Ancillary Infrastructure.
- Water Management System.
- Linear Infrastructure, including access road (Hardtack/Sawbill).
- Borrow Sites.

Of these, the key components related to the atmospheric environment are the Mine, the WRMF, and the Ore Processing Facility. Project components are shown in Figure 1-2. A detailed description of Project components is provided in Chapter 5 of the EIS/EA Report.

1.4 General Assessment Approach

The Project has the potential to affect the atmospheric environment. The approach for this TSD follows six key steps:

- Step 1: Screening of Project activities to determine which activities have the potential to produce changes to the atmospheric environment.
- Step 2: Identify temporal and spatial boundaries within which potential changes to the atmospheric environment may occur.
- Step 3: Identify parameters used to characterize these potential changes.
- Step 4: Design and carry out field studies and/or background research to characterize the existing atmospheric environment, and to support the prediction of changes on the atmospheric environment as a result of the Project.
- Step 5: Carry out predictive modelling of potential changes to the atmospheric environment during Project phases identified as bounding scenarios.
- Step 6: Outline the monitoring requirements for each Project phase to confirm predicted changes to the atmospheric environment and to ensure that requirements are being met for identified parameters.

This TSD is intended to support the EIS/EA Report by describing the potential changes to the atmospheric environment. The identification of potential environmental effects and assessment of significance due to potential changes to the atmospheric environment are addressed in the EIS/EA Report, Human Health and Ecological Risk Assessment TSD, Aquatic Environment TSD, Terrestrial Ecology TSD, and Socio-economic Environment TSD.

1.5 Incorporation of Traditional Knowledge

Traditional knowledge in combination with other information sources is valuable in achieving a better understanding of the Project's potential effects on the biophysical and socio-economic environment. It also contributes to the description of the existing biophysical and human environment, natural cycles, resource distribution and abundance, and the use of land and water resources. A detailed discussion on traditional knowledge, including any aspects relevant to the atmospheric environment, is included in the Aboriginal Interests TSD.

1.6 Selection of Valued Ecosystem Components

The Valued Ecosystem Components (VECs) selected for the Atmospheric Environment TSD, the rationale for selection of these VECs, and proposed indicators are provided in Table 1-1.

Table 1-1: Valued Ecosystem Components Selected for the Atmospheric Environment

VEC	Rationale for Selection	Indicators
Air Quality		
Air quality	■ Air quality is selected as a VEC since it has been identified as an important aspect of the environment by both public and regulators. In addition, emissions from the Project Site activities have the potential to alter the existing air quality	Compounds which are expected to be emitted in measureable amounts from the Project that have Limits under Ontario Regulation 419/05 – General Air Quality.
Noise		
Noise levels	■ Noise levels are selected as a VEC since they have been identified as being important to regulators and stakeholders. In addition, Project activities have the potential to affect existing noise levels.	■ The effect of the on-site noise sources will be evaluated using the 1-hour equivalent noise level (L_{eq}). The 1-hour L_{eq} is the continuous energy equivalent sound level, which has the same energy as the time varying signal over a 1-hour period at the same location. ■ Other noise indicators are available that are not appropriate for the evaluation of the Project Site noise levels, but are appropriate for evaluating the indirect effects of changes in noise levels on other VECs (e.g., human health).
Vibration from Blasting		
Vibration Levels	■ Vibration levels are selected as a VEC since they have been identified as being important to regulators and stakeholders. In addition, Project Site activities have the potential to affect existing vibration levels.	■ The effect of blasting on air vibrations will be evaluated using Peak Air Pressure Level in dBL. ■ The effect of blasting on ground vibrations will be evaluated using Peak Particle Velocity in mm/s.

The above VECs identify those components of the atmospheric environment that have a potential to change as a result of activities associated with the Project. The atmospheric environment components of meteorology, climate and climate change are not identified as VECs. These components are critical to understanding how the Project may change the atmospheric environment, but there is limited potential for these components to change as a result of the Project.

1.7 Effects Assessment

There are several areas in the vicinity of the Project Site where changes to the atmospheric environment, as a result of the Project, could adversely affect the usage and enjoyment of these locations. However, changes to the atmospheric environment are not considered assessment endpoints. Therefore, the assessment of effects for changes to the atmospheric environment is addressed in the Human Health and Ecological Risk Assessment TSD, Aquatic Environment TSD, Terrestrial Ecology TSD, and Socio-economic Environment TSD.

1.8 Temporal and Spatial Boundaries

1.8.1 Temporal Boundaries

Temporal boundaries define the temporal extents within which changes to the environment resulting from Project activities are considered. The temporal boundaries of the atmospheric assessment are directly related to the Project phases, namely:

- Construction phase: 30 months.
- Operations phase: 11 years.
- Closure phase: 2 years.
- Post-closure phase: 10 years.

1.8.2 Spatial Boundaries

Spatial boundaries define the geographical extents within which potential environmental changes may occur. As such, spatial boundaries become the Project's study areas. The study areas for the atmospheric environment were selected based on the following factors:

- Location and concentration of emission sources, including noise emissions.
- Potential sensitive receptor locations.
- The extent of transport, propagation and dispersion of the VECs.

This TSD has four study areas; the Mine Study Area (MSA), the Local Study Area (LSA), the Regional Study Area (RSA) and the Linear Infrastructure Study Area (LISA). These study areas are defined differently for air quality, noise and vibration. Therefore they are more thoroughly defined in Sections 3.0, 4.0 and 5.0.

2.0 METEOROLOGY AND CLIMATE

Within the atmospheric environment, the physical process referred to as meteorology will strongly influence how emissions from the Project may affect the atmospheric environment. Meteorology refers to the day-to-day or hour-to-hour variations in parameters such as wind, precipitation or temperature. Climate, on the other hand, represents the expected values for these meteorological parameters. The climate of an area is typically described using normals, which are typically averages calculated over a 30-year period.

Long-term, reliable meteorological data are available from the Environment Canada monitoring stations and has been used to describe the existing meteorological conditions and climate. Long term data has been augmented by the data collected from a short-term monitoring station commissioned at the Project Site. The combined data has been used to develop a dispersion meteorology data set for use in this assessment. This section discusses the Dispersion Meteorology data set, and compares those data to the climate normal for the same region.

The dispersion meteorological data used in the air quality assessment was prepared by the MOE, and represents 5 years of observations from the station in Atikokan, Ontario (climate ID 6020379). This is also the closest available station to the Project Site for which climate normal are available from Environment Canada's National Climate Data and Information Archive. Although normal are usually calculated using a full 30 years of data, the climate normals for the Atikokan station are based on only 18 years of data (1971 through to 1988).

The comparison of the dispersion meteorological data set prepared by the MOE to the long-term climate for Atikokan, presented in the balance of this section, shows the following:

- The dispersion meteorology covering the 5 years from January 1, 2005 to December 31, 2009 is consistent with the climate normals for Atikokan.
- Is appropriate for use in modelling changes in air quality associated with the Project.

As part of the overall Project activities, a meteorological monitoring station was commissioned at the Project Site. Following discussions with MOE, it was decided that data from the on-site Station was not to be relied of for the dispersion modelling. A more thorough discussion of the dispersion meteorology, including comparisons to the available on-site data is presented in Appendix 2.I.

A map showing the location of the Atikokan station and the Project Site is provided in Figure 2-1.

2.1 Wind

Figure 2-2 provides a wind-rose for the dispersion meteorology. A "wind-rose" is often used to illustrate the frequency of wind direction and the magnitude of the wind speed. The lengths of the bars on the wind-rose indicate the frequency and speed of the wind. The wind direction (blowing from) is illustrated by the orientation of the bar in one of 16 cardinal directions. A comparable figure cannot be generated from the climate normal as hourly observations are required when producing a wind-rose.

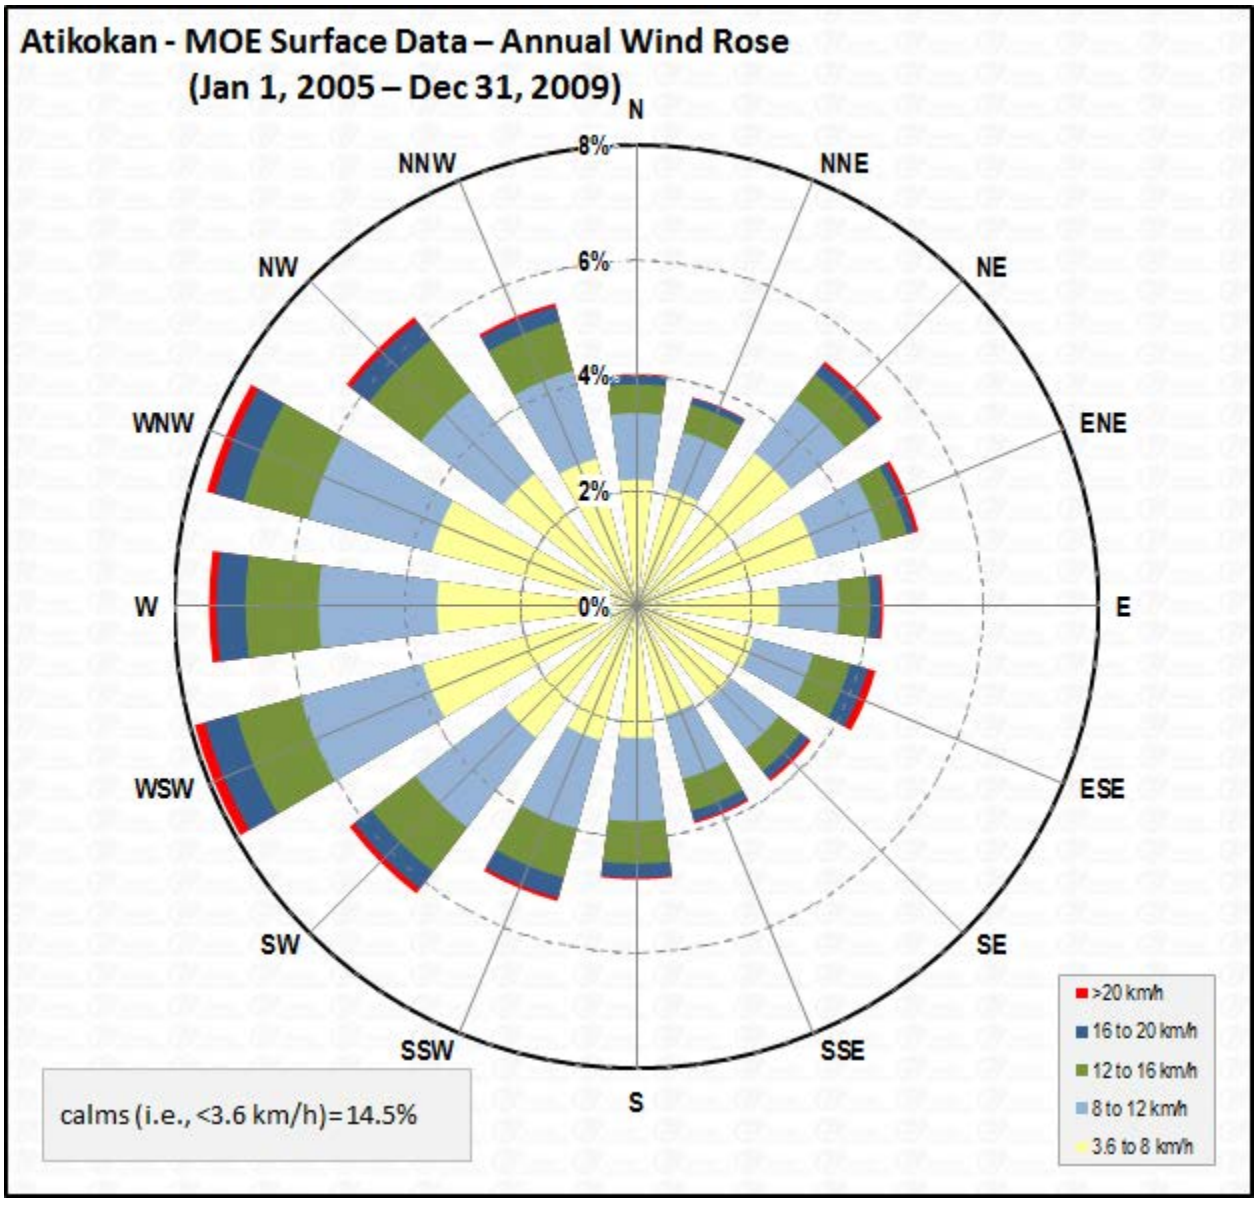

Figure 2-2: Wind Rose for Dispersion Meteorology

Wind speed and direction are the two meteorological parameters that will have the most influence on the dispersion of the emissions from the Project. Table 2-1 compares the wind speed and direction seen in the climate normal to these in the 5 year dispersion meteorological data set. Overall, the dispersion meteorology has winds that blow predominantly from the west, the same as for the climate normal. In addition, the average speeds for the dispersion meteorology (7.9 Km/h) are the same as for the long-term normal (7.7 Km/h).

Table 2-1: Comparison of Wind Speeds and Directions

Month	Atikokan Normals		Dispersion Meteorology	
	Speed (Km/h)	Most Prevalent Direction	Speed (Km/h)	Most Prevalent Direction
January	7.2	W	7.1	W
February	6.9	W	7.4	NW
March	8.3	W	8.4	NE
April	8.6	NW	8.6	NE
May	8.3	NW	9.1	NE
June	8.1	NW	8.1	SW
July	7.1	W	7.5	W
August	6.8	S	7.5	W
September	7.8	W	7.5	SW
October	8.5	S	8.1	W
November	7.9	W	8.1	W
December	6.8	W	7.0	W
Annual	7.7	W	7.9	W

2.2 Precipitation

A comparison of the long-term precipitation normals for Atikokan to the precipitation in the dispersion meteorology is provided in the Table 2-2. The dispersion meteorology had less rainfall, snowfall and day with precipitation that could be expected over the long-term.

Table 2-2: Comparison of Precipitation for Atikokan Normals and Dispersion Meteorology

Parameter	Atikokan Normals	Dispersion Meteorology
Rainfall (mm)	568	188
Snowfall (cm)	220	146
Precipitation (mm)	788	334
Extreme Daily Precipitation (mm)	—	38
Days per year with Measurable Precipitation	160	125

Notes:

— Data not available

2.3 Temperature

A comparison of the long-term temperature normals to the temperatures in the dispersion meteorology are provided in the Table 2-3. Overall, the temperatures in the dispersion meteorology were slightly higher than the long-term normals.

Table 2-3: Comparison of Temperatures

Parameter	Atikokan Normals	Dispersion Meteorology
Daily Average (°C)	1.6	3.1
Daily Maximum (°C)	8.1	8.5
Daily Minimum (°C)	-4.9	-3.3
Extreme Maximum (°C)	37.2	33.8
Extreme Minimum (°C)	-45.6	-41.2
Days per year with Maximum Temperatures Above 30 °C	5	5
Days per year with Minimum Temperatures Below -10°C	110	103

3.0 AIR QUALITY

The air quality assessment for the Project has been completed consistent with the accepted practice in Ontario. This includes characterizing the existing conditions, predicting changes to air quality, discussing the mitigation measures that are inherit in the design of the Project and describing the monitoring requirements for the Project. The air quality assessment has been prepared in compliance with the ToR, provides a prediction of changes in air quality and provides an evaluation of potential compliance with Ontario Regulation (O. Reg.) 419/05 Air Pollution – Local Air Quality (MOE 2005). To demonstrate that the Project can operate in compliance with s.20 of O. Reg. 419/05 dispersion models were used to predict Point-of-Impingement (POI) concentrations which were then compared to the POI Limits are established under O. Reg. 419/05 including standards listed in Schedule 3 of O. Reg. 419/05 and guidelines used in the provincial permitting process.

In addition to demonstrating compliance with O. Reg. 419/05, this assessment provides predictions of how the ambient air quality could change as a results of additional activities associated with the Project that are not part of an assessment of compliance with O. Reg. 419/05. The results of the air quality assessment will be used as inputs for endpoint assessments in other TSDs (e.g., Human Health and Ecological Risk Assessment TSD) and in the EIS/EA Report, to meet the requirements of the Project's ToR and the EIS Guidelines. Specifically, O. Reg. 419/05 considers the emissions from selected stationary sources only. Ontario exempts emission sources associated with construction activities or mobile sources from evaluation (O. Reg. 524/98 [MOE 1998]). Similarly, compliance evaluations per O. Reg. 419/05 do not include considerations of background concentrations.

Activity levels and air emissions from the Project will vary during the different phases. However, the greatest quantity of equipment with the highest emissions will occur during the operations phase. Therefore, the operations phase has been identified as the bounding case for air quality effects associated with Project activities.

3.1 Methods

The general approach used for assessing air quality from the Project, supports the philosophy of the environmental assessment as a planning and decision-making process and conforms to the general methodology presented in the approved ToR. The air quality study characterized and assessed the potential changes to air quality from the proposed undertaking in a thorough, traceable, step-wise manner.

The general approach is outlined as follows:

- Description of the study area in terms of geographical extent and operations assessed.
- Identification and evaluation of the pre-development conditions of the Project relevant to air quality.
- Evaluation of potential air quality changes due to the Project including the following:
  - Evaluating the air emissions from the Project for the operation phase (i.e., the emission inventory).
  - Predicting the effect of these emissions using air dispersion modelling.
  - Comparing the predicted ambient concentration to the POI Limits established under O. Reg. 419/05.

- Providing dispersion modelling predictions for the Human Health and Ecological Risk Assessment TSD, Aquatic Environment TSD, Terrestrial Ecology TSD, and Socio-economic Environment TSD, including estimates of ambient concentration and deposition rates of air emissions from the Project during the operation phase. (i.e., the phase when emissions and changes in air quality are expected to be at their highest).

- Preparation of monitoring, mitigation and adaptive management strategies that reflect the nature of the Project, the area where the Project is situated and the predicted air quality changes due to the Project.

The specific study methods used in the assessment are described in Sections 3.1.1 through 3.1.6.

3.1.1 Temporal and Spatial Boundaries

The assessment of existing air quality and the prediction of changes to air quality associated with the Project were conducted considering activities related to the following:

- The Mine (i.e., Mine, Ore Processing Facility and associated infrastructure).
- The access road (Hardtack/Sawbill).

The assessment of the Project works and activities on the environment is conducted within the framework of temporal and spatial boundaries that are common to all of the environmental components (with some modifications). The specific temporal and spatial boundaries for the air quality assessment are described in Sections 3.1.1.1 and 3.1.1.2.

3.1.1.1 Temporal Boundaries

The temporal boundaries of an environmental assessment establish the timeframes for which the direct, indirect and cumulative effects are assessed. For each of the Project study areas, four distinct phases were considered, as outlined in Section 1.8.1. These timeframes are intended to be sufficiently flexible to capture the effects of the Project. As noted in Table 3-1, the assessment of air quality focuses on the operations phase, as the other phases are anticipated to have lower emission levels than during life of mine.

Table 3-1: Phases of the Hammond Reef Gold Project

Phase	Description	Duration	Included in Air Quality Assessment?
Construction Phase	Early construction activity of facilities or infrastructure needed to support the construction phase of the Project, including site preparation; also includes pre-development of the Mine, such as stripping of overburden from the first open pit. Construction of the Mine infrastructure and facilities leading to the first production of gold.	30 months	No – This Phase uses similar types of equipment and/or activities as the operations phase however fewer of them. Therefore, emissions are bounded by the operations phase and are not assessed.
Operations Phase	The ongoing operation of the Mine and associated facilities to produce gold through to the end of the mine life.	11 years	Yes – Bounding condition for Assessment.

Table 3-1: Phases of the Hammond Reef Gold Project (Continued)

Phase	Description	Duration	Included in Air Quality Assessment?
Closure Phase	The post operations period when gold is no longer being produced and the Mine and the associated infrastructure are being decommissioned, demolished, removed and reclamation is underway to return the Project Site to a physically and chemically stable condition.	2 years	No – This phase uses similar types of equipment and/or activities as the operations phase; however, fewer of them. Therefore, emissions are bounded by the operations phase and are not assessed.
Post-closure Phase	The monitoring of the reclaimed Project Site to ensure the physical and chemical stability over time.	10 years	No – This phase does not include significant equipment usage and/or activities that would contribute significant emissions when compared to the operations phase.

3.1.1.2 Spatial Boundaries

Spatial boundaries define the geographical extents within which environmental effects are considered. Therefore, these boundaries become the study areas adopted for the environmental assessment.

The Project's EIS Guidelines require that the study areas encompass the environment that can reasonably be expected to be affected by the Project. Specific study areas are defined by boundaries to encompass all relevant components of the environment including the people, land, water, air and other aspects of the natural environment.

Four study areas were selected for the assessment of air quality:

- Mine Study Area (MSA).
- Local Study Area (LSA).
- Regional Study Area (RSA).
- Linear Infrastructure Study Area (LISA).

The study areas are illustrated on Figure 3-1. Each study area includes the smaller study areas (i.e., they are not geographically separate). The boundaries for these areas were based on the following factors:

- Location and concentration of emission sources.
- Potentially sensitive receptor locations.
- The extent of the dispersing plume(s).

3.1.1.2.1 Mine Study Area

The MSA (Figure 3-1) encompasses the most immediate area of the Project. This includes the direct area of physical disturbance associated with the operation of the Project (disturbance footprint), and extends to a distance of approximately 100 m from the edge of the disturbance footprint.

3.1.1.2.2 Local Study Area

The LSA (Figure 3-1) generally corresponds to the area in the immediate vicinity of the Project where most the air quality effects of the Project are expected to occur, and can be predicted or measured with a reasonable degree of accuracy. The LSA is enclosed within the RSA and is subject to a more focussed assessment of the effects associated with the Project. This extends approximately 10 km from the MSA.

3.1.1.2.3 Regional Study Area

The RSA (Figure 3-1) encompasses the dispersion modelling domain used in the assessment. It is not expected that the effects of the Project would be measurable beyond the RSA.

3.1.1.2.4 Linear Infrastructure Study Area

The Linear Infrastructure Study Area (LISA) encompasses the footprints of the access road (Hardtack/Sawbill). The LISA is represented by an Y-shaped area that extends 1 km on either side of the central line of the access road (Hardtack/Sawbill).

3.1.2 Indicator Compounds

Indicator compounds represent compounds that are expected to be emitted from the Project activities that must be included as part of an O. Reg. 419/05 air quality assessment:

- **Suspended Particulate matter**, SPM defined by O. Reg. 419/05 is typically associated with airborne dust from vehicles travelling on unpaved roads/haul routes, ore extraction, and material loading and unloading activities.
- **Combustion gases**, including oxides of nitrogen (NO_X), sulphur dioxide (SO_2), and carbon monoxide (CO), which are associated with blasting and the diesel exhaust from generators.
- **Process chemicals,** associated with the Ore Processing Facility, including ammonia (NH_3), hydrochloric acid (HCl), hydrogen cyanide (HCN), and sodium hydroxide (NaOH).
- **Metals** emitted in small amounts with the particulate matter due to the nature of the material being handled and from fugitive dust emissions from paved and unpaved roadways that have limits under O. Reg. 419/05 including: antimony, arsenic, beryllium, cadmium, chromium, cobalt, copper, lead, manganese, nickel, selenium, silver and tin.

In addition, other compounds that do not have point of impingement (POI) limits and compounds that have POI limits from sources that are exempt from O. Reg. 419/05 have been included in the assessment. The modelling results of these compounds are passed on to other technical disciplines for further assessment as part of the EIS/EA Report.

- **Particulate matter**, nominally smaller than 10 µm in aerodynamic diameter (PM_{10}), and particles nominally smaller than 2.5 µm in aerodynamic diameter ($PM_{2.5}$), as well as SPM from paved and unpaved roadways.

- **Combustion gases**, including nitrogen dioxide (NO_2) resulting from NO_x emissions, SO_2, carbon monoxide (CO) and hydrocarbons (HC) which are associated with the diesel exhaust from on-site vehicles and generators as well as blasting.
- **Diesel particulate matter (DPM)**, which is associated with diesel exhaust from on-site vehicles and generators.
- **Metals** emitted in small amounts with the particulate matter due to the nature of the material being handled and from fugitive dust emissions from paved and unpaved roadways. Metals include compounds with POI limits described above, as well as compounds that do not have POI limits including aluminum, barium, bismuth, calcium, iron, potassium, lithium, magnesium, molybdenum, sodium, strontium, thallium, titanium, uranium, vanadium, yttrium and zinc.

Ozone (O_3) has not been identified as an indicator compound for the Project because it will not be directly emitted as a result of Project activities, nor will the emissions of NO_X and other "precursor" compounds that can contribute to the photochemical formation of ozone be emitted in sufficient amounts to have a measurable effect on ozone formation. However, existing ozone levels are important when describing the existing air quality in the region. In addition, ozone can be an important factor in contributing to the chemical transformation of NO_X emitted from the Project into ambient concentrations of nitrogen dioxide (NO_2).

3.1.3 Description of Existing Conditions

At the time of this TSD assessment there are no industrial applications within the RSA and the area is undeveloped, thus the existing air quality is not currently impacted by local sources. The Atikokan Generating Station was considered; however, it is not located within the RSA. Northern Ontario does not typically have air quality issues as much of the land is natural and undisturbed. Field studies were not undertaken to characterize the existing air quality conditions, since available data from Northern Canada stations are considered adequate to characterize the existing air quality in the RSA and LSA. However, existing air quality measurements are not available for all indicator compounds. Further, it is expected that in remote locations such as the RSA, existing air quality values will be lower than the available measured values and that for indicator compounds (e.g., ammonia) the existing air quality concentration will be zero. Therefore, the available air quality data for particulate matter and combustion gases will be used to describe the existing conditions.

3.1.4 Estimating Air Emissions from the Project

The identification of emission sources was based on the list of Project activities presented in the ToR, and on information provided by OHRG. Air emissions were calculated using accepted methods, such as emission factors, and were based on the activity data provided in the Project Description (Chapter 5 of the EIS/EA Report). Details of specific emission calculation methods are provided in Appendix 3.I.

3.1.4.1 Mine Study Area

Table 3-2 provides a summary of the activities for which emissions were calculated in the air quality assessment from the Mine as well as a summary of the compounds released.

Table 3-2: Activities and Compounds Released from the Mine during Operations Phase

Project Component	Activity	Compounds Released												
		TSP	PM_{10}	$PM_{2.5}$	DPM	Metals	NO_X	CO	SO_2	HC	HCN	HCl	NH_3	NaOH

Notes:
— = compound not emitted from this source

For any activity where ore could be a component of the particulate, the particulate emissions were speciated into metals as outlined in Appendix 3.I.

In order to assess the air emissions associated with the Project, some key assumptions about the operations of the Mine and processing plant were made and confirmed by OHRG. The assumptions were developed so that the assessment would document the scenario that produced a bounding condition for the emissions for the Project throughout the operations phase. Only this scenario was carried through the assessment since all other scenarios would likely produce similar or less emissions.

The following are the key assumptions used throughout the assessment to establish the scenario that was assessed:

- Maximum extraction rates of 65,000 tonnes/day of ore and 100,000 tonnes/day of waste rock were assumed.
- Open pit extraction operations were assumed to occur simultaneously in both pits.
- Emissions from open pit extraction operations were divided between the open pits based on maximum pits volumes.
- The longest haul truck routes were assessed based on the final year of operations.
- A maximum ore processing rate of 22,000,000 tonnes/year was assumed.

This bounding condition corresponds most closely to years 6-9, when both pits are being mined simultaneously. In years 0-5 only the east pit will be mined at a shallower depth than the bounding condition. In the final years of the project only the west pit will be mined up to the depth assumed in the bounding condition. This approach is considered conservative, and unlikely to underestimate the emissions from the Project. There is confidence in the conservatism in this approach as it is unlikely that maximum productions rates will be occurring at the same time as the longest haul truck routes. Appendix 3.I contains the full listing of assumptions used for this assessment.

3.1.4.2 Linear Infrastructure Study Area (Access Road (Hardtack/Sawbill))

The emissions associated with the operation of the access road (Hardtack/Sawbill) include fugitive road dust and vehicle tailpipe exhaust. The following parameters were assessed:

- Fugitive road dust (i.e., TSP, PM_{10}, $PM_{2.5}$).
- Exhaust gases (i.e., NO_X, SO_2, and CO).

The following outlines the key assumptions that were made and used throughout the assessment to establish the worst case scenario for the access road (Hardtack/Sawbill):

- A 1-km stretch of the road was assessed to determine the distance from the road at which the effects of the emissions from the road are negligible.
- Natural road dust mitigation (i.e., precipitation) and best management practices, such as watering, were included.

3.1.5 Negligible Emissions from the Project

There are many Project activities that produce emissions; however, not all activities produce emissions for any or all indicator compounds that are significant enough to contribute to the overall emissions from the Project. The following lists possible reasons certain activities and/or emissions of certain compounds may be excluded from the assessment:

- The emission rates of certain compounds are very small relative to the overall emissions at the Project Site.
- The location of the source relative to the rest of the sources on-site (i.e., the source is located far away from any receptors).

Table 3-3 lists the possible emission sources that were not assessed and the accompanying rationale.

Table 3-3: Insignificant Sources

Emission Source	Rationale for Excluding from the Assessment
Wet drilling	Emissions from wet drilling were not assessed since the drilling is occurring with wet suppression at all times.
Tailpipe exhaust from surface vehicles (not including haul trucks)	Tailpipe emissions from surface dozers and graders, etc., which have smaller relative horsepower ratings, in comparison to the haul truck fleet as they do not operate continuously. These equipment are mostly used for repair and maintenance at times when the production values would be lower than maximum. .
Wind erosion from stockpiles	Due to the size of the material being stockpiled (i.e., waste rock and low-grade ore prior to primary crushing) wind erosion emissions will not be significant in comparison to the material handling emissions from the stockpiles.
Operational support activities, such as maintenance welding	The emissions are insignificant relative to the overall emissions from the Project.

3.1.6 Predictive Air Quality Modelling

An air dispersion model was used to estimate the ambient ground level concentrations and deposition rates for air emissions released from the Project. Air dispersion models employ assumptions that simplify the random processes associated with atmospheric motions and turbulence. While this simplification limits the model's ability to replicate individual events, the strength of the air dispersion model lies in the ability to predict overall values for a given set of meteorological conditions.

The AERMOD-PRIME (AERMOD) dispersion model (Version 11103) was used for this assessment because it is the regulatory default model required under s. 7 of O. Reg. 419/05. Air modelling guidance from the province of Ontario was followed where appropriate; therefore, the dispersion modelling approach for this assessment is in accordance with the MOE publication: Guideline A-11: Air Dispersion Modelling Guideline for Ontario, Version 2.0, dated March 2009 (ADMGO) PIBS 5165e02.

The selection of this model is appropriate for this assessment because the model:

- Was designed to evaluate the various source types and compounds associated with the Project.
- Has a technical basis that is scientifically sound, and is in keeping with the current understanding of dispersion in the atmosphere.
- Applies formulations that are clearly delineated and that have been subjected to rigorous independent scrutiny.
- Makes predictions that are consistent with observations.

In addition, since the terrain is relatively simple, long range transport of compounds is not anticipated and the indicator compounds associated with the Project are not subject to acid deposition AERMOD is a suitable model for this assessment.

Table 3-4 provides a summary of the reliability of the AERMOD dispersion model.

Further details pertaining to the air dispersion modelling assessment are found in Appendix 3.II.

Table 3-4: Reliability Summary for the AERMOD Dispersion Model

Model Name	Developer	Use in Assessment	Verification	Calibration	Validation	Uncertainty and Sensitivity
AERMOD (Version 11103)	United States Environmental Protection Agency	Predict air quality concentrations	■ AERMOD was developed to replace the long-standing ISC model as the model recommended by the U.S. EPA. ■ AERMOD is based on Gaussian plume dispersion theory (U.S. EPA 2004) that has been used for more than 30 years. ■ The application of specific algorithms has been updated to reflect current understanding of dispersion theory (U.S. EPA 2004).	■ Five years of meteorological data were used in the modelling (provided by the MOE). ■ Surrounding land use used as inputs to the model pre-processor (provided by the MOE).	■ AERMOD has been adopted by the U.S. EPA as its preferred and recommended dispersion model (U.S. EPA 2005). ■ Prior to adoption, the U.S. EPA completed a rigorous review of the model performance (U.S. EPA 2003a, 2003b)	■ AERMOD is based on known theory, and proven to reliably produce repeatable results. ■ Uncertainty associated with emissions is managed by making conservative assumptions. ■ Predictions are sensitive to fluctuations in meteorology, which can be managed by using a five year data set. ■ Five years of data should include the full range of meteorological conditions.

3.1.6.1 Modelling Receptors

Ambient concentrations resulting from Project emissions were predicted at selected groups of receptors and at other locations of interest in order to provide a better understanding of the potential changes to air quality as a result of the Project. Details on the development of the modelling receptor grids are provided in Appendix 3.III.

Modelling receptors were chosen based on recommendations provided in 7.1 of the ADMGO, which is in accordance with s.14 of O. Reg.419/05. The O. Reg. 419/05 Receptor Grid, illustrated on Figure 3-2, includes the nested grid described above; however, all receptors within the Hammond Reef Property were removed from the nested grid creating a boundary that acts as a property boundary in accordance with O. Reg. 419/05 (Figure 3-3). In accordance with O. Reg. 419/05 receptors within this property boundary are not assessed. The property boundary was selected to cover an area close to the MSA that can be used for the purposes of this assessment. Receptors were also placed every 10 m along this property boundary in sections of the property boundary that are within 200 m of an emission source and every 100 m in sections of the property boundary that are greater than 200 m from an emission source. However, it is important to note that OHRG's surface rights extend well past the property boundary chosen to demonstrate compliance with O. Reg. 419/05.

Data from the above receptors and receptors included within the property boundary were included in the predictions that are considered in the Ecological Risk Assessment (Human Health and Ecological Risk Assessment TSD). The receptors were distinguished as land based or water based. The area of modeling coverage is illustrated on Figure 3-4.

In addition, 51 discrete human health locations were identified by the socio-economic team. These locations are also illustrated on Figure 3-5. The human health locations also include the accommodation camp. Data from these locations has been considered in the Human Health Risk Assessment (Human Health and Ecological Risk Assessment TSD).

Some existing human health receptors (#'s 10, 11, 17, 19, 23, 36 and 37 from Figure 3-5) were identified within the selected O. Reg. 419 property boundary (Table 3-5). Once construction begins access to these receptors will be restricted. Therefore, these locations are not considered as air quality receptors. As such, dispersion modelling predictions were not made at these locations.

3.1.6.2 Conservatism in the Emission Rate Calculations

Table 3-6 outlines the areas where conservatism was assumed in the emission rate calculations which results in an assessment that is not likely to under-predict the emissions associated with the Project.

Table 3-6: Areas of Conservatism in the Emission Rate Calculations

Area	Conservatism
Blasting	Emissions from the largest blast possible, based on the amount of material blasted, are calculated. Emissions are calculated using a Specific Gravity (SG) that is likely lower than the actual SG. A higher SG would result in lower emissions.
Waste rock handling	The emission factors for metallic minerals were used as opposed to crushed stone which typically gives lower emissions.
Fugitive dust from unpaved roads	A correction for natural mitigation (i.e., the number of precipitation days) was not included. Only an 80% control was placed on the roadways due to the Best Management Practices Plan (BMPP). In Golder's experience some sites can achieve up to 90 % control with the implementation of a BMPP. The assumption that 10% of the roads surface silt content would be ore is likely an overestimate. The implementation of a BMPP would reduce this percentage since causes such as vehicle track out and dropping practices would be minimized.
Ore crushing and screening	The emission calculations are based on the maximum possible material throughput.
Propane combustion for building heating	OHRG has identified that some building heating will be electric however all buildings were assumed to be heated through propane combustion.

3.1.6.3 Key Modelling Assumptions

The model source types used in this assessment include: point sources, volume sources and open pit sources. Figure 3-6 illustrates the model source locations used in the assessment. Table 3-7 describes how the emission sources at the site were modelled.

Table 3-7: Dispersion Modelling Source Configuration

Model Source Type	Description	Applicability to Project
Point sources	Used to model releases from vertical stack or vents. Takes into account buoyancy and plume rise from the exhaust.	Cyanide destruction stack and the acid wash stack on the Concentrator building.
Volume sources	Used to model releases from a variety of industrial sources that could not be classified as a vertical stack or vent. Releases occur from a three dimensional area without plume rise.	Many aspects of the Project are in the design phase so that stack specifications are not available therefore the majority of the sources were modelled as volume sources. For example, the Concentrator building and the Gyratory Crusher Building.
Road volume sources	The MOE has suggested that roads should be modelled as a series of individual volume sources creating a line that follows the road (MOE 2005).	The tailpipe emissions and road dust emissions were combined and modelled for each segment.
Open pit sources	Used to model particulate or gaseous emissions from open pits, such as surface mines and rock quarries. The open pit sources can account for the amount of particulate emissions that are retained within the pit due to the pit depth (pit retention).	East pit and west pit were modelled as individual open pit sources.

3.1.6.4 Conservatism in the Modelling Assessment

Table 3-8 outlines the areas where conservatism was assumed in the modelling approach which results in an assessment that is not likely to under-predict the air quality associated with the Project.

Table 3-8: Areas of Conservatism in the Modelling Approach

Area	Conservatism
All operations were modelled to be occurring simultaneously, including blasting out of both pits	The modelling assessment includes all operations namely waste rock hauling and ore hauling simultaneously with blasting occurring in both pits. This is unlikely to occur in practice.
Production years 6-9 when both pits are being mined simultaneously, was modelled	All emission rate calculations (Appendix 3.I) incorporated the maximum throughput and processing rates and as stated above all were modelled to be operating simultaneously. This is considered a bounding assumption for the operations phase.
Majority of sources were modelled as volume sources	Since the Project does not have building ventilation and exhaust plans at this stage, most buildings were modelled as volume sources. This does not taking into consideration the buoyancy of any exhausts that will be constructed as vertical stacks and will overestimate the concentration at receptors close to the MSA.
Waste rock and low-grade ore stockpile emissions were modelled at the worst case location which may not occur at the same time as maximum production	The model source for each stockpile was placed in closest proximity to the closest receptor. In the peak production year it is unlikely that the stockpiles will be actively worked at this location.

3.1.6.5 Emissions included in the Air Quality Assessment

The air quality assessment of the Project focused on demonstrating compliance with O. Reg. 419/05 and considers the emissions from selected stationary sources only. Ontario exempts emission sources associated with construction activities or mobile sources from evaluation (O. Reg. 524/98 [MOE 1998]) and provides additional guidance in the ESDM Procedure Document (MOE 2009). Therefore, the emissions from the following Project activities were not included in the air quality assessment used to document compliance with O. Reg. 419/05:

- The surface mobile vehicle exhausts emissions.
- Fugitive dust emissions if a best management practices plan is implemented however the metals emissions with POI Limits associated with the dust must still be included.
- Emergency power systems.

Table 3-9 lists which Project activities were included in the air quality assessment.

Table 3-9: Activities Included in the Air Quality Assessment

Project Component	Activity	Included in Air Quality Assessment?
Open Pit Extraction	Blasting – fugitive dust and explosives	All indicator Compounds
	Material Handling	Only metals with POI Limits
	Bulldozing	Only metals with POI Limits
	Grading	Only metals with POI Limits
	Vehicles – Exhaust Emissions	No
	Vehicles – Unpaved Fugitive Road Dust	Only metals with POI Limits
Low-grade Ore Stockpile	Material Handling	Only metals with POI Limits
	Bulldozing	Only metals with POI Limits
	Grading	Only metals with POI Limits
Waste Rock Stockpile	Material Handling	No
	Bulldozing	No
	Grading	No
Surface Roads	Vehicles – Exhaust Emissions	No
	Vehicles – Unpaved Fugitive Road Dust	Only metals with POI Limits
Ore Crushing and Screening	Material Handling	Only metals with POI Limits
	Ore Crushing	All indicator Compounds
	Ore Screening	All indicator Compounds

Table 3-9: Activities Included in Ontario Compliance Assessment (Continued)

Project Component	Activity	Included in Air Quality Assessment?
Ore Processing and Refining	CIP Adsorption	All indicator Compounds
	Acid Wash	All indicator Compounds
	Carbon Regeneration	All indicator Compounds
	Regeneration Furnace	All indicator Compounds
	Cyanide Destruction	All indicator Compounds
	Electrowinning	All indicator Compounds
	Smelting Furnace	All indicator Compounds
	Sodium Cyanide Use	All indicator Compounds
Emergency Power Generators	Stationary Diesel Combustion	No
Comfort Heating	Propane Combustion	Only NO_x

The dispersion modelling for the air quality assessment was carried out using emission rates for the activities identified in Table 3-9, in order to predict POI concentrations along the Project property boundary, and receptors shown in Figure 3-2 for indicators with MOE POI Limits. The dispersion modelling was conducted in accordance with the MOE *publication "Guideline A-11: Air Dispersion Modelling Guideline for Ontario, Version 2.0"*, dated March 2009 (ADMGO) PIBS 5165e02

3.1.6.6 Emissions included in Predictions for Other Technical Support Documents

There are a number of activities that may contribute air emission that are excluded from an O. Reg. 419/05 assessment as well as a number of compounds that do not have POI limits. To address these, the emissions from all sources listed in Table 3-2 were inputted into a separate dispersion modelling and the predicted results were passed on for assessment in other TSDs (e.g. Human Health and Ecological Risk Assessment TSDs).

Table 3-10 shows the dispersion modelling carried out for human health locations.

Table 3-10: Dispersion Modelling Completed for Human Health Locations

Locations	Parameters	Averaging Period	Assessment of Results
EA HHERA locations	TSP, PM_{10}, $PM_{2.5}$, NO_X, CO, SO_2, HC, DPM, Metals, HCl, Ammonia, NaOH, HCN	1-hr	Human Health Assessment (Human Health and Ecological Risk TSD)
	TSP, PM_{10}, $PM_{2.5}$, NO_X, CO, SO_2, HC, DPM, Metals, HCl, Ammonia, NaOH, HCN	24-hr	
	TSP, PM_{10}, $PM_{2.5}$, NO_X, CO, SO_2, HC, DPM, Metals, HCl, Ammonia, NaOH, HCN, TSP deposition, DPM deposition, Metals deposition	Annual	

Table 3-11 shows the dispersion modelling carried out for the all EA Air Quality Receptors.

Table 3-11: Dispersion Modelling Completed for EA Air Quality Receptors

Locations	Parameters	Averaging Period	Assessment of Results
EA Air Quality Receptor Grid	TSP wet and dry deposition, DPM wet and dry deposition, Metals wet and dry deposition	Annual	Ecological Risk Assessment (Human Health and Ecological Risk TSD)

Concentrations with distance from the access road (Hardtack/Sawbill) were calculated using the AERMOD dispersion model for 1-hour, 24-hour and annual periods using daily average emission rates. Specific inputs included an assumption of rural, flat terrain, and a road segment 1 km in length, simulated using a series of adjacent volume sources. A line of receptors was placed at increasing distance from 50 to 1,000 m from the centre point of the road. Two scenarios were modelled; one with a road running north-south and another with a road running east-west since the resulting concentrations will depend on wind direction.

3.2 Results

Following the methods listed in Section 3.1, this section describes the results of the air quality assessment.

3.2.1 Existing Air Quality

The data from air monitoring stations was analyzed to estimate the existing air quality. Figure 3-7 illustrates the location of the monitoring stations in relation to the Project Site and Table 3-12 provides the station information.

Table 3-12: Monitoring Station Information

Station ID	Location	Type of Area	Distance to Project Site
Fort Liard	Northwest Territories	Rural	2,343 km
Fort Chipewyan	Alberta	Rural	1,656 km
La Loche	Saskatchewan	Rural	1,451 km
Brandon	Manitoba	Urban	621 km
Pickle Lake	Ontario	Rural	351 km
Thunder Bay	Ontario	Urban	171 km
Fraserdale	Ontario	Rural	723 km
Senneterre	Quebec	Rural - forest	1,050 km

Eight monitoring stations were identified in order to obtain a monitoring result for as many indicator compounds as possible. Appendix 3.III contains the full description of the air quality for each compound at each of the stations identified in Table 3-12.

Table 3-13 provides a listing of the 90th percentile concentrations from the air monitoring stations.

3.2.2 Description of Project Air Emissions

3.2.2.1 Mine Study Area

Based on the assumptions and operations scenario discussed in Section 3.1.6, Table 3-14 summarizes the emissions associated with the Project Site used in the predictions that are considered in the Human Health and Ecological Risk Assessments. Table 3-15 shows a breakdown of the relative contributions for each source.

Table 3-16 summarizes the emissions used in the air quality assessment to demonstrate compliance with O. Reg. 419/05. Table 3-17 shows a breakdown of the relative contributions for each source.

A detailed description of how these emissions were developed can be found in Appendix 3.I.

3.2.2.2 Linear Infrastructure Study Area (Access Road (Hardtack/Sawbill))

Traffic along the access road is exempt under O. Reg. 419/05 and was not assessed in this TSD. However, these activities will cause emissions that could alter air quality and will be assessed in other TSDs. Based on the assumptions discussed in Section 3.1.4.2, Table 3-18 summarizes the emissions associated with the access road (Hardtack/Sawbill).

Table 3-18: Daily Emission Rates for the Access Road (Hardtack/Sawbill)

Vehicle Type	Emission Rate (g/s)					
	TSP	PM_{10}	$PM_{2.5}$	NO_X	SO_2	CO
Pickup	0.79	0.34	0.03	0.003	0.00001	0.01
Passenger Car	22.42	9.62	0.96	0.026	0.00025	0.87
Passenger Van	0.26	0.11	0.01	0.001	0.00000	0.02
Transport Truck	4.75	2.04	0.20	0.052	0.00011	0.01

Traffic along the access road (Hardtack/Sawbill) was assumed to be the same every day of the week, year-round.

3.2.3 Air Quality Assessment Results

The air quality assessment of the Project focuses on demonstrating compliance with O. Reg. 419/05. The predicted maximum POI concentrations were assessed using the emission rates for the activities identified in Table 3-9 in order to assess the POI concentrations along the Project property boundary shown in Figure 3-3. The dispersion modelling was conducted in accordance with the MOE publication "*Guideline A-11: Air Dispersion Modelling Guideline for Ontario, Version 2.0*", dated March 2009 (ADMGO) PIBS 5165e02.

All of the predicted POI concentrations meet the respective POI limits demonstrating that the Project will comply with O. Reg. 419/05 during the operations phase, as defined by the bounding conditions stated in Section 3.1.3. Table 3-19 shows the comparison between the modelled concentrations and the Schedule 3 POI limits.

Table 3-19: Air Quality Assessment Results

Compound	Averaging Period	Predicted POI Concentration (µg/m³)	Schedule 3 POI Limits	% of Standard/ Guideline
NO_X	24-hr	173.72	200	87%
NO_X	1-hr	364.96	400	91%
TSP	24-hr	76.97	120	64%
SO_2	24-hr	28.43	275	10%
SO_2	1-hr	221.90	690	32%
CO	1/2-hr	1432.39	6000	24%
HCl	24-hr	16.19	20	81%
Ammonia	24-hr	12.21	100	12%
HCN	24-hr	5.32	8	66%
NaOH	24-hr	5.55	10	56%
Silver	24-hr	1.00×10^{-4}	1	<1%

Table 3-19: Air Quality Assessment Results (Continued)

Compound	Averaging Period	Predicted POI Concentration (µg/m³)	Schedule 3 POI Limits	% of Standard/ Guideline
Arsenic	24-hr	4.58×10^{-4}	0.3	<1%
Beryllium	24-hr	1.97×10^{-4}	0.01	2%
Cadmium	24-hr	1.34×10^{-5}	0.025	<1%
Cobalt	24-hr	1.69×10^{-3}	0.1	2%
Chromium	24-hr	6.82×10^{-3}	0.5	1%
Copper	24-hr	3.87×10^{-3}	50	<1%
Manganese	24-hr	7.80×10^{-2}	0.4	19%
Nickel	24-hr	4.73×10^{-3}	2	<1%
Lead	24-hr	3.85×10^{-3}	0.5	1%
Antimony	24-hr	3.42×10^{-5}	25	<1%
Selenium	24-hr	2.53×10^{-4}	10	<1%
Tin	24-hr	2.24×10^{-4}	10	<1%
Tellurium	24-hr	7.85×10^{-5}	10	<1%
Vanadium	24-hr	7.29×10^{-3}	2	<1%

3.2.4 Dispersion Modelling Data for other TSDs

Predicted changes in air quality for assessment in other TSDs (e.g., Human Heath and Ecological Risk Assessment) for all sources and compounds outlined in Section 3.1.6.6 are documented in Appendix 3.IV.

3.3 In-Design Mitigation

In estimating the air emissions associated with the Project certain mitigation measures were considered to be integral to the design and implementation of the works and activities. These mitigation measures, which are considered to be typical and consistent with best practices, were incorporated into the emission estimates and the resulting air predictions. The following mitigation measures were incorporated to the Project:

- Best management practices to control fugitive particulate emissions from haul roads and material handling will be implemented including:
  - Identification of Sources of Fugitive Dust and Metal Emissions within the Project Site: Describing sources of fugitive dust and metal emissions within the Project Site, detailing the areas and operating procedures that result in dust emissions, along with identification of potential causes of high dust emissions from these sources.
  - Review of the Composition and Size Range of the Fugitive Dust: Reviewing the composition and size range of fugitive dust at the Project Site based on-site-specific data, if available.
  - Preventative Procedures and Control Measures for Control of Fugitive Dust: Describing preventative procedures and control measures to be implemented at the Project Site to prevent and minimize the impacts of fugitive dust emissions.

- Implementation of the Best Management Practices Plan: Describing of schedule and resources (including training) necessary to implement the Best Management Practices Plan.
- Inspection and Monitoring Procedures: Describing inspection and monitoring procedures required to obtain information necessary to support the application of preventative procedures and control measures, as well as information to evaluate the effectiveness of the procedures and measures applied in minimizing the impacts of the air emissions.
- Record Keeping: Describing procedures for record-keeping the information related to the Best Management Practices Plan, for the purpose of audits and continuous improvement of the plan.
- Best Management Practices Plan Review: Describing procedures for the periodic review of the BMP plan (continuous improvement).

- Sources of particulate emissions at the Ore Processing Facility will be controlled through the use of baghouses.
- Enclosures will be used to reduce fugitive emissions at the Ore Processing Facility.
- Exhaust emissions from non-road vehicles will be managed through purchasing equipment that meets Tier 3 emission standards.
- Exhaust emissions from non-road vehicles will be managed through regular and routine maintenance of vehicles.
- SO_2 emissions from non-road vehicles and stationary equipment will be reduced through the use of diesel fuel with less than 15 ppm of sulphur.

Table 3-20 summarizes these mitigation measures.

Table 3-20: Summary of In-Design Mitigation Incorporated in the Air Quality Assessment

Mitigation Measure	Compound Affected by Mitigation Measure
Fugitive Dust BMP	TSP PM_{10} $PM_{2.5}$ metals
On-Site vehicles and equipment purchase	NO_2 CO SO_2 TSP PM_{10} $PM_{2.5}$
Process Dust Control	TSP PM_{10} $PM_{2.5}$ metals

3.4 Monitoring

The air quality monitoring program is designed to be appropriate to the scale of the Project and the potential effects identified through the environmental assessment process. The monitoring program is intended to confirm the effectiveness of mitigation measures assumed in the Project, and in doing so, assess if alternative mitigation strategies are required to minimize emissions from the Project and their impacts. Three specific activities are recommended to verify the potential effects of the Project:

- Verification of silt loadings on roadways.
- Source testing of the process sources to confirm process emissions.
- Ambient air monitoring for indicator compounds that are greater than 51% of the MOE POI Limits and not included in the source testing program.

The objective of silt testing on the roadways is to confirm the particulate emissions from the unpaved roadways on the Project Site. The silt loading used in the emission estimation calculations for fugitive emissions is one of the largest sources of uncertainty. Therefore, this value will be confirmed through on-site measurements once operations commence. It is likely that the value used in the assessment is higher than the actual conditions. This monitoring will also demonstrate the effectiveness of the BMP plan recommended under the mitigation section. The silt will also be analyzed for metals content to confirm the assumptions for metal emissions.

The objective of the source testing is to confirm that the estimated emission rates, that are based on data from other sites or Golder's experience, is appropriate for Project-specific conditions. The source testing program will be designed and implemented in accordance with the Ontario Source Testing Code, June 2010 (PIBS 1310e03). OHRG will retain a source testing specialist to assist in the sampling location selection, source testing methods, quality assurance/quality control, and reporting. OHRG will submit a pre-test plan to the MOE for approval prior to completing the source testing. The dispersion modelling assessment will be updated based on site-specific data.

The objective of the ambient air quality monitoring plan is to collect sufficient data to assess the environmental effects of the sources of particulates on air quality. Based on the assessment, the most prominent air quality issue that is anticipated for the Project is particulates, including concentrations of SPM, PM_{10} and $PM_{2.5}$. All other indicator compounds were well below their respective criteria or will be addressed in the source testing program described above. The monitoring program will be designed and implemented in accordance with the Operations Manual for Air Quality Monitoring in Ontario prepared by the Ontario Ministry of the Environment, March 2008 (PIBS 6687e).

The samplers will be placed at in the area of the maximum POI location and specific consideration will be given to the following:

- Site accessibility.
- Power supply.
- Topography.
- Security.

OHRG will retain an air quality specialist to assist in the site selection, installation and training of the mine personnel in instrument operation, quality assurance/quality control, and reporting. The monitoring will follow the National Air Pollutant Surveillance (NAPS) schedule, which requires a single 24-hour sample collected every sixth day. The sampling program can be discontinued after a years' worth of data confirms that the monitored results are in line with the predicted air quality results.

Table 3-21 lists the air monitoring proposed to support the Project and confirm the findings presented in the Environmental Assessment. The table describes what will be monitored, the method for completing the monitoring and the frequency proposed for the monitoring.

Table 3-21: Air Quality Monitoring During Operations

Parameter	Method	Frequency
Fugitive Dust	Periodic sampling road silt loadings to improve accuracy of emission estimations.	Annually during summer months until the silt loading is established.
Process Chemicals	Source testing to confirm the emission rates used in the dispersion modelling assessment.	One time source testing campaign.
Particulate Emissions	Installation of periodic TSP/PM_{10}/ $PM_{2.5}$ sampling units.	Samples should be collected on the 6-day National Air Pollutant Surveillance (NAPS) Cycle.

4.0 NOISE

The noise assessment for the Project is done in a manner that is consistent with the accepted practice in the Province of Ontario. This includes describing the existing environment, establishing noise emissions associated with the Project and predicting noise levels at sensitive locations due to Project activities. The noise assessment presented in this section has been prepared with regard to the ToR with the objective of evaluating potential changes to the noise conditions under a worst case operating scenario.

Activity levels and noise emissions from the Project will vary during the life of mine. However, the operations phase of the Project will involve the greatest quantity of equipment with the highest noise emissions (i.e., highest sound power levels). Therefore, the operations phase of the Project has been identified as the bounding case for noise associated with the Project activities.

As the Project is located in Ontario, the first step is a noise assessment is based on MOE publication NPC 232 "Sound Level Limits for Stationary Sources in Class 3 Areas (Rural)" (MOE 1995). The noise assessment is carried out at the most sensitive Points of Reception (PORs), which have been identified within the vicinity of the Project. All POR locations for the Project are located in a Class 3 area in accordance with NPC 232 (MOE 1995). A Class 3 area can best be described as rural with the existing noise environment dominated by sounds of nature with little or no road traffic. Daytime and evening/nighttime hours for Class 3 areas are defined as follows:

- Daytime – 0700 – 1900 hours.
- Evening/nighttime – 1900 – 0700 hours.

The sound level limits for the PORs in a Class 3 area are described as follows:

The energy averaged sound level (L_{eq}) produced by a source at a receptor location in any one hour period should not exceed the greater of: the energy averaged sound level produced by road traffic in the same hour period, or 45 dBA in the daytime period, or 40 dBA in the evening / nighttime period.

The assessment will focus on demonstrating that the Project can operate in compliance with these limits.

Changes in noise levels can also have an effect on other elements of the environment. To assist in this evaluation, noise modelling results are forwarded for assessment in the Human Health and Ecological Risk Assessment TSD.

Mitigation measures that are included in the assumptions of this assessment are provided along with monitoring and management strategies to confirm the effectiveness of mitigation measures and the predicted changes to noise conditions during the operations phase.

4.1 Methods

The general approach used for assessing noise from the Project supports the philosophy of the environmental assessment as a planning and decision-making process and conforms to the general methodology presented in

the approved ToR. The noise study characterized and assessed the potential noise from the proposed undertaking in a thorough, traceable, step-wise manner.

The general approach is outlined as follows:

- Describe the temporal and spatial boundaries within which noise from the Project will be evaluated.
- Identify parameters used to characterize noise levels associated with the Project.
- Characterize the existing noise environment and identify sensitive locations for noise.
- Evaluation of potential changes to noise levels due to the Project including the following:
  - Evaluate the noise emissions from the Project during the operations phase (i.e., noise source summary).
  - Estimate the noise levels at sensitive locations associated with Project activities during the operation phase.
  - Compare the predicted noise levels at sensitive locations to noise level limits identified in NPC 232.
  - Provide predictions to be assessed in the Human Health and Ecological Risk Assessment TSD.
- Prepare monitoring, mitigation and adaptive management strategies that reflect the nature of the Project, the area where the Project is situated and the predicted changes in noise due to the Project.

4.1.1 Temporal and Spatial Boundaries

The assessment of potential noise associated with the Project, including the description of existing noise levels, was conducted using the primary Project components:

- The Mine (i.e., Mine, Ore Processing Facility and associated infrastructure).
- The access road (Hardtack/Sawbill).

The assessment of the Project works and activities on the environment is conducted within the framework of temporal and spatial boundaries that are common to all of the environmental components (with some modifications). The particular temporal and spatial boundaries used in the assessment of noise are described in Sections 4.1.1.1 and 4.1.1.2.

4.1.1.1 Temporal Boundaries

The temporal boundaries for the environmental assessment establish the timeframes for which the direct, indirect and cumulative effects are assessed. For each of the Project areas, four distinct phases were considered, as outlined in Section 1.8.1 and described in Table 4-1.

Table 4-1: Phases of the Hammond Reef Gold Project

Phase	Description	Duration	Included in Noise Assessment?
Construction Phase	Early construction activity of facilities or infrastructure needed to support the construction phase of the Project, including site preparation; also includes pre-development of the Mine, such as stripping of overburden from the first open pit. Construction of the Mine infrastructure and facilities leading to the first production of gold.	30 months	No – This phase uses similar types of equipment and/or activities as the operations phase however fewer of them. Therefore, emissions are bounded by the operations phase and are not assessed.
Operation Phase	The ongoing operation of the Mine and associated facilities to produce gold through to the end of life of mine.	11 years	Yes – Bounding condition for Assessment.
Closure Phase	The post operations period when gold is no longer being produced and the Mine and the associated infrastructure are being decommissioned, demolished, removed and reclamation is underway to return the Project Site to a physically and chemically stable condition.	2 years	No – This phase uses similar types of equipment and/or activities as the operations phase however fewer of them. Therefore, emissions are bounded by the operations phase and are not assessed.
Post-closure Phase	The monitoring of the reclaimed site to ensure the physical and chemical stability over time.	10 years	No – This phase does not include significant equipment usage and/or activities that would contribute significant emissions when compared to the operations phase.

These timeframes are intended to be sufficiently flexible to capture the effects of the Project. The assessment of the noise assessment focuses on the operations phase of the Project, as the other phases are anticipated to have lower emission levels than when the Mine is in full operation.

4.1.1.2 Spatial Boundaries

Spatial boundaries define the geographical extents within which environmental effects are considered. Therefore, these boundaries become the study areas adopted for the environmental assessment.

The Project EIS Guidelines require that the study areas encompass the environment that can reasonably be expected to be affected by the Project, or which may be relevant to the assessment of cumulative effects. Specific study areas are defined by boundaries to encompass all relevant components of the environment including the people, land, water, air and other aspects of the natural environment.

Four study areas were selected for the assessment of noise: the Mine Study Area (MSA), the Local Study Area (LSA), the Regional Study Area (RSA) and the Linear Infrastructure Study Area (LISA). Each of the first three

study areas encloses the smaller study areas (i.e., they are not geographically separate). These areas are shown in Figure 4-1 and described below.

4.1.1.2.1 Mine Study Area

The MSA (Figure 4-1) encompasses the most immediate area of the Project. This includes the direct area of physical disturbance associated with the operation of the Project (disturbance footprint), and extends to a distance of approximately 100 metres from the edge of the disturbance footprint.

4.1.1.2.2 Local Study Area

The Local Study Area (LSA) (Figure 4-1) generally corresponds to the area in the immediate vicinity of the Project where most the noise effects of the Project are expected to occur, and can be predicted or measured with a reasonable degree of accuracy. The LSA is a subset of the RSA and is subject to a more focussed assessment of the effects associated with the Project. The LSA for noise covers an area approximately 15 km x 15 km centred on the Project Site.

4.1.1.2.3 Regional Study Area

The Regional Study Area (RSA) (Figure 4-1) encompasses the areas used to describe the existing noise levels in the vicinity of the Project, it is not expected that the effects of the Project would be measurable beyond the RSA.

4.1.1.2.4 Linear Infrastructure Study Area

The Linear Infrastructure Study Area (LISA) encompasses the footprints of the access road (Hardtack/Sawbill) and project transmission line. The LISA is represented by a Y-shaped area that extends 1 km on either side of the central line of the access road (Hardtack/Sawbill) and the project transmission line. The project transmission line is not expected to result in any changes to noise conditions; therefore, only the access road (Hardtack/Sawbill) was assessed.

4.1.2 Indicators

Noise from the operations of the Project activities is evaluated using the 1-hour equivalent noise level (L_{eq}) during the predictable worst-case hour operation. The 1-hour L_{eq} is the energy equivalent continuous sound level, which has the same energy as the time varying signal over a one hour period at the same location. However, other noise indicators are available that are not appropriate for the evaluation of noise, but are appropriate for evaluating the indirect effects of changes in noise on other VECs (e.g., human health).

4.1.3 Existing Conditions

Based on the remote nature of the Project and PORs, the existing noise conditions have been assumed to be consistent with a remote environment with little influence from anthropogenic sources and therefore measurements are not required.

4.1.4 Estimating Noise Emissions from the Project

Noise emissions during the operations phase of the Project will result from noise source activities within the MSA. These emissions are used as inputs for the noise model, which provided estimates of off-site noise levels due to Project related emissions. In order to determine the noise emissions relating to the Project, some key assumptions about the Project operations were made based on the activity data provided in the Project description (Chapter 5 of the EIS/EA Report). The assumptions were developed so that the assessment would document the scenario that produced the worst case emissions for the Project. Only the worst case scenario was carried through the assessment since all other scenarios would result in lower noise emissions.

The following outlines the key assumptions that were made and used for the assessment to establish the bounding condition for the worst case scenario:

- Maximum extraction rates of 65,000 tonnes/day of ore and 100,000 tonnes/day of waste rock were used in the emission calculations.
- Open pit extraction operations were assumed to occur simultaneously in both pits.
- The pit depths were assumed to be shallow.
- Noise emissions from open pit extraction operations were divided between the pits based on the maximum pit volumes.
- Maximum truck volumes were used on the on-site haul roads.
- The concentrator maximum ore processing rate of 22,000,000 tonnes/year was used in the noise assessment.

This bounding condition corresponds most closely to years 6-9, when both pits are being mined simultaneously. In years 0-5 only the east pit will be mined at a shallower depth than the bounding condition. In the final years of the project only the west pit will be mined up to the depth assumed in the bounding condition. Since it is unlikely that all of these assumptions will occur concurrently (i.e., shallow pit depths with maximum productions rates); the noise emissions evaluated are not likely to underestimate emissions from the Project.

Noise emissions were established using the Project design details, Golder's database of similar noise sources, manufacturer's specifications, and publicly available data. The emissions also relied on details regarding the proposed equipment and planned operating modes associated with the Project, including the operation of the various access roads.

Elements incorporated into the Project design, as well as operating practices that could avoid or reduce noise emissions were also considered.

4.1.5 Predictive Noise Modelling

The Computer Aided Noise Attenuation (Cadna/A) software, developed by DataKustik GmbH, is widely accepted for evaluating noise from industrial projects, including mining projects world-wide. The Cadna/A software has the ability to use a number of algorithms, including the ISO 9613 Acoustics: Attenuation of Sound during Propagation Outdoors (International Organization for Standardization 1993, 1996) model. This model has been independently validated (Golder 2005) and is the model preferred in Ontario.

The model has the ability to simulate emission sources including roads, vessels and industrial facilities. Noise sources are characterized by entering the sound power and/or sound pressure octave band spectrum associated with each source. Other parameters including building dimensions, frequency of use, hours of operation, and enclosure attenuation ratings also define the nature of sound emissions. The ISO 9613 prediction method is conservative as it assumes that all receptors are downwind from the noise source or that a moderate ground based temperature inversion exists. In addition, ground cover and physical barriers, either natural (terrain-based) or constructed and atmospheric absorption are included as they relate specifically to the Project.

Noise associated with the Project operations is evaluated with the aid of the Cadna/A noise prediction software, which uses the ISO 9613-2 noise prediction algorithms. This model allows for the incorporation of the following environmental factors that can result in noticeable changes in noise levels:

- Attenuation because of the distance between the noise source and receiver location.
- Absorption of acoustic energy by the atmosphere.
- Loss of acoustic energy as it travels around or over hills, or intervening buildings.
- Loss of acoustic energy as it passes over the ground (i.e., ground impedance).

In addition to the attenuation factors listed above, constructed features can be used to reduce the noise levels further, including: buildings, weather/acoustic enclosures, noise barriers, silencers, and exhaust mufflers.

To accurately account for these factors and features, the noise assessment relies on numeric models. The selection of appropriate models to support the noise assessment ensures that the results of the assessment are credible and indicative of the conditions likely to occur should the Project proceed. The selection of this model considered several capabilities:

- Incorporates site-specific terrain data.
- Evaluates the various source types associated with the Project.
- Has a technical basis that is scientifically sound, and is in keeping with the current understanding of the propagation of sound in the outdoors.
- Applies a prediction program that has undergone scrutiny for correct implementation of established ISO methods.
- Makes predictions that are consistent with observations.
- Is recognized by the MOE as suitable for use.

Table 4-2 provides a summary of the model verification and scientific defensibility, model calibration, model validation, as well as the uncertainty and sensitivity for the Cadna/A noise modelling software used in the noise assessment.

Table 4-2: Reliability Table for the Cadna/A Noise Prediction Model

Model Name	Developer	Use in Assessment	Verification	Calibration	Validation	Uncertainty and Sensitivity
Cadna/A	DataKustik GmbH	Predicting noise levels associated with on-site activities, equipment and operations	■ Cadna/A implements the ISO standards for noise propagation outdoors ■ ISO 9613 ■ Drew et. al., 2005	■ Cadna/A predictions have been calibrated using measurements in the Project Site-vicinity	■ Cadna/A predictions are continuously validated ■ Drew et. al., 2005	■ ISO 9613 is based on known theory and proven to reliably produce repeatable results ■ Cadna/A predictions of sound energy are sensitive to inputs (i.e., doubling sources will result in a doubling of acoustic energy at receptors) ■ Uncertainty associated with emissions is managed by making conservative assumptions (e.g., all equipment operating at the same time)

4.1.5.1 Noise Receptor Locations

The noise predictions were made at 40 PORs, which have been identified by the socio-economic team as being the most likely locations for the noise assessment in accordance with MOE guidelines (Figure 4-1). Table 4-3 provides a summary of the PORs used in this assessment.

Table 4-3: Point of Reception Summary

4.1.5.2 Conservatism in Predictive Noise Modelling

Table 4-4 outlines the areas where conservatism was assumed in the modelling approach which results in an assessment that is not likely to under-predict noise associated with the Project.

Table 4-4: Areas of Conservatism in the Modelling Approach

Area	Conservatism
PORs	All receptors assumed to be downwind from each source simultaneously and no reduction in noise level for PORs that are upwind
All operations were modelled to be occurring simultaneously	The modelling assessment includes all operations namely waste rock / ore hauling and processing
Peak production year was modelled	Maximum number of noise sources included in the model with a shallow pit depth. Pit depth during peak production year will be deeper and provide more shielding
Waste rock stockpiles	Waste rock stockpiles were assumed to be in early development to provide little shielding to PORs

4.2 Results

The assessment provided below considered the noise emissions associated with the operations of the Project during maximum activity (i.e., predictable worst-case hour operation).

4.2.1 Description of Existing Conditions

Based on the remote nature of the Project and PORs, the existing noise conditions have been assumed to be 5 dB quieter than the MOE exclusionary noise levels for daytime and nighttime operations of the Project (i.e., 40 dBA during daytime hours and 35 dBA during nighttime hours).

4.2.2 Description of Project Noise Emissions

The overall sound power data for each noise source associated with the operations of the Project are summarized in Table 4-5. Only the noise sources for operations are presented as this was determined to be the phase of the Project with the highest emissions. The table also summarizes the quantity of each piece of equipment used in the modelling and whether the equipment operates indoors or outdoors.

Table 4-5: Operations Equipment Sound Power Data

Source	Location	Quantity	Sound Power Level (dBA)

As identified in Table 4-5 many of the noise sources are located within various buildings within the Project Site. Therefore, in predicting the noise emissions from these sources, the construction of the buildings, in terms of Transmission Loss (TL) was included as the noise energy associated with these sources would be radiated into the environment via the building structure. Table 4-6 summarizes the assumed TL performance of the building roof and facades.

Table 4-6: Building Transmission Loss Performance

Building Component	Octave Band Transmission Loss Performance (dB)							
	63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	8000 Hz
Roof	12	15	21	31	42	48	48	48
Facades	12	15	21	31	42	48	48	48

4.2.2.1 Conservatism in Noise Emissions

Noise emissions from the sources identified in Table 4-5 are based on measurements of similar equipment. This data represents worst case noise emissions from each source (e.g., loader with a full bucket loading a truck vs. a loader idling). In addition, the emissions have not been adjusted to account for duty cycle for the various pieces of equipment. Therefore, it has been assumed that all the pieces of equipment operate for a full hour during each hour.

4.2.3 Predictive Modelling Results

Using the sound power levels for the activities identified in Table 4-5, the Cadna/A software was used to assess sound pressure levels at the POR locations shown in Figure 4-1 in accordance with MOE accepted practices.

4.2.3.1 Noise Assessment Modelling Results

Noise prediction results for the Project activities during the operations phase of the Project are summarized in Table 4-7 and provided in Figure 4-2. It is understood that operations do not vary from daytime to nighttime and therefore predicted noise levels will be the same for both time periods.

Note: Shaded table rows indicate locations where the predicted noise levels exceed the assumed existing background noise levels and/or MOE noise level limits.

4.2.3.1.1 Comparison to Criteria/Guidelines

The predicted noise levels associated with the Project will meet the MOE noise level limits at 36 of the 40 PORs. However, the predicted noise levels will exceed the criteria at the four (4) POR locations shown in Table 4-8. It should be noted that access to these locations will be restricted during Project operations (see Section 4.3).

POR37	41	0	1

4.2.3.2 Modelling Results for Other Disciplines

The following sections provide a summary of the predicted results forwarded for the human health and ecological risk assessment (Human Health and Ecological Risk Assessment TSD).

4.2.3.2.1 Noise Predictions at Human Health Locations

Changes in the noise levels have the potential to have an indirect effect on human health. The indirect effects associated with noise have been assessed in the Human Health and Ecological Risk Assessment TSD and presented in the EIS/EA Report.

The predicted noise levels at the identified health receptors can be compared to the existing conditions and Health Canada criteria. Health Canada has published a draft national guideline for evaluating the health impacts of noise. This guideline considers the following:

- Characteristics of the noise level.
- Construction noise impacts based on increased levels of annoyance in the population.
- Operations noise impacts based on increased levels of annoyance in the population.
- Impact on special land uses such as schools, hospitals and seniors' residences.
- Sleep disturbance impacts.

The Health Canada approach deals with increases in predicted noise levels over the existing conditions for the daytime (L_d) and nighttime (L_n) equivalent noise levels, as well as a whole day equivalent noise level descriptor (L_{eq24}). In addition, impulsive and tonal characteristics of source noise are accounted for because they can increase potential effects. The following two measures are included in the Health Canada document:

- The percentage of the exposed population that could be "highly annoyed" by increased noise levels caused by projects (%HA), which is described by the following formula:

$$HA = \frac{100}{1 + exp[10.4 - 1.32 \times \log(10^{0.1 \times L_{eq24}} + 3.375 \times 10^{0.1 \times L_n})]}$$

where:

L_{eq24} = the 24-hour equivalent noise level calculated according to ISO1996-1:05.

L_n = the nighttime average sound level according to ISO1996-1:05.

- The specific impact, or impulse noise, indicator (HCII), which is defined as follows:

$$HCII = 10 \times \log(10^{0.1 \times L_{eq24}}) + 3.375 \times 10^{0.1 \times L_n}$$

where:

L_{eq24} = the 24-hour equivalent noise level calculated according to ISO1996-1:05.

L_n = the nighttime average sound level according to ISO1996-1:05.

Table 4-9 provides a summary of the predictions for the human health locations for the %HA measure. A value of 6.5%HA is considered by Health Canada to have the potential for adverse effects on human health.

Notes:

[a] Existing HCII only considers the existing noise levels (i.e., 40 dBA during the day and 35 dBA at night).

[b] Ambient HCII includes the combined effects of the Project and existing noise levels.

4.2.3.2.2 Noise Predictions at Ecological Locations

Ecological receptors can also experience adverse effects as a result of changes in noise levels associated with noise emissions from the Project. This would be an indirect effect on ecological receptors, which would be assessed in the ecological risk assessment (Human Health and Ecological Risk Assessment TSD).

Un-weighted noise levels, described as dB_{lin}, were considered to be more appropriate for evaluating potential effects on ecological receptors than A-weighted levels (dBA), which are used in describing human response to noise. The un-weighted noise levels represent the actual acoustic energy in the atmosphere, and are

considered to be a less biased representation of how ecological receptors react to noise levels in the environment.

Based on our experience monitoring noise levels in remote/rural areas, the difference in the overall levels measured in dB_{lin} vs. dBA can range from 10 dB to 20 dB. Therefore, the assumed existing noise levels have been as follows for locations of ecological interest:

- 50 dB_{lin} during daytime hours.
- 45 dB_{lin} during nighttime hours.

Figure 4-3 provides a summary of the noise level predictions for the ecological risk assessment.

4.2.3.2.3 Modelling Results for Linear Infrastructure Study Area Access Road (Hardtack/Sawbill)

The access road (Hardtack/Sawbill) was evaluated based on a maximum of 18 highway trucks (i.e., heavy trucks) per hour travelling at a speed of 80 km/hr. Table 4-11 summarizes the predicted noise levels from the centre of the access road (Hardtack/Sawbill).

4.3 Mitigation

Based on the predicted noise levels at the PORs identified in Table 4-7, mitigation measures will be required to ensure compliance with MOE noise level limits as identified in NPC-232. However, access to the identified PORs will be restricted during the construction and operations of the Project. Table 4-12 identifies the PORs that will have restricted access during construction and operations of the Project.

Table 4-12: Summary of Receptor Locations Requiring Restricted Access

Location	Description
POR10	Sawbill Bay – Designated Camping Site
POR11	Flood Bay – Designated Camping Site
POR17	Designated Camping Site
POR19	Designated Camping Site
POR23	Canoe Canada Outfitters
POR29	Trapper Cabin
POR36	Designated Camping Site
POR37	Designated Camping Site

Once access to these receptors is restricted, all receptors will be in compliance with MOE noise guidelines.

4.4 Monitoring

Based on the results presented in Table 4-7, no follow-up noise monitoring is proposed as the predicted noise levels are well below the MOE noise level limits for Class 3 areas.

5.0 VIBRATIONS

The vibrations assessment has been conducted in a manner that is consistent with the accepted practice in the Province of Ontario, as well as requirements of the Department of Fisheries and Oceans Canada (DFO). This includes predicting vibration levels associated with the controlled blasting operations necessary during the excavation of the open pits and predicting vibration levels and assessing the air and ground vibration levels at sensitive locations. The vibration assessment presented in this section has been prepared with regard to the ToR with the objectives of evaluating potential changes to vibration levels at sensitive receptors under a worst case operating scenario. The vibrations assessment methodology used in this study is based on MOE publication NPC 119 “Blasting” (MOE 1978), as well as guidelines provided by DFO for vibration levels in water.

The focus of the vibration assessment was to demonstrate that the Project can operate in compliance with the limits specified in NPC 119 and in meeting DFO limits. Therefore, modelling results were passed on to other disciplines for assessment in the Human Health and Ecological Risk Assessment and Aquatics Environment TSD.

5.1 Methods

The general approach used for assessing vibrations from the Project supports the philosophy of the environmental assessment as a planning and decision-making process and conforms to the general methodology presented in the approved ToR. The vibrations study characterized and assessed the potential ground and air vibrations from the proposed undertaking in a thorough, traceable, step-wise manner.

The general approach is outlined as follows:

- Describe the temporal and spatial boundaries within which vibrations from the Project will be evaluated.
- Identify parameters used to characterize vibration levels associated with the Project.
- Characterize the existing environment and identify potential sensitive locations for vibrations.
- Evaluation of potential changes to vibration levels due to the Project including the following:
  - Estimate the vibration levels at sensitive locations associated with blasting.
  - Compare the predicted vibration levels at sensitive locations to vibration limits identified in NPC 119.
  - Compare the predicted vibration levels potential aquatic receptor locations with DFO guidelines.
  - Provide predictions to be considered in the Aquatic Environment TSD.
- Prepare monitoring, mitigation and adaptive management strategies that reflect the nature of the Project, the area where the Project is situated and the predicted changes in noise due to the Project.

5.1.1 Temporal and Spatial Boundaries

The assessment of the Project works and activities on the environment is conducted within the framework of temporal and spatial boundaries that are common to all of the environmental components (with some

modifications). The particular temporal and spatial boundaries used in the assessment of blasting are described in the following sections. These areas are shown in Figure 5-1 and described below.

5.1.1.1 Temporal Boundaries

The temporal boundaries for the environmental assessment establish the timeframes for which the direct, indirect and cumulative effects are assessed. For each of the Project areas, four distinct phases were considered, as outlined in Section 1.8.1 and described in Table 5-1.

Table 5-1: Phases of the Hammond Reef Gold Project

Phase	Description	Duration	Included in Vibration Assessment?
Construction Phase	Early construction activity of facilities or infrastructure needed to support the construction phase of the Project, including site preparation; also includes pre-development of the mining facility, such as stripping of overburden from the first open pit. Construction of the Mine infrastructure and facilities leading to the first production of gold.	30 months	No – This Phase may involve blasting but much less than during operations. Therefore, emissions are bounded by the operations phase and are not assessed
Operation Phase	The ongoing operation of the Mine and associated facilities to produce gold through to the end of life of mine.	11 years	Yes – Bounding condition for Assessment.
Closure Phase	The post operations period when gold is no longer being produced and the Mine and the associated infrastructure are being decommissioned, demolished, removed and reclamation is underway to return the site to a physically and chemically stable condition.	2 years	No – blasting will not occur during this phase
Post-closure Phase	The monitoring of the reclaimed site to ensure the physical and chemical stability over time.	10 years	No – blasting will not occur during this phase

These timeframes are intended to be sufficiently flexible to capture the effects of the Project. The vibrations assessment focuses on the operations phase of the Project (i.e., pit excavation) as blasting activities are not expected to occur during the construction, closure and post-closure phases of the Project.

5.1.1.2 Spatial Boundaries

Spatial boundaries define the geographical extents within which environmental effects are considered. Therefore, these boundaries become the study areas adopted for the environmental assessment.

The Project EIS Guidelines require that the study areas encompass the environment that can reasonably be expected to be affected by the Project, or which may be relevant to the assessment of cumulative effects.

FIGURE: 5-1

G:\Projects\2010\10-1118-0020_BrettResources_HammondReef\GIS\MXDs\Draft\Vibration\StudyArea.mxd

Specific study areas are defined by boundaries to encompass all relevant components of the environment including the people, land, water, air and other aspects of the natural environment.

Three study areas were selected for the assessment of the atmospheric environment: the Mine Study Area (MSA), the Local Study Area (LSA), and the Regional Study Area (RSA). Each of the first three study area encloses the smaller study areas (i.e., they are not geographically separate).

5.1.1.2.1 Mine Study Area

The MSA (Figure 5-1) encompasses the most immediate area of the Project. This includes the direct area of physical disturbance associated with the operation of the Project (disturbance footprint), and extends to a distance of approximately 100 metres from the edge of the disturbance footprint.

5.1.1.2.2 Local Study Area

The Local Study Area (LSA) (Figure 5-1) generally corresponds to the area in the immediate vicinity of the Project where ground and air vibration can be predicted or measured with a reasonable degree of accuracy. The LSA is a subset of the RSA and is enclosed within the RSA and is subject to a more focussed assessment of the effects associated with the Project. The LSA covers an area approximately 15 km x 15 km.

5.1.1.2.3 Regional Study Area

The Regional Study Area (Figure 5-1) encompasses the modelling domain used in the assessment, it is not expected that the effects of the Project would be measurable beyond the RSA.

5.1.1.2.4 Linear Infrastructure Study Area

The Linear Infrastructure Study Area (LISA) encompasses the footprints of the access road (Hardtack/Sawbill) and project transmission line. The LISA is represented by a Y-shaped area that extends 1 km on either side of the central line of the access road (Hardtack/Sawbill) and the project transmission line. The LISA is not assessed as part of the vibrations assessment because there are no blasting operations along the LISA during the operations phase of the Project.

5.1.2 Indicators

Vibrations from Project activities is evaluated through two components: air vibrations due to blasting will be evaluated using Peak Air Pressure Level in linear decibels (dBL); and blasting contributions to ground vibrations will be evaluated using Peak Particle Velocity in millimetres per second (mm/s).

5.1.2.1 Ontario Ministry of the Environment Guidelines

The allowable ground and air vibration produced at private, off-site structures near to mines and quarries are subject to guidelines contained in MOE publication NPC 119 “Blasting” of the Model Municipal Noise Control By Law, dated August 1978.

Under conditions where monitoring of the blasting operations will be routinely carried out, as they are expected to be at the Project , the vibration limits at the nearest structure to the property will be:

- Peak Particle Velocity (PPV) (Ground vibration) – 12.5 mm/s.
- Peak Air Pressure Level (Air vibration) – 128 dBL.

Where ground vibration monitoring is not routinely carried out, the vibration limits at the nearest structure to the property will be:

- Peak Particle Velocity (PPV) (Ground vibration) – 10.0 mm/s.
- Peak Air Pressure Level (Air vibration) – 120 dBL.

5.1.2.2 Fisheries and Oceans Canada Guidelines

Fisheries and Oceans Canada (DFO) has established a set of guidelines for the use of explosives in or near Canadian fisheries waters (Wright and Hopky 1998). The DFO guidelines set out that: *"No explosive may be used that produces or is likely to produce, a PPV greater than 13 mm/s in a spawning bed during egg incubation."*

Under conditions where these guidelines cannot be met, the proponent is required to prepare a mitigation plan outlining additional procedures for protecting fish and their habitat. The DFO guidelines also set out an underwater overpressure limit of 100 kPa at fish habitat. The underwater overpressure limit is primarily a concern when blasting or explosives are used within the water body itself; however, overpressure still occurs when blasting happens near to water. No blasting is planned to occur in any body of water as part of the Project.

The following shorelines will represent the nearest potential locations to the proposed mine blasting operations where the DFO guidelines could be applied:

- Sawbill Bay.
- Marmion Reservoir.
- Lynxhead Bay.

The reader is referred to the Aquatic Environment TSD for discussion on fish and fish habitat.

5.1.3 Existing Conditions

Effects of energy released from the Project in the form of air and ground vibrations are most likely to be experienced by those living in close proximity to the Project. As there are currently no blasting operations within the LSA, an assessment of background conditions is not necessary for this assessment.

5.1.4 Predicting Project Air and Ground Vibrations

The rate at which ground and air vibrations attenuate from a source is site-specific. Predictive modelling to determine the attenuation characteristics of ground and air vibration levels from blasting operations at individual receptor points would typically involve monitoring a number of site blasts at specific locations. As there have been no blasting operations to date, predictive modelling of both ground and air vibrations from the proposed blasting operations was carried out using the open pit blasting parameters described below and generalized attenuation equations available in the published literature. The assessment was based on a worst case scenario, which assumed maximum explosive weights per delay period and minimum distances between the blast source and receptor.

5.1.4.1 Open Pit Blasting Parameters

During the operations phase, the pits will be excavated in multiple 12 m benches. Table 5-2 summarizes the blast designs considered for the open pits.

Table 5-2: Blast Design Parameters

Parameter	Values
Hole Diameter (mm)	270
Bench Height (m)	12.0
Hole Inclination (^{o})	90
Sub-drill (m)	2.50
Hole Depth (m)	14.50
Stemming Height (m)	5.81
Stemming Material	Crushed Stone
Rock Density (g/cc)	2.75
Explosive Column (m)	8.69
Explosive Type	Emulsion ANFO Blend
Explosive Density (g/cc)	1.20
Explosive Mass (kg/hole)	596
Holes/Delay	1
Burden (m)	7.00
Spacing (m)	8.00
Pattern Type	Equilateral
Powder Factor (kg/m^3)	0.89
Detonator Type	Electronic

The proposed blasting will utilize electronic detonators for directing rock movement, optimizing rock fragmentation and controlling vibration effects.

5.1.4.2 Predicting Air Vibrations

Blasting for the open pit mining operations will result in air vibrations. This section describes the attenuation (i.e., reduction in intensity) of air vibrations from blasting.

Air vibrations attenuate from a blast site at a slower rate than ground vibrations. The distribution of air vibration energy from a blast is also strongly influenced by the prevailing weather conditions during the blast. For example, wind can increase down-wind levels by 10 to 15 dBL above that which would otherwise be measured (Dowding 1985). Low cloud ceilings and temperature inversions also contribute to air vibrations propagating further than would typically be the case. Other factors influencing air vibration distribution from a blast include the local topography and vegetation, length of collar and type of stemming material, differences in explosive types and variations in burden distance.

The rate at which air vibrations decay or attenuate from a blast site can be expressed by the Scaled Distance, which is defined as:

$$Scaled\ Distance\ (SD) = \left(\frac{D}{\sqrt[3]{W}}\right)$$

where D is the distance (m) between the blast and receptor

W maximum weight of explosive (kg) detonated per delay period

Depending on the degree of confinement of the explosive, predicted maximum air vibrations would fall within the bounds of the following two equations (ISEE, 1998):

$P = 20\log_{10}(2.522 * SD)^{-1.1} + 170.75$ (based on an average burial of explosives)

$P = 20\log_{10}(0.252 * SD)^{-1.1} + 170.75$ (based on explosive burial designed for air vibration suppression)

where P = Peak Air Pressure (dBL)

SD = Scaled Distance (m/kg$^{0.33}$)

The described model is plotted on Figure 5-2. The planned blast parameters for the Project are more applicable to the model for average burial of explosives.

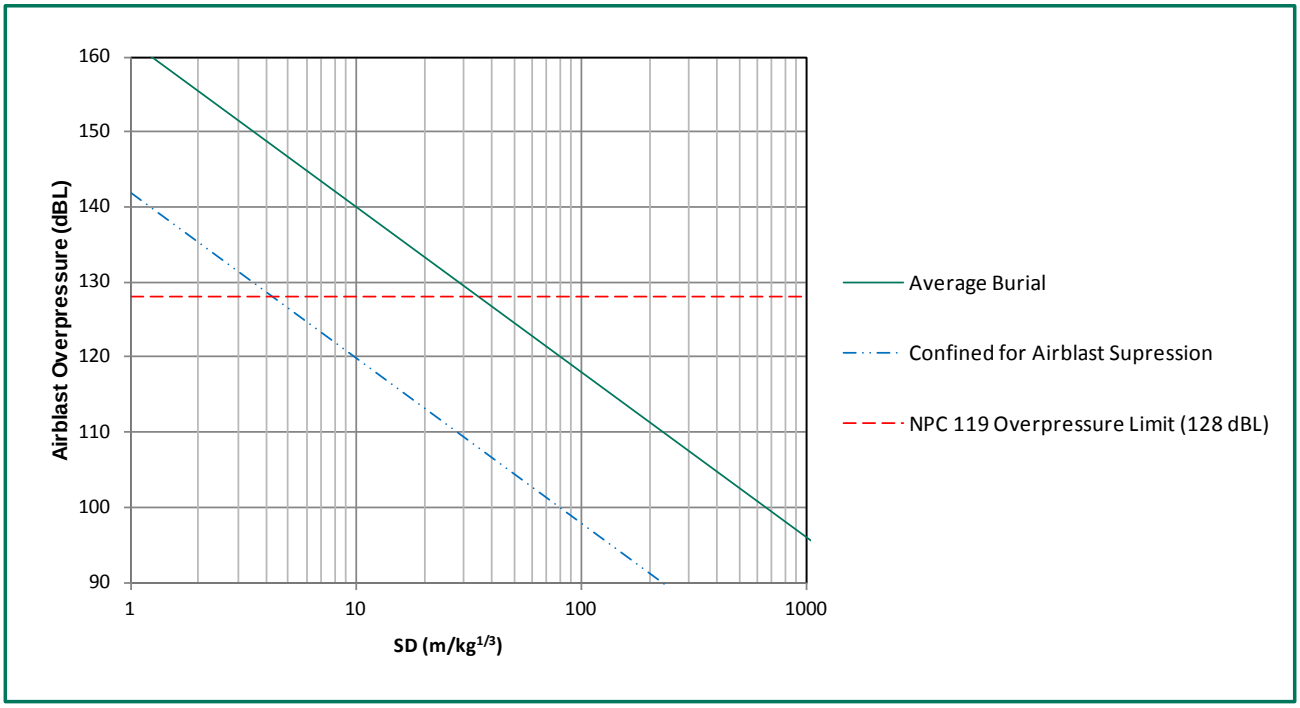

Figure 5-2: Air Vibration Attenuation Model (ISEE, 1998)

5.1.4.3 Predicting Ground Vibrations

Blasting during Project operations will also result in ground vibrations. This section describes the attenuation of ground vibrations from blasting.

The rate at which ground vibrations attenuate from a blast site is dependent on a number of variables. These include the characteristics of the blast (delay timing, type of explosive, etc.), topography of the site, as well as the characteristics of the bedrock and/or soil materials. In the absence of ground vibration monitoring data from the Project, predicting the magnitude of blast vibrations from the surface quarries at the neighbouring properties was carried out using published attenuation characteristics (ISEE 1998). The intensity of ground vibrations from blasting operations is primarily a function of the maximum explosive weight detonated per delay period, and the distance between the blast and the receptor. The rate at which ground vibrations decay or attenuate from a blast site can be expressed by the Scaled Distance, which is defined as:

$$Scaled\ Distance\ (SD) = \left(\frac{D}{\sqrt{W}}\right)$$

where D = the distance (m) between the blast and receptor

W = the maximum weight of explosive (kg) detonated per delay period

Prediction of maximum ground vibrations can be calculated based on the following upper bound equation for typical blast data (ISEE 1998), which takes into account differing rock conditions and surface blast procedures for down-hole bench blasting:

$$PPV = 1725(SD)^{-1.60}$$

where PPV = Peak Particle Velocity (mm/sec)

SD = Scaled Distance (m/kg$^{1/2}$) as defined above

The model is plotted on Figure 5-3.

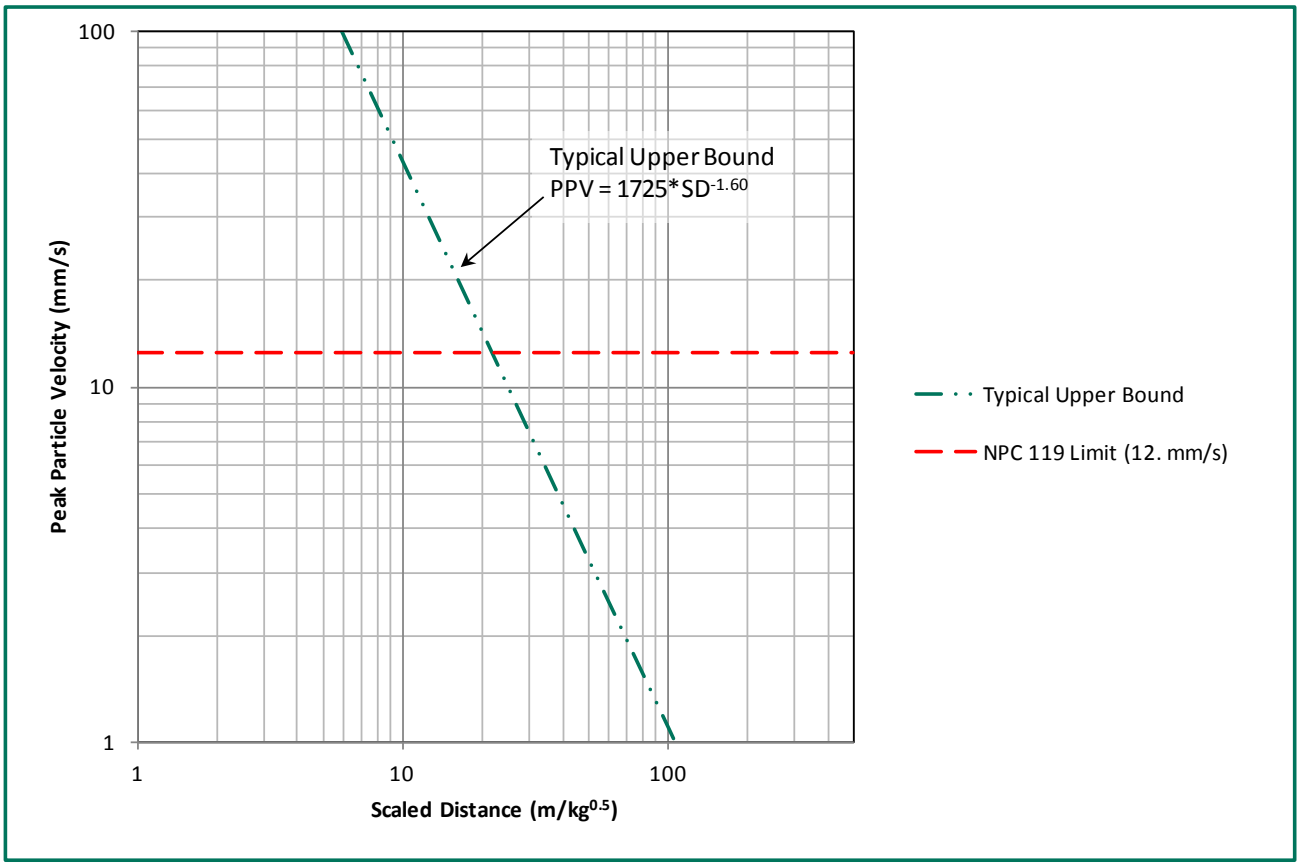

Figure 5-3: Ground Vibration Attenuation Model (ISEE, 1998)

5.1.4.4 Predicting Instantaneous Water Overpressure

The underwater overpressure limit only tends to become a measurable indicator when blasting or explosives are used within the water body itself. No blasting is planned to occur in Sawbill Bay, Marmion Lake or Lynxhead Bay. However, the methodology to estimate the required setback distance for confined explosives to achieve the 100 kPa guidelines provided by Wright and Hopky (1998) is reviewed below.

The relationship between acoustic impedance and the density and velocity of the medium through which the compression wave travels is given by:

$$\frac{Z_w}{Z_r} = \frac{D_w \times C_w}{D_r \times C_r}$$

where: D_w = density of water = 1 g/cm^3

D_r = density of the substrate, g/cm^3

C_w = compression wave velocity in water = 146,300 cm/s

C_r = compression wave velocity in substrate, cm/s

Z_w = acoustic impedance of water

Z_r = acoustic impedance of substrate

Typical values used for D_r and C_r for various substrates are shown in Table 5-3.

Table 5-3: Typical Values for Substrate Density and Compression Wave Velocity

Substrate	D_r (g/cm^3)	C_r (cm/s)
Rock	2.64	457,200
Frozen Soil	1.92	304,800
Ice	0.98	304,800
Saturated Soil	2.08	146,300
Unsaturated Soil	1.92	45,700

Reference: Wright and Hopky (1998).

The transfer of shock pressure from the substrate to the water can be estimated from:

$$P_w = \frac{\left(2 \times \left({}^{Z_w}/_{Z_r}\right) \times P_r\right)}{\left(1 + \left({}^{Z_w}/_{Z_r}\right)\right)}$$

where: P_w = pressure (kPa) in water

P_r = pressure (kPa) in substrate

Z_w = acoustic impedance of water

Z_r = acoustic impedance of substrate

The equation can be re-written to solve for the pressure in the substrate (P_r), as:

$$P_r = \frac{P_w \times \left(1 + \left({}^{Z_w}/_{Z_r}\right)\right)}{\left(2 \times \left({}^{Z_w}/_{Z_r}\right)\right)}$$

The equation is solved by setting the value of P_w to the 100 kPa guideline to determine the pressure in the substrate, P_r, which is required to produce this detonation overpressure in the water. The resulting value for P_r is used to determine the PPV (cm/s) in the rock for the given conditions based on the following:

$$PPV = \frac{2 \times P_r}{(D_r \times C_r)}$$

The relationship between PPV, charge weight, and distance is given by:

$$PPV = K\left(\frac{R}{\sqrt{W}}\right)^{-e}$$

where D = the distance (m) between the blast and nearest fishery

W = the maximum weight of explosive (kg) detonated per delay period

K & e = site-specific constants

Equating the two equations for PPV, and solving for distance, R, for a given charge weight, W, gives the minimum setback distance from fish habitat required so as not to exceed the 100 kPa overpressure guideline. The properties shown in Table 5-4 were used to predict the minimum setback distance.

Table 5-4: Properties Used to Assess Setback Distance for Instantaneous Overpressure

Medium	Density (g/cm^3)	Compressional Wave Velocity (cm/s)
Water	1.0	146,300[(a)]
Rock	2.6	457,200[(a)]

Source: Wright and Hopky (1998).

5.1.4.5 Vibration Receptor Locations

Sensitive receptors to vibrations have been identified in a human health assessment and are displayed on Figure 5-1. All of the identified receptors were considered in the vibrations assessment except designated camping sites which are not subject to the NPC 119 guidelines. Table 5-5 summarizes the sensitive receptors identified in Figure 5-1.

Table 5-5: Receptor Locations

33	Unnamed Trapper Cabin	Cabin	12,300
35	Unnamed Cottage	Cottage	12,600
39	Finlayson Resort	Tourism Establishment	14,200

In addition Sawbill Bay, Marmion Reservoir and Lynxhead Bay were selected as the potential receptor locations for the DFO assessment.

5.2 Results

5.2.1 Modelling Results for Ontario Air Vibration Guideline

Based on the equations described in Section 5.1.4.2, the prediction of peak airblast overpressure levels can be carried out at differing distances from a blast based on an expected maximum explosive weight per delay period. The air vibration levels from blasting activities are expected to be below the limits for blasts with an average burial of explosives and show the estimated air vibration amplitudes for the proposed design at a range of distances.

Figure 5-4 shows a contoured estimate of the maximum blast-induced air vibration levels. Figure 5-5 shows estimated maximum air blast overpressure at a given distance for the proposed blast design. Table 5-6 shows the estimated air vibration levels at the sensitive receptors using the blast design parameters.

Estimates shown in Table 5-6 suggest that blast-induced air-blast overpressure levels should be below the MOE 128 dBL limit at the closest identified receptors. The estimated maximum explosive charge weight allowable to comply with the NPC 119 limits on air overpressure at the nearest structure (1,400 m) is 65,000 kg (i.e., scaled distance of 34.9 m/kg$^{1/3}$).

Notes:
[(a)] "OP" is airblast overpressure.

5.2.2 Modelling Results for Ontario Ground Vibration Guideline

Based on the equations described in Section 5.1.4.3, the prediction of peak ground vibration levels can be carried out at differing distances from a blast based on an expected maximum explosive weight per delay period. Figure 5-6 shows the estimated ground vibration amplitudes for the proposed design at a range of distances.

Figure 5-7 shows the estimated of the maximum blast-induced ground vibration levels around the Project Site, while Table 5-7 shows the estimated ground vibration levels at the sensitive receptors using the blast design parameters.

5.2.2.1 Modelling Results for DFO – Ground Vibration

The shoreline at Sawbill Bay, Marmion Lake or Lynxhead Bay will be considered as the nearest locations to the mine blasting operations for potential active spawning beds and fisheries. The estimated maximum explosive charge weight allowable to comply with the DFO limits (i.e., 13 mm/s) on ground vibration at the nearest shoreline is shown in Table 5-8.

Table 5-8: Estimated minimum separation distance to meet PPV levels at the Sawbill Lake Shoreline

Location	Blast Location	Distance (m)	Maximum Explosive Weight / Delay (kg)
East Pit	Pit center	510	1141
	Pit crest	95	40
West Pit	Pit center	395	684
	Pit crest	35	5.4

The estimates suggest that blast-induced PPV levels are likely to exceed the 13 mm/s limit for blasts using 270 mm diameter holes at distances less than 369 m from the nearest shoreline. The PPV amplitudes are likely to change resulting from changes to the mine plan, pit optimization, blast design optimization, and calibration of the vibration attenuation model. Monitoring of the PPV from test blasts is recommended to provide site-specific data. Ongoing blast monitoring will provide guidance as to when, if at all, blast designs should be altered to accommodate vibration levels to comply with DFO requirements.

5.2.2.2 Modelling Results for DFO – Instantaneous Underwater Overpressure

Based on the instantaneous underwater overpressure properties and the proposed blast design parameters, the estimated instantaneous overpressure at the Sawbill Bay shoreline is shown in Table 5-9. The table also shows the estimated maximum explosive charge weight allowable to comply with the DFO limits at the shoreline.

Table 5-9: Estimated minimum separation distance from to meet Instantaneous Underwater Overpressure at Sawbill Bay Shoreline

Location	Blast Location	Distance (m)	Est. Maximum Overpressure (kPa)[(a)]	Max. Explosive Wt/Delay (kg)[(b)]
East Pit	Pit center	510	10.7	10,500
	Pit crest	95	157	365
West Pit	Pit center	395	16.1	6,300
	Pit crest	35	777	50

Notes:

(a) Assuming a blasthole diameter of 311 mm and a maximum explosive charge weight of 596 kg.

(b) Maximum explosive charge weight per delay period to comply with the DFO water overpressure limit.

The minimum predicted setback distances are less than the distances from the proposed pit crest to the nearest shoreline. The relationship between charge weight per delay and minimum setback distance to achieve both the 100 kPa guidelines for instantaneous overpressure is shown on Figure 5-8. The graph can be used as a guide for the development of alternative blast designs in areas that may be affected by instantaneous overpressures greater than 100 kPa.

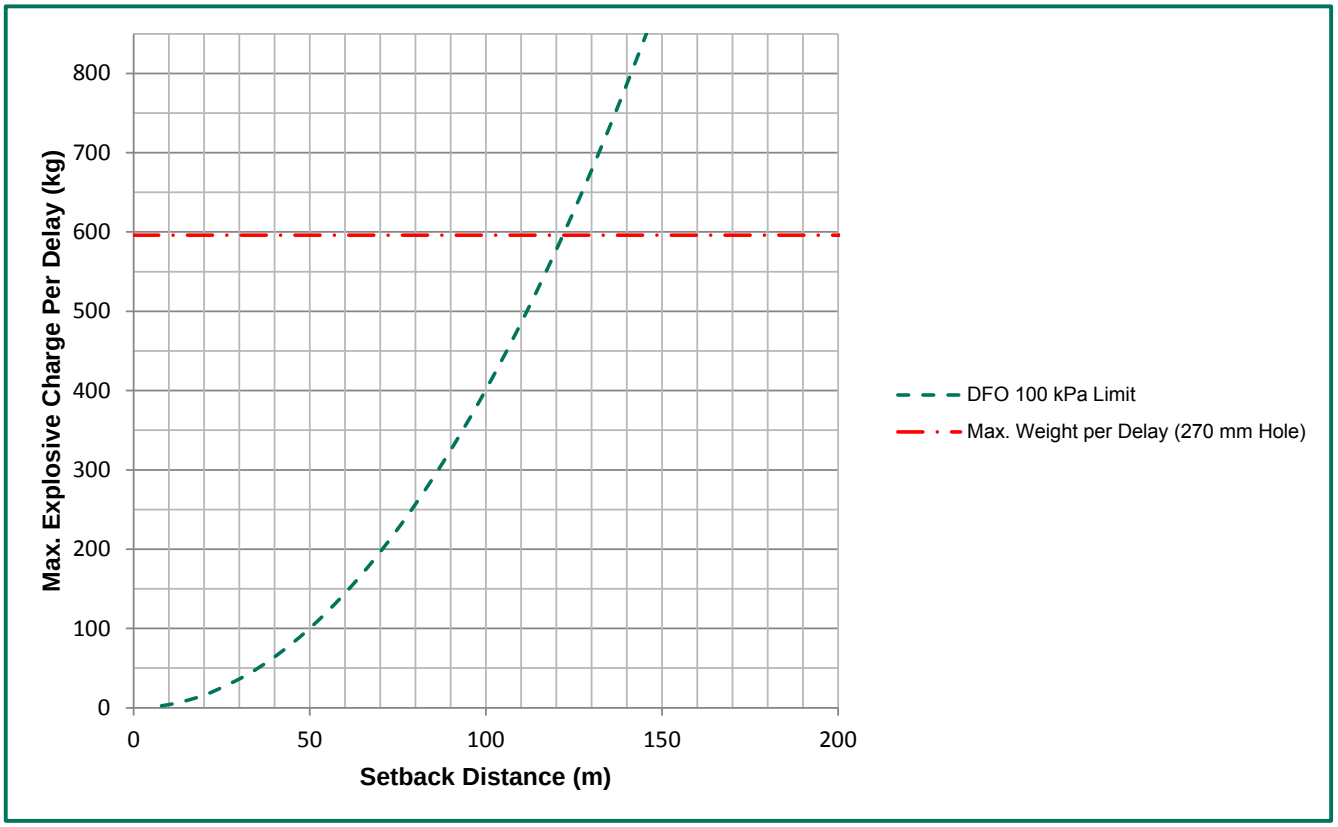

Figure 5-8: Charge Weight versus Setback Distance for Instantaneous Water Overpressure

Figure 5-7 indicates that the minimum setback distance, below which the 100 kPa overpressure guideline will not be exceeded, is 122 m. Monitoring of the instantaneous overpressure from test blasts is recommended to provide site-specific data.

5.3 Mitigation

As noted in the previous section, predicting ground and air vibration attenuation from blasting is specific to the characteristics of the site and the blasting parameters. Since there are no blasting operations currently at the Project Site, predictive modelling using generalized equations was carried out. For this reason, on-site monitoring is needed to confirm the results of the assessment since it is impractical to propose mitigation for conditions that may not arise when blasting actually occurs at the site.

5.3.1 Mitigation for Ontario Blasting Guideline NPC 119

The vibrations assessment using generalized equations indicates that the blast-induced air and ground vibration levels should be well within the NPC 119 guidelines. As such, no mitigation will be required to comply with these guidelines.

5.3.2 Mitigation for DFO Blasting Guideline

The vibrations assessment using generalized equations indicates that the blast-induced air and ground vibration levels could be above DFO guidelines at potential aquatic receptors as follows:

- Blast-induced PPV levels may exceed the 13 mm/s guideline using 270 mm diameter holes at distances less than 369 m from the shoreline.
- Blast induced overpressure levels may exceed the 100 kPa overpressure guideline using 270 mm diameter holes at distances less than 122 m from the shoreline.

Therefore, the proposed blasting at the west pit and much of the blasts for the east pit as excavation approaches the pit perimeter may exceed the DFO guidelines. For this reason, an adaptive management approach is proposed as the mitigation proposed for the Project. As part of this approach, on-site measurements of ground and air vibration as well as overpressure will be used to develop the actual separation distances and will also support the types of mitigation needed.

The intensity of blast vibrations is primarily influenced by the maximum explosive weight detonated per delay period within a blast and the distance between the blast and the receptor. Thus, two primary means of meeting DFO guidelines could be: a) increasing the distance to these environmental receptors; or b) reducing the weight of explosive charge detonated per delay period.

The distance between the pit perimeter and the nearest active spawning bed will depend on both the actual locations and times when the beds are active. The actual location of the pit perimeter is an issue that will be determined during the detailed design stage of the Project.

It is anticipated that a reduction in the maximum explosive weight detonated per delay period within the blast would be required to comply with the DFO limits. This will be dependent on the bench height and the monitoring results. Any one, or combination, of the following in-design mitigation measures would reduce the maximum charge weight per delay:

1) Reducing the borehole diameter with a corresponding reduction in the drill pattern.
2) Introducing decked charges within each borehole.
3) Reducing the borehole length (depth) by reducing the bench height.

For example, a reduction in the borehole diameter from 270 mm to 251 mm would reduce the explosive weight per hole by approximately 14%. Decking of the explosive column, could further reduce the maximum explosive weight per hole by an additional amount. The amount of reduction is dependent on the decking configuration. Additional decking, or reductions in the bench height, as identified above, could achieve further reductions in maximum explosive weights per hole.

5.4 Monitoring

Table 5-10 summarizes the vibration monitoring proposed to support the Project's adaptive management approach and confirm the findings presented in the Environmental Assessment. The table describes what will be monitored, the method for completing the monitoring and the frequency proposed for the monitoring.

Table 5-10: Vibration Monitoring During Operations Phase

Parameter	Method	Frequency
Ground and air vibration level monitoring from blasting operations to develop site-specific vibration attenuation.	Establishing a series of seismographs at varying distances from blasts and keeping a detailed record of the loading parameters.	Monitoring campaign; from a minimum 12 blasts at 6 sites during each blast, set up at distances varying from about 300 m to 2000 m from the blast.
Blast ground and air vibrations at nearest receptor locations.	Establishing instrumentation at nearest receptor locations.	Instrumentation to record ground and air vibration intensities on a continuous basis. Data would be compared to known blast times to assess peak ground and air vibration intensities produced.
Blast-induced water overpressure level at nearest active fishery.	Establishing instrumentation at nearest active fishery location. This will include a hydrophone and data acquisition unit.	Instrumentation to record water overpressure intensities during the initial blasts. Based on the data recorded, a decision will be made on subsequent monitoring. Periodic monitoring should be conducted as the blasts approach the nearest fishery.

The results of the monitoring will be used to establish that proper mitigation is implemented as part of the adaptive management program throughout the Project.

6.0 CLIMATE CHANGE ASSESSMENT

The need to consider the effects of a changing climate in the assessment of the Project is defined by the Federal-Provincial-Territorial Committee on Climate Change and Environmental Assessment (FPTCCCEA) which has prepared a general guidance document for practitioners to use when incorporating climate change issues into environmental assessments (FPTCCCEA 2003).

The requirement of the guidelines to consider climate change is addressed through the following considerations:

- How will potential changes in climate affect the infrastructure associated with the Project?
- How will the operation of the Project affect climate change (e.g., the Project's contribution to climate through the emission of greenhouse gases)?

Further, the Canadian Environmental Assessment Agency (CEAA 2011) Guidelines require that:

> *".. the EIS shall take into account how local conditions and natural hazards, such as severe and/or extreme weather conditions and external events (e.g., flooding, ice jams, rock slides, landslides, fire, drought, low snowfall during winter, outflow conditions and seismic events) could adversely affect the Project. These events should be considered in different probability patterns (i.e., 5 year flood vs. 100 year flood). The EIS shall include other considerations in relation to the assessment of the effects of the environment including any downstream water users that have water use agreements already in place and water quantity/availability for long term tailings management. Longer-term effects of climate change shall also be discussed up to and during the projected post-closure phase of the Project. This discussion should include a description of climate data used.*
>
> *The sensitivity of the Project to long-term climate variability and effects shall be identified and discussed."*

This assessment includes how climate change may affect the Project infrastructure and identifies which aspects of the Project may need to be assessed in greater detail because of a potential changing climate. To understand how the climate has been changing, and may change in the future, climate trends were analyzed by:

- Describing the current climate.
- Documenting how the climate has changed over the past 40 years (1970 to 2010) in the region.
- Discussing the range of future climate projections (2041 to 2070).
- Presenting a climate risk matrix.

In addition, the annual Greenhouse Gas (GHG) emissions from the Project were estimated for a worst case operating year and these emissions were compared to the Provincial and Canadian emissions to assess the relative contribution of the Project on a Canadian basis. The possible contribution of the Project to future climate change was assessed by comparing the Project GHG emissions to the Global GHG emissions used in the future climate predictions to gain an appreciation of the relative magnitude and likely effects of the Project.

6.1 Meteorological and Climate Station Selection

The station selection is based upon the specific recommendations from Environment Canada's Canadian Climate Change Scenarios Network (CCCSN) (2012). The CCCSN is Environment Canada's interface for distributing information related to climate change scenarios and adaptation research. The CCCSN sets the guidelines on how to select a climate station to represent an area of interest, and how climate data should be used when calculating trends.

The criteria used to select the station were based on the following CCCSN selection factors:

- The length of data record (minimum 30 years of data).
- A continuity of data record.
- Availability of recent data.
- Proximity of station to the area of interest.

There may be a number of climate stations that fall within the boundaries of the area of interest. However, from a detailed analysis perspective it is often not practical to use all of the available climate stations within the area. The available climate data from each station must be compared to, and pass, the selection criteria mentioned above. Data from most of the available climate stations is constrained by low numbers of observations, limited life span for the station, and varying data quantity and quality. The climate assessment completed for the Project uses data from two climate stations to describe historic climate conditions, climate variation and trends, as shown in Figure 2-1.

Based on the CCCSN criteria and the defined study area, the two selected stations for the historic climate trend analysis are Atikokan Marmion station and Sioux Lookout A station, as described in Table 6-1.

Table 6-1: Selected Stations to Represent Study Areas

Station Name	Station Climate ID	Latitude	Longitude	Elevation (masl)
Atikokan Marmion	6020384	48.80	-91.58	772.0
Sioux Lookout A	6037775	50.12	-91.90	383.1

Atikokan Marmion and Sioux Lookout A (Sioux Lookout) are located approximately 40 and 190 km from the Project Site. Available daily meteorological data from each station was collected for the period from 1970 through to 2010. Once the datasets passed the quality assurance/quality control (QA/QC) process (e.g., data checks, ranges, missing data), climate normals and trend analysis were prepared. The ranges of available data for the period of interest (1970 through 2010) are shown in Table 6-2 and the percentage of missing data for mean temperature and total precipitation for those periods is shown in Table 6-3.

Table 6-2: Data Availability at Selected Stations

Station Name	Daily Observations Availability
Atikokan Marmion	1980 – 2007
Sioux Lookout A (Sioux Lookout)	1970 – 2010

Table 6-3: Percentage of Missing Data at Selected Stations

Climate Parameter	Atikokan Marmion	Sioux Lookout A
Mean temperature	62%	1%
Total precipitation	73%	1%

As specified by the CCCSN's QA/QC procedures, stations with more than 10% missing data should not be included for quantitative variation and trend analyses. However, in the remote region of northwestern Ontario, there may be gaps in the station data and it is difficult to find stations representative of the area with 30 years of complete data. Atikokan Marmion station is such a case, with over half of the data missing for the period of 1970 through to 2010. Therefore, Sioux Lookout has been used in the following climate change discussion in due to its contiguous climate record.

6.2 Historic Climate Trends

The climate change analysis relies on the use of climate normals, which are long-term (30-year) averages of observed climate for set periods of time. An analysis and summary of the current climate conditions for the region for both the 1971 through 2000 (the currently recognized climate period by Environment Canada) was conducted and the longer period of 1970 through 2010 where data is available. As noted in Section 2 historic climate data earlier than 1971 are not available for this assessment.

6.2.1 Background to Trend Analysis

Traditionally, the review of changing climate considers past weather records to provide guidance for predicting future conditions. Historic climate trends are assessed using data from the climate data archives (National Climate Data and Information Archive 2012) at Atikokan Marmion Station and Sioux Lookout Station, see Figure 6-1. Two periods were assessed:

- The defined climate normal over the period from 1971 through 2000 to form a baseline for future model projection comparison.
- All available information from 1970 through 2010.

Potential trends in temperature and precipitation are evaluated by fitting a model to the data using the Sen's nonparametric model. The statistical significance of the observed trends is determined using the Mann-Kendall test (Salmi et. al. 2002). The Mann-Kendall test is applicable to the detection of a monotonic trend of a time series with no seasonal cycle. The analysis uses a two-tail test to determine statistical significance at the 90^{th}, 95^{th}, 99^{th} and 99.9^{th} percentile levels. A trend that is not determined to be significant at the 90^{th} percentile is classified as being "not significant." A trend that is determined to be significant at the 99.9^{th} percentile level indicates that there is a 99.9% probability that the direction of the trend is correct. This methodology was developed by Finnish Meteorological Institute and is widely used to assess climate changes predicted from weather data. Both methods Mann-Kendall test and Sen's Method were applied to the available climate data.

6.2.2 Results of Trend Analysis

The historic trends in climate were computed for both of the available data sets. Trend analysis was applied to the Atikokan Marmion and Sioux Lookout datasets for the annual and seasonal mean temperature and total precipitation. The trend analysis returns two pieces of information for each climate indices: the climate normal and the climate trend. The climate normal is calculated as the average of a given climate index over the selected period and the climate trend is calculated as the average change in the climate index per year. The decadal trend (change per decade) is calculated from the yearly trend (change per year). The trends are also represented graphically in Appendices 6.I and 6.II.

6.2.2.1 Atikokan Marmion Trend Analysis

As discussed in Section 2 of this report, this monitoring station is missing a significant amount of data and, therefore, there is insufficient information to perform a full 30-year climate normal trend analysis with this station in this assessment. However, the results of the Atikokan Marmion trend analysis for the period from 1979 through 2007 (29 years) may be considered qualitatively. During this period, Atikokan Marmion shows that the average annual temperature climate index indicates a slight increase or warming.

Table 6-4: Atikokan Marmion(a) Trend Analysis Results

Climate Indices	1980 – 2007 Averages	1980 – 2007 Trend (Change per year)	1980 – 2007 Trend (Change per decade)	Level of Statistical Significance
Total Precipitation (mm [equiv.])	702.5	+11.33	+113.3	significant at the 95th percentile
Spring Total Precipitation (mm [equiv.])	135.6	+5.55	+55.5	significant at the 99.9th percentile
Summer Total Precipitation (mm [equiv.])	299.5	+0.76	+7.6	not statistically significant
Fall Total Precipitation(mm [equiv.])	205.6	+1.02	+10.2	not statistically significant
Winter Total Precipitation (mm [equiv.])	71.2	+1.93	+19.3	significant at the 95th percentile
Average Annual Temperature [°C]	3.4	-0.01	-0.1	not statistically significant
Average Spring Temperature [°C]	2.7	-0.05	-0.5	not statistically significant
Average Summer Temperature [°C]	17.6	+0.01	+0.1	not statistically significant
Average Fall Temperature [°C]	4.9	+0.01	+0.1	not statistically significant
Average Winter Temperature [°C]	-13.4	+0.04	+0.4	not statistically significant

Notes:
(a) Represents the available long term data from this station.

6.2.2.2 Sioux Lookout Trend Analysis

The results of the Sioux Lookout trend analysis for all available data (see Table 6-5) shows that all temperature climate indices (i.e., annual and seasonal) indicate a slight increase or warming from 1970 through 2010 (41 years). Of all the seasons, only the spring trend is not statistically significant. Moreover, precipitation indices indicate a statistically significant increase in precipitation annually and during the spring and summer.

Table 6-5: Sioux Lookout Trend Analysis Results

Climate Indices	1970 – 2010 average	1970 – 2010 Trend (Change per year)	1970 – 2010 Trend (Change per decade)	Level of Statistical Significance
Annual Total Precipitation (mm [equiv.])	744.7	+5.19	+51.9	significant at the 99th percentile
Spring Total Precipitation (mm [equiv.])	155.0	+1.95	+19.5	significant at the 95th percentile
Summer Total Precipitation (mm [equiv.])	283.4	+3.10	+31.0	significant at the 99.9th percentile
Fall Total Precipitation (mm [equiv.])	213.3	+0.71	+7.1	not statistically significant
Winter Total Precipitation (mm [equiv.])	92.9	-0.07	-0.7	not statistically significant
Average Annual Temperature [°C]	1.9	+0.05	+0.5	significant at the 99th percentile
Average Spring Temperature [°C]	1.9	+0.04	+0.4	not statistically significant
Average Summer Temperature [°C]	17.3	+0.03	+0.3	significant at the 90th percentile
Average Fall Temperature [°C]	3.6	+0.05	+0.5	significant at the 95th percentile
Average Winter Temperature [°C]	-15.7	+0.08	+0.8	significant at the 99th percentile

A similar assessment of the climate normal period from 1971 to 2000 shows a similar trend (see Table 6-6).

Table 6-6: Sioux Lookout Climate Normal Trend Analysis Results

Climate Indices	1971 – 2000 average	1971 – 2000 Trend (Change per year)	1971 – 2000 Trend (Change per decade)	Level of Statistical Significance
Annual Total Precipitation (mm [equiv.])	706.4	+5.05	+50.5	not statistically significant
Spring Total Precipitation (mm [equiv.])	138.3	+0.77	+7.7	not statistically significant
Summer Total Precipitation (mm [equiv.])	268.3	+2.08	+20.8	not statistically significant

Table 6-6: Sioux Lookout Climate Normal Trend Analysis Results (Continued)

Climate Indices	1971 – 2000 average	1971 – 2000 Trend (Change per year)	1971 – 2000 Trend (Change per decade)	Level of Statistical Significance
Fall Total Precipitation (mm [equiv.])	210.1	+2.26	+22.6	not statistically significant
Winter Total Precipitation (mm [equiv.])	89.7	-0.14	-1.4	not statistically significant
Average Annual Temperature [°C]	1.7	+0.05	+0.5	significant at the 95th percentile
Average Spring Temperature [°C]	1.9	+0.06	+0.6	not statistically significant
Average Summer Temperature [°C]	17.2	+0.04	+0.4	not statistically significant
Average Fall Temperature [°C]	3.1	+0.01	+0.1	not statistically significant
Average Winter Temperature [°C]	-16.0	+0.10	+1.0	significant at the 95th percentile

6.3 Future Climate Change

In 1988, the Intergovernmental Panel on Climate Change (IPCC) was formed by the World Meteorological Organization (WMO) and the United Nations Environment Program (UNEP) to review international climate change data. A series of improved global climate models have been developed to respond to the concerns over future climate trends and the influence of human activities on climate.

Climate modelling is a complex process that involves the mathematical representation of global land, sea and atmosphere interactions over a long period. The results of global climate models are subject to many uncertainties and interpretations. This assessment used various climate scenarios to partially address this concern. Since the models are susceptible to inter-decadal variability, the analysis used 30 years of data, centred on 2050, as this is accepted practice and it corresponds to the forecast period that covers the operational and closure phase of the Project.

The results of this assessment are presented in three formats:

- "Scatter plots" – to show the range in the projected annual absolute change for temperature and precipitation from the current climate normal for all the models.
- "Cloud graphs" – to show the range of the minimum to maximum predictions for each model in comparison to the observed annual variation over the climate normal.
- 'Histogram" – to show the distribution of the model predictions in comparison to the observed annual data.

The Project operations are anticipated to last for approximately 11 years, starting in 2015 with closure activities commencing during operation and being completed 2 years after closure, for this reason longer-term effects of climate change (beyond 2060) are not included in this assessment.

6.3.1 Global Climate Forecast Models

Creating predictions of future climate requires the use of sophisticated mathematical computer programs called Global Climate Models (GCMs). Numerous GCM's have been developed by international government laboratories and academic institutions. The IPCC has been charged with providing state-of-the-art reviews of climate change science produced by researchers at these international institutions.

Climate simulations produced by these models vary because each model uses a different combination of algorithms to describe and couple Earth's atmospheric, oceanic and terrestrial processes. Thus an ensemble approach or combining the results from multiple GCM's provides the best, unbiased approach to evaluating climate change predictions. The GCM's used in this assessment (Table 6-7) are highly regarded, have been validated against observations, and the interpretation of their results has been peer reviewed. Rather than selecting a single model, the climate change projections from all the models were included in the assessment. This multi modal ensemble approach is used to delineate the probable range of results and should capture the actual outcome which is an inherent unknown.

6.3.2 Climate Scenarios

GCM's require extensive inputs in order to characterize the physical and social developments that could alter climate in the future. In order to represent the wide range of the inputs possible to GCM's, IPCC has established a series of socio-economic scenarios that help define the future levels of Global Greenhouse Gas (GHG) emissions. While the IPCC identifies many scenarios, the following three, namely A1B, B1, and A2, were selected for this study and are the most common scenarios used for assessment.

- Scenario A1B — the A1 family of scenarios describes a future world of very rapid economic growth, global population that peaks in mid-century and declines thereafter, and the rapid introduction of new and more efficient technologies. The A1 family includes three groups of scenarios that describe alternative directions in the energy system. The A1B group is distinguished by a balance across all sources of energy – green and fossil.
- Scenario A2 — the A2 scenario family describes a world with an underlying theme of self-reliance and preservation of local identities. Fertility patterns across regions converge very slowly, which results in continuously increasing population. Economic development is regionally oriented and per capita economic growth and technological change more fragmented and slower than for other scenarios.
- Scenario B1 — the B1 scenario family describes a convergent world with the same global population that peaks in mid-century and declines thereafter (similar to the A1 scenarios). The B1 family has rapid change in economic structures toward a service and information economy, with reductions in raw material intensity and the introduction of clean and resource-efficient technologies. The emphasis is on global solutions to economic, social and environmental sustainability, including improved equity, but without additional climate initiatives.

Most GCMs (not all) produce the above three emission scenarios. The A1B and A2 scenarios represent a focus on economic growth while the B1 scenario represents a shift towards more environmentally conscious solutions to growth. Both scenarios A1B and B1 include a shift towards global solutions, while the A2 scenario includes growth based on regional models.

These three socio-economic scenarios have been described more fully by IPCC in the Special Report on Emission Scenarios (SRES 2000). Although IPCC has not stated which of these scenarios are most likely to occur, the A2 scenario most closely reflects the current global socio-economic situation. In relation to the A2 scenario, scenarios A1B and B1 result in lower long-term GHG emissions over the next century. Of the A1 scenarios, A1B yields high emissions in the first half of the 21st century due to increasing population and high dependence on fossil fuels for energy.

6.3.3 Understanding Climate Projections and their Limitations

The GCM's used for this assessment have inherent limitations that are important to bear in mind when evaluating variability and the rate of climate change, (i.e., when comparing future projections to historical observations). These limitations are depended on the research institutions' approach to overcoming model uncertainty. Since no one model or climate scenario can be viewed as completely accurate, the IPCC recommends that climate change assessments use as many models and climate scenarios as possible. For this reason the ensemble approach described above was used for this assessment to account for these uncertainties and limitations.

The following provides a brief discussion on these limitations in the context of spatial and temporal scale, unpredictability, changes to our understanding of climate change drivers and comparison to baseline.

6.3.3.1 Scale

Due to limitations on computing power the GCM outputs are limited to grid cells of 1^{o} to 2.5^{o} (approximately 110 to 275 km) and a small number of vertical layers in the atmosphere. These grid cells represent a mathematically defined "region" and are different for many models. Although the appropriate grid cell was selected to represent the Project location from each model and the data extracted from each grid cell, this scale is much larger than that of weather processes, such as convective thunder storms. In addition, local changes in topography cannot be represented at this scale.

Temporally the GCM's simulations are run at monthly time scales and only monthly average temperature and precipitation are available as outputs.

The process of "downscaling" is a method to overcome these limitations on scale. Downscaling may decrease uncertainty for regions where the regional topography and/or geography is complex compared to the GCM grid-scale, or where diurnal fluctuations in local meteorology are important. While this technique can improve comparisons between historical observations and simulations of past climate for a specific GCM model, it does not address uncertainty in the models as noted in the following sections.

6.3.3.2 Unpredictable Events

Climate model simulations represent average conditions and typically do not consider the influence of inherently unpredictable "stochastic" or episodic events (e.g. volcanic eruptions, earthquakes and tsunamis). In other words, events of a certain magnitude tend to occur at a certain frequency; however, their actual magnitude and timing is unknown and are not currently predictable within a specific GCM's model outputs.

Though large events are rare, they have the potential to invalidate climate model projections both globally and regionally. For example, the 1991 eruption of Mount Pinatubo is well known to have decreased the average planetary surface temperature by ~1^{o}C for at least one year; a significant offset to predictions of ~3^{o}C of warming over the next century. The Pinatubo eruption ranks as a 6 of 8 on the logarithmic-based volcanic explosivity index, and events such as Pinatubo have return periods on the order of 100 years. Larger events have return periods of 1,000 years or more; however, their plumes can reach altitudes of greater than 40 km and inject sufficient amounts of sulphur into the stratosphere to suppress global temperature from years to decades (7).

6.3.3.3 Understanding of the Processes

The Earth's system process and feedbacks are very complex and therefore have to be approximated into the model simulations. In these instances, mathematical parameterizations of these processes are required to reduce the computational burden within the simulations. Each of these independent processes that drive climate change can be assigned a rank based on the current level of scientific understanding (LOSU). The contribution of aerosols in the GCMs is an example of this uncertainty. Aerosols were ranked as very-low LOSU in the 2001 IPCC report and were upgraded to a medium to low LOSU in the 2007 IPCC report.

In addition, new discoveries can change the inputs to the GCM and the interrelationship of these drivers within the GCM. For example, the 1988 discovery of *Prochlorococcus,* the most abundant photosynthetic organism in the ocean, lead change in the understanding of ocean biology, the carbon cycle and atmospheric CO_2 .

Similarly, the 2001 discovery of ubiquitous atmospheric N_2-fixation by the marine cyanobacterium *Trichodesmium* changed the understanding of the effects of ocean biology and our understanding of the Earth's nitrogen cycle.

6.3.3.4 Comparison to Baseline Normal

In keeping with accepted climate practices, the description of historical climate has been based on the 30 year period from 1971 to 2000. The climate change projections have been compared to model predictions for the 1971 to 2000 period in order to assess a potential change.

However, change will be dependent on length of period selected for comparison. Any period may be subject to a cyclical trend. Chen and Grasby (2009) note that analysis of hydro-meteorological time series has identified decadal and inter-decadal quasi-cyclic oscillations and that these natural variations can affect Mann-Kendall tests such as those presented here. Chen and Grasby recommend that trend analysis for hydro-meteorological time series be restricted to data sets with records >60 years, due to the predominance of 45 to 60-year climate cycles observed in instrumental records. All of these large scale ocean-atmosphere phenomena have the potential to influence our trend analysis over the 1971 to 2010 time period, especially considering the timing of the recent PDO warm phase (1976 to 2005).

Longer term data from local stations is not available. Therefore, the results of the trend analysis should be interpreted with this understanding.

6.3.4 Summary of Climate Projections for Sioux Lookout

The climate forecast data from the available GCMs listed above were obtained for the three forecast scenarios (A1B, A2 and B1), when available, for the 2041 to 2070 time period. The appropriate grid square was chosen to represent Sioux Lookout. Forecast data was then extracted from the CCCSN website and summarized for trend and magnitude of change from the modelled climate normal baseline.

In order to graphically represent the individual model output in a comparable and meaningful format, the data must first have a consistent baseline. For each model, the change in temperature and precipitation is calculated relative to the respective modelled baseline values, which are unique to each model. This change is then imposed onto the historic climate baseline for the selected site, Sioux Lookout. Precipitation is represented as both a percent change relative to baseline values and as the quantity the percent change represents in equivalent millimetres.

6.3.4.1 Scatter Plot Assessment

To allow comparisons between the range of future forecasts, changes in climate have been presented as a scatter plot assessment of the range of model forecasts. When the results of the models are clustered very close together this shows a greater consistency between the various GCMs and scenario assessments. Conversely, when the grouping is more spread out or divergent and members are in two or three quadrants, confidence is lower in the outcome of the future projections.

Figure 6-2 presents the scatter plot showing the projected annual absolute change for temperature and precipitation from all available model projections. The grouping of all model projection scenarios indicates that most GCMs forecast a warmer and wetter climate for the projection period of 2041 to 2070 (2050s).

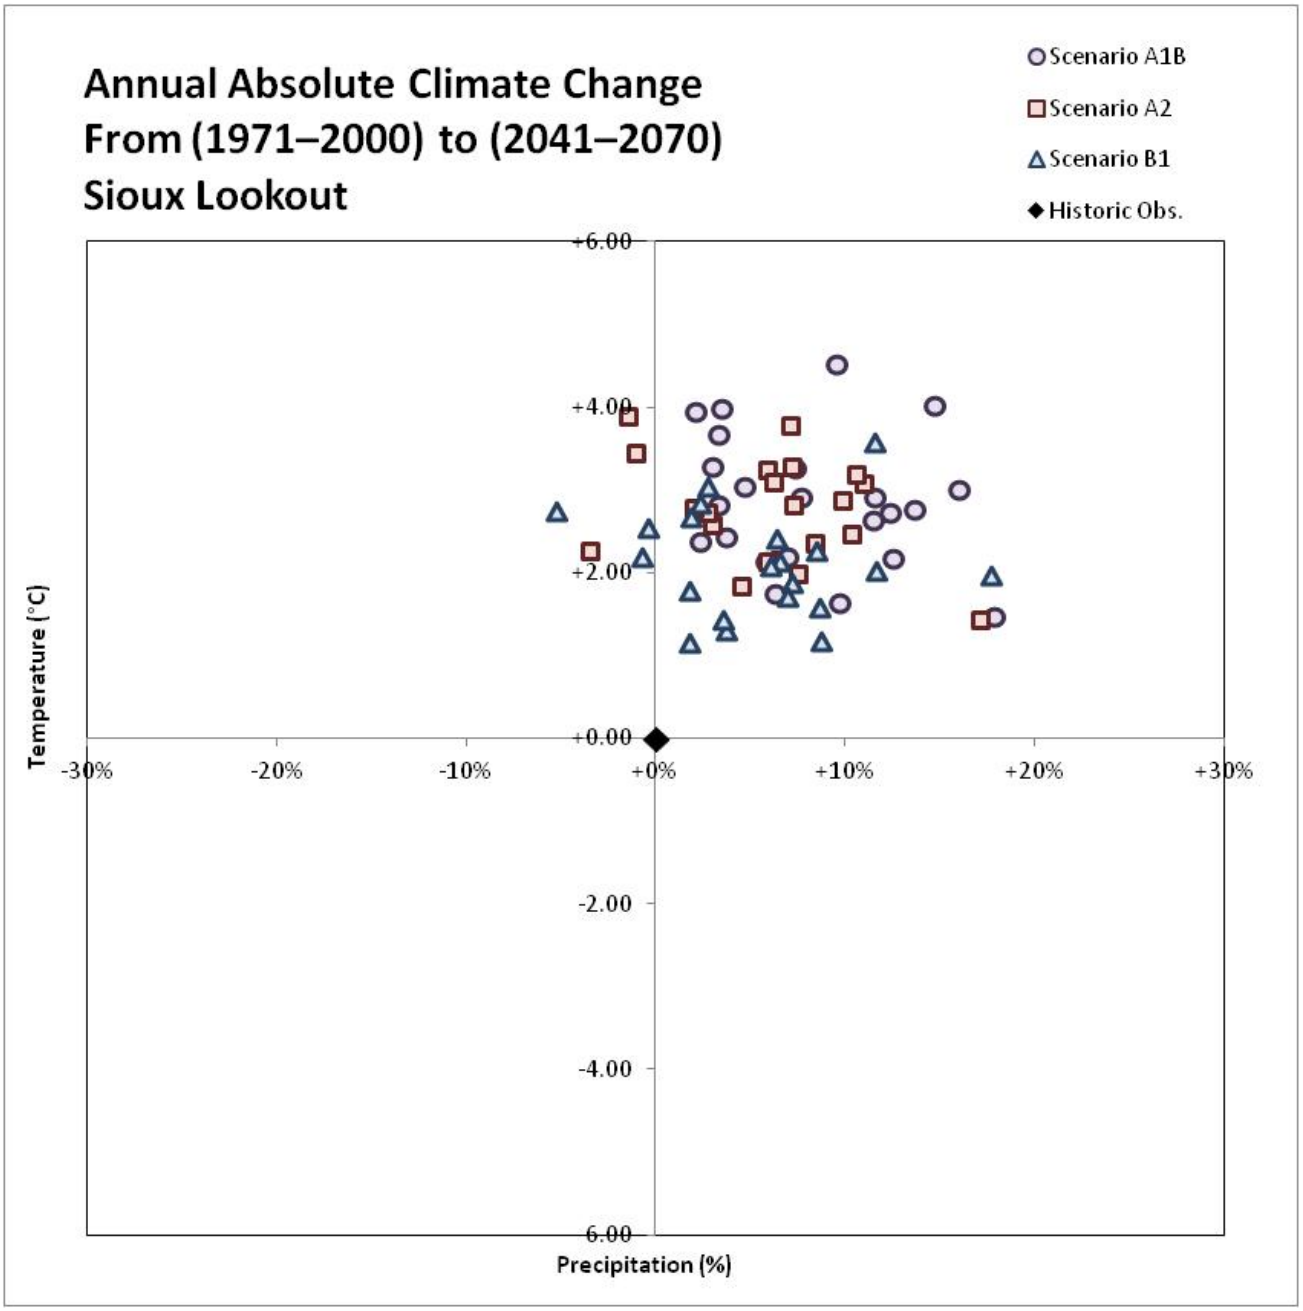

Figure 6-2: 1971-2000 to 2041-2070 (2050s) Annual Absolute Change for Sioux Lookout.

6.3.4.2 Cloud Graph Assessment

To allow comparisons between range of historic observations and future forecasts, changes in climate have been presented as a time series of the range of model forecasts. This time series is called a “cloud” as it shows a shaded area covering the range from the minimum to maximum forecast for each point of the time series.

Figure 6-3 provides a cloud plot showing the model forecast range for annual temperature. The historic observations and historic normal are overlaid on the figure to provide context. The shaded area shows the range covered by the individual annual forecasts. The absolute maximum (100th percentile) and absolute minimum (zero percentile) of the modelled forecast values are also shown. Differences between the range of the historic observations and the future forecast cloud indicate projected changes in climate. If the historic observations are not well captured by the cloud of model forecasts, any infrastructure designed for the historic range may become vulnerable in the future. The figure shows that, for Sioux Lookout, the cloud of model forecasts indicates an increase in annual temperatures compared to the historic record. The overall range of the cloud is similar to, if not larger than, the range of the historic observations. The historic climate normal is below the absolute minimum modelled forecast value.

Figure 6-4 is a cloud plot showing the model forecast range (the shaded area) for annual precipitation, as well as the maximum and minimum of the annual forecasts. The historic observations and historic normals are overlaid on the figure to provide context. The figure shows that total annual precipitation for Sioux Lookout are not predicted to change dramatically in the future relative to the observed climate over the past 30 years. This is evident from the figure that shows the range of future forecasts enclosing nearly all of the past observations.

6.3.4.3 Histogram Assessment

The number of times that the models forecast temperatures that fall within a certain range can be shown graphically. Such a graph is called a histogram. The height of each bar in the histogram indicates how often the models forecast temperatures that fall into the ranges shown below the bottom axis. The higher a bar, the more often temperatures in that range were forecast by the models.

Figure 6-5 and Figure 6-6 provide respective histograms for annual temperature and precipitation in Sioux Lookout. The histograms also show a dashed line, which represents the distribution of the model forecasts. The distribution is a theoretical curve representing how often forecast temperatures are expected to occur. The forecast distributions and forecast data in the figures show good agreement. The solid line in the figures represents the distribution of historic observations (either temperature or precipitation) based on data from 1971 to 2000. Figure 6-5 shows a noticeable difference between the forecast (projected) distribution and the historic distribution, with forecast temperatures being approximately 3.0-3.5°C higher. The difference between the forecast and historic distributions of precipitation is smaller as shown in Figure 6-6 the difference between the forecast distribution and the historic distribution of precipitation is approximately 40 mm to 80 mm.

In creating the histogram figures all of the future projections are used. The projected and historic distributions represent normal probability curves mathematically fitted to the forecast and historic data sets. For display purposes these distributions have been exaggerated vertically to facilitate comparison with the histogram bars.

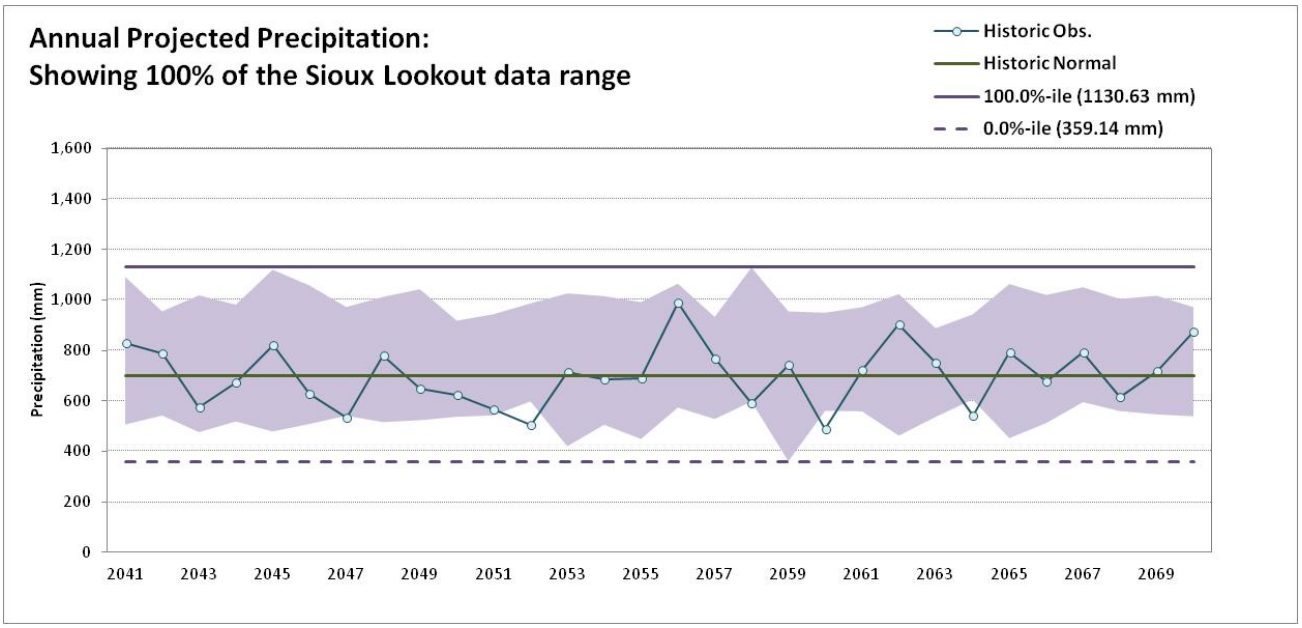

Figure 6-4: Annual Projected Precipitation for Sioux Lookout for the 2050s.

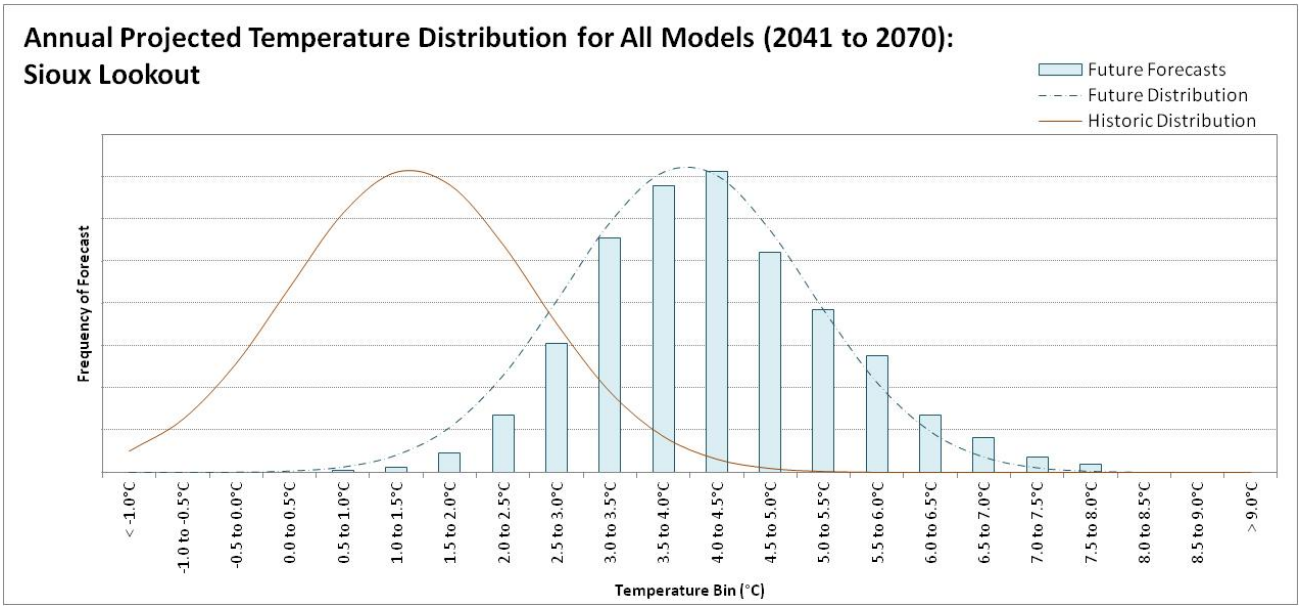

Figure 6-5: Annual Projected Temperature Distribution All GCM's for Sioux Lookout for the 2050s

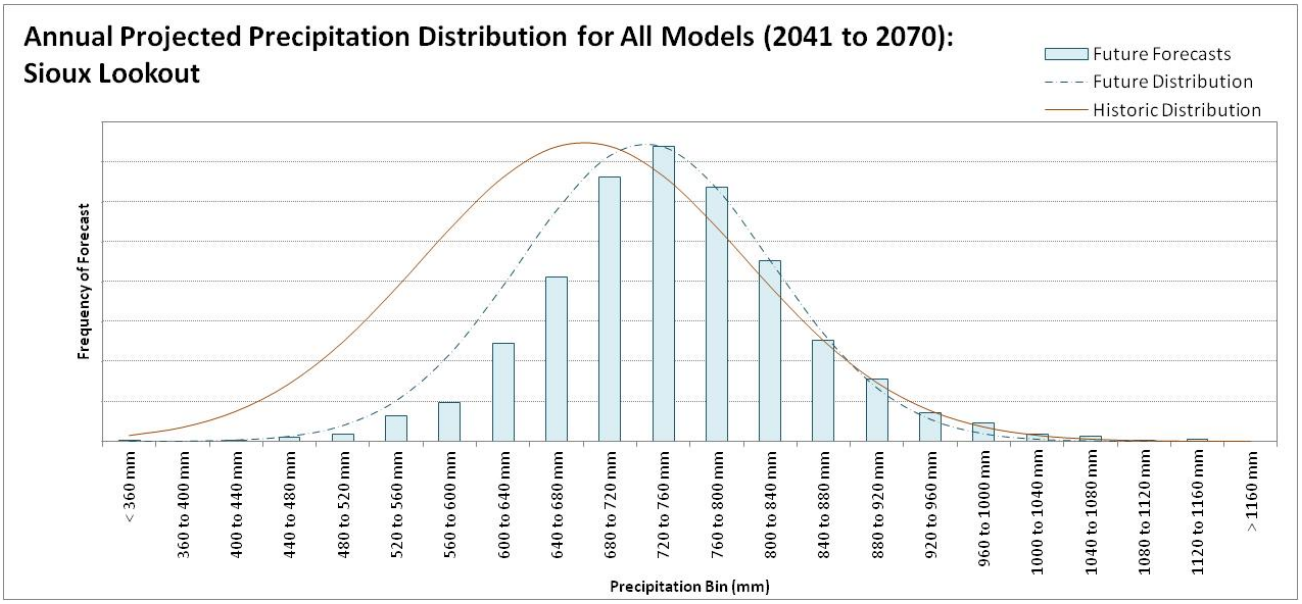

Figure 6-6: Annual Projected Precipitation Distribution All GCM's for Sioux Lookout for the 2050s

6.4 Summary of Climate Trends

In general, the climate in the RSA is projected to be warmer when compared to all climate models analyzed and observed historic values for the 2050s horizons. Precipitation shows a smaller increase than temperature and the agreement in projections among the climate models analyzed is dependent on season. For the two climate parameters (temperature and precipitation), the size of the projected deviation depends on whether the suite of model projections are being analyzed annually or seasonally. In general, the fall and winter show the largest projected increases in temperature, while the spring and winter show the largest increases in precipitation. The average projected climate trend deviations from the observed historic values are provided in Table 6-8 below. The deviations are calculated as the shift in the peak of the normal distribution from the historic dataset to the future forecasts in the histograms for the given periods of interest.

Table 6-8: Summary of Average Projected Climate Trend Deviations from Observed Historic Values

Station/Period			Temperature [°C]	Precipitation [mm (equiv.)]
Sioux Lookout	2050s	Annual	+ 2.5 to 3.0	+ 30 to 40
		Spring	+ 2.0 to 2.5	+ 15 to 20
		Summer	+ 2.0 to 2.5	+ 5 to 10
		Fall	+ 2.5 to 3.0	+ 10 to 20
		Winter	+ 2.5 to 3.0	+ 15 to 20

6.4.1 Results of the Climate Change Assessment

Climate change may result in an environment that is different from the current environment as less severe winters, changing precipitation patterns or other considerations may affect future operations and affect the operation of infrastructure associated with the Project. A qualitative assessment of how a changing climate may affect Project aspects has been completed. Table 6-9 presents a climate risk matrix for the Project for the 2050s based on the climate trends described above.

This table identifies those climate change risk factors that may impact the Project, those which are unlikely to have an impact on the Project and those for which the potential impact on the Project is unknown.

Table 6-9: Climate Risk Matrix

Climate Factor	Trend	Justification
Frequency of Drought	Qualitative	
Freeze-Thaw Cycles	Increasing	Slight increase based on increasing winter precipitation and average temperatures
High Humidity Periods	Increasing	Slight increase based on increasing precipitation from analysis of all models, and increase in temperatures
Frequency of Extreme Temperatures	Unknown	Possible increase in extreme temperatures but strength of trend is unknown
Frequency of Rainfall	Unknown	Trend is unclear due to unknown distribution of rain events in future projections
Heavy Rain	Increasing	Slight increase based on higher rainfall volume in the summer season

Table 6-9: Climate Risk Matrix (Continued)

Climate Factor	Trend	Justification
Total Rainfall	Increasing	Increase of ~50 mm annually above historic baseline
Freezing Rain	Increasing	Slight increase in temperature will create a vertical profile that is conducive to freezing rain events
Rain on Snow Events	Increasing	Slight increase in temperature will create a vertical profile that is conducive to rain or snow events
Flash Freeze Event (Rain/Freeze-Thaw)	Qualitative	Further assessment of trend is required due to unknown distribution of rain events in future projections
Snow Accumulation	Qualitative	Further assessment of trend is required due to unknown distribution of precipitation events in future projections
Snowmelt	Qualitative	Further assessment of trend is required due to unknown distribution of precipitation events in future projections
Sunny days	Qualitative	Further assessment of trend is required due to lack of information on future dynamics (cloud cover)
Extreme Heat	Increasing	Slight increase based on increase in average summer temperatures
Extreme Cold	Decreasing	Slight decrease based on increase in average winter temperatures
Cooling Degree Days	Increasing	Slight increase based on increase in average summer temperatures
Heating Degree Days	Decreasing	Slight decrease based on increase in average winter temperatures
Average Temperature	Increasing	Analysis of all models indicates and average increase of ~3°C above historic baseline

The Project does not rely on an ice road or other highly weather dependent infrastructure for its operations, has a relatively short operational life (11 years) and therefore it was concluded that the effects of a potentially changing climate on the Project are not significant.

6.5 Effects of the Project on Climate Change

The Project may also contribute to potential changes in climate (e.g., through changes in the levels of GHG emissions emitted to the atmosphere due to the Project). The assessment will quantify the direct GHG emissions as a result of the Project and put them into context on a provincial, national and international basis.

6.5.1 Direct GHG Emissions

The Project will directly emit GHGs from combustion sources related to production, heating and transportation. A detailed assessment of the GHG emissions is provided in Appendix 6.III.

6.5.2 Indirect GHG Emissions

Indirect emissions are not included in this assessment. A discussion of the indirect sources of GHG emissions is provided in Appendix 6.III.

6.5.3 Comparison of Project GHG Emissions to Canadian Emissions

For comparison purposes the annual GHG emissions in CO_2e for Ontario, Canada and globally are provided in Table 6-10. Data for Ontario's and Canada's GHG is provided by Environment Canada (Environment Canada 2012).

Table 6-10: Comparison of Project GHG Emissions to Canadian Emissions

Source	Annual GHG Emissions (kt CO_2e/yr)	Project Total as a Relative Percentage
Direct Project Emissions	233.532	100%
Indirect Emissions	—	
Project Total	233.532	
Ontario (2010)	171300	0.13633%
Canada (2010)	692000	0.03375%

Notes:
— = Not quantitatively assessed but will not be significant to overall project emissions.

6.5.4 Comparison of Project GHG Emissions to Global Emissions

A review of literature from the IPCC confirms that the majority of scientists feel that there is compelling evidence to link observed and forecast changes in climate to the release of anthropogenic GHG emissions. However, the FPTCCCEA 2003 indicates in its guidance document for practitioners that "…unlike most project-related environmental effects, the contribution of an individual project to climate change cannot be measured."

To illustrate this, the GHG emissions associated with the Project are compared to the 2000 global GHG emissions associated with the forecast changes in climate expected over the project life. Table 6-11 compares the global and Project-related emissions, and can be seen to reasonably support the conclusion that the GHG emissions from the Project will not have a measurable effect on climate. Therefore, the effect of the Project on climate can be considered to be negligible.

Table 6-11: Comparison of Project GHG Emissions to Changes used in the IPCC models

Parameter	SRES Scenario A1B	SRES Scenario A2	SRES Scenario B1	Project
Change in GHG emissions relative to the 2000 global baseline[(a)]	+59.7%	+109.3%	+18.6%	0.00138%
Change in annual temperature for the 2041 to 2070 horizon[(b)]	+2.5 – 3.0 °C			Cannot be measured [c]
Change in annual precipitation for the 2041 to 2070 horizon[(b)]	+30 – 40 mm			Cannot be measured [d]

Notes:

(a) The global baseline emissions for 2000 were listed by the IPCC as 16,927 MT CO_2e (Nakicenovic, N. and R. Swart 2000).

(b) Changes were calculated as the difference between the baseline and scenario forecasts for the 2041 to 2070 time horizon. Changes are shown for the ensemble results rather than per scenario, as discussed in Section 6.2.

(c) On the basis of proportionality, the GHG emissions from the Project could represent an increase of less than 0.000041°C in the annual temperature. Such a change would not be measurable.

(d) On the basis of proportionality, the GHG emissions from the Project could represent an increase of less than 0.00055 mm in the annual precipitation. Such a change would not be measurable.

7.0 MONITORING PROGRAM

The monitoring and follow-up program is designed to be appropriate to the scale of the Project and the effects identified through the environmental assessment process. The monitoring program are intended to confirm the methods used to estimate the emissions and the effectiveness of mitigation measures assumed in the Project, and in doing so, assess if alternative mitigation strategies are required to minimize emissions from the Project and their impacts. Four specific activities are recommended to verify the potential impacts of the Project:

- Verification of silt loadings on the roads.
- Source testing to confirm process emissions.
- Ambient air monitoring for indicator compounds that are greater than 51% of the MOE POI Limits and not included in the source testing program.
- Vibration monitoring.

It is, therefore, recommended that the following monitoring programs be implemented to measure changes in the atmospheric environment during the operations phase.

Table 7-1: Proposed Monitoring Program

Parameter	Method	Frequency
Fugitive Dust	Periodic sampling road silt loadings to improve accuracy of emission estimations	Annually during summer months until the a consistent silt loading is established
Process Chemicals	Source testing to confirm the emission rates used in the dispersion modelling assessment	One time source testing campaign
Ambient Air Quality	Installation of periodic TSP/PM_{10}/$PM_{2.5}$ sampling units	Samples should be collected on the 6 day National Air Pollutant Surveillance (NAPS) Cycle
Ground and air vibration level monitoring from blasting operations to develop site-specific vibration attenuation.	Establishing a series of seismographs at varying distances from blasts and keeping a detailed record of the loading parameters.	Monitoring campaign; from a minimum 12 blasts at 6 sites during each blast, set up at distances varying from about 300 m to 2000 m from the blast.
Blast ground and air vibrations at nearest receptor locations.	Establishing instrumentation at nearest receptor locations.	Instrumentation to record ground and air vibration intensities on a continuous basis. Data would be compared to known blast times to assess peak ground and air vibration intensities produced.
Blast-induced water overpressure level at nearest active fishery.	Establishing instrumentation at nearest active fishery location. This will include a hydrophone and data acquisition unit.	Instrumentation to record water overpressure intensities during the initial blasts. Based on the data recorded, a decision will be made on subsequent monitoring. Periodic monitoring should be conducted as the blasts approach the nearest fishery.

8.0 SUMMARY OF FINDINGS

Air dispersion models were used to estimate the ambient ground level concentrations and deposition rates for air emissions released from the Project during the operations phase. Air modelling guidance for the province of Ontario was followed where appropriate; therefore, the dispersion modelling approach for this assessment is in accordance with the MOE *publication Guideline A-11: Air Dispersion Modelling Guideline for Ontario, Version 2.0*, dated March 2009 (ADMGO) PIBS 5165e02. The assessment demonstrates that the Project can operate in compliance with s.20 of O. Reg. 419/05 for the Operations phase in the peak production year.

Outdoor noise propagation models were used to estimate the A-weighted sound pressure levels at off-site points of reception due to the Project during the operations phase for stationary sources of sound as defined by the MOE. The assessment of noise was carried out in accordance with MOE noise guidelines, namely, publications NPC 233 and NPC 232. The assessment demonstrates that during the operations phase, the Project can operate in compliance with noise level limits specified in NPC 232 in the peak production year.

Air vibrations in dBL (peak air pressure level) and ground vibrations in mm/s (peak particle velocity) due to blasting operations were estimated using predictive models based on blast design parameters in accordance with MOE publication NPC 119. The assessment demonstrates that during the operations phase, the Project can operate in compliance with MOE guidelines as specified in NPC 119 in the peak production year.

Additional data on air concentrations, particulate and metal deposition, noise levels and vibration from the Mine and access road (Hardtack/Sawbill) are addressed in the Human Health and Ecological Risk Assessment TSD and in the EIS/EA Report.

In addition to the assessment of the VECs identified above, the Atmospheric TSD also addressed the potential of a changing climate. Specifically, the TSD has assessed climate change through the following considerations:

- How will potential changes in climate affect the infrastructure associated with the Project?
- How will the operation of the Project affect climate change (e.g., the Project's contribution to climate through the emission of greenhouse gases)?

The Project does not rely on an ice road or other highly weather dependent infrastructure for its operations, has a relatively short operational life (11 years) and therefore it was concluded that the effects of a potentially changing climate on the Project are not significant.

The predicted greenhouse gas emissions from this Project are insignificant in comparison to the global emissions and therefore, the Project will have virtually no impact on current estimates of future global climate change.

10.0 GLOSSARY OF TERMS

Table 10-1: Glossary of Terms

Term	Definition
Ambient	Surrounding natural conditions or environment at a given place and time. Environmental or surrounding conditions. (US Department of the Interior 2012)
Anthropegenic	Generated by humans. Used to indicate soil conditions, disturbances, or stresses that are created by people. (USDA 2012)
Attenuation	Decrease in amplitude of the seismic waves with distance due to geometric spreading, energy absorption and scattering. (US Department of the Interior 2012)
Precipitation	As used in hydrology, precipitation is the discharge of water, in a liquid or solid state out of the atmosphere, generally onto a land or water surface. It is the common process by which atmospheric water becomes surface, or subsurface, water. The term “precipitation” is also commonly used to designate the quantity of water that is precipitated. Precipitation includes rainfall, snow, hail and sleet and is therefore a more general term than rainfall. (NOAA 2012)
Spawning Beds	Places in which eggs of aquatic animals lodge or are placed during or after fertilization. (US Department of the Interior 2012)
Substrate	Surface on which a plant or animal grows or is attached. The base on which an organism lives; a substance acted upon. (US Department of the Interior 2012)

1.0 INTRODUCTION

This Appendix documents the methods, data and assumptions that were used to develop the meteorological data set that was used to in the dispersion modelling assessment of the Project. The dispersion meteorological data set was developed using the following process:

- an AERMOD-ready data for air dispersion modelling data set was obtained from the Ontario Ministry of Environment (MOE) for the region in which the Project is located;
- the MOE data set was compared to the data from the on-site meteorological data station to demonstrate that this data set is appropriate for use at the Project location; and
- hourly precipitation and relative humidity were added to the data set to allow the assessment of dust deposition, providing additional information to other technical disciplines for their assessments.

These steps are detailed in the following sections.

2.0 INFORMATION PROVIDED BY THE MOE

The AERMOD-ready data for air dispersion modelling was prepared by the MOE specifically for this project. This dispersion meteorology data set, incorporating data from multiple stations in the Project area, was used due to the lack of a long-term meteorological record at the Hammond Reef station and the need for weather parameters that are not usually observed at automated weather stations such as ceiling height and cloud cover amounts. For the purposes of this assessment, the onsite data set from Hammond Reef was used to confirm that the MOE data set is representative of climatic conditions at the project site, providing assurance that the dispersion modelling will reflect the environment in the vicinity of the Project. The five year (2005-2009) dispersion meteorology data set, prepared by Ontario Ministry of Environment for the study area, consists of surface and upper air meteorological variables.

In the MOE data set, the surface meteorological data was assembled using data from the Atikokan automatic station (Climate ID: 6020LPQ) combined with data from the Upsala automatic station (Climate ID: 6049095) and from the Dryden Airport station (Climate ID: 6032120). The Upsala station data were used to replace missing wind records at Atikokan station while other missing surface meteorological variables were replaced using Dryden Airport records. The Upsala station is located approximately 85 km west of Atikokan, while the Dryden Airport station is approximately 140 km northwest of Atikokan. The upper air meteorological variables were assembled using upper air soundings from International Falls, located approximately 150 km south of Atikokan, Ontario.

2.1 Winds Analysis

The frequency of wind direction in the MOE data set is representative of much of Ontario, with winds predominantly from the west (west-southwest through west-northwest) with seasonal variability. In winter, there are fewer high-speed winds, and winds are generally from the west-southwest through west-northwest. In spring, wind speeds increase and there is a fairly even distribution of easterly and westerly winds. Summer winds are predominantly from the southwest and west-southwest while in autumn winds are changeable, veering from south through west-northwest.

No table in the data set is a large percentage of calm hours, 14.5% of the total hours, which are defined as hours having a wind speed less than 3.6 km/hr or 1 m/s. The annual average wind speed in the data set was 7.8 km/hr. This appears to be representative of the region as seen in the long-term and short-term records presented in the previous section. Seasonally, winds were found to be similar to the annual average in summer, fall and winter. Spring was found to have a higher average wind speed than the annual average, approximately 8.7 km/hr. Figure 1, below, illustrates the annual and seasonal surface wind patterns in the dispersion meteorology from the MOE data set. Figure 2, below, shows the diurnal (daytime vs. nighttime) wind roses for the same data. Nighttime winds are noticeably lower in speed than those in the day, averaging X km/hr in the night compared to Y km/hr in the day. This is expected behaviour.

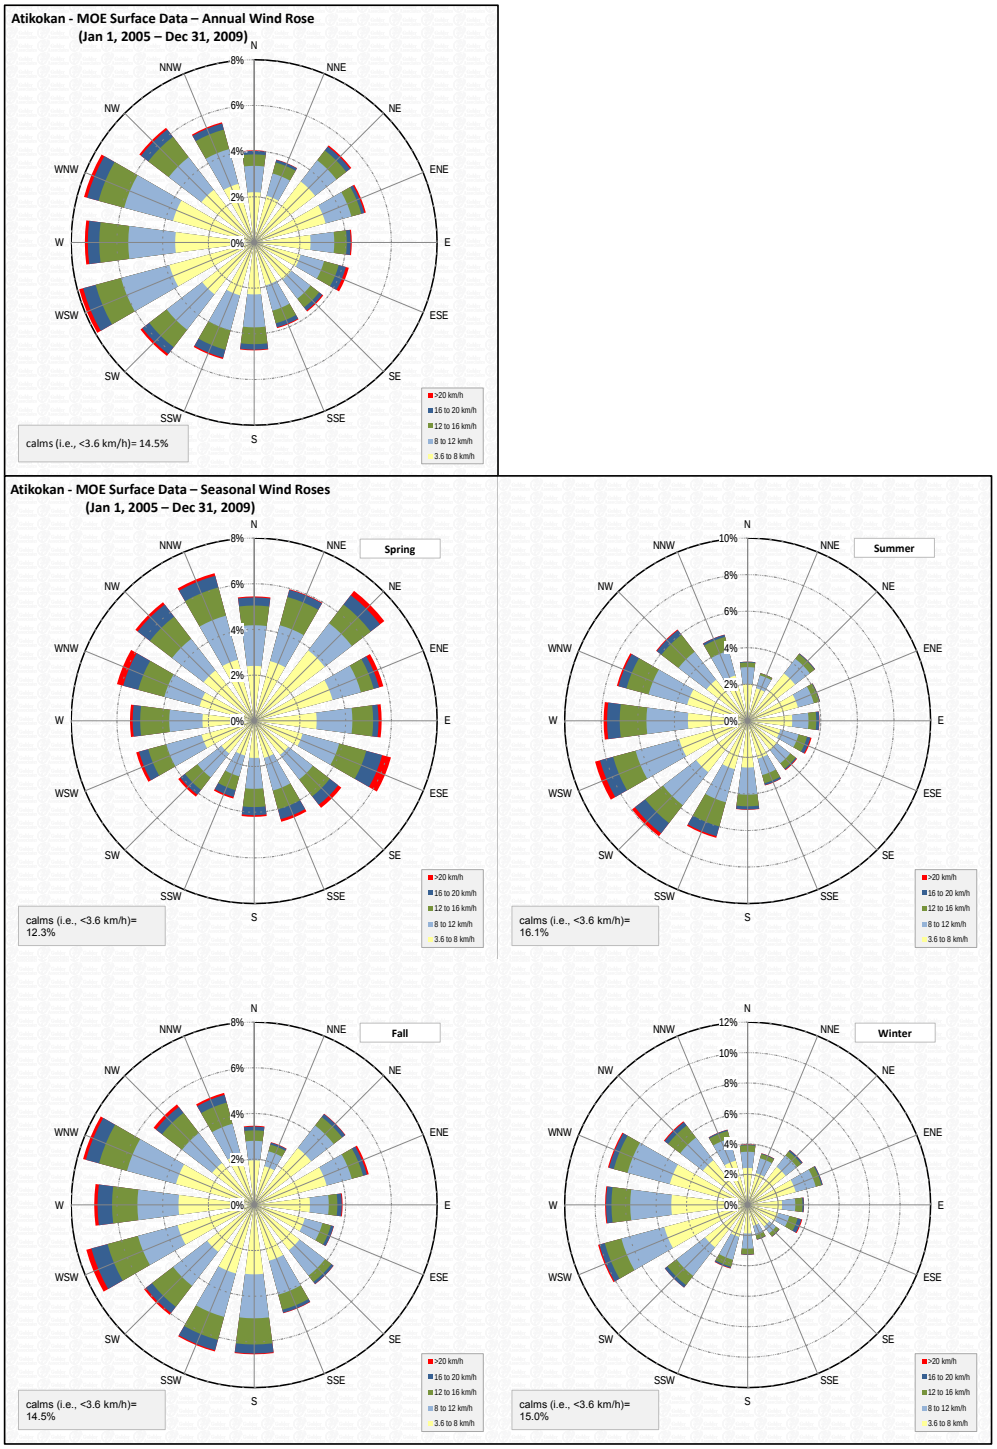

Figure 1: Annual and Seasonal Wind-roses for the MOE Dispersion Meteorology Data

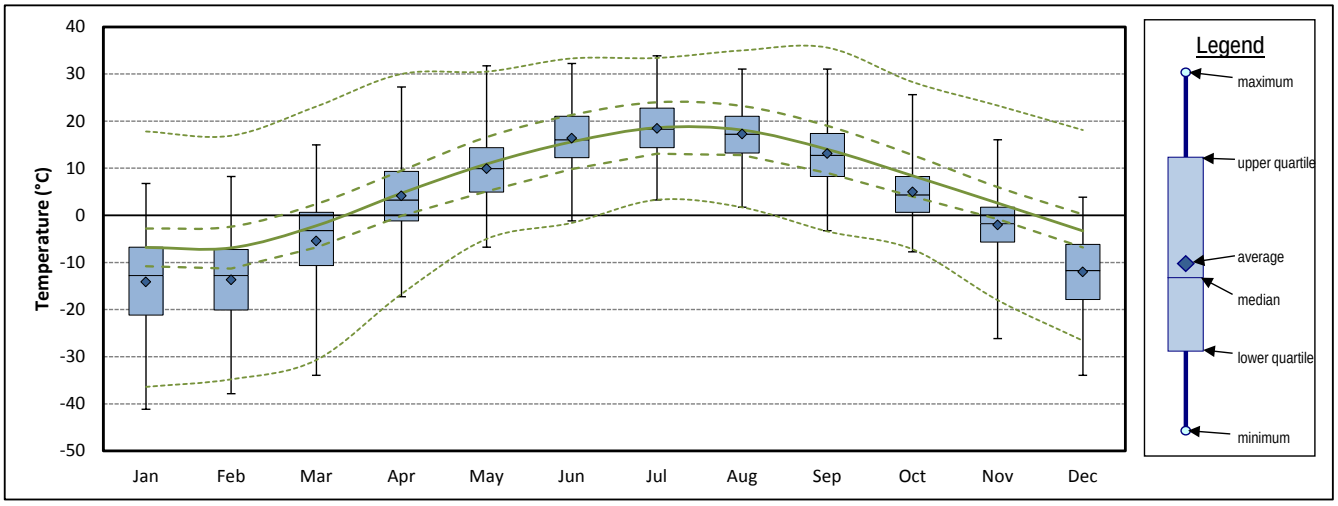

Figure 2: Monthly Temperature Distribution

2.2 Temperature Analysis

From the MOE data set, the average temperature in the winter season is approximately -13°C, while the extreme minimum temperature in the area may reach as low as -40°C. Summer temperatures in the study area are fairly mild, with an average of approximately 17°C, while the extreme maximum temperature may reach slightly above 30°C. Figure 2 illustrates the daily average temperatures for each month in the year.

Table 1 provides a more detailed breakdown of the monthly temperature distribution in the MOE meteorological data set. From this table it can be seen that temperatures above 30°C occur only occasionally, in June, July and August, while temperatures below -10°C are common in December, January, February and March.

Table 1: Monthly Temperature Distribution

MOE Surface Data Parameters	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
Daily Average (°C)	-14.1	-13.7	-5.5	4.1	9.9	16.4	18.4	17.2	13.1	5.0	-2.0	-12.0	3.1
Standard Deviation	9.5	8.9	8.8	7.3	6.7	5.9	5.7	5.6	8.4	5.5	8.5	7.6	13.8
Daily Maximum (°C)	-8.8	-7.5	0.8	10.3	15.6	21.8	24.2	23.2	19.0	9.2	1.5	-8.0	8.5
Daily Minimum (°C)	-21.0	-21.6	-13.2	-2.9	3.4	9.6	11.7	10.1	6.7	0.4	-6.2	-17.5	-3.3
Extreme Maximum (°C)	6.7	8.2	14.9	27.2	31.7	32.2	33.8	31.0	31.0	25.6	16.0	3.8	33.8
Extreme Minimum (°C)	-41.2	-37.9	-34.0	-17.3	-6.8	-1.2	3.2	1.7	-3.3	-7.8	-26.2	-34.0	-41.2
Days with Maximum Temperatures Above 30°C	0	0	0	0	0	1	3	1	0	0	0	0	5
Days with Minimum Temperatures Below -10°C	24	25	19	3	0	0	0	0	0	0	8	25	103

Figure 3 presents a temperature comparison between MOE dispersion meteorology and Hammond Reef station. Temperature distribution in MOE dataset is very similar to the observed records at Hammond Reef station, demonstrating the suitability of this dataset for dispersion modelling in the Project area.

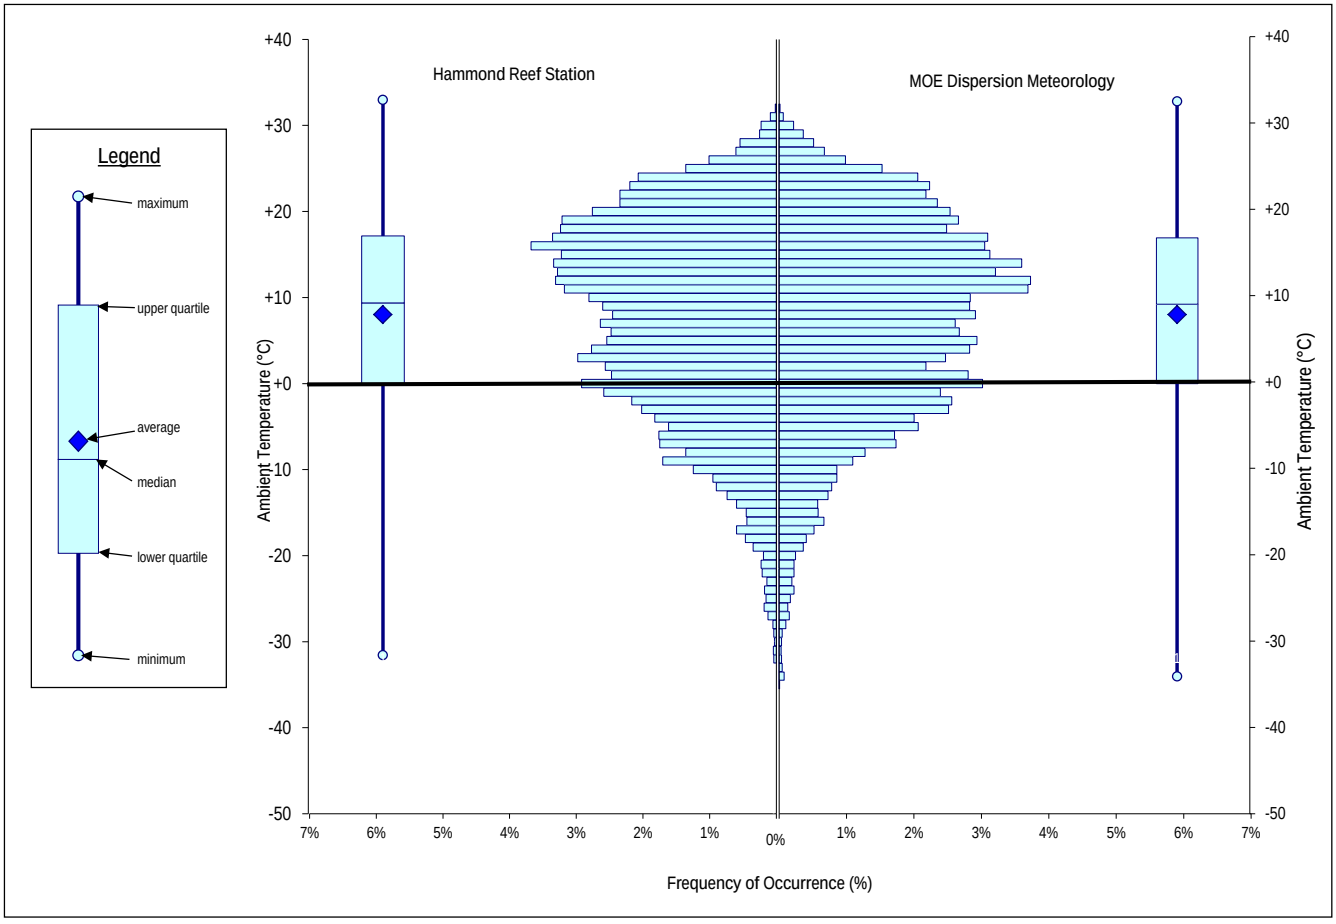

Figure 3: Temperature Comparison between MOE Dispersion Meteorology and Hammond Reef Station

2.3 Mixing Height Summary

Mixing height describes the height above ground of the atmospheric layer in which turbulent flow occurs because of the influence of surface characteristics such as albedo, bowen ratio and surface roughness. Mixing height can be described as "convective", resulting from solar heating (daylight hours only); or mechanical, resulting from wind flow over terrain. Both convective and mechanical mixing heights, by hour of day, for each season, and as an annual summary from MOE dispersion meteorology dataset, are presented below. The convective mixing height is a result of upward movement of air mass driven by temperature lapse rate as a function of surface characteristics. Convective mixing heights build during the day as the sun rises and collapse

after sunset when temperatures drop. Mechanical mixing height is mostly driven by winds over the Earth's surface and the surface roughness. Mixing height greatly influences dispersion by providing a region of turbulent flow through which emissions can mix and disperse, and through the daily growth/collapse cycle of the convective mixing layer, all of which greatly affect ground concentrations of emissions.

Figure 4 presents the annual and seasonal summary of mixing height by hour of day and Figure 5 compares day- and night-time mixing heights, both convective and mechanical. Mechanical mixing heights are significantly lower at night, compared to those in the day, due to lower wind speeds at night. Convective mixing heights are effectively zero from sunset until just after sunrise.

The mixing heights from the MOE data set show the expected seasonal variability. For example, sunrise is later in winter than in summer, and the growth of the convective mixing layer reflects this with the summer mixing layer beginning to build at 7 AM while the winter mixing layer does not being to build until 10 AM. The mixing layers found in the MOE data reflect those expected in a region with lower wind speeds and relatively flat terrain (both of which result in reduced turbulence). Overall, the mixing layer data appear representative of what would be expected in the Project area.

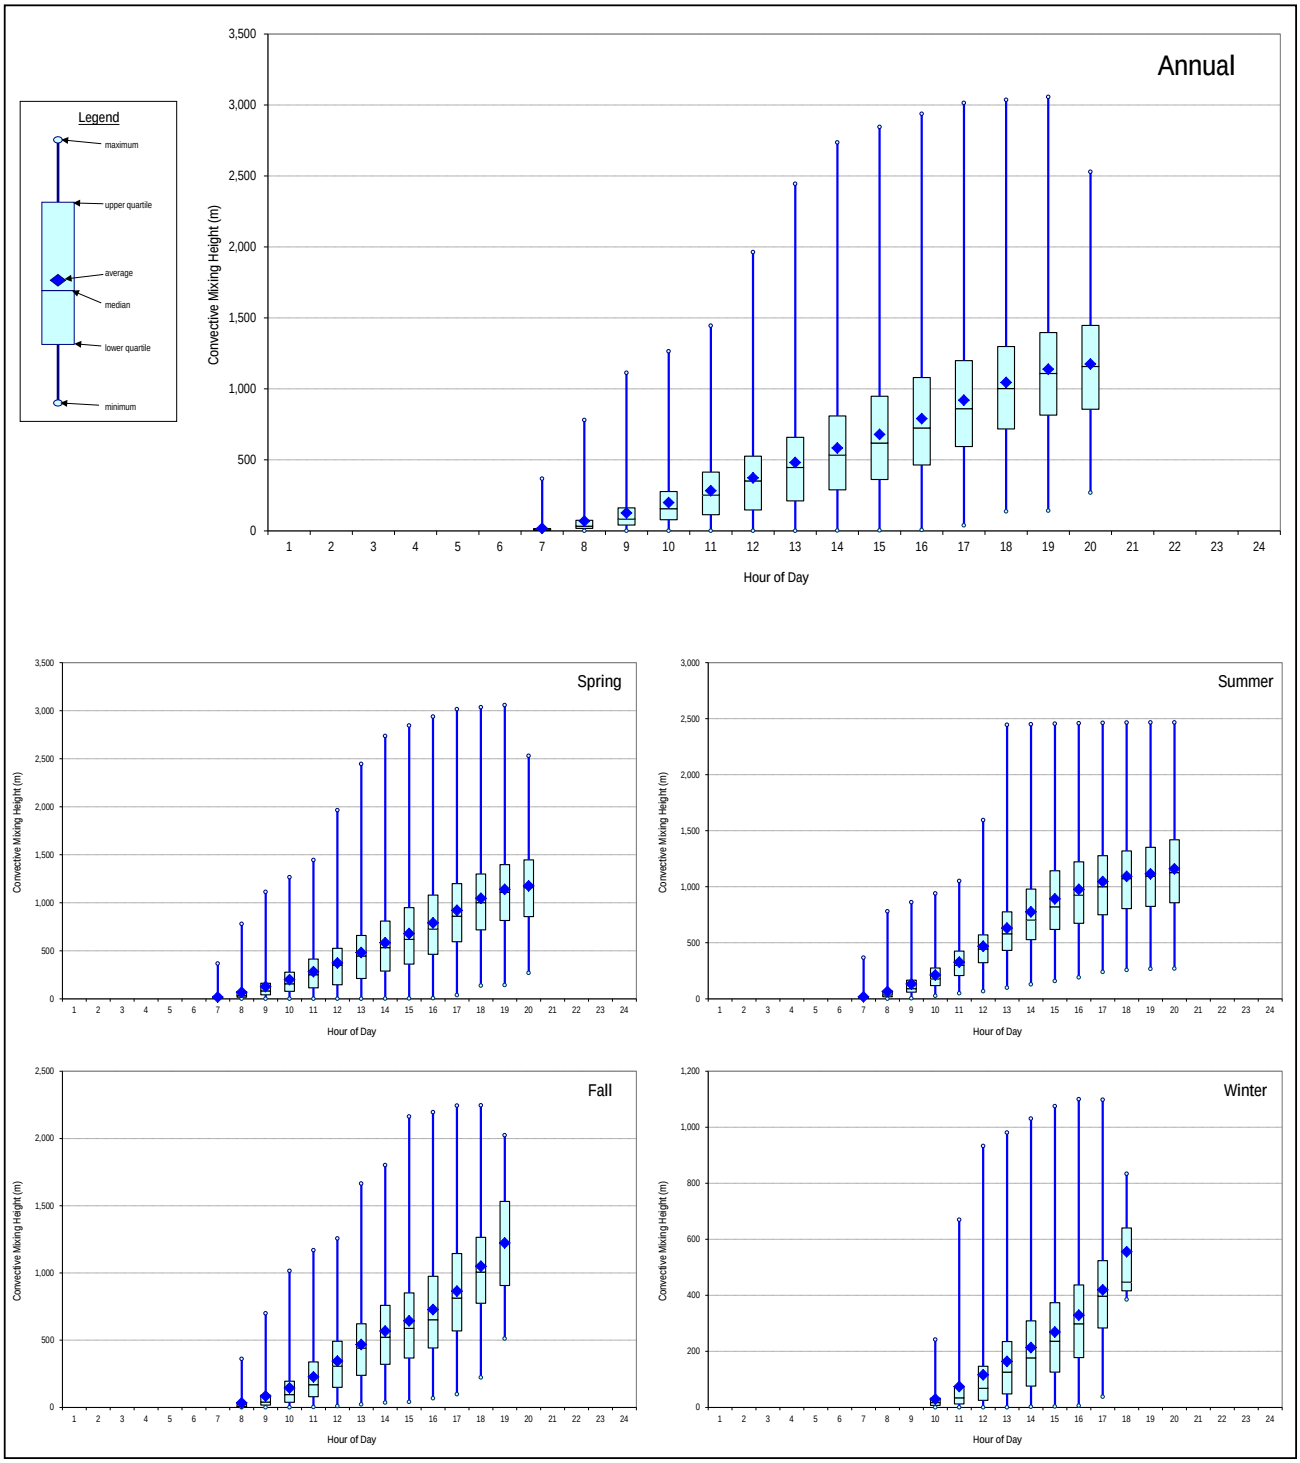

Figure 4: Annual and Seasonal Mixing Height Summary

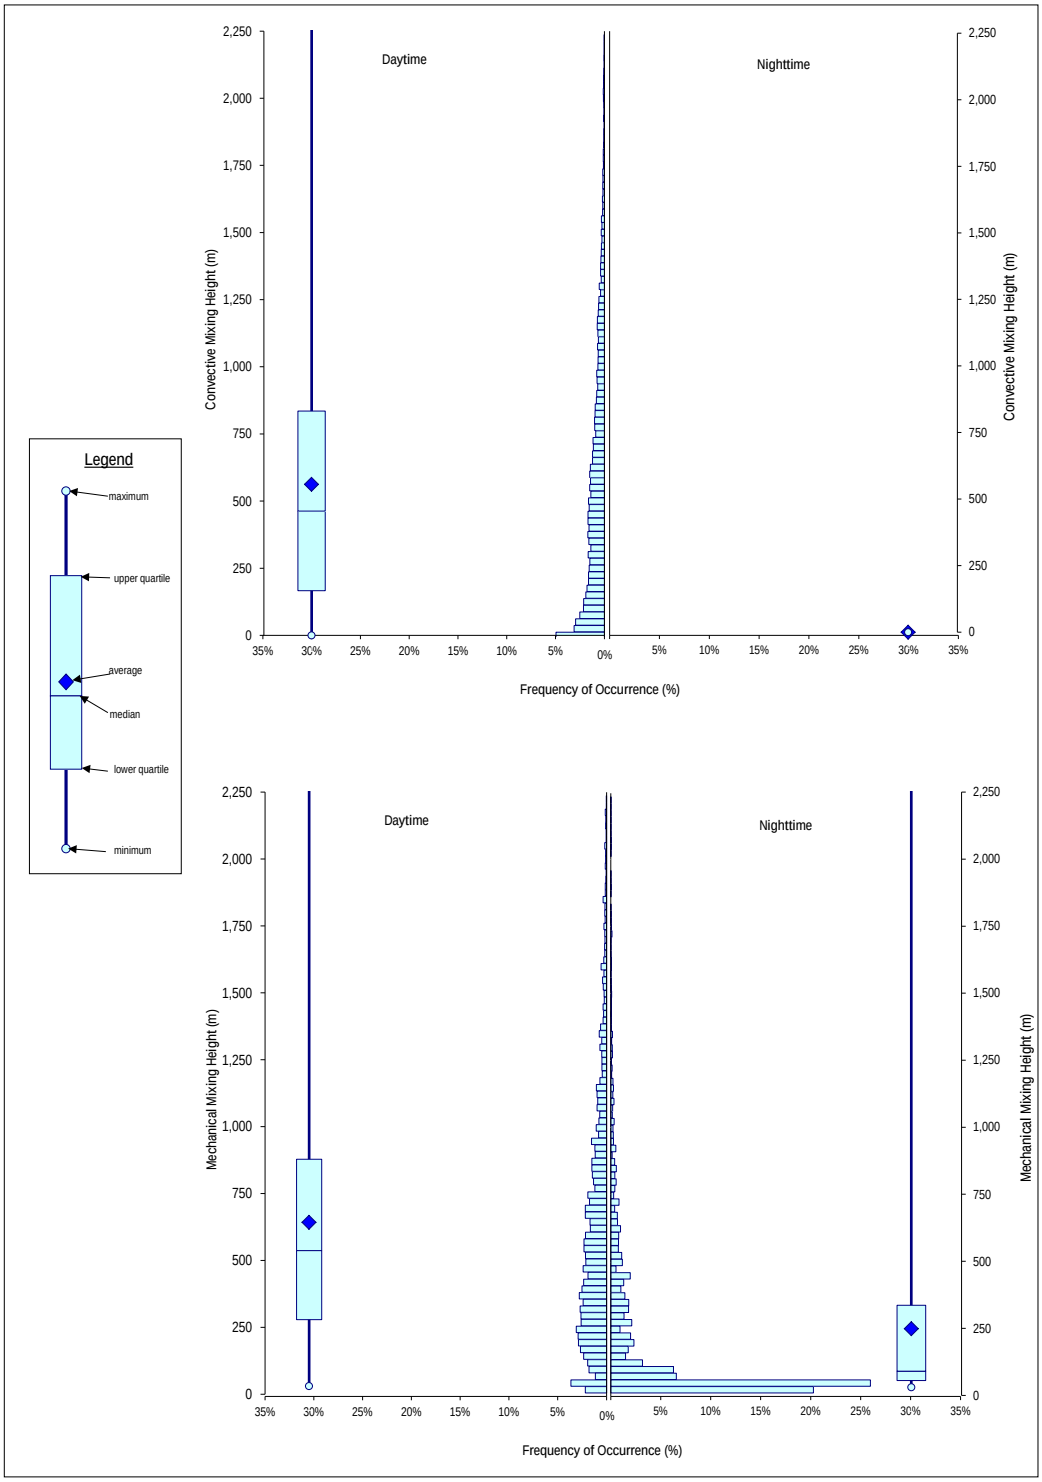

Figure 5: Convective and Mechanical Mixing Height Summary

2.4 Added Variables Summary

In order to model deposition, additional weather variables such as relative humidity, hourly precipitation rate and precipitation code were added into the surface meteorological data. Atikokan station precipitation and relative humidity records were used to infill the additional weather parameters. The additional parameters from Atikokan station were reviewed by Golder and any out-of-range values were flagged as missing. Table 2 lists the hourly precipitation rates that were considered out of range and were removed from the surface data. Additionally, any hourly precipitation rate above 10 mm/hr was checked against ambient temperature, relative humidity and dew point temperature for that hour and a determination was made as to whether such precipitation was possible given the atmospheric condition for that particular hour.

Table 2: Out of range Values Flagged as "Missing"

STATION ID	YEAR	MONTH	DATE	JULIAN DAY	TIME	Precipitation Amount (Minutes 01-60) [mm]
6020LPQ	2007	9	24	267	17	269.9
6020LPQ	2008	11	11	316	9	50.1
6020LPQ	2008	11	11	316	11	190.2
6020LPQ	2009	5	20	140	11	108.3
6020LPQ	2009	6	22	173	8	213.9
6020LPQ	2009	8	8	220	17	377.5

The precipitation code flags data as liquid precipitation when the temperature is equal to or above 0°C and as solid precipitation when the temperature is below 0°C.

Annual total precipitation varies slightly from year to year, however comparing year-to-year monthly total precipitation shows greater variability. For example, maximum monthly total precipitation in 2007 happened in fall season while most years show summer month's produces greater total precipitation in the study area. Table 3 illustrates monthly total precipitation and its yearly total.

Table 3: Precipitation Summary

Month	2005 (mm)	2006 (mm)	2007 (mm)	2008 (mm)	2009 (mm)
Jan	50.5	23.3	9.7	7.6	19.7
Feb	17.9	11.8	8.1	6.8	20.2
Mar	21.4	63.8	28.3	20.1	64.1
Apr	70.1	28.8	45.1	88.2	76.8
May	140.8	52.4	72.2	122.5	87.6
Jun	93.1	46.2	121	110.9	73.3
Jul	137.9	147.9	86.1	68.8	103.9
Aug	55.3	19.5	20.5	36.1	117.1
Sep	69.3	36	177.9	114	44.5
Oct	93.7	30.4	66.3	53.6	49.2
Nov	94.8	23.4	22.2	61.5	1
Dec	27.2	43.3	33.8	26.3	20.6
Yearly Total	872	526.8	691.2	716.4	678

No changes were performed in the relative humidity records unless if there is explicit flag as missing data in the original Environment Canada data.

3.0 HAMMOND REEF ONSITE WEATHER STATION

In order to provide site-specific data for validation of the MOE dispersion modelling data set, a meteorological station was erected at Hammond Reef, at the Project Site. The station has been collecting continuous weather data since March 2011. The current section will present the onsite data collected to date and provide a comparison to the MOE data provided for this project. This comparison will help determine whether the data set provided by the MOE is representative of the project site and can be used for the dispersion modelling assessment.

3.1 Winds Comparison

As discussed previously, Figure 1 provides the annual and seasonal windroses for the MOE dispersion meteorology data. These data show predominant westerly winds through much of the year, with a stronger easterly component in spring. Figure 6 shows wind-rose diagrams for the annual and seasonal winds at Hammond Reef Project Site. As in the MOE data set, at the Hammond Reef station, westerly winds predominate generally throughout the year. A stronger easterly component in the winds does appear in the spring, in both the MOE and the Hammond Reef data. Generally, comparing the Hammond Reef data to that from the MOE, there is a stronger northerly contribution to overall winds in the Hammond Reef data while winds in the MOE data set are more westerly with a southwestly component. Generally speaking, however, the trends at both locations are similar, with mostly westerly winds in the winter, a stronger easterly contribution to the winds in spring, and a return to predominant west winds in summer. The greatest difference in the two data sets appears in the fall, where the Hammond Reef data show a very strong northwesterly bias while winds in the MOE data set are more west-southwest through west-northwest.

A comparison of average wind speeds shows a similarity across both stations, with an average wind speed of approximately 7 km/hr at Hammond Reef compared to 7.6 km/hr for the MOE data. As in the MOE data set, the Hammond Reef data show a large percentage of calms (hours with winds less than 3.6 km/hr or 1 m/s). The percentage of calms was higher in the Hammond Reef data; however it should be noted that only 20 months of data are available from Hammond Reef at this time, compared to 60 months in the MOE data set.

Overall, comparing the dispersion meteorology wind-roses to those from the Hammond Reef onsite data provides assurance that the modelling data will generally reflect the conditions at the Project Site.

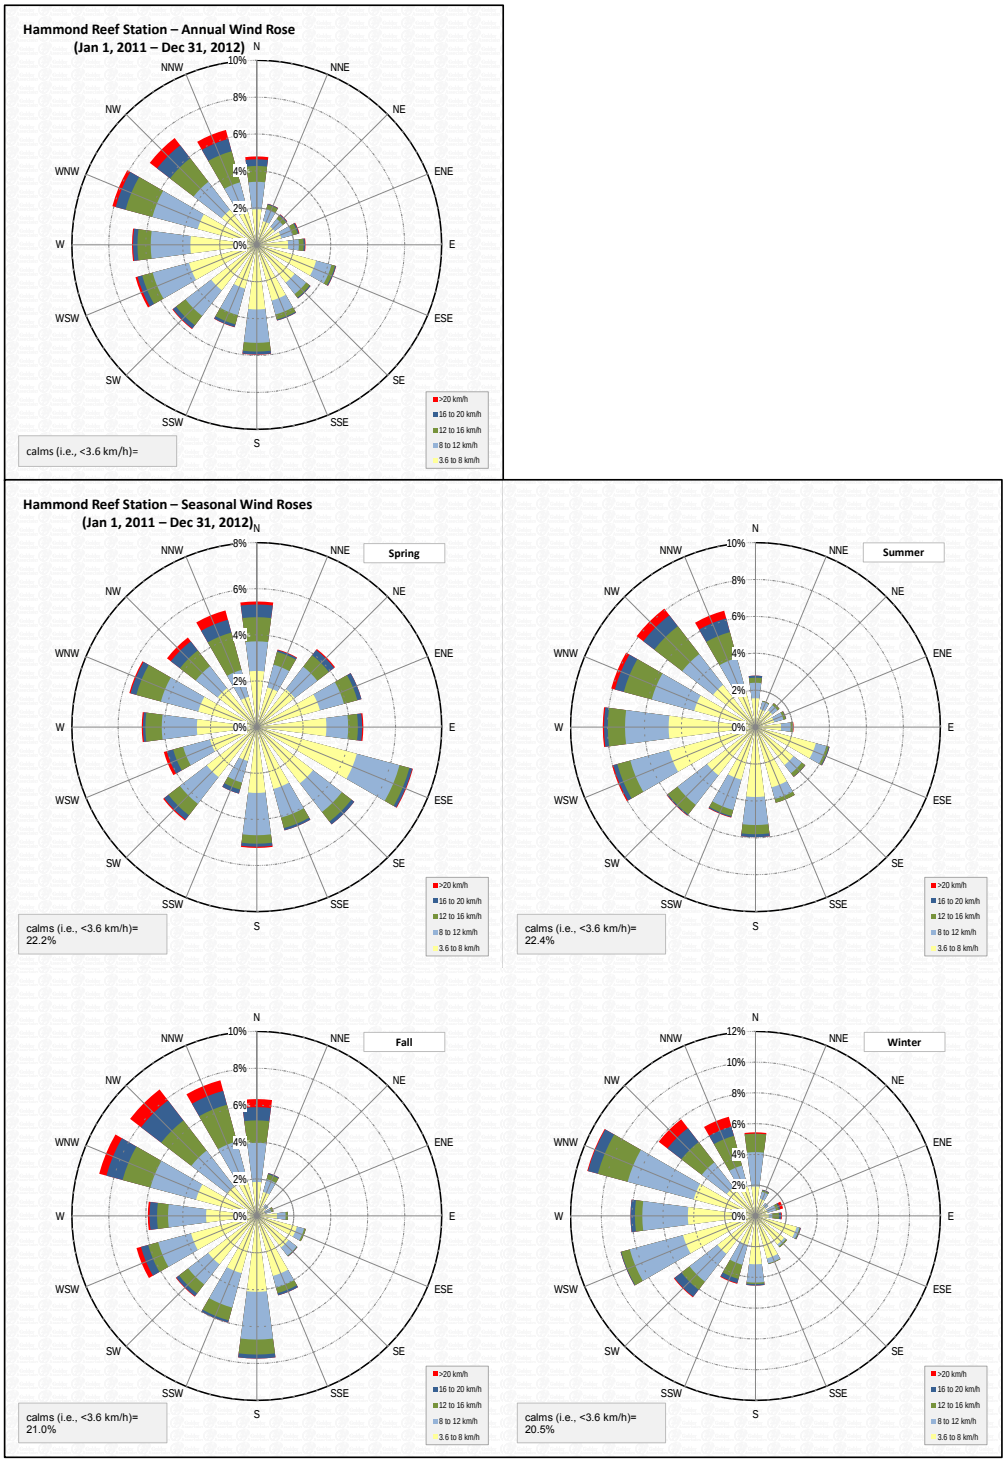

Figure 6: Annual and Seasonal Wind-roses for the Hammond Reef Station

3.2 Temperature Comparison

Temperatures recorded at Hammond Reef station are slightly warmer than those at Atikokan, especially during winter season. In the middle of the winter season, the difference in daily average temperatures can reach approximately 7°C but the difference decreases to less than 3°C as the season progresses into spring and summer. Because the HaAs the onsite station records more data, the differences between the onsite data and measurements at Atikokan are expected to decrease since the current comparison uses less than two years of observed data while the climate normals are derived from a 30-year period. Figure 7 illustrates the comparison of daily average temperatures recorded at the project site and the Atikokan climate station.

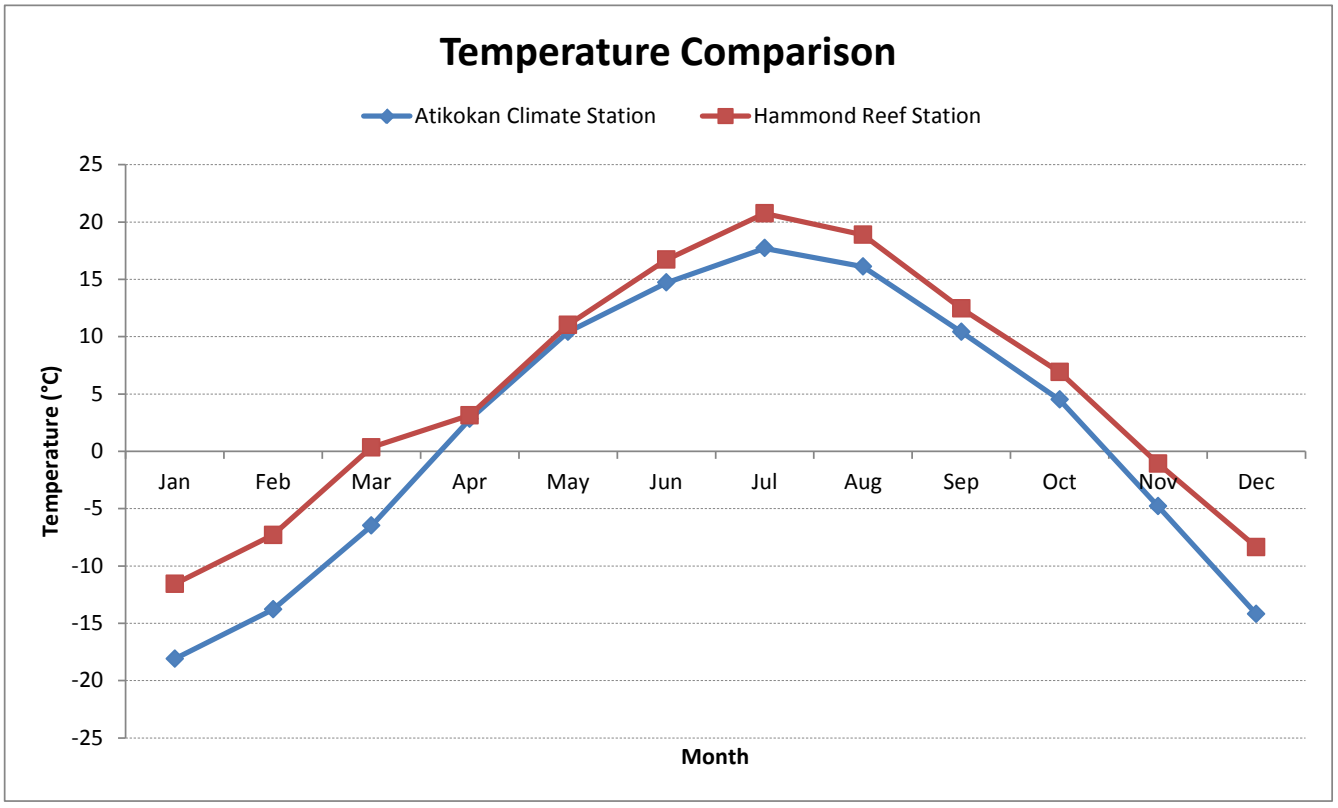

Figure 7: Comparison of Daily Average Temperature at Atikokan Station and Hammond Reef Station.

4.0 SUMMARY

Comparisons between Atikokan climate station and Hammond Reef station show that climatic conditions at the project site can be represented by long term records at Atikokan climate station. However, it is important to note that the normals from Atikokan station are derived from a 30-year period of observed data, while the record from Hammond Reef station covers less than two years. A statistical summary, such as that found over long term records, tend to smooth out year-to-year or month-to-month variations, while a similar summary over a shorter term appears less smooth. Thus, while the differences between the temperatures recorded at the two stations might appear large in Figure 7, the trend or rate of change which was shown to be very similar in that figure provides assurance that the two sets of data correlate reasonably well.

1.0 INTRODUCTION

This appendix documents the methods, input parameters and assumptions that were used to estimate the air emission rates for the Hammond Reef Gold Project (Project) works and activities. These emission rates were then used as inputs for the dispersion modelling that provided estimates of maximum ground-level concentrations resulting from the Project. The emission estimation methods described within follow generally accepted practices for conducting environmental assessments and, where appropriate, guidance in the Ontario Ministry of the Environment (MOE) document "Procedure for Preparing an Emission Summary and Dispersion Modelling Report" Version 3.0 (March 2009) (ESDM Procedure Document).

Emissions were calculated for significant mining, gold processing and supporting activities at the Mine Site. A bounding condition scenario was considered to represent the emissions throughout the Operation Phase of the Project. Sources of emissions for this scenario included:

- Open pit extraction including blasting and material handling.
- Fugitive dust emissions from stockpiling and material handling activities on the surface.
- Fugitive dust emissions from haul routes (unpaved roads).
- Vehicle tailpipe exhaust emissions.
- Emissions from gold refining process.
- Emissions from auxiliary processes including emergency power and comfort heating.

This bounding condition scenario corresponds most closely to years 6-9, when both pits are being mined simultaneously. In years 0-5 only the east pit will be mined at a shallower depth than the bounding condition. In the final years of the project only the west pit will be mined up to the depth assumed in the bounding condition. This approach is considered conservative, with a low likelihood to underestimate the emissions from the Project because it is unlikely that all of these assumptions may be true at any one given time, (i.e., maximum productions rates may not be occurring at the same time as the longest haul truck routes).

Emissions were also calculated for the Access Road (Hardtack/Sawbill) which includes the following sources:

- Fugitive dust emissions from unpaved roads.
- Vehicle tailpipe exhaust emissions.

Some Project activities were considered insignificant and were not assessed. These are discussed in more detail in Section 2.1. The physical parameters and assumptions that were used in the emission rate calculations for each Project component are discussed in Section 3.0 and sample calculations for each activity are provided in Section 4.0.

2.0 ASSESSMENT OF SIGNIFICANT COMPOUNDS AND ACTIVITIES

Emissions were calculated using activity and equipment specifications provided in the Project Description (Chapter 5 of the EIS/EA Report) and based on the Site Layout provided by Osisko Hammond Reef Gold Ltd. (OHRG) dated August 8, 2012 (Figure 1). Internationally accepted emission factors, most notably AP-42 (U.S. EPA 1995) were also used.

Compounds that are discharged from the Project in negligible amounts and/or activities that discharge a compound in a negligible amount were excluded from further analysis. The rationale for these exclusions is provided in Section 2.1. Table 1 provides a summary of the activities for which emissions were calculated in the air quality assessment of the Mine site as well as a summary of the compounds released.

Note:

— emissions not released from this source

In any activity where ore could be a component of the particulate, the particulate emissions were speciated into metals (denoted as Metals in Table 1) using an ore assay that was representative of the ore found at the Project Site. The following table illustrates the ore assay that was used.

Table 2: Osisko Hammond Reef Gold Ltd. Typical Ore Assay

Compound	Concentration in Ore
Aluminum	6.44087%
Antimony	0.00002%
Arsenic	0.00024%
Barium	0.04322%
Beryllium	0.00010%
Bismuth	0.00002%
Cadmium	0.00001%
Calcium	2.38284%
Chromium	0.00363%
Cobalt	0.00090%
Copper	0.00206%
Iron	2.45307%
Lead	0.00205%
Lithium	0.00071%
Magnesium	0.65091%
Manganese	0.04152%
Molybdenum	0.00043%
Nickel	0.00252%
Potassium	2.20338%
Selenium	0.00013%
Silver	0.00005%
Sodium	2.01303%
Strontium	0.01372%
Thallium	0.00003%
Tin	0.00012%
Titanium	0.15043%
Uranium	0.00011%
Vanadium	0.00388%
Yttrium	0.00063%

Waste rock produced by the Project will contain lower concentrations of metals than the ore. To simplify the calculations, the metal speciation for all movement that may contain metals was speciated as ore.

Parameters assessed for the Access Road (Hardtack/Sawbill) include the following:

- Fugitive road dust (i.e., TSP, PM_{10}, $PM_{2.5}$).
- Exhaust gases (i.e., NO_X, SO_2, and CO).

2.1 Assessment of Insignificant Activities

There are many activities at the Project Site that produce emissions; however, not all activities produce emissions for any or all compounds that are significant in comparison to the overall emissions from the Project.

The following lists possible reasons certain activities and/or emissions of certain compounds may be excluded from the assessment:

- The emission rates of certain compounds are very small relative to the overall emissions at the Project Site.
- The emissions of certain sources are not known to be significant due to the type of operations in the assessment.
- The location of the source relative to the rest of the sources onsite (i.e., the source is located far away from any receptors).

Table 3 lists the activities and/or compounds that were not assessed and the accompanying rationale.

Table 3: Insignificant Emissions Associated with the Project

Activity/Compound	Rationale for Excluding from the Assessment
Wet drilling	Emissions from wet drilling were not assessed. Emissions from the activity are expected to be minimal since the drilling is occurring with wet suppression at all times.
Tailpipe exhaust from surface vehicles (not including haul trucks)	Tailpipe emissions from surface dozers and graders, etc. (which have smaller relative HP ratings) are small in comparison to the haul truck fleet as they don't operate continuously since most are used for repair and maintenance.
Wind erosion from stockpiles	Due to the moisture content and the size of the material being stockpiled (i.e., waste rock and low grade ore prior to primary crushing), wind erosion emissions will not be significant.
Operational support activities, such as maintenance welding	The emissions are insignificant relative to the overall emissions from the Project.

3.0 EMISSION RATE CALCULATION ASSUMPTIONS

For each Project component, parameters were used to calculate the emissions. All parameters are documented in Sections 3.1 through 3.9 and any assumptions made are also stated in the "Notes" column in Tables 4 through 11.

3.1 Open Pit Extraction

The following table outlines the parameters used to calculate emissions related to Open Pit Extraction.

Table 4: Open Pit Extraction Emission Calculation Parameters

Parameter		Notes
Blasts per day per pit	2	Assumed duration of each blast is 1 hour and blasting occurs 365 days a year.
Pit volumes	744 m x 722 m x 96 m deep for east pit 806 m x 1282 m x 130 m deep for west pit	Total pit volume is used to scale emissions between the two pits.
Daily Throughput	45,920 tonnes – east pit 119,080 tonnes – west pit	Based on 100,000 tonnes/day waste rock and 65,000 tonnes/day ore divided between the pits based on pit volumes.
Tonnes of Material per Blast	22,960 tonnes – east pit 59,540 tonnes – west pit	Based on daily throughput and the number of blasts per day for each pit.
Specific Gravity of Material	1.5	—
Blast Hole Depth	14.8 m	—
Tonnes of Emulsion per Blast	13 tonnes – east pit 33 tonnes – west pit	Based on 46 tonnes/blast divided between the pits based on pit volumes.
Ore Hauling	754 tonnes/hr – east pit 1,955 tonnes/hr – west pit	Based on 65,000 tonnes/day, 24-hour hauling divided between the pits based on pit volumes.
Waste Rock Hauling	1,160 tonnes/hr – east pit 3,007 tonnes/hr – west pit	Based on 100,000 tonnes/day, 24-hour hauling divided between the pits based on pit volumes.
Equipment dedicated to Pits	6 Drill Rigs – 800 HP each 2 Loaders – 2000 HP each 1 Track Dozer – 646 HP 1 Grader – 297 HP 1 Wheel Dozer – 904 HP	Exhaust emissions divided based on kilometers travelled. Dust emissions based on 24-7 bulldozing (5% surface moisture content, 9.14% surface silt content) and daily grading (5.4 km of roads in east pit and 7.1 km of roads in the west pit) at 5 km/hr occurring in each pit simultaneously.

Notes:
— = No additional assumptions.

3.2 Low-grade Ore Stockpile

Table 5 outlines the parameters used to calculate emissions related to the low-grade ore stockpile.

Table 5: Low-grade Ore Stockpile Emission Calculation Parameters

Parameter		Notes
Daily Throughput	27,400 tonnes/day	24 hr/day, 365 days/year.
Bulldozing	24 hr/day, 365 days/year, 5% surface moisture content, 9.14% surface silt content.	Exhaust emissions from dozer not considered significant compared to emissions from haul trucks.
Grading	1.31 km of roads graded daily at 5 km/hr.	Exhaust emissions from grader not considered significant compared to emissions from haul trucks.

3.3 Waste Rock Stockpile

Table 6 outlines the parameters used to calculate emissions related to the waste rock stockpile.

Table 6: Waste Rock Stockpile Emission Calculation Parameters

Parameter		Notes
Daily Throughput	100,000 tonnes/day	—
Bulldozing	24 hr/day, 365 days/year, 5% surface moisture content, 9.14% surface silt content.	Exhaust emissions from dozer not considered significant compared to emissions from haul trucks.
Grading	3.32 km of roads graded daily at 5 km/hr.	Exhaust emissions from grader not considered significant compared to emissions from haul trucks.

Notes:
— = No additional assumptions.

3.4 Surface Roads

Table 7 outlines the parameters used to calculate emissions related to the on-site surface roads.

Table 7: Surface Roads Emission Calculation Parameters

Parameter		Notes
No. of trucks	20	—
Engines	Tier 2	Vehicles with greater than 750 HP use Tier 2 standards.
Speed limit	25 km/hr	—
Truck capacity	227 tonnes	—
Hauling capacity	65,000 tonnes/day ore to crusher. 100,000 tonnes/day waste rock to stockpile 27,400 tonnes/day low grade ore to stockpile.	Exhaust and fugitive emissions divided based on kilometers travelled. Assumed 10% of roadway dust is ore.

Notes:
— = No additional assumptions.

3.5 Ore Crushing and Screening

The following table outlines the parameters used to calculate emissions related to ore crushing and screening.

Table 8: Ore Crushing and Screening Emission Calculation Parameters

Parameter		Notes
Material Throughput	65,000 tonnes/day 24 hr/day 365 days/year	—
Primary Crushing	Drop to crusher occurs in an enclosure, therefore 75% control efficiency applied. Gyratory crusher controlled via scrubber therefore 99% control efficiency applied.	—
Material transfer to Bin	Controlled via fabric filter therefore 99.5% control efficiency applied.	—
Screening	Controlled via fabric filter therefore 99.5% control efficiency applied.	—
Secondary Crushing	Controlled via scrubber therefore 99% control efficiency applied.	—
Reclaim material transfer	Controlled via fabric filter therefore 99.5% control efficiency applied.	—
Final Crushing	Controlled via scrubber therefore 99% control efficiency applied.	—

Notes:
— = No additional assumptions.

3.6 Ore Processing and Refining

There are no international emission factors relating specifically to gold ore processing and refining which the exception of hydrogen cyanide emissions. For all other compounds, sites typically conduct stack testing in order to characterize emissions from different process activities. Based on Golder's experience with various gold mining operations, as well as Osisko Mining Corporation[1] (Osisko) Malartic operations, emission estimates were prepared for each of the different processes based on the amount of ore processed so that these factors can be scaled accordingly for the Project. Table 9 outlines the parameters used to calculate emissions related to ore processing and refining.

[1] Osisko Hammond Reef Gold Ltd. (OHRG) is a subsidiary of Osisko Mining Corporation (Osisko), a mid-tier gold producer based in Montreal, Quebec. Osisko operates the Canadian Malartic Gold Mine in the Abitibi-Temiscamingue region of Quebec.

Table 9: Ore Processing and Refining Emission Calculation Parameters

Parameter		Notes
Annual Ore Processing Rate	22,000,000 tonnes/year	Used to scale source testing from other sites.
Carbon in Pulp Adsorption	Emissions based on other sites scaled based on annual ore processing rate. 24-7 operation.	—
Acid Wash	Emissions based on other sites scaled based on annual ore processing rate. 24-7 operation.	HCl emissions exhausting from a stack (4.0 m above roof, 11.64 m/s exit velocity, 0.2 m exit diameter, 20°C exit temperature).
Carbon Regeneration	Emissions based on Malartic scaled based on annual ore processing rate. 24-7 operation.	—
Regeneration Furnace	Propane combustion. ~31.5 MBtu/day. 24-7 operation.	—
Cyanide Destruction	Emissions based on other sites scaled based on annual ore processing rate. 24-7 operation.	SO_2 emissions exhausting from a stack (10 m above roof, 12 m/s exit velocity, 1 m exit diameter, 20°C exit temperature).
Electrowinning	Emissions based on other sites scaled based on annual ore processing rate. 24-7 operation.	—
Smelting Furnace	Emissions based on Malartic scaled based on annual ore processing rate. Assumed 12 hours/day totally 700 hours/year.	—
Hydrogen Cyanide	Based on 2.64 tonnes of NaCN per year. The NaCN decomposes forming HCN.	NaCN usages based on 0.12 kg/tonne of ore.

Notes:
— = No additional assumptions.

3.7 Emergency Power Generators

Table 10 outlines the parameters used to calculate emissions related to emergency power generation.

Table 10: Emergency Power Generators Emission Calculation Parameters

Parameter		Notes
Fuel Type	Diesel	—
Capacity	2 x 2,500 kW 2 x 800 kW 4 x 250 kW	Assumes simultaneous weekly 1-hour testing.

Notes:
— = No additional assumptions.

3.8 Comfort Heating

Table 11 outlines the parameters used to calculate emissions related to comfort heating.

Table 11: Comfort Heating Emission Calculation Parameters

Parameter		Notes
Fuel Type	Propane	—
Hours of Operation	24 hr/day 242 days/year (not including summer months)	—
Residential Building Heating per Square foot	54 Btu/ft²	Assumes one air exchange per hour. Applied to Accommodation Camp buildings.
Plant Building Heating per Square foot	200 Btu/ft²	Assumed six air exchanges per hour. Applied to all buildings except the Accommodation Camp buildings.
Hot Water Boilers	5 MBtu/hr	Divided between the Accommodation Camp buildings based on square footage.

Notes:
— = No additional assumptions.

3.9 Access Road

The following outlines the key assumptions that were made and used throughout the assessment to establish the bounding case scenario for the Access road (Hardtack/Sawbill):

- A 1-km stretch of the road was assessed to determine the distance from the road at which emissions from the road are negligible.

- A 50% control for natural road dust mitigation (i.e., precipitation) and best management practices such as watering, etc.

Based on the information provided by OHRG, the vehicle fleet will not change with season or day of the week. A summary of the daily access road (Hardtack/Sawbill) fleet traffic is provided in Table 12.

Table 12: Access Road (Hardtack/Sawbill) Fleet Traffic

Vehicle Type	Number of Trips per Day (1-way)
Pickup	3
Passenger Car	85
Passenger Van	1
Transport Truck	18

4.0 SAMPLE CALCULATIONS

The following sample calculations for selected activities demonstrate how the emissions for the Project were developed. The results are in units of g/s, consistent with the model inputs described in Appendix 3.II. The emission rates in g/s were averaged hourly, daily and annually based on the activity/process operating times outlined in Section 3.0.

4.1 Blasting

4.1.1 Fugitive Dust

An equation from Table 11.9-2, U.S. EPA AP-42 Chapter 11.9 "*Western Surface Coal Mining*" (October 1998) was used to calculate the fugitive dust emissions associated with blasting activities. The equation is as follows:

$$EF = 0.00022 \times \mathrm{A}^{1.5} \times \mathrm{SF}$$

where: *EF = emission factor (kg/blast)*
A = horizontal area (m²)
SF = scaling factor

The blast surface area was determined using the amount of material blasted, the material specific gravity and the hole depth.

$$A = \frac{tonnage}{SG \times h}$$

where: *A = horizontal area (m²)*
SG = specific gravity
tonnage = amount of material blasted (Mg)
h =blast hole depth (m)

The following is a sample calculation for the fugitive $PM_{2.5}$ from blasting in the east pit using the following values:

Amount of material blasted (Mg)	22,960
SG	1.5
Blast hole depth (m)	14.8
Number of blasts per day	2
TSP scaling factor	1
PM_{10} scaling factor	0.52
$PM_{2.5}$ scaling factor	0.03

The horizontal area blasted is calculated as follows:

$$A = \frac{22{,}960}{1.5 \times 14.8}$$

$$A = 1{,}034\ m^2$$

The $PM_{2.5}$ predictive emission factor for the blast area above is calculated as follows:

$$EF = 0.00022 \times 1{,}034^{1.5} \times 0.03$$

$$EF = 0.22\ kg/blast$$

The daily $PM_{2.5}$ emission rate is calculated as follows:

$$ER = EF\ \times Daily\ Number\ of\ Blasts \times \frac{1{,}000\ g}{kg} \times \frac{1\ day}{24\ hr}\ \frac{1\ hr}{3{,}600\ s}$$

$$ER = \frac{0.22\ kg}{blast} \times \frac{2\ blasts}{day} \times \frac{1{,}000\ g}{kg} \times \frac{1\ day}{24\ hr}\ \frac{1\ hr}{3{,}600\ s}$$

$$ER = 0.005\ g/s$$

The emissions of PM_{10} and TSP were calculated in the same manner presented above.

The emissions of metals from blasting ore were calculated using the amount of ore blasted and the typical ore assay for the Project Site, as follows.

$$ER = ER_{TSP}\ from\ blasting \times the\ fraction\ of\ ore\ blasted \times concentration\ of\ the\ metal\ in\ the\ ore$$

The emissions of manganese from the east pit are as follows:

ER of TSP from blasting (g/s)	0.169
Amount of ore blasted per day (tonnes)	18,090
Total amount blasted per day (tonnes)	45,920
Concentration of manganese in ore (%)	0.04

$$ER = \frac{0.169g}{s} \times \frac{18{,}090\ tonnes}{45{,}920\ tonnes} \times 0.04\%$$

$$ER = 0.000027\ g/s$$

4.1.2 Explosives

Emission factors from Australia NPI "*Explosives Detonation and Firing Ranges 3.0*" (January 2012) were used to calculate the NOx and CO emissions associated with blasting activities. The emission rate is then calculated as follows:

$$ER = EF \times usage$$

where: *ER = emission rate (kg)*
EF = emission factor (kg/Mg)
usage = amount of explosive usage per blast (Mg)

A sample calculation for the West Pit and the emission factors used follows:

Amount of emulsion used per blast (Mg)	33
CO emission factor (kg/Mg)	2.3
NOx emission factor (kg/Mg)	0.2
Hours per blast	1
Number of blasts per day	2

Assuming the emissions from each blast are averaged over one hour, the following is the daily emission rate for CO from blasting out of the west pit.

$$ER = EF \times usage \times \frac{hours\ per\ blast\ x\ number\ of\ blasts\ per\ day}{24\ hr} \times \frac{1{,}000g}{kg} \times \frac{1hr}{3{,}600s}$$

$$ER_{CO} = 2.3\frac{kg}{Mg} x\ 33\ Mg \times \frac{\frac{1hr}{blast} x\ 2\ blasts}{24\ hr} \times \frac{1{,}000g}{kg} \times \frac{1hr}{3{,}600s}$$

$$ER_{CO} = 1.77\ g/s$$

The NOx emissions are calculated in a similar manner.

4.2 Material Handling

The material handling emissions associated with ore and waste rock handling were estimated using the emission factors from Section 11.24 "*Metallic Minerals Processing*" of the AP 42 document (revised January 1995). Material handling emissions are estimated when the ore and waste rock are moved, dropped or conveyed (e.g., unloading of ore at stockpiles).

Table 11.24-1 provides TSP emission factors in kg/Mg for material handling and transfers for low moisture and high moisture ore. High moisture ore is considered to have a moisture content greater than 4%. The TSP

emission rate would then be calculated by multiplying the emission factor by the amount of material being moved.

$$ER = EF \times tonnage$$

where: *ER = emission rate (kg)*
EF = emission factor (kg/Mg)
tonnage = amount of material being moved (Mg/day)

The following is a sample calculation for the TSP emissions from dropping the low-grade ore at the low-grade ore stockpile using the following values:

Amount of material handled (Mg/day)	27,400
Hours per day (hr/day)	24
Days per year (days/year)	365
TSP EF for high moisture ore (kg/Mg)	0.005

$$ER = 0.005\ \frac{kg}{Mg} \times 27{,}400\ \frac{Mg}{day} \times \frac{1\ day}{24\ hr} \times \frac{1\ hr}{3{,}600 s} \times \frac{1{,}000 g}{kg}$$

$$ER = 1.59\ g/s$$

The emissions of PM_{10} and $PM_{2.5}$ were calculated in a consistent manner. The emissions of metals were calculated as described in Section 4.1.1.

4.3 Bulldozing

An equation from U.S. EPA AP-42 Chapter 11.9 "*Western Surface Coal Mining*" (October 1998) was used to calculate the fugitive dust emission factors associated with bulldozing activities. The equation for TSP is as follows:

$$EF = 2.6 \times \frac{s^{1.2}}{M^{1.3}}$$

where: *EF = particulate emission factor (kg/hr),*
s = silt content of material (%), and
M =moisture content of material (%)

The emission factors for PM_{10} and $PM_{2.5}$ are based on the TSP and PM_{15} emission factors. The following is a sample calculation for the TSP emissions for bulldozing activities at the waste rock stockpile using the following values:

Silt content (%)[(a)]	9.14
Moisture content (%)	5

[(a)] Typical value for Ontario mining operations as outlined in the CEMI Fugitive Dust Guidance Document, August 2010

$$EF = 2.6 \times \frac{9.14^{1.2}}{5^{1.3}}$$

$$EF = 4.57\ kg/hr$$

The following is a sample calculation for the TSP emission rate:

$$ER = EF \times \frac{1\ hr}{3{,}600\ s} \times \frac{1{,}000\ g}{kg}$$

$$ER = \frac{4{,}57 kg}{hr} \times \frac{1\ hr}{3{,}600\ s} \times \frac{1{,}000\ g}{kg}$$

$$ER = 1.27\ g/s$$

The emissions of PM_{10} and $PM_{2.5}$ were calculated in a similar manner to that presented above using the appropriate scaling factors from the U.S. EPA AP-42 Chapter 11.9. For bulldozing activities that involves the movement of ore, the emissions of metals were calculated as described in Section 4.1.1.

4.4 Grading

An equation from U.S. EPA AP-42 Chapter 11.9 "*Western Surface Coal Mining*" (October 1998) was used to calculate the fugitive dust emission factors associated with grading activities. The equation for TSP is as follows:

$$EF = 0.0034 \times S^{2.5}$$

where: EF = particulate emission factor (kg/km),and
S = vehicle speed (km/hr)

The emission factors for PM_{10} and $PM_{2.5}$ are based on the TSP and PM_{15} emission factors. The following is a sample calculation for the TSP emissions for grading activities at the waste rock stockpile using the following values:

Vehicle speed (km/hr)	5
VKT (km/day)	3.32

$$EF = 0.0034 \times 5^{2.5}$$

$$EF = 0.19\ kg/km$$

The following is a sample calculation for the TSP emission rate:

$$ER = EF \times VKT \times \frac{1\ day}{24\ hr} \times \frac{1\ hr}{3{,}600\ s} \times \frac{1{,}000\ g}{kg} \times hr\ operating\ in\ 24\ hr$$

$$ER = \frac{0.19 kg}{km} \times 3.32\ \frac{km}{day} \times \frac{1\ day}{24\ hr} \times \frac{1\ hr}{3{,}600\ s} \times \frac{1{,}000\ g}{kg} \times \frac{\frac{3.32\ km}{5\ km/hr}}{24\ hr}$$

$$ER = 0.0002\ g/s$$

The emissions of PM_{10} and $PM_{2.5}$ were calculated in a similar manner to that presented above using the appropriate scaling factors from the U.S. EPA AP-42 Chapter 11.9.

4.5 Vehicles – Exhaust Emissions

Crank case emission standards from Nonroad Engine Modelling (Compression Ignition) – U.S. EPA 009d (Report No. NR-009d) (July 2010) were used to calculate the exhaust emissions from the Project mobile vehicles. It was assumed that all on-site vehicles with a horsepower less than 750 comply with at least Tier 3 emission standards. For the vehicles with a horsepower greater than 750, Tier 2 emission standards were used.

Emission standards were not provided for PM_{10} and $PM_{2.5}$; therefore, it was assumed that all TSP emissions consist of PM_{10} and that $PM_{2.5}$ emissions are 97% of PM_{10} emissions. Load factors are provided based on vehicle type as per Table F4 and F6 in Appendix F Report No. NR-009d.

The following equation was used to determine the emission rates for on-site vehicles:

$$ER = EF \times Engine\ Horsepower\ Rating \times LF \times \frac{Hours\ of\ Operation}{24\ hr} \times \frac{1\ hr}{3600\ s}$$

where: *ER = emission rate (g/s)*
EF = emission factor (g/HP-hr)
LF = load factor

The sample calculation for the TSP emission rate for the track dozer which is dedicated to the Pits is below and uses the following:

Vehicle HP	646
Hours of operation in 24 hours	24
Emission Standard (g/HP-hr)	0.15
Load factor	0.58

$$ER = \frac{0.15\ g}{hp - hr} \times 646hp \times 0.58 \times \frac{24\ hr\ of\ operation}{24\ hr} \times \frac{1\ hr}{3600\ s}$$

$$ER = 0.016\ g/s$$

The emissions of DPM, CO, NOx, HC, PM_{10} and $PM_{2.5}$ were calculated in the same manner presented above.

Sulphur dioxide (SO_2) emissions were estimated using fuel consumption data for the non-road engines. The sulphur content of fuel was assumed to be 15 parts per million (ppm). The following equation was used to determine the SO_2 emission factor:

$$EF = Fuel\ Density \times Sulphur\ Content \times \frac{MM\ SO_2}{MM\ Sulphur}$$

where: *EF = particulate emission factor (g/L)*
MM = molar mass (g/mol)

The following is a sample calculation for the SO_2 emissions from the same track dozer using the following values:

Fuel density (g/L)	845
Sulphur content (ppm)	15
MM SO_2 (g/mol)	64
MM S (g/mol)	32
BSFC (lb/HP-hr)[(a)]	0.367

[(a)] For all HPs greater than 100 as per Table A4 of Report No. NR-009D.

$$EF = \frac{845\ g}{L} \times \frac{15}{1000000} \times \frac{64\frac{g}{mol}}{32\frac{g}{mol}}$$

$$EF = 0.025\ g/\mathrm{L}$$

The fuel consumption can be calculated using the steady state brake specific fuel consumption (BSFC) conversion in Table A4 of Report No. NR-009D and is as follows:

$$Fuel\ Consumption = BSFC\ (\frac{lb}{HP - hr}) \times HP \times \frac{LF}{fuel\ density}$$

$$Fuel\ Consumption = 0.367\frac{lb}{HP - hr} \times 646\ HP \times \frac{0.58}{0.845kg/L} \times \frac{0.45359kg}{lb}$$

$$Fuel\ Consumption = 73.81\ L/hr$$

The SO_2 emission rate can be calculated as follows:

$$ER = EF\ \times Fuel\ Consumption\ \times \frac{Hours\ of\ Operation}{24\ hr} \times \frac{1\ hr}{3600\ s}$$

where: ER = emission rate (g/s)
EF = emission factor (g/L)

$$ER = \frac{0.025\ g}{L} \times \frac{73.81\ L}{hr} \times \frac{24\ hr\ of\ operation}{24\ hr} \times \frac{1\ hr}{3{,}600\ s}$$

$$ER = 0.001\ g/s$$

4.6 Vehicles – Unpaved Fugitive Road Dust

The predictive equation in U.S. EPA AP-42 Chapter 13.2.2 "*Unpaved Roads*" (November 2006) was used to calculate the fugitive dust emissions from the unpaved roadways. The equation is as follows:

$$EF = k\left(\frac{s}{12}\right)^{a} \times \left(\frac{W}{3}\right)^{b} \times 281.9 \times (1 - 80\%)$$

where: EF = particulate emission factor (g/VKT),
k = empirical constant for particle size range (pounds per vehicle mile travelled) (Table 4-1),
s = road surface silt content (%),
W = average weight (tons) of the vehicles traveling the road,
a= empirical constant for particle size range (dimensionless) (Table 4-1),
b= empirical constant for particle size range (dimensionless) (Table 4-1),
281.9 = conversion from pounds per vehicle miles travelled to grams per vehicle kilometres travelled,
80% = reduction of fugitive dust emissions due to best management practices to control fugitive dust.

Table 13 shows the constants used for the unpaved roadways fugitive dust emissions.

Table 13: Particle Size Constants for Unpaved Road Dust – Industrial Roads

Size Range	k (lb/VMT)	a	b
$PM_{2.5}$	0.15	0.9	0.45
PM_{10}	1.5	0.9	0.45
TSP	4.9	0.7	0.45

Unpaved road dust emissions were conservatively calculated without an adjustment for natural mitigation.

The following is a sample calculation for the TSP emission factor using the following values for the section of roadway from the east pit to the gyratory crusher:

Silt content (%)	9.14
Average weight of vehicles (tons)[(a)]	304.9
Length of road segment (km)	2.95
Number of one-way vehicle passes per day	80

(a) Average weight assumes a full truck weighs 390 tonnes and an empty truck weighs 163 tonnes and the truck drives there and back in one trip.

$$EF = 4.9\left(\frac{9.14}{12}\right)^{0.7} \times \left(\frac{304.9}{3}\right)^{0.45} \times 281.9$$

$$EF = 9134.43\ g/VKT$$

The following is a sample calculation for the TSP emission rate:

$$ER = EF \times Daily\ Vehicle\ Kilometres\ Travelled \times (1 - Control\ Efficiency) \times \frac{1\ day}{24\ hr} \times \frac{1\ hr}{3600\ s}$$

$$ER = \frac{1934.43 g}{km} \times \frac{\left(2.95 \frac{\text{km}}{\text{trip}} (\text{one way}) \times 2\ (\text{return}) \times 80\ \text{trips}\right) \text{km}}{1\ \text{day}} \times (1 - 80\%) \times \frac{1\ \text{day}}{24\ hr} \times \frac{1\ hr}{3600\ s}$$

$$ER = 9.94\ g/s$$

The emissions of TSP and PM_{10} were calculated in a similar manner.

The metals in the fugitive road dust were calculated based on the conservative assumption that 10% of the surface road silt is ore. Therefore 10% of the emissions were then speciated using an assay to represent typical ore found at the site. The emission rate for each metal was derived from the following equation.

$$ER = ER\ on\ the\ road\ segment \times 10\% \times concentration\ of\ the\ metal\ in\ the\ ore$$

The following is a calculation for manganese on the roadway from the East pit to the gyratory crusher using the ore assay illustrated in Section 1.0.

$$ER = \frac{9.94 g}{s} \times 10\% \times 0.04\%$$

$$ER = 0.0004\ g/s$$

4.7 Ore Crushing and Screening

Table 11.24-1 in Section 11.24 "*Metallic Minerals Processing*" of the AP 42 document (revised January 1995) provides TSP emission factors in kg/Mg for crushing for low moisture and high moisture ore. High moisture ore is considered to have a moisture content greater than 4%. The TSP emission rate would then be calculated by multiplying the emission factor by the amount of material being moved. The crushing is controlled via wet scrubber so a control efficiency is also applied. A sample calculation is as follows:

$$ER = EF \times material\ throughput \times (1 - control\ efficiency)$$

For the gyratory crusher with a wet scrubber the calculation is as follows:

Primary crushing EF (kg/Mg)	0.01
Material throughput (Mg/day)	65,000
Wet scrubber control efficiency (%)	99
Concentration of manganese in ore (%)	0.04

$$ER = 0.01 kg/Mg \times 65{,}000 Mg/day \times (1 - 99\%) \times \frac{1\ day}{24\ hr} \times \frac{1 hr}{3{,}600 s} \times \frac{1{,}000 g}{kg}$$

$$ER = 0.075\ g/s$$

The emissions of PM_{10} were calculated in a consistent manner. Since there is not an emission factor for $PM_{2.5}$, the emissions of $PM_{2.5}$ were assumed to be in the same fraction as they are in the AP-42 Chapter 11.19 for a controlled conveyor transfer point.

The emissions of metals were calculated as follows.

$$ER = ER_{TSP} \times concentration\ of\ the\ metal\ in\ the\ ore$$

$$ER = \frac{0.075 g}{s} \times 0.04\%$$

$$ER = 0.00003\ g/s$$

There are no emission factors for ore screening in Table 11.24-1; therefore, Section 11.19 must be used to determine the TSP emissions. Table 11.19.2-1 provides emission factors in kg/Mg for controlled and uncontrolled screening. Screening is considered controlled when the operation is equipped with a wet suppression system. The emission factor for uncontrolled screening was used with a control efficiency since the screening operation is controlled via a fabric filter. A sample calculation is as follows:

$$ER = EF \times material\ throughput \times (1 - control\ efficiency)$$

For the screening with a fabric filter the calculation is as follows:

Screening EF (kg/Mg)	0.0125
Material throughput (Mg/day)	65,000
Fabric filter control efficiency (%)	99.5
Concentration of manganese in ore (%)	0.04

$$ER = 0.0125 kg/Mg \times 65{,}000 Mg/day \times (1 - 99.5\%) \times \frac{1\ day}{24\ hr} \times \frac{1 hr}{3{,}600 s} \times \frac{1{,}000 g}{kg}$$

$$ER = 0.047 g/s$$

The emissions of PM_{10} were calculated in a consistent manner. Since there is not an uncontrolled emission factor for $PM_{2.5}$, the emissions of $PM_{2.5}$ were assumed to be in the same fraction as they are for controlled screening.

The emissions of metals were calculated as follows.

$$ER = ER_{TSP} \times concentration\ of\ the\ metal\ in\ the\ ore$$

$$ER = \frac{0.047g}{s} \times 0.04\%$$

$$ER = 0.000019g/s$$

4.8 Ore Processing and Refining

Based on Golder's experience with various gold mining operations that includes Osisko's Malartic operations, emission estimates were created for each of the different processes based on the amount of ore processed so that these estimates can be scaled accordingly for the Project.

The following table lists the emission factors that were used in the calculations.

Table 14: Ore processing emission factors

Contaminants	Emission Rates [g/s/tonne of ore processed]					
	CIP Adsorption	Acid Wash	Carbon Regeneration (a)	Cyanide Destruction	Electrowinning	Smelting Furnace(a)
Ammonia	2.13×10^{-8}	—	—	8.99×10^{-11}	2.68×10^{-8}	—
Carbon Monoxide	—	—	1.75×10^{-9}	—	—	—
Hydrochloric Acid	—	8.97×10^{-8}	—	—	—	—
NO_X	—	—	—	—	—	—
TSP(b)	—	—	4.71×10^{-9}	—	—	1.49×10^{-9}
PM_{10}	—	—	4.71×10^{-9}	—	—	1.49×10^{-9}
$PM_{2.5}$	—	—	4.71×10^{-9}	—	—	1.49×10^{-9}
SO_2	—	—	—	9.01×10^{-7}	—	—
Sodium Hydroxide	1.22×10^{-8}	—	—	—	9.73×10^{-9}	—
Zinc	—	—	—	3.44×10^{-9}	—	2.67×10^{-11}

(a) Emissions taken from Osisko Malartic operations'

(b) All TSP was conservatively assumed to be $PM_{2.5}$

— Emissions not released from this source

The emission from each compound for each process was calculated as follows:

$$ER = EF \times amount\ of\ ore\ processed$$

For ammonia emissions from the CIP Adsorption process, the calculation is as follows:

EF (g/s/tonne of ore processed)	2.13×10^{-8}
Annual ore processing rate (tonnes/year)	22,000,000

$$ER = \frac{2.13E-08 g/s}{tonne} \times 22{,}000{,}000 tonnes$$

$$ER = 0.469 g/s$$

All other compounds were calculated in a similar manner.

The regeneration furnace uses propane therefore its emissions were calculated using the methods outlined in Section 4.10.

The Australian National Pollutant Inventory's "*Emission Estimation Technique Manual for Gold Ore Processing Version 2.0*" (December 2006) was used to estimate hydrogen cyanide emissions from the mill process area. This document states that 1% of the ionic cyanide used in the process can be assumed to be lost through volatilization as hydrogen cyanide (HCN) within the processing area. These emissions are not associated with any single emission source and therefore act as a summation of source emissions. Molar ratios along with Osisko's sodium cyanide usage data have been used to estimate annual hydrogen cyanide emissions.

$$ER = usage\ of\ NaCN \times mol\ ratio \frac{CN}{NaCN} \times mol\ ratio \frac{HCN}{CN} \times 1\%$$

The following data and calculation was used to determine the hydrogen cyanide emissions.

NaCN usage (kg/tonne of ore processed)	0.12
Annual ore processing rate (tonnes/year)	22,000,000
MW NaCN (g/mol)	49.01
MW CN (g/mol)	26.02
MW HCN (g/mol)	27.03

$$ER = \frac{0.12kg}{tonne} \times 22{,}000{,}000 \frac{tonnes}{year} \times \frac{26.02g/mol}{49.01g/mol} \times \frac{27.03g/mol}{26.02g/mol} \times 1\% \times \frac{1\ year}{365\ days} \times \frac{1\ day}{24\ hr} \times \frac{1\ hour}{3{,}600s} \times \frac{1{,}000g}{kg}$$

$$ER = 0.462\ g/s$$

4.9 Stationary Diesel Combustion

The emission factors in AP-42 Chapter 3.4 "*Large Stationary Diesel and all Stationary Dual Fuel Engines*" (October 1996) were used to calculate the emissions from the emergency diesel power generators using the following calculation.

$$ER = EF \times power\ rating$$

The NOx emission rate calculation for one of the generators is as follows.

NOx EF (lb/HP-hr)	0.024
Power rating (kW)	2,500

$$ER = 0.024\frac{lb}{HP-hr} \times 2{,}500kW \times \frac{hp}{0.7457kW} \times \frac{g}{0.0022lb} \times \frac{hr}{3{,}600s}$$

$$ER = 10.1 g/s$$

The other compounds were calculated in a similar manner.

4.10 Propane Combustion

The emission factors in AP-42 Chapter 1.5 "*Liquefied Petroleum Gas Combustion*" (July 2008) for industrial boilers, assuming a sulphur content of 0.18 gr/100 ft³, were used to calculate the emissions from the propane heaters and boilers using the following calculation.

$$ER = EF \times thermal\ input\ rating$$

The thermal input ratings were determined using the building square footages and standard HVAC practices for plant and residential buildings. The following is a sample calculation for NOx from the Concentrator building.

NOx EF (lb/Btu)	1.42×10^{-7}
Building square footage (ft^2)	43,983
Residential building heating factor ($Btu/ft^2/hr$)	54
Plant building heating factor ($Btu/ft^2/hr$)	200

$$ER = 1.42E-07 lb/Btu \times \frac{\frac{200Btu}{hr}}{ft^2} \times 43{,}983 ft^2 \times \frac{g}{0.0022lb} \times \frac{hr}{3{,}600s}$$

$$ER = 0.157\ g/s$$

All other compounds were calculated in a similar manner. All TSP was assumed to be $PM_{2.5}$.

4.11 Access Road

Fugitive road dust (i.e., TSP, PM_{10}, $PM_{2.5}$) emissions were calculated using the emission factors presented in Sections 13.2.2 of AP-42 (U.S. EPA 2010a) using equation 1b and the vehicle activity levels in Table 12. Inputs to the calculation included an assumed vehicle speed of 80 km/hr, silt content of 10% and a moisture content of 6.5%.

Exhaust emissions were calculated using the U.S. EPA MOBILE6 emissions model and the vehicle activity levels in Table 3-9.

5.0 EMISSION RATES

Emission rates, in g/s, were calculated for each activity as described in the previous section. The metals emissions from each activity were speciated as described in Section 1.0 according the assay provided as Table 2.

5.1 Human Health and Ecological Risk Assessment

Table 15 displays the daily emission rates for each activity that requires assessment for the Human Health and Ecological Risk TSDs.

Table 15: Daily Emission Rates for the Human Health and Ecological Risk Assessment

Project Component	Activity	Daily Emission Rates (g/s)												
		TSP	PM_{10}	$PM_{2.5}$	DPM	Metals	NO_X	CO	SO_2	HC	HCN	HCl	NH_3	NaOH
Open Pit Extraction	Blasting – fugitive dust and explosives	0.877	0.456	0.026	—	0.345	0.213	2.449	—	—	—	—	—	—

Notes:
— = Compound not emitted from that activity.

5.1.1 Percentage Contributions

The following table illustrates what percentage each component contributes to the overall emissions for the Project for the Human Health and Ecological Risk Assessment.

Table 16: Percentage contributions for daily emission rates for the Human Health and Ecological Risk Assessment

Project Component	Percentage Contributions for Daily Emission Rates (%)												
	TSP	PM_{10}	$PM_{2.5}$	DPM	Metals	NOx	CO	SO_2	HC	HCN	HCl	NH_3	NaOH
Open Pit Extraction	48%	48%	47%	46%	50%	42%	48%	<1%	47%	—	—	—	—
Low Grade Ore Stockpile	1%	1%	4%	—	10%	—	—	—	—	—	—	—	—
Waste Rock Stockpile	3%	4%	10%	—	—	—	—	—	—	—	—	—	—
Surface Roads	46%	45%	32%	52%	33%	48%	45%	<1%	53%	—	—	—	—
Ore Crushing and Screening	<1%	<1%	4%	—	5%	—	—	—	—	—	—	—	—
Ore Processing and Refining	<1%	<1%	3%	—	1%	<1%	<1%	97%	—	100%	100%	100%	100%
Emergency Power Generators	<1%	<1%	—	2%	—	3%	<1%	3%	—	—	—	—	—
Comfort Heating	<1%	<1%	2%	—	—	7%	6%	<1%	—	—	—	—	—

Notes:

— = Compound not emitted from that component.

5.2 Air Quality Assessment

Ontario Regulation 419/05 (O. Reg. 419/05) considers the emissions from selected stationary sources only. Ontario exempts emission sources associated with construction activities or mobile sources from evaluation (O. Reg. 524/98 [MOE 1998]). Therefore, certain emissions that are part of the Project are not included in the O. Reg. 419/05 assessment. The following emissions associated with the Project are not included in the Air Quality Assessment:

- The surface mobile vehicle exhaust emissions.
- Fugitive dust emissions if a best management practices plan is implemented however the metals emissions with POI Limits associated with the dust must still be included.
- Emergency power systems.

Table 17 illustrates which Project activities are not included in Air Quality Assessment.

Table 17: Activities Included in the Air Quality Assessment

Project Component	Activity	Included in Ontario Compliance Assessment?
Open Pit Extraction	Blasting – fugitive dust and explosives	Yes
	Material Handling	Only metals with POI Limits
	Bulldozing	Only metals with POI Limits
	Grading	Only metals with POI Limits
	Vehicles – Exhaust Emissions	No
	Vehicles – Unpaved Fugitive Road Dust	Only metals with POI Limits
Low-grade Ore Stockpile	Material Handling	Only metals with POI Limits
	Bulldozing	Only metals with POI Limits
	Grading	Only metals with POI Limits
Waste Rock Stockpile	Material Handling	No
	Bulldozing	No
	Grading	No
Surface Roads	Vehicles – Exhaust Emissions	No
	Vehicles – Unpaved Fugitive Road Dust	Only metals with POI Limits
Ore Crushing and Screening	Material Handling	Only metals with POI Limits
	Ore Crushing	Yes
	Ore Screening	Yes
Ore Processing and Refining	CIP Adsorption	Yes

Table 17: Activities Included in Ontario Compliance Assessment (Continued)

	Acid Wash	Yes
	Carbon Regeneration	Yes
	Regeneration Furnace	Yes
	Cyanide Destruction	Yes
	Electrowinning	Yes
	Smelting Furnace	Yes
	Sodium Cyanide Use	Yes
Emergency Power Generators	Stationary Diesel Combustion	No
Comfort Heating	Propane Combustion	Only NO_x

The daily emission rates outlined in Table 15 are adjusted to remove the activities that are not assessed under O.Reg.419/05. Table 18 displays the daily emission rates for each activity that is included for the Air Quality Assessment.

Table 18: Daily Emission Rates for the Air Quality Assessment

Project Component	Activity	Daily Emission Rates (g/s)												
		TSP	PM_{10}	$PM_{2.5}$	DPM	Metals	NO_X	CO	SO_2	HC	HCN	HCl	NH_3	NaOH
Open Pit Extraction	Blasting – fugitive dust and explosives	0.877	0.456	0.026	—	0.345	0.213	2.449	—	—	—	—	—	—

Notes:
— = compound not emitted from this source

5.2.1 Percentage Contributions

The following table illustrates what percentage each component contributes to the overall emissions for the Project for the Air Quality Assessment.

Table 19: Percentage contributions for daily emission rates for the Air Quality Assessment

Project Component	Percentage Contributions for Daily Emission Rates (%)												
	TSP	PM_{10}	$PM_{2.5}$	DPM	Metals	NOx	CO	SO_2	HC	HCN	HCl	NH_3	NaOH
Open Pit Extraction	50%	47%	4%	—	50%	6%	98%	—	—	—	—	—	—
Low Grade Ore Stockpile	—	—	—	—	10%	—	—	—	—	—	—	—	—
Waste Rock Stockpile	—	—	—	—	—	—	—	—	—	—	—	—	—
Surface Roads	—	—	—	—	33%	—	—	—	—	—	—	—	—
Ore Crushing and Screening	33%	22%	53%	—	5%	—	—	—	—	—	—	—	—
Ore Processing and Refining	17%	31%	44%	—	1%	<1%	2%	100%	—	100%	100%	100%	100%
Emergency Power Generators	—	—	—	—	—	—	—	—	—	—	—	—	—
Comfort Heating	—	—	—	—	—	93%	—	—	—	—	—	—	—

Notes:

— = Compound not emitted from that component.

5.3 Averaging Periods

A detailed operation schedule is not available at this time; therefore, most activities were assumed to be operating 24 hours a day and 365 days a year except for the activities that are outlined below.

- Blasting since it occurs for only two hours per day.
- Road grading occurs less than 24 hours per day.
- The smelting furnace since it only operates for 12 hours per day, 58 days of the year.
- The emergency generators since they are only tested for one hour per week.
- The comfort heating since they only operate during the summer months.

Since the federal and provincial air quality limits are expressed for different averaging periods, the daily emission rates can be adjusted to match the appropriate averaging period using the formulas below.

$$hourly\ ER = dailyER \times \frac{24\ hr}{number\ of\ hours\ activity\ occurs\ within\ 24\ hr}$$

$$annual\ ER = dailyER \times \frac{number\ of\ days\ activity\ occurs\ within\ the\ year}{365\ days}$$

The following calculation for the hourly $PM_{2.5}$ emission rate from blasting is an example.

Daily $PM_{2.5}$ emission rate (g/s)	0.005
Hours blasting occurs within 24 hours (hr)	2

$$hourly\ ER = 0.005 g/s \times \frac{24\ hr}{2\ hr}$$

$$hourly\ ER = 0.06\ g/s$$

The following table summarizes the hourly, daily and annual emission rates for the activities that vary based on operating hours.

Table 20: Emission Rates that Vary by Averaging Period

Activity	Compound	Emission Rate (g/s)		
		Hourly	Daily	Annual
Blasting	TSP	10.521	0.877	0.877
	PM_{10}	5.471	0.456	0.456
	$PM_{2.5}$	0.316	0.026	0.026

Table 20: Emission Rates that Vary by Averaging Period (Continued)

Activity	Compound	Emission Rate (g/s)		
		Hourly	Daily	Annual
	Metals	4.144	0.345	0.345
	CO	29.389	2.449	2.449
	NO_X	2.556	0.213	0.213
Grading	TSP	0.028	0.001	0.000
	PM_{10}	0.020	0.001	0.000
	$PM_{2.5}$	0.001	0.000	0.000
Smelting Furnace	TSP	0.399	0.199	0.032
	PM_{10}	0.399	0.199	0.032
	$PM_{2.5}$	0.399	0.199	0.032
	Metals	0.399	0.199	0.032
Emergency Power Generators	CO	7.262	0.303	0.043
	NO_X	32.002	1.333	0.190
	TSP	0.781	0.033	0.005
	DPM	0.781	0.033	0.005
	PM_{10}	0.372	0.015	0.002
	SO_2	13.879	0.578	0.082
Comfort Heating	TSP	0.166	0.166	0.110
	PM_{10}	0.166	0.166	0.110
	$PM_{2.5}$	0.166	0.166	0.110
	SO_2	0.004	0.004	0.003
	NO_X	3.085	3.085	2.045
	CO	1.780	1.780	1.180

All other activities operate 24 hr/day, 365 days/year therefore the emission rates, in g/s, are the same for all averaging periods.

5.4 Access Road

Based on the assumptions discussed in Section 3.9, Table 21 summarizes the emissions associated with the Access Road (Hardtack/Sawbill).

Table 21: Daily Emission Rates for the Access Road (Hardtack/Sawbill)

Vehicle Type	Emission Rate (g/s)					
	TSP	PM_{10}	$PM_{2.5}$	NO_X	SO_2	CO
Pickup	0.79	0.34	0.03	0.003	0.00001	0.01
Passenger Car	22.42	9.62	0.96	0.026	0.00025	0.87
Passenger Van	0.26	0.11	0.01	0.001	0.00000	0.02
Transport Truck	4.75	2.04	0.20	0.052	0.00011	0.01

Traffic along the access road (Hardtack/Sawbill) was assumed to be the same every day of the week, year-round.

6.0 CONSERVATISM IN EMISSION RATE CALCULATIONS

Table 22 outlines the areas where conservatism was assumed in the emission rate calculations which results in an assessment that is not likely to under-predict the emissions associated with the Project.

Table 22: Areas of Conservatism in the Emission Rate Calculations

Area	Conservatism
Blasting	Emissions from the largest blast possible, based on the amount of material blasted, are calculated. Emissions are calculated using a SG that is likely lower than the actual SG. A higher SG would result in lower emissions.
Waste rock handling	The emission factors for metallic minerals were used as opposed to crushed stone which typically gives lower emissions.
Ore crushing and screening	The emission calculations are based on the maximum possible material throughput. Also the emission factors used also account for a material transfer to and from the equipment which for the Project would overestimate the actual emissions since individual drops were accounted for separately.
Propane combustion for comfort heating	Osisko has identified that some building heating will be electric however all buildings were assumed to be heated through propane combustion. Assumed year round emissions?

6.1 Fugitive Dust from Unpaved Roads

Unpaved roadway segments were assessed based on the type of roadway and traffic data. Chapter 13.2.1 of the AP-42 Emission Factor (U.S. EPA 1995) emission estimation equations were used for fugitive road dust from paved and unpaved roads. These emission estimates are conservative and will significantly overestimate emissions from facility roadways for the following reasons:

- The U.S. EPA AP-42 equations were developed from measured emissions from public roadways and as a result will tend to over-estimate low speed vehicle traffic from construction sites.
- All roadways are modelled assuming simultaneous and continuous use, this situation cannot occur in reality as the same trucks drive over multiple road segments sequentially.
- The assumed silt loading used to calculate emission rates are based on the typical expected from a construction site (see EIS-04-148) (U.S. EPA 1995: Section 11.9). As the best management practices outlined above are revised through continuous improvements, the emissions from the on-site roadways are likely to decrease.

The AERMOD dispersion model was used to predict the changes to air quality. The parameters that were required for modelling include the locations of the roadway segments, base elevations, effective heights of the emissions, and the initial plume size in the lateral and vertical directions. It is recognized that this modelling approach will result in higher predicted concentrations close to the roadways than actual values for the following reasons:

- The layout of the Facility is such that many roads are located in areas where there are large structures (buildings, equipment and other physical obstructions such as waste rock piles) located between the roads and the property line. These structures physically block the transport of dust off-site. There has been extensive research on the estimation of the "transportable fraction" of fugitive dust, based on different urban settings. Recent research by the U.S. EPA (U.S. EPA 2005) provides ranges of "capture fraction" (i.e., percentage of dust captured by structures and consequently not transported off-site) for various land use types. For an urban setting, with structures ranging from 5 to 50 m in height, the estimated range of capture fraction is 25% to 75%.
- The model has not been run to account for depletion of the plumb due to deposition. AERMOD has the capability to account for various mechanisms including wet and dry deposition, and chemical transformation of substances that would reduce ground level concentrations at points of interest. However, the deposition and chemical transformation algorithms were not implemented in this assessment to calculate the concentration at point of impingement. There has been extensive research on the estimation of the "transportable fraction" of fugitive dust from roadways. Based on studies done by the Desert Research Institute in Nevada and in the San Joaquin Valley, CA (Watson et al. 1996) showed a large (i.e., greater than 90%) decrease in dust concentration within 100 m of an unpaved road (Watson et al. 1996; Watson et al. 2000). A value of 75% reduction has been suggested beyond 50 m for unpaved roadway emissions. This value would increase at greater distances.

When the roads are wet or snow-covered, the emissions will be reduced or eliminated. AERMOD has the capacity to have a variable emission rate that could account for actual meteorological emissions; however the work to set up such a variable emission rate would be significant. Review of historical normals for the Atikokan meteorological station (Climate ID 6020379) found that on average there are 160 days with measurable precipitation (greater than 0.2 mm) and 149 days with greater than one cm of snow on the ground. Therefore, roads can be considered wet or snow covered for a significant portion of the year.

Despite the limitations of the emission rate estimates and dispersion modelling they are the best estimates available. The above noted biases and emission estimates are cumulative, that is to say they would work together to reduce emissions and the reductions should be multiplied to estimate a total reduction. To account for the above biases in both the emission estimates and the model itself, a conservative correction factor to reduce the emissions by 75% was incorporated into the emission rates; in reality the natural reduction would be higher.

In addition the best management practices outlined above will further reduce emissions; specifically watering will be used on dry days to decrease emissions from roads.

1.0 INTRODUCTION

This appendix documents the methods, input parameters and assumptions that were used to model the air emission rates for the Hammond Reef Gold Project (Project) works and activities to provide estimates of maximum ground-level concentrations resulting from the Project. The modelling approach described within follow generally accepted practices for conducting environmental assessments and, where appropriate, guidance in the Ontario Ministry of the Environment (MOE) document "*Guideline A-11: Air Dispersion Modelling Guideline for Ontario, Version 2.0"*, dated March 2009 (ADMGO) PIBS 5165e02.

The air emissions associated with the Project are evaluated with the aid of the AERMOD-PRIME (AERMOD) dispersion model (Version 11103). The selection of this model was based on the following capabilities:

- Evaluates the various source types and compounds associated with the Project.
- Has a technical basis that is scientifically sound, and is in keeping with the current understanding of dispersion in the atmosphere.
- Applies formulations that are clearly delineated and are subjected to rigorous independent scrutiny.
- Makes predictions that are consistent with observations.
- The terrain is relatively simple and can be addressed by the terrain features of the model.
- Long range transport of compounds is not anticipated.
- The compounds of concern associated with the Project are not subject to acid deposition.

More specifically, is recognized by provincial regulators as one regulatory default model for use for mining operations and therefore this model was chosen for the Project.

2.0 AERMOD DISPERSION MODEL

The AERMOD dispersion model (Version 11103) using MOE-provided meteorological data from Atikokan was used to evaluate the air quality effects associated with the Project. The model was developed by the United States Environmental Protection Agency (U.S. EPA), and has been identified as appropriate for modelling in Ontario by the MOE (MOE 2005). The AERMOD modelling system is made up of the AERMET meteorological pre-processor, the AERMAP terrain pre-processor and the AERMOD dispersion model (Figure 1).

A review of the EIS Guidelines for the Project highlights the need to provide information regarding the model verification and scientific defensibility, model calibration, model validation, as well as the uncertainty and sensitivity of the model. Information regarding the AERMOD dispersion model is outlined in Sections 2-1 to 2-4.

2.1 Model Verification

The AERMOD dispersion modelling system was developed by the U.S. EPA as a replacement to the long-standing Industrial Source Complex (ISC) model, as the model recommended by the U.S. EPA for regulatory applications in the United States. This model has also been adopted in Ontario as the regulatory model recommended for permitting and regulatory applications (MOE 2005). The model is generally based on Gaussian plume dispersion theory (U.S. EPA 2004a), but also incorporates a series of specific algorithms to reflect current understanding of dispersion theory (U.S. EPA 2004a).

2.2 Model Calibration

Regulatory dispersion models do not readily lend themselves to modification to incorporate site-specific characteristics in the equations themselves. However, the model does require meteorological data to operate. For this assessment, five years of meteorological data were used as inputs to the AERMET pre-processor, along with information regarding site specific land use information. Finally, digital terrain data for the site and surrounding area were input to the AERMET pre-processor and used to characterize how the local topography could affect the dispersion of air contaminants.

2.3 Model Validation

Part of the rigorous process used by the U.S. EPA prior to adopting AERMOD as a regulatory model (U.S. EPA 2004a) was a significant verification process to confirm that the model could accurately predict ground-level concentrations when compared to monitoring data (U.S. EPA 2003, 2004a).

2.4 Model Uncertainty and Sensitivity

Dispersion models employ assumptions that simplify the random processes associated with atmospheric motions and turbulence. While this simplification limits the model's ability to replicate individual events, the strength of the model lies in the ability to predict overall values for a given set of meteorological conditions. The process undertaken by the U.S. EPA ensured that the model predictions can be relied on as reasonable

estimate of the likely concentrations. AERMOD is based on known theory, and proven to reliably produce repeatable results. To limit the uncertainty associated with emissions input to the model, conservative assumptions were made where practical (Section 5). Finally, five years of meteorological data were used as an input to the model to ensure the full range of possible meteorological conditions is evaluated.

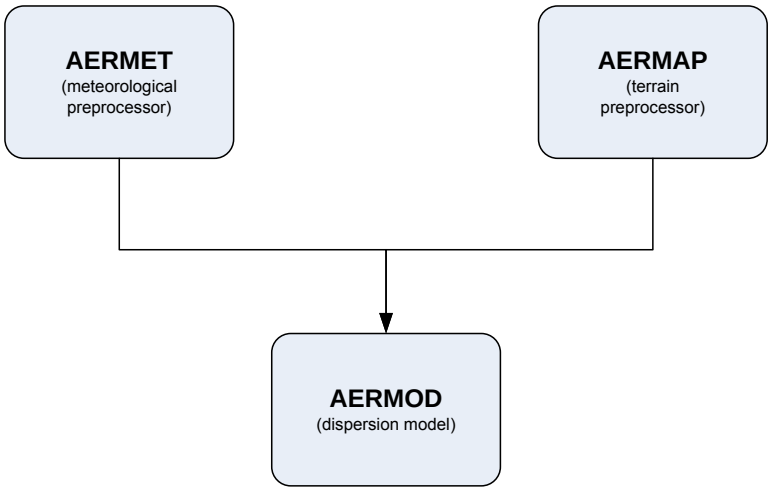

Figure 1: AERMOD Modelling System

Table 1: Reliability Summary for the AERMOD Dispersion Model

Model Name	Developer	Use in Assessment	Verification	Calibration	Validation	Uncertainty and Sensitivity
AERMOD (Version 11103)	United States Environmental Protection Agency	Predict air quality concentrations	AERMOD was developed to replace the long-standing ISC model as the model recommended by the U.S. EPA. AERMOD is based on Gaussian plume dispersion theory (U.S. EPA 2004a) that has been used for more than 30 years. The application of specific algorithms has been updated to reflect current understanding of dispersion theory (U.S. EPA 2004a).	5 years of meteorological data were used in the modelling (Section 3.1). Surrounding land use input to the model pre-processor (Section 3.1). Digital terrain data for the site and surrounding area input to the model (Section 3.2).	AERMOD has been adopted by the U.S EPA as its preferred and recommended dispersion model (U.S. EPA 2005). Prior to adoption, the U.S. EPA completed a rigorous review of the model performance (U.S. EPA 2003, 2005).	AERMOD is based on known theory, and proven to reliably produce repeatable results. Uncertainty associated with emissions is managed by making conservative assumptions. Model predictions are sensitive to fluctuations in the meteorology, which can be managed by using a five-year data set. Five years of data should include the full range of possible meteorological conditions.

3.0 MODEL INPUTS

In order to complete the air dispersion model, a series of inputs are required. These inputs can be grouped into categories:

- Dispersion meteorological data.
- Terrain and receptors.
- Emissions and source configurations.
- Dispersion model options.

Each of these input categories will be discussed separately in the Sections 3.1 to 3.4.

3.1 Dispersion Meteorology

The selection of appropriate meteorological data for use in dispersion modelling is an important step in any modelling study. The selection of meteorological data needs to consider the requirements of the models selected, the availability of meteorological data and the relevance of the available data to the facility in question. The meteorological input files used by the AERMOD dispersion model are generated using the AERMET pre-processor, which is designed to be run in three stages:

1. Extracts the data and assesses data quality.
2. Merges the available data for 24-hour periods and writes these data to an intermediate file.
3. Reads the merged data file and develops the necessary boundary layer parameters for dispersion calculations by AERMOD.

Quality assurance of the meteorological data is performed at four critical junctures before the resulting data is used by AERMOD. The AERMET pre-processor produces two meteorological data files. The first file contains boundary layer scaling parameters (e.g., surface friction velocity, mixing height, and Monin-Obukhov length) as well as wind speeds, wind directions and temperature at a reference-height. The second file contains one or more levels (a profile) of winds, temperature, and the standard deviation of the fluctuating components of the wind.

3.1.1 Meteorological Data Sources

The MOE recommends that five years of hourly data be used in the model (MOE 2005). The current surface and upper air meteorological data were processed by the MOE using AERMET and supplied for use in this assessment. Details regarding the dispersion meteorology are provided in Appendix 2.I.

3.2 Terrain and Model Receptors

Relying on the assumption that terrain will affect air quality concentrations at individual receptors, surrounding terrain data is required when using regulatory dispersion models, where simple to complex terrain situations apply (U.S. EPA 2004b). Terrain data are determined using the AERMAP pre-processor. AERMAP determines the base elevation for each receptor and source and then searches the terrain height and location that has the greatest influence on dispersion for each receptor (U.S. EPA 2004b). This is referred to as the hill height scale. The base elevation and hill height scale produced by AERMAP can be directly inserted into the AERMOD input file.

3.2.1 Digital Terrain Data

Digital terrain data was obtained from the MOE (7.5 minute format). The digital terrain data is illustrated on Figure 2.

Local terrain data from air photos taken of the site is available. When this data is compared against the MNR data described above, it was determined that the MNR data was suitable to use for this assessment since the variation was found to be +/- 20 m over the area covered by the air photos.

3.2.2 Model Receptors

Ambient concentrations and deposition rates resulting from on-site emissions were predicted at selected groups of receptors and at other locations of interest in order to provide a better understanding of the potential impacts of the Project. This included approximately 30,000 locations.

Receptors for the environmental assessment (EA) Air Quality Grid were chosen based on recommendations provided in 7.1 of the ADMGO, which is in accordance with s.14 of O.Reg.419/05. Specifically, a nested receptor grid, centered around the outer edges of all the sources, was placed as follows:

a) 20 m spacing, within an area of 200 m by 200 m.

b) 50 m spacing, within an area surrounding the area described in (a) with a boundary at 300 m by 300 m outside the boundary of the area described in (a).

c) 100 m spacing, within an area surrounding the area described in (b) with a boundary at 800 m by 800 m outside the boundary of the area described in (a).

d) 200 m spacing, within an area surrounding the area described in (c) with a boundary at 1,800 m by 1,800 m outside the boundary of the area described in (a).

e) 500 m spacing, within an area surrounding the area described in (d) extending to cover the entire LSA.

The O. Reg. 419/05 Receptor Grid, illustrated on Figure 3, includes the nested grid described above however all receptors within the OHRG surface rights claims area were removed from the nested grid creating a boundary which acts as a property boundary in accordance with O. Reg. 419/05. The property boundary for the air quality assessment was created based on OHRG surface rights (Figure 4). It is important to note that OHRG's surface rights extend well past the chosen property boundary chosen to demonstrate compliance with O. Reg. 419. The property boundary was selected to cover an area close to the MSA that can be used to for the purposes of this

assessment. Receptors were also placed every 10 m along this property boundary in sections of the property boundary that are within 200 m of an emission source and every 100 m in sections of the property boundary that are greater than 200 m from an emission source. Data from this grid is used in the Ontario Compliance Assessment.

Data from all receptors were included in the predictions that are considered in the Ecological Risk Assessment (Ecological Risk Assessment TSD). The receptors were distinguished as land based or water based. The area of modeling coverage is illustrated on Figure 5.

In addition, the 51 discrete human health locations were identified by the socio-economic team. These locations are also illustrated on Figure 6. The human health locations also include the worker accommodation camp. Data from these locations has been considered in the Human Health Risk Assessment (Human Health and Ecological Risk Assessment TSD).

Some existing human health receptors (#'s 10, 11, 17, 19, 23, 36 and 37 from Figure 6) were identified within the selected O. Reg. 419 property boundary (Table 2). Once construction begins, access to these receptors will be restricted. Therefore, these locations are not considered receptors. As such, dispersion modelling predictions were not made at these locations.

3.3.1 Human Health and Ecological Risk Assessment (HHRA)

Air emissions from all significant sources were calculated using accepted methods, such as emission factors, and were based on the activity data provided in the Project Description (Chapter 5 of the EIS/EA Report). Details of specific emission calculation methods are provided in Appendix 3.I. Emission rates for each of the model sources for the HHRA assessment are included in Tables 4 to 6 and 8.

3.3.2 Ontario Compliance Assessment (OCA)

Ontario Regulation 419/05 (O. Reg. 419/05) considers the emissions from selected stationary sources only. Ontario exempts emission sources associated with construction activities or mobile sources from evaluation (O. Reg. 524/98 [MOE 1998]). Therefore, certain emissions that are part of the Project are not included in the O. Reg. 419/05 assessment. The following emissions associated with the Project are not included in the Ontario Compliance Assessment:

- The surface mobile vehicle exhaust emissions.
- Fugitive dust emissions if a best management practices plan is implemented however the metals emissions with POI Limits associated with the dust must still be included.
- Emergency power systems.
- Emissions of PM_{10} and $PM_{2.5}$ as there are no MOE limits under O. Reg. 419/05.

Table 3 illustrates which Project activities are not included in the Ontario Compliance Assessment.

Table 3: Activities Included in Ontario Compliance Assessment

Project Component	Activity	Included in Ontario Compliance Assessment?
Open Pit Extraction	Blasting – fugitive dust and explosives	Yes
	Material Handling	Only metals with POI Limits
	Bulldozing	Only metals with POI Limits
	Grading	Only metals with POI Limits
	Vehicles – Exhaust Emissions	No
	Vehicles – Unpaved Fugitive Road Dust	Only metals with POI Limits
Low-grade Ore Stockpile	Material Handling	Only metals with POI Limits
	Bulldozing	Only metals with POI Limits
	Grading	Only metals with POI Limits
Waste Rock Stockpile	Material Handling	No
	Bulldozing	No
	Grading	No
Surface Roads	Vehicles – Exhaust Emissions	No
	Vehicles – Unpaved Fugitive Road Dust	Only metals with POI Limits
Ore Crushing and Screening	Material Handling	Only metals with POI Limits

Table 3: Activities Included in Ontario Compliance Assessment (Continued)

	Ore Crushing	Yes
	Ore Screening	Yes
Ore Processing and Refining	CIP Adsorption	Yes
	Acid Wash	Yes
	Carbon Regeneration	Yes
	Regeneration Furnace	Yes
	Cyanide Destruction	Yes
	Electrowinning	Yes
	Smelting Furnace	Yes
	Sodium Cyanide Use	Yes
Emergency Power Generators	Stationary Diesel Combustion	No
Comfort Heating	Propane Combustion	Only NO_x

Emission rates for each of the model sources for the OCA assessment are included in Tables 4 to 6 and 8.

3.3.3 Point Sources

Point sources are stacks or vents. The point sources include the cyanide destruction stack and the acid wash stack on the concentrator building. Since the exhaust layout for the building has not been designed yet, an arbitrary stack location was assumed for both stacks. The point source model input parameters are summarized in Table 4. Since both sources are included in the OCA, the emission rates for both modelling assessments are the same.

Table 4: Point Source Model Input Parameters

Source Description	Stack Height Above Grade [m]	Stack Gas Exit Velocity [m/s]	Stack Inner Diameter [m]	Stack Exit Gas Temperature [K]	UTM Northing [m]	UTM Easting [m]	Contaminant	Maximum Emission Rate [g/s]
Cyanide Destruction Stack	35	12.00	1	293	612798	5422315	SO_2	1.98 x 10
Acid Wash	16.50	11.64	0.2	293	612798	5422315	HCl	1.97

3.3.4 Volume Sources

Volume sources are used to model releases from a variety of industrial sources that could not be classified as a stack or vent. Many aspects of the Project are in the design phase so that stack specifications are not available. Therefore, the majority of the sources were modelled as volume sources. Table 5 outlines the volume source model input parameters.

In any activity where ore could be a component of the particulate, the particulate emissions were speciated into metals as discussed in Appendix 3.I.

Table 5: Volume Source Model Input Parameters

Notes:

— Emissions not include in Ontario Compliance Assessment as per MOE guidance

The MOE has suggested that roads should be modelled as a series of individual volume sources creating a line that follows the road (MOE 2005). The roads in the assessment were modelled using this volume source approach. The roads were assumed to be 24 m wide. The tailpipe emissions and road dust emissions were combined and modelled for each segment.

The roads were divided into contiguous volume sources measuring 24 by 24 m. A release height of 4.76 m was assumed to be half of the following: the height of CAT 793F Mining Truck (5.6 m), multiplied by 1.7 per EPA memorandum "Haul Road Workgroup Final Report Submission to EPA-OAQPS." The emission rate for the entire road segment was divided amongst the volume sources. There were 11 road segments considered in the assessment.

The model source parameters for the road volume sources are summarized in Table 6.

3.3.5 Open Pit Sources

Open pit sources are generally used to model particulate or gaseous emissions from open pits, such as surface mines and rock quarries. In general, the open pit sources can account for the amount of particulate emissions that are retained within the pit due to the pit depth (pit retention) if particle sizes and densities are specified in the input. Table 7 outlines the values specified for TSP, PM_{10}, $PM_{2.5}$, Metals and DPM. Where possible, the mass fractions of each particle diameter were determined using the emission rates for each source. A particle density of 2.8 (which is the density of the waste rock) was conservatively used for all particles except DPM. Ore typically has a higher density which would result in greater particle pit retention and less emissions.

Table 7: Particle Sizes Specified for the Open Pit Model Sources

Particle Type Modelled	Inputs Specified	Value
TSP	Particle diameter (mass fraction)	30 (0.66), 10 (0.23), 2.5 (0.11)
	Particle density	2.8
PM_{10}	Particle diameter (mass fraction)	10 (0.87), 2.5 (0.13)
	Particle density	2.8
$PM_{2.5}$	Particle diameter (mass fraction)	2.5 (1)
	Particle density	2.8
Metals	Particle diameter (mass fraction)	30 (0.66), 10 (0.23), 2.5 (0.11)
	Particle density	2.8
DPM	Particle diameter (mass fraction)	10 (0.03), 2.5 (0.97)
	Particle density	1.0

Two open pit sources were defined in the assessment: the east pit and the west pit. The two open pit sources used in the model are presented in Table 8. A release height of 4.76 m was assumed to be half of the following: the height of CAT 793F Mining Truck (5.6 m), multiplied by 1.7 per EPA memorandum "Haul Road Workgroup Final Report Submission to EPA-OAQPS."

3.3.6 Averaging Periods

Tables 4 to 6 and 8 presented the daily emission rates for each of the modelled sources. For many of the sources, the daily emission rate does not equal the hourly or annual emission rate. This can be attributed to a source's activity not occurring continuously during the corresponding averaging period. The following activities have emission rates that vary based on averaging period:

- Blasting since it occurs for only two hours per day.
- Road grading occurs less than 24 hours per day.
- The smelting furnace since it only operates for 12 hours per day, 58 days of the year.
- The emergency generators since they are only tested for one hour per week.
- The comfort heating since they only operate during the summer months.

Table 9 displays the emission rates for each averaging time for model sources and contaminants that vary based on averaging period. All other activities operate 24 hr/day, 365 days/year therefore the emission rates, in g/s, are the same for all averaging periods.

Table 9: Emission Rates Modelled for Various Averaging Periods

Modelling Source	Contaminant	Hourly Emission Rate (g/s)	Daily Emission Rate (g/s)	Annual Emission Rate (g/s)
East Pit	TSP	2.61 x 10	2.43 x 10	2.43 x 10
	PM_{10}	8.26	7.29	7.29
	$PM_{2.5}$	1.45	1.40	1.40
	Metals	4.72	3.99	3.99
	NO_X	5.19	4.54	4.54
	CO	1.10 x 10	3.48	3.48
West Pit	TSP	8.12 x 10	7.34 x 10	7.34 x 10
	PM_{10}	2.65 x 10	2.24 x 10	2.24 x 10
	$PM_{2.5}$	3.97	3.73	3.73
	Metals	1.33 x 10	1.03 x 10	1.03 x 10
	NO_X	1.69 x 10	1.52 x 10	1.52 x 10
	CO	3.06 x 10	1.11 x 10	1.11 x 10
Concentrator	CO	8.00	1.04	5.45×10^{-1}
	NO_X	3.32 x 10	2.57	1.02
	TSP	1.35	4.01×10^{-1}	1.83×10^{-1}
	PM_{10}	9.39×10^{-1}	3.84×10^{-1}	1.81×10^{-1}
	$PM_{2.5}$	5.68×10^{-1}	3.68×10^{-1}	1.79×10^{-1}
	Metals	5.02×10^{-1}	3.03×10^{-1}	1.35×10^{-1}
	SO_2	3.37 x 10	2.04 x 10	1.99 x 10
	DPM	7.81×10^{-1}	3.25×10^{-2}	4.63×10^{-3}

Table 9: Emission Rates Modelled for Various Averaging Periods (Continued)

Modelling Source	Contaminant	Hourly Emission Rate (g/s)	Daily Emission Rate (g/s)	Annual Emission Rate (g/s)
Gyratory Crusher Building	TSP*	1.02	1.02	1.02
	PM_{10}*	4.07×10^{-1}	4.07×10^{-1}	4.07×10^{-1}
	$PM_{2.5}$*	1.63×10^{-1}	1.63×10^{-1}	1.63×10^{-1}
	SO_2	3.07×10^{-5}	3.07×10^{-5}	2.04×10^{-5}
	NO_X	2.22×10^{-2}	2.22×10^{-2}	1.47×10^{-2}
	CO	1.28×10^{-2}	1.28×10^{-2}	8.49×10^{-3}
Secondary and Tertiary Crushing Building	TSP	5.46×10^{-1}	5.46×10^{-1}	5.43×10^{-1}
	PM_{10}	5.30×10^{-1}	5.30×10^{-1}	5.27×10^{-1}
	$PM_{2.5}$	3.46×10^{-1}	3.46×10^{-1}	3.42×10^{-1}
	SO_2	2.54×10^{-4}	2.54×10^{-4}	1.68×10^{-4}
	NO_X	1.83×10^{-1}	1.83×10^{-1}	1.22×10^{-1}
	CO	1.06×10^{-1}	1.06×10^{-1}	7.01×10^{-2}

Notes: The emission rates vary slightly due to propane comfort heating although the change isn't displayed due to the scientific notation.

Only model sources that contain emissions from more than just comfort heating were displayed. For the comfort heating sources the hourly emission rates are the same as the daily emission rates. The annual emission rates can be obtained by multiplying the daily emission rates by 0.66.

In most cases, the emissions from road grading contribute less than 1% of the total emissions from that source (e.g. the waste rock stockpile and low-grade ore stockpile) so the variation over the different averaging periods is insignificant.

3.3.7 Building Downwash

AERMOD has the ability to characterize the planetary boundary layer (PBL) through both surface and mixed layer scaling. The AERMOD model constructs vertical profiles or required meteorological variables using similarity (scaling) relationships. Vertical profiles of wind speed, wind direction, turbulence, temperature, and temperature gradient are estimated using the available meteorological observations.

The Plume Rise Model Enhancements (PRIME) algorithms in AERMOD include vertical wind shear calculations (important for buoyant releases from short stacks). The PRIME algorithm also allows for the wind speed deficit induced by the building to change in relation to the distance from the building. These factors improve the accuracy of predicted concentrations within building wake zones that form in the lee of buildings, as illustrated on Figure 8.

Building downwash was not considered in this assessment since the major emission sources were modelled as volume sources.

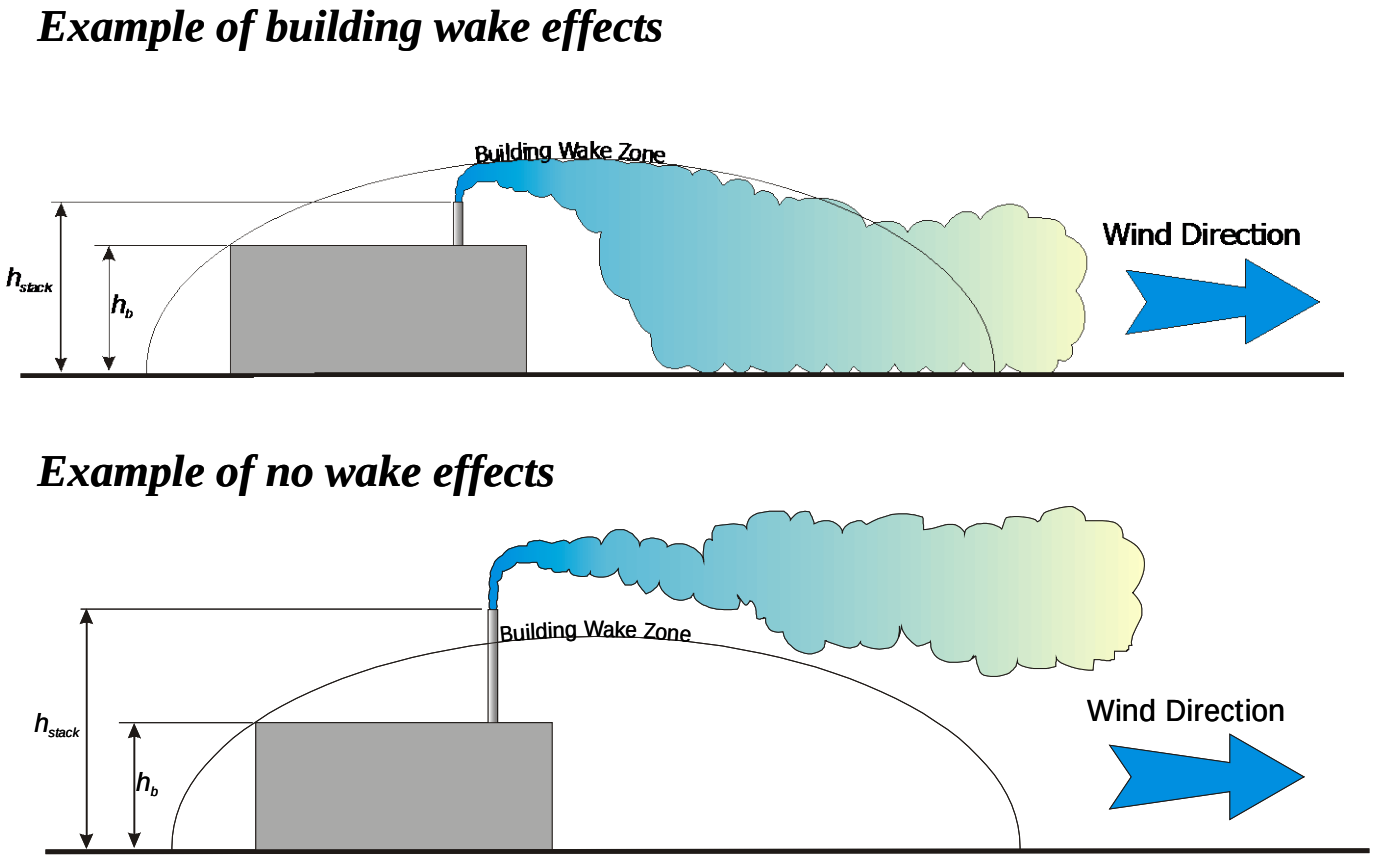

Figure 8: Building Wake Effects

3.4 Model Options and Results Processing

3.4.1 Options Used in the AERMOD Model

The options used in the AERMOD model are summarized in Table 10.

Table 10: Options Used in the AERMOD Model

Modelling Parameter	Description	Used in concentration modelling?	Used in particle deposition modelling?
DFAULT	Specifies that regulatory default options will be used	Yes	No
CONC	Specifies that concentration values will be calculated	Yes	Yes
DEPOS	Specifies that total deposition flux values will be calculated	No	Yes
OLM	Specifies that the non-default Ozone Limiting Method for NO_2 conversion will be used	No	No
DDEP	Specifies that dry deposition will be calculated	No	Yes
NODRYDPLT	Option to disable dry depletion (removal) processes	For particulate species only	No
WDEP	Specifies that wet deposition will be calculated	No	Yes
NOWETDPLT	Option to disable wet depletion (removal) processes	For particulate species only	No
FLAT	Specifies that the non-default option of assuming flat terrain will be used	No, the model will use elevated terrain as detailed in the AERMAP output	No, the model will use elevated terrain as detailed in the AERMAP output
NOSTD	Specifies that the non-default option of no stack-tip downwash will be used	No	No
AVERTIME	Time averaging periods calculated	1-hr, 24-hr, and Annual	Annual
URBANOPT	Allows the model to incorporate the effects of increased surface heating from an urban area on pollutant dispersion under stable atmospheric conditions	No	No

Table 10: Options Used in the AERMOD Model (Continued)

Modelling Parameter	Description	Used in concentration modelling?	Used in particle deposition modelling?
URBANROUGHNESS	Specifies the urban roughness length (m)	No, site specific roughness values were incorporated into the AERMET processing	No, site specific roughness values were incorporated into the AERMET processing
FLAGPOLE	Specifies that receptor heights above local ground level are allowed on the receptors	No	No

4.0 POST PROCESSING

4.1 Averaging Time Conversions

The smallest time scale that AERMOD predicts is a 1-hour average value. There are instances when criteria are based on smaller averaging times and in these cases the following conversion factor is recommended by the MOE for conversion from a 1-hour averaging period to the applicable averaging period less than 1-hour (MOE 2005):

$$F = \left(\frac{t1}{t0}\right)^{n} = \left(\frac{60}{10}\right)^{0.28} = 1.65$$

Where:

F is the factor to convert from the averaging period t_1 output from the model (MOE assumes AERMOD predicts true 60-minute averages) to the desired averaging period t_0 (assumed to be 10 minutes in the example above).

n is the exponent variable; in this case the MOE historical value of n = 0.28 is used for conversion.

This conversion was used to compare the one-hour AERMOD output to the ½ hour O. Reg. 419/05 standard for CO. For averaging periods greater than one hour, the AERMOD output was used directly.

4.2 Conversions of NO_x to NO_2

Emissions of oxides of nitrogen (NO_X) were used as inputs to the AERMOD model. Ambient predictions of nitrogen dioxide (NO_2), one of the indicator compounds, were modelled by AERMOD using the Ozone Limiting Method (OLM) suggested by Cole and Summerhays (Cole et al. 1979). This method is widely accepted as being a reasonable approach that recognizes the most important mechanism for NO_X conversion, namely reactions with ozone. A non-default OLM option in the AERMOD allows that conversion of NO_X to NO_2 be modelled provided the background ozone concentration is available. The 1-hour, 24-hour and annual NO_2 concentrations were calculated using the 90th percentile of the eight-hour ground-level ozone concentrations from the Pickle Lake, Ontario station for the years 2000 to 2008.

5.0 CONSERVATISM IN MODELLING APPROACH

Table 11 outlines the areas where conservatism was assumed in the modelling approach which results in an assessment that is not likely to under-predict the air quality associated with the Project.

Table 11: Areas of Conservatism in the Modelling Approach

Area	Conservatism
All operations were modelled to be occurring simultaneously, including blasting out of both pits	The modelling assessment includes all operations namely waste rock hauling and ore hauling simultaneously with blasting occurring in both pits.
The bounding condition for the Operations phase of the Project was modelled	All emission rate calculations (Appendix 3.I) incorporated the maximum throughput and processing rates and as stated above all were modelled to be operating simultaneously. Emissions from years leading up to and after this bounding condition will likely be less than the scenario that was modelled.
Almost all sources were modelled as volume sources	Since the Project does not have building ventilation and exhaust plans at this stage, most buildings were modelled as volume sources therefore not taking into consideration the buoyancy of any exhausts that will be constructed as vertical stacks.
Waste rock and ore stockpile emissions were modelled at the worst case location which may not occur at the same time as maximum production	The model source for each stockpile was placed in closest proximity to the receptors. In the peak production year it is unlikely that the stockpiles will be actively worked at this location.

The bounding condition that was modelled corresponds most closely to years 6-9, when both pits are being mined simultaneously. In years 0-5 only the east pit will be mined at a shallower depth than the bounding condition. In the final years of the project only the west pit will be mined up to the depth assumed in the bounding condition. This approach is considered conservative, with a low likelihood to underestimate the modelled air quality associated with the Project because it is unlikely that all of these assumptions may be true at any one given time, (i.e., maximum productions rates may not be occurring at the same time as the longest haul truck routes).

It is assumed that the conservative emission rates (Appendix 3.I), when combined with the conservative operating conditions and conservative dispersion modelling assumptions description herein, are not likely to under predict the modelled concentrations at each of the identified receptors.

1.0 INTRODUCTION

The proposed Hammond Reef Gold Project (Project) is located in northeastern Ontario approximately X km from the community of Atikokan. The approach to develop the background concentration was discussed in a meeting with the Ontario Ministry of the Environment (MOE) and Environment Canada in May 2012.

2.0 EXISTING AIR QUALITY DATA SOURCES

The existing environment for air quality includes current air quality conditions in the area surrounding the Project Site. Existing air quality data are analyzed to establish background air quality concentrations.

Northern Ontario is generally free of significant industry. As a result there are limited sources of air quality data. The following sources of information were used in the characterization of the existing air quality:

- Ontario Ministry of the Environment, Air Quality Monitoring Station Data.
- Government of Saskatchewan Air Quality Readings.
- Northwest Territories Air Quality Monitoring Network.
- Quebec Department of Sustainability, Environment and Parks, Air Quality Index Monitoring Stations.
- Government of Manitoba, Manitoba Air Quality.
- Government of Alberta, Clean Air Strategic Alliance, the Alberta Ambient Air Quality Monitoring System.
- Environment Canada, National Air Pollution Surveillance Network.

The data from monitoring stations was analyzed to estimate the air quality in the RSA. Figure 1 illustrates the location of the monitoring stations in relation to the Project Site. A brief description of each station follows.

Fort Liard

The Fort Liard station is operated by the Northwest Territories Air Quality Monitoring Network and is located at an airport in southern Northwest Territories. This station is used to establish baseline community air quality. However, there are a number of oil and gas developments in the region that could contribute to the existing air quality. In addition, the station at Fort Liard is located at the airport; therefore, baseline air quality may also be influenced by aircraft.

Fort Chipewyan

The Fort Chipewyan station is operated by the Wood Buffalo Environmental Association (WBEA) and is used to calculate the air quality index readings in the province. It is located near the small town of Fort Chipewyan, Alberta (population around than 1,000 people).

La Loche

The La Loche station is operated by the Saskatchewan government and is located in a rural town (population less than 2,500 people). While there are no known industrial emission sources in the vicinity that would have an impact on the local air quality, the La Loche station was established to track the quality of air entering the province from the heavily industrialized areas in the Alberta Oil Sands. In addition, the areas in both northern Alberta and northern Saskatchewan are known for frequent forest fires that contribute to local and regional air quality.

Brandon

The Brandon station is operated by the Manitoba government and is used to calculate the air quality index readings in the province. It is classified as urban/industrial neighbourhood. It is located in the city of Brandon, Manitoba (population less than 47,000 people). The major industry in the city is related to agriculture and it is located along a rail line.

Pickle Lake

The Pickle Lake station is also operated by Environment Canada's NAPS program and is used to provide air quality data to be included with other stations across Canada. It is classified by NAPS as undeveloped. It is located north of the Site and within the community of Pickle Lake, Ontario (population less than 500 people).

Thunder Bay

The Thunder Bay station is the nearest monitoring station to the Project Site and is operated by the MOE. Located in the city of Thunder Bay this station will be affected by local industry including pulp and paper mills and manufacturing. The results of this station will also be affected by transportation sources such as cars or trucks and therefore the NOx and O_3 concentrations will not be representative of background levels at the Project Site. This data can provide information pertaining to long-range transport of contaminants from the United States.

Fraserdale

The Fraserdale station is operated by Environment Canada's National Air Pollution Surveillance (NAPS) program and is used to provide air quality data to be included with other stations across Canada. It is classified by NAPS as undeveloped. It is located northeast of the Project Site and approximately 50 km north of the town of Smooth Rock Falls, Ontario (population less than 1,500 people).

Senneterre

The Senneterre station is operated by the Quebec government and is used to calculate the air quality index readings in the province. It is classified as rural – forest. It is located near the town of Senneterre, Quebec (population less than 3,000 people).

Table 1 provides a summary of the station information.

Table 1: Monitoring Station Information

Station ID	Location	Distance to Site
Fort Liard	Northwest Territories	2,343 km
Fort Chipewyan	Alberta	1,656 km
La Loche	Saskatchewan	1,451 km
Brandon	Manitoba	621 km
Pickle Lake	Ontario	351 km
Thunder Bay	Ontario	171 km
Fraserdale	Ontario	723 km
Senneterre	Quebec	1,050 km

Field studies were not undertaken to characterize the existing air quality, since available data can be used to characterize the local and regional air quality.

The existing air quality in the RSA is characteristic of the general air quality in North Western Canada, and has been described using monitoring data from stations operated by the Environment Canada and various provincial groups.

Table 2 provides a summary of the monitoring data available from each of these stations.

Table 2: Availability of Ambient Air Quality Data

Location	Electronic Data Availability					
	NO_2	SO_2	CO	O_3	$PM_{2.5}$	PM_{10}
Fort Liard	2006-2010	2006-2010	N/A	2007-2010	2006-2010	2008-2011
Fort Chipewyan	2006-2010	2006-2010	N/A	2006-2010	2006-2010	N/A
La Loche	2008-2010	2008-2010	2008-2010	2008-2010	2008-2010	2008-2010
Brandon	2008-2010	2006-2010	N/A	2008-2010	N/A	2008-2010
Pickle Lake	N/A	N/A	N/A	2006-2009	N/A	N/A

Fraserdale	N/A	N/A	N/A	2005-2007	N/A	N/A
Senneterre	N/A	N/A	N/A	N/A	2006-2010	N/A

Notes:

N/A = not available.

Sections 2.1 through 2.5 summarize the air quality for each parameter at each station identified above.

2.1 Nitrogen Dioxide

Nitrogen dioxide (NO_2) emissions occur mainly from high-temperature combustion processes. In Ontario, the transportation sector accounts for approximately 64% of the NO_X emissions a precursor to NO_2 (MOE 2006). Although the majority of NO_X emissions are in the form of NO, these rapidly oxidize in the presence of ozone to form NO_2. A summary of the available 1-hour NO_2 monitoring results is presented in Table 3. All of the values were below the ambient air quality criteria (AAQC) in Ontario of 0.200 ppm (i.e., 200 ppb) except for the maximum value for La Loche.

Table 3: Ambient 1-hour NO_2 Monitoring Results

Station	Ambient Monitoring Results (ppb)						
	Average	Median	75%-ile	90%-ile	98%-ile	99%-ile	Maximum
Fort Liard	0.34	0.00	0.56	1.24	1.87	2.11	12.61
Fort Chipewyan	1.16	0.00	1.00	3.00	9.00	13.00	31.00
La Loche	2.47	1.00	3.00	6.00	12.00	15.00	*549.00*
Brandon	5.09	3.00	7.00	12.00	22.00	27.00	49.00
Thunder Bay	8.21	6.00	11.00	18.00	31.00	35.00	55.00
AAQC (ppb)	**200**						

Notes: Cells shaded in grey with italics represent values above the AAQC.

Table 4 provides a summary of the available 24-hour NO_2 concentrations measured at the ambient monitoring stations. None of the 24-hour ambient monitoring results exceed the AAQC of 0.100 ppm (i.e., 100 ppb). Annual data are not reported in Ontario for NO_2. Instead, the average value of the data reported is used to represent the annual data.

Table 4: Ambient 24-hour NO_2 Monitoring Results

Station	Ambient Monitoring Results (ppb)						
	Average	Median	75%-ile	90%-ile	98%-ile	99%-ile	Maximum
Fort Liard	0.34	0.01	0.59	1.23	1.76	1.84	3.21
Fort Chipewyan	1.15	0.57	1.39	2.83	6.26	8.13	21.61
La Loche	2.48	1.92	3.15	5.04	8.36	9.71	28.14
Brandon	5.10	4.09	6.96	9.96	16.01	18.67	30.74
Thunder Bay	8.21	6.92	10.59	15.04	21.35	22.81	33.54
AAQC (ppb)	**100**						

Notes: Cells shaded in grey with italics represent values above the AAQC.

2.2 Sulphur Dioxide

Sulphur dioxide (SO_2) is formed when sulphur in fuel reacts with oxygen during the combustion process. Table 5 presents summaries of the 1-hour SO_2 concentrations. The maximum value from the La Loche station exceeds the AAQC however the 99th percentile is below the AAQC. All other results are below the AAQC.

Table 5: Ambient 1-hour SO_2 Monitoring Results

Station	Ambient Monitoring Results (ppb)						
	Average	**Median**	**75%-ile**	**90%-ile**	**98%-ile**	**99%-ile**	**Maximum**
Fort Liard	0.30	0.00	0.44	1.22	1.79	1.90	2.91
Fort Chipewyan	0.31	0.00	0.00	1.00	3.00	5.00	20.00
La Loche	0.47	0.00	0.00	1.00	3.00	4.00	*469.00*
Brandon	0.31	0.00	0.00	1.00	3.00	5.00	20.00
AAQC (ppb)	**250**						

Notes: Cells shaded in grey with italics represent values above the AAQC.

Table 6 provides summaries of the available 24-hour SO_2 concentrations measured at the ambient monitoring stations. All of the stations are below the AAQC.

Table 6: Ambient 24-hour SO_2 Monitoring Results

Station	Ambient Monitoring Results (ppb)						
	Average	**Median**	**75%-ile**	**90%-ile**	**98%-ile**	**99%-ile**	**Maximum**
Fort Liard	0.30	0.00	0.44	1.23	1.72	1.78	1.90
Fort Chipewyan	0.31	0.00	0.26	1.04	2.61	3.61	7.74
La Loche	0.37	0.00	0.27	0.67	2.24	7.32	24.10
Brandon	0.31	0.00	0.26	1.04	2.61	3.61	7.74
AAQC (ppb)	**100**						

Annual data for SO_2 are not reported in Ontario. Instead, the average value of the data reported is used to represent the annual data.

2.3 Carbon Monoxide

Carbon monoxide (CO) is produced primarily through the incomplete combustion of hydrocarbons. A summary of the available 1-hour CO monitoring results is presented in Table 7. The maximum value exceeds the AAQC; however; all other values are below.

Table 7: Ambient 1-hour CO Monitoring Results

Station	Ambient Monitoring Results (ppm)						
	Average	Median	75%-ile	90%-ile	98%-ile	99%-ile	Maximum
La Loche	0.60	0.20	0.30	1.00	5.40	7.70	*48.30*
AAQC (ppm)	**30**						

Notes: Cells shaded in grey with italics represent values above the AAQC.

Table 8 provides summaries of the available 8-hour CO concentrations measured at the ambient monitoring stations. Similar to the 1-hour results, the maximum value exceeds the AAQC but all other values are below.

Table 8: Ambient 8-hour CO Monitoring Results

Station	Ambient Monitoring Results (ppm)						
	Average	Median	75%-ile	90%-ile	98%-ile	99%-ile	Maximum
La Loche	0.60	0.20	0.30	1.01	5.45	7.59	*34.35*
AAQC (ppm)	**13**						

Notes: Cells shaded in grey with italics represent values above the AAQC.

2.4 Ozone

Ozone (O3) is an essential part of the upper atmosphere that protects us from most of the sun's harmful ultra-violet radiation. Ozone can also be present at the earth's surface. Ground-level ozone can be attributed to three causes in Canada, namely photochemical ozone formation, stratospheric intrusion and long-range transport. The interaction of the three sources of ground-level ozone is illustrated on Figure 2.

Photochemical ozone formation is one of the key ingredients of urban smog that is associated with large American cities, such as Los Angeles. Photochemical ozone forms when large volumes of oxides of nitrogen (NO_X) and volatile organic compounds (VOCs) are present during the right meteorological conditions. This type of ozone formation occurs during the daylight hours in the summer months when hot, sunny, stagnant conditions favour the necessary chemical reactions.

At night, this photochemical ozone breaks down because sunlight, essential in the reaction, is absent. This relationship is shown in the following formulae:

$$\mathrm{VOC} + \mathrm{sunlight} + \mathrm{NO_X} \rightarrow \mathrm{O_3} \qquad \text{daytime}$$

$$O_2 + NO_2 \leftarrow O_3 + NO \qquad \text{nighttime}$$

The ozone layer is relatively close to the earth's surface in northern and central Canada. Under some conditions, this stratospheric ozone can intrude into the lower atmosphere and result in elevated ground-level ozone concentrations. This intrusion of stratospheric ozone has been identified as the key source of ground-level ozone in the rural areas of northern Canada (CCME 1999). This is likely only a source of elevated ozone concentrations in areas of northern Ontario.

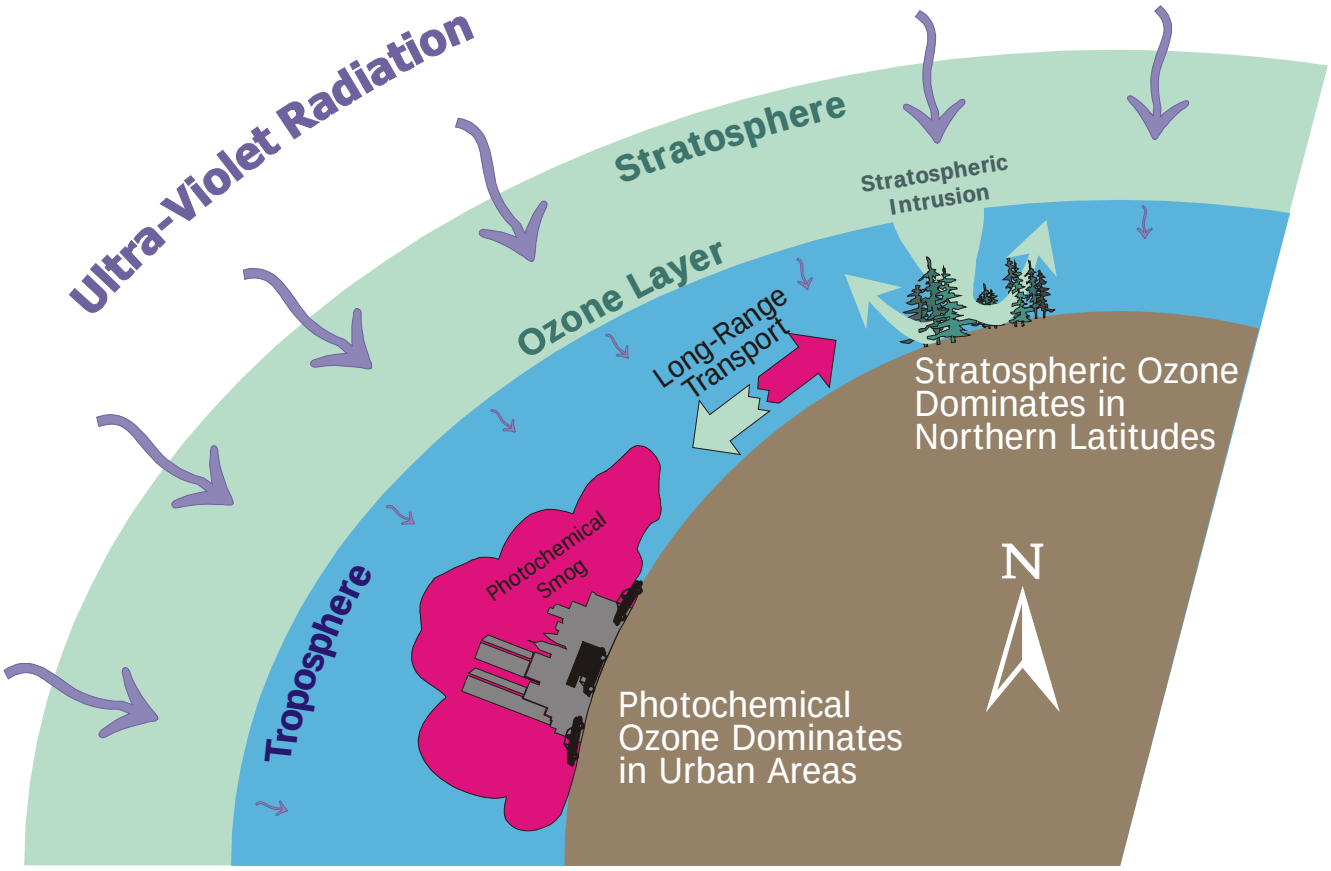

Figure 2: Potential Sources of Ground-Level Ozone in Canada

The transport of ozone over long distances occurs in several regions of Canada. In Southern Ontario, photochemical ozone is frequently transported into Canada from larger cities in the United States.

Ozone was not identified as a key indicator for the assessment as the Project does not directly emit ozone, nor does it emit precursor compounds in sufficient volumes to results in enhanced ozone formation. However, ozone is important in the conversion of nitric oxide (NO), the major constituent of NO_X emissions, to nitrogen dioxide (NO_2) in the atmosphere.

A summary of the available 1-hour ozone monitoring results is presented in Table 9. Most of the stations are below the AAQC; however, Fraserdale and Pickle Lake are at the AAQC level and La Loche exceeded the AAQC less than 1% of the time.

Table 9: Ambient 1-hour Ozone Monitoring Results

Station	Ambient Monitoring Results (ppb)						
	Average	**Median**	**75%-ile**	**90%-ile**	**98%-ile**	**99%-ile**	**Maximum**
Fort Liard	23.71	23.37	31.78	39.13	48.88	51.47	65.02
Fort Chipewyan	27.01	27.00	33.00	39.00	47.00	50.00	66.00
La Loche	24.87	24.00	31.00	38.00	46.00	48.00	*460.00*
Brandon	24.88	25.00	32.00	40.00	49.00	52.00	66.00
Pickle Lake	29.95	30.00	36.00	43.00	51.00	54.00	80.00
Thunder Bay	24.10	25.00	33.00	40.00	49.00	52.00	74.00
Fraserdale	28.29	28.00	34.00	41.00	53.00	57.00	79.00
AAQC (ppb)	**80**						

Notes: Cells shaded in grey with italics represent values above the AAQC.

Table 10 provides summaries of the available maximum 8-hour ozone concentrations measured at the ambient monitoring stations. Currently there is no 8-hour AAQC for ozone, but there is a Canada-Wide Standard (CCME 2000) that has been used for comparison to the data. Maximum 8-hour ozone concentrations at four of the stations exceed the Canada-Wide Standard of 0.065 ppm (i.e., 65 ppb). However, compliance with the Canada-Wide Standard is based on the fourth highest 8-hour value annually, averaged over a 3-year period. These are presented for La Loche, Thunder Bay, Fraserdale and Pickle Lake in Table 11. There were not any 3-year data sets available for the other stations. The values were all above the Canada-Wide Standard of 0.065 ppm (65 ppb).

Table 10: Ambient 8-hour Ozone Monitoring Results

Station	Ambient Monitoring Results (ppb)						
	Average	**Median**	**75%-ile**	**90%-ile**	**98%-ile**	**99%-ile**	**Maximum**
Fort Liard	23.72	23.12	31.50	38.60	47.09	49.61	61.29

	2007-2009	*65.5*
	2008-2010	*65.5*
Fraserdale	2005-2007	*75.125*
Pickle Lake	2006-2008	*70.25*
	2007-2009	*70.25*
Canada-Wide Standard (ppb)		**65**

Notes:
Cells shaded in grey with italics represent values above the CWS.

2.5 Particulate Matter

Airborne particulate matter in Ontario is described using three size categories. Suspended particulate matter (SPM) is the largest category and includes those airborne particles with an aerodynamic diameter less than 44 µm. The portion of the SPM with aerodynamic diameters of 10 µm, or less is referred to as PM_{10}. The PM_{10} sized particles are small enough to be inhaled into the upper respiratory tract. The fraction of the SPM and PM_{10} with an aerodynamic diameter of 2.5 µm or less is referred to and $PM_{2.5}$. The $PM_{2.5}$ sized particles are small enough to be drawn into the lungs, and are sometimes described as the respirable fraction of airborne particles. While periodic monitoring of SPM and PM_{10} is still done in Ontario, only the continuous $PM_{2.5}$ monitoring data is available electronically for review and presentation.

A summary of the available daily PM2.5 monitoring results is presented in Table 12. While there is no AAQC for PM2.5, the Canada-Wide Standard (CCME 2000) has been used to compare to the data. As illustrated in the table, all of the stations recorded 98th percentile daily PM2.5 levels that were below the Canada-Wide Standard level of 30 µg/m³. However, compliance with the Canada-Wide Standard is based on the 98th percentile of the monitoring data, averaged over a 3-year period. Table 12 presents a summary of the 3-year rolling 98th percentile PM2.5 concentrations for comparison to the Canada-Wide Standard.

Table 12: Ambient 24-hour $PM_{2.5}$ Monitoring Results

Station	Ambient Monitoring Results (µg/m³)						
	Average	Median	75%-ile	90%-ile	98%-ile	99%-ile	Maximum
Fort Liard	3.57	2.69	4.35	6.77	11.74	14.21	74.67
Fort Chipewyan	2.68	1.66	2.98	4.93	11.11	18.86	68.20
La Loche	3.52	1.43	5.44	8.86	14.10	16.55	39.11
Thunder Bay	4.29	3.46	5.63	8.50	14.52	16.54	28.58
Canada-Wide Standard (µg/m³)[(a)]	—	—	—	—	**30**	—	—

Notes:

[(a)] Compliance with the Canada-Wide Standard is based on the 98th percentile of the monitoring values, averaged over a 3-year period.

"%-ile" = Percentile.

— = Not available.

There is an interim AAQO in Ontario for PM_{10} of 50 µg/m³. Table 13 presents summary of the available PM_{10} concentrations measured at the ambient monitoring stations.

Table 13: Ambient 24-hour PM_{10} Monitoring Results

Station	Ambient Monitoring Results (µg/m³)						
	Average	Median	75%-ile	90%-ile	98%-ile	99%-ile	Maximum

Brandon	22.20	15.33	29.05	47.44	*72.69*	*82.92*	*255.01*
AAQC (µg/m³)	**50**						

Notes:

Cells shaded in grey with italics represent values above the AAQC.

3.0 SUMMARY OF BACKGROUND AIR QUALITY

Air monitoring data collected from north eastern Canada represent the naturally occurring sources and those from long range transport for the RSA. The emissions transported into the region could be considered to be the "background air quality." Based on feedback from regulators, and expert judgement, the 90th percentile of the available monitoring data is considered a conservative estimate of background air quality.

Table 14 provides a listing of the 90th percentile concentrations from the air monitoring stations.

Table 14: Background Air Quality

Compound	Ave. Period	90th Percentile of Monitored Data (µg/m³)							
		Fort Liard	La Loche	Thunder Bay	Fraserdale	Pickle Lake	Senneterre	Brandon	Fort Chipewyan
PM_{10}	24-hour	17.81	102.09	—	—	—	—	47.44	—
$PM_{2.5}$	24-hour	6.77	8.86	8.50	—	—	8.21	—	4.93
SO_2	1-hour	3.19	2.62	—	—	—	—	2.62	2.62
	24-hour	3.21	1.77	—	—	—	—	2.73	2.73

HISTORIC TREND ANALYSIS

In the historic trend graphs, the focus should be on the slope of the trend line and how it compares to the normal. The normal represents a 'baseline' or average value of what's happening over the time period. If the trend varies largely from normal (large slope) then it is not unreasonable to think there will be significant changes to the same climate index in the future. Likewise, if there is little variation between the normal and trend (small slope) then it is likely that the climate index will remain relatively constant in the future. Of course, this all assumes there will be no wild changes in the climate.

The statistical significance indicates the confidence in the data and is not a direct measure of the probability that the trend will occur in the future. It indicates the confidence in the trend. For example, if a trend is statistically significant in the 95th percentile, it means that there is 95% chance that the trend falls within the confidence interval. Only the 90th, 95th, 99th and 99.9th confidence intervals are tested. A trend with no statistical significance can mean a combination of things:

- The confidence is less than 90% but may not be low (e.g. 85%).
- There is not enough data to properly capture the trend (missing values).
- There is a large variability in the data (no significant trend can be determined).

The confidence interval on the graph can be thought of as the range in the slope. If the range is small compared to variability in the data points, then the confidence in the slope is high.

Data Quality

This data can be considered of low quality with over half of the data missing and limited continuous periods of data available. For the period of 1980 through to 2007, the years of 1986 through to 1991 do not meet the quality control / quality assurance criteria for the data or are missing. For temperature alone, the years of 2005 through to 2007 are also missing. The data shown in the figures below should only be considered qualitative in nature and should not be used in any quantitative calculations.

HISTORIC TREND ANALYSIS

In the historic trend graphs, the focus should be on the slope of the trend line and how it compares to the normal. The normal represents a 'baseline' or average value of what's happening over the time period. If the trend varies largely from normal (large slope) then it is not unreasonable to think there will be significant changes to the same climate index in the future. Likewise, if there is little variation between the normal and trend (small slope) then it is likely that the climate index will remain relatively constant in the future. Of course, this all assumes there will be no wild changes in the climate.

The statistical significance indicates the confidence in the data and is not a direct measure of the probability that the trend will occur in the future. It indicates the confidence in the trend. For example, if a trend is statistically significant in the 95th percentile, it means that there is 95% chance that the trend falls within the confidence interval. Only the 90th, 95th, 99th and 99.9th confidence intervals are tested. A trend with no statistical significance can mean a combination of things:

- The confidence is less than 90% but may not be low (e.g. 85%).
- There is not enough data to properly capture the trend (missing values).
- There is a large variability in the data (no significant trend can be determined).

The confidence interval on the graph can be thought of as the range in the slope. If the range is small compared to variability in the data points, then the confidence in the slope is high.

Data Quality

This data can be considered to be of high quality with less than 10% of the data missing overall and a continuous record of data over the selected time period.

1.0 INTRODUCTION

This Appendix documents the methods, data and assumptions that were used to estimate the greenhouse gas (GHG) emissions for the Project. The assessment consisted of a three step process:

- Estimation of the total emission from the facility and a comparison to the GHG reporting requirements under the federal and provincial reporting programs;
- Comparison to the total reported emissions both provincially and federally; and
- Estimation of the projects significance compared to the global emissions used in the assumptions to estimate climate change.

It is important to note that the inputs used to estimate the emissions are based on the Project description and may significantly overestimate the actual emissions so any comparison to the reporting programs must be validated once actual consumption data is available.

2.0 ASSESSMENT FRAMEWORK

The estimated emissions methods described within follow generally accepted practices for conducting Environmental Assessments and where applicable the provincially and federally regulatory reporting programs.

GHG emissions were calculated for significant mining, gold processing and supporting activities. A worst case emissions scenario was considered. Sources of emissions for this scenario included:

- blasting;
- vehicle tailpipe exhaust emissions;
- emissions from gold refining process; and
- emissions from auxiliary processes including emergency power generators (EPGs) and comfort heating.

Some activities relating to the Project were considered insignificant and were not assessed. These are discussed in more detail in Section 3. The physical parameters and assumptions that were used in the emission rate calculations for each Project Component are discussed in Section 6.

This Appendix provides the procedures for estimation of GHG emissions from all significant sources at the Facility subject to the above reporting programs.

Table 1 presents relevant reference material that forms the basis of GHG emission estimates for the GHG Manual. The following sub-sections present a brief description of this material.

Table 1: Applicable Guidelines for Estimation of GHG Emissions

Guideline	Program	Source	Date
The Greenhouse Gas Protocol/A Corporate Accounting and Reporting Standard (1)	GRI	World Business Council for Sustainable Development/World Resources Institute (WBCSD/WRI)	April 2004
Guideline for Greenhouse Gas Emissions Reporting (2)	O. Reg. 452/09	Ontario Ministry of the Environment (MOE)	February 2012
Technical Guidance on Reporting Greenhouse Gas Emissions (3)	GHGRP	Environment Canada	2012

2.1 The GHG Protocol, WRI/WBCSD (2004)

The GHG Protocol provides guidance for preparing corporate GHG inventories, as well as sector specific and general (i.e., not sector specific) calculation tools that can be used for estimating GHG emissions. The GHG Protocol has been adopted by the Global Reporting Initiative (GRI).

The GHG Protocol introduces the concept of direct and indirect emissions and scopes for GHG emission inventory under three broad categories, as follow:

Scope 1 - Direct GHG emissions:

Carbon emissions occurring from sources that are owned or controlled by the company (e.g., emissions from combustion in owned or controlled boilers, furnaces and vehicles, process and fugitive emissions).

Scope 2 - Electricity indirect GHG emissions:

Carbon emissions from the generation of purchased electricity, heat or steam consumed by the company.

Scope 3 - Other indirect GHG emissions:

Carbon emissions which are a consequence of a company's activities, but occur from sources not owned or controlled by the company (e.g., emissions from waste, the extraction and production of purchased materials; and employee travel to and from work).

This classification is illustrated in Figure 1. The GHG Protocol requires reporting of Scope 1 (direct emissions from site) and Scope 2 (emissions from on-site energy consumption) emissions only. Scope 1 and Scope 2 emissions are typically the focus of most corporate inventories, although many organizations choose to account for other activities such as employee travel and downstream emissions from waste. These sources are classified as Scope 3 (indirect) emissions, and are reported as an option. Given the nature of Facility operations, Scope 1 and 2 emissions will be the most significant, and will provide the best opportunity for mitigation. Accordingly, these categories will be the primary focus of the GHG inventory.

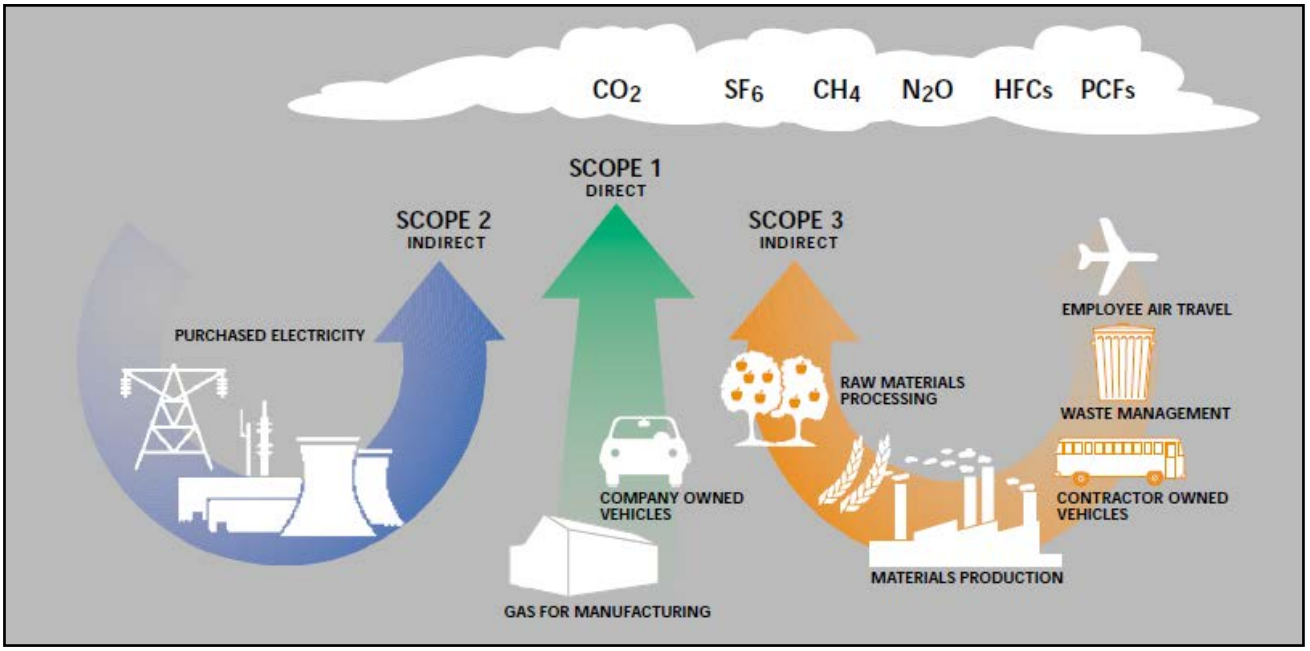

Figure 1: Scope 1, 2 and 3 GHG Emissions

2.2 Guideline for Greenhouse Gas Emissions Reporting, Ontario MOE (February 2012)

O. Reg. 452/09 governs the documentation and reporting of GHG emissions in Ontario. The *Guideline for Greenhouse Gas Emissions Reporting* (February 2012) (the O. Reg. 452/09 Guideline), provides the emission estimation approaches that are required to be used under this reporting regulation. The reporting threshold for O. Reg. 452/09 is 25 kilotonnes of CO_2e. The emissions generated at the Facility are defined by the O. Reg. 452/09 Guideline GHG emission estimation method ON.20 – General Stationary Combustion.

ON.20: Sources to be Included in Inventory

As per ON.20, sources that meet the definition of stationary fuel combustion sources are to be documented and reported. This includes devices such as boilers, kilns, furnaces, combustion turbines incinerators and process heaters. It is important to note that the Ontario guideline does not require the documentation and reporting of GHG emissions associated with on-site fuel combustion in mobile sources (e.g., on-site vehicles).

ON.20 Emission Estimation Methodologies

The methodologies included in ON.20 for the estimation of GHG emissions from fuel consumption are defined as Calculation Methodologies 1, 2 and 3. One additional methodology exists, but it only applies if a CO_2 continuous emission monitoring system is installed at the reporting facility.

Further, ON.24 defines the methodologies for the calculation of CH_4 and N_2O emissions and ON.25 defines the Sampling, Analysis and Measurement Requirements.

2.3 Technical Guidance on Reporting Greenhouse Gas Emissions, Environment Canada (2009)

The *Technical Guidance on Reporting Greenhouse Gas Emissions* (2006) (the GHGRP Guideline), provides direction in determining if facilities are required to submit a GHG report to Environment Canada, an overview of the reporting process, as well as technical information related to GHG emissions estimations. Technical information includes GHG emission sources subject to reporting and information on emission estimation methodologies.

The GHGRP Guideline references GHG estimation methodologies from the United Nations Framework Convention on Climate Change (UNFCCC) and developed by the International Panel on Climate Change (IPCC). The GHGRP guideline states that “no specific estimation methods are prescribed” and that facilities should choose estimation methods that are most appropriate for their particular industry but are consistent with the guidelines adopted by the UNFCCC for preparing GHG inventories.

Table 2 of the GHGRP references specific IPCC document sections pertaining to each GHG emission source category.

The reporting threshold for the GHGRP is 50 kilotonnes of CO_2e.

3.0 INVENTORY BOUNDARY

The definition of the inventory boundary, which frames the GHG emission sources that are included in the GHG Emissions Inventory for the Project, is based on the GHG estimation guidelines for O. Reg. 452/09 and the GHGRP, and therefore, process-related emissions and on-site mobile and stationary fuel combustion emissions have been included in the GHG Emissions for the Project.

Table 2 outlines the GHG inventory boundaries of the Programs and presents the source categories included in this appendix.

Table 2: Source Categories Included in O. Reg. 452/09, the GHGRP and assessed in the EA

Source Category	O. Reg. 452/09	GHGRP	Assessed in EA
Process-related emissions (process streams containing carbon) (Scope 1)	—	✓	✓
On-site stationary fuel combustion sources (Scope 1)	✓	✓	✓
On-site mobile fuel Combustion Sources (Scope 1)	—	✓	✓
Electricity purchases (Scope 2)	—	—	—
Other indirect emissions (Scope 3)	—	—	*

Notes:

* = Not quantitatively assed.

Other indirect GHG emissions (Scope 3) have been included in the inventory for the project. As presented in Section 2, reporting Scope 2 and Scope 3 emissions is not required by the O. Reg. 452/09 Guideline or the GHGRP Guideline. For the project, these emissions are the result of land clearing and are assessed qualitatively.

4.0 IDENTIFICATION OF GHG SOURCES

Table 3 presents the GHG sources identified at the Facility based on the inventory boundary defined in Section 4.

Table 3: GHG Sources Included in the GHG Reporting

Source	Source Category	Carbon Containing Materials
Blasting	Process Related Emissions (Scope 1)	Explosives – Emulsion
Ore Processing and Refining (Regeneration Furnace)	On-site Stationary Fuel Combustion Sources (Scope 1)	Propane
EPGs	On-site Stationary Fuel Combustion Sources (Scope 1)	Diesel
Comfort Heating	On-site Stationary Fuel Combustion Sources (Scope 1)	Propane
Mining Fleet	On-site Mobile Fuel Combustion Sources (Scope 1)	Diesel
Land Clearing	On-site Land Clearing (Scope 3)	Vegetation, Soil

5.0 GHG EMISSION ESTIMATION METHODOLOGY

The following sections describe the methodologies used for calculating GHG emissions for the Project.

5.1 Blasting

The explosive used at the Project's mine site is emulsion and is composed of various carbon-containing substances. There is no specific guidance available for calculation of the GHG emissions from explosives detonation, however based on the nature of the reaction in explosive detonation, it is reasonable to assume that all carbon contained in the explosives is fully oxidized in the explosion.

The methodology applied to calculate CO_2 emissions from explosives detonation uses a carbon mass balance approach in which the carbon content of the detonated explosives is based on the respective Material Safety Data Sheets of the explosives and all carbon is assumed to be oxidized to CO_2, as described by the equation below:

$$E_{CO_{2,expl}} = \left(Q_{expl,i} \times C_i\right) \times \frac{44}{12} \qquad \text{(Equation 1)}$$

Where:

- $E_{CO_{2,expl}}$ = total CO_2 emitted from explosives detonation (tonnes / year)
- $Qexpl_i$ = total quantity of explosive *i* detonated during year (tonnes / year)
- C_i = carbon content of the explosive (%)
- 44/12 = ratio between molecular weights of CO_2 and carbon

5.2 Stationary Fuel Combustion Emissions

A requirement of O. Reg. 452/09 is that GHG emissions estimates calculated for the purposes of screening against or reporting to O. Reg. 452/09 be calculated in accordance with the O. Reg. 452/09 Guideline. The O. Reg. 452/09 Guideline presents four different methodologies for calculation of CO_2 emissions from stationary sources:

- **Calculation Methodology 1:** based on fuel consumption and a default fuel specific emission factor (HHV x EF) on a mass basis (e.g., kg CO_2/kg) volume basis (e.g., kg CO_2/L or kg CO_2/m^3). The default fuel specific emission factors are provided in the MOE Guideline.
- **Calculation Methodology 2:** based on fuel consumption, site and fuel specific HHV (value provided by the supplier or measured for fuels used at the facility), and default fuel specific emission factor on an energy basis (kg CO_2/GJ).

- **Calculation Methodology 3:** based on fuel consumption, site and fuel specific carbon content of fuel (from analysis results of fuel used at the facility) and ratio of molecular weights between carbon dioxide and carbon (3.664).
- **Calculation Methodology 4:** based on CO_2 Continuous Emission Monitoring System (CEMS) and stack flow rate monitoring results.

Calculation methodologies defined by the O. Reg. 452/09 Guideline for CH_4 and N_2O for stationary sources are equivalent to Calculation Methodologies 1 and 2 for CO_2.

The GHGRP Guideline is not prescriptive in the quantification method or methods used to quantify GHG emissions but presents the following approaches for calculating CO_2, CH_4 and N_2O emissions from stationary sources:

- **Detailed fuels-based approach:** based on fuel consumption and fuel specific emission factor on a mass (e.g., kg CO_2/kg) or volume basis (e.g., kg CO_2/L or kg CO_2/m^3). The emission factor used can be a facility specific, locally available or default value (e.g., used by Environment Canada in the National Inventory). Emission factors for CH_4 and N_2O are also specific for different sectors.
- **Detailed source-based approach:** similar to the fuels-based approach. In this approach the emission factor is also specific for different combustion technologies.

Considering the reference methodologies presented above and the availability of data at the Facility the approach that uses default emission factors on a mass/volume basis has been applied for the calculations presented in this appendix. This calculation methodology is the most appropriate for this application since it satisfies both Calculation Methodology 1 from the O. Reg. 452/09 Guideline and the first above-listed GHGRP Guideline approach for calculating emissions from stationary sources.

Stationary Fuel Combustion Emissions Calculation on a Mass/volume Basis:

Total CO_2 emissions from stationary fuel combustion:

$$E_{CO_2,i,s.comb} = Fuel_i \times EF_{CO_2,i,s.comb} \times UC_1 \quad \text{(Equation 2)}$$

$$E_{CO_2,s.comb} = \sum_i E_{CO_2,i,s.comb} \quad \text{(Equation 3)}$$

Where:

- $E_{CO2,i,s.comb}$ = CO_2 emissions from combustion of fuel *i* in stationary sources, calculated on a mass basis (tonne CO_2/year)
- $Fuel_i$ = quantity of fuel *i* used at the Facility during the year(unit of volume / year)
- $EF_{CO2,I,s.comb}$ = *Default CO_2 emission factor* (mass of CO_2 / unit of volume)
- UC_1 = Unit conversion factor, to equate the units of EF_i to tonne CO_2/unit of volume
- $E_{CO2,s.comb}$ = total CO_2 emissions from combustion of all fuels used at the Facility in stationary sources, calculated on an volume basis (tonne CO_2/year)

Total CH4 and N2O emissions from stationary fuel combustion:

$$E_{CH_4/N_2O,i,s.comb} = Fuel_i \times EF_{CH_4/N_2O,i,s.comb} \times UC_2 \quad \text{(Equation 4)}$$

$$E_{CH_4/N_2O,s.comb} = \sum_i E_{CH_4/N_2O,i,s.comb} \quad \text{(Equation 5)}$$

Where:

- $E_{CH4/N2O,i,s.comb}$ = CH_4 or N_2O emissions from combustion of fuel *i* in stationary sources, calculated on a volume basis (tonne CH_4/period or tonne N_2O/year)
- $Fuel_i$ = quantity of fuel *i* used at the Facility during the inventory period (unit of volume / year)
- $EF_{CH4/N2O,i}$ = Default CH_4 or N_2O emission factor on a mass basis (mass of CH_4 or N_2O / unit of volume)
- UC_2 = Unit conversion factor, to equate the units of $EF_{CH4/N2O,i}$ to tonne CO_2/ unit of volume
- $E_{CH4/N2O,s.comb}$ = Total CH_4 or N_2O emissions from combustion of all fuels at the Facility in stationary sources, calculated on a mass basis (tonne CH_4/period or tonne N_2O/year)

5.2.1 Total Stationary Fuel Combustion Emissions

Total GHG emissions from stationary fuel combustion:

$$E_{i,s.comb} = E_{CO_2,i,s.comb} + E_{CH_4,i,s.comb} \times GWP_{CH_4} + E_{N_2O,i,s.comb} \times GWP_{N_2O} \quad \text{(Equation 6)}$$

$$E_{s.\mathrm{comb}} = \sum_i E_{i,s.comb} \quad \text{(Equation 7)}$$

Where:

- $E_{i,s.comb}$ = Total GHG emissions from combustion of fuel *i* in stationary sources Facility, calculated on a volume basis (tonne CO_2e/year)

- $E_{CO2,i,s.comb}$ = CO_2 emissions from combustion of fuel *i* in stationary sources at the Facility, calculated on a volume basis (tonne CO_2/year)
- $E_{CH4,i,s.comb}$ = CH_4 emissions from combustion of fuel *i* in stationary sources at the Facility, calculated on a volume basis (tonne CH_4/year)
- $E_{N2O,i,s.comb}$ = N_2O emissions from combustion of fuel *i* in stationary sources at the Facility, calculated on a volume basis (tonne N_2O/year)
- GWP_{CH4} = Global Warming Potential of CH_4
- GWP_{N2O} = Global Warming Potential of N_2O
- $E_{s.comb}$ = Total GHG emissions from combustion of all fuels used at the Facility in stationary sources, calculated on a mass basis (tonne CO_2e/year)

5.3 Mobile Fuel Combustion Emissions

The O. Reg. 452/09 Guideline does not present methodologies for calculation of GHG emissions from mobile fuel combustion as this source is not within the inventory boundary for that program.

The approach presented by the GHGRP for calculating CO_2, CH_4 and N_2O emissions from mobile sources is similar to the approaches for stationary combustion, based on fuel consumption and fuel specific emission factor on a mass (e.g., kg CO_2/kg) or volume basis (e.g., kg CO_2/L or kg CO_2/m^3). The emission factor used can be a facility specific, locally available or default value (e.g., used by Environment Canada in the National Inventory). Emission factors for CH_4 and N_2O are also specific for different combustion technologies.

To maintain consistency, the emission calculation from mobile sources has been based on the same calculation approach used for stationary sources, described by Equations (2) to (7) in the Manual.

5.3.1 Total Mobile Fuel Combustion Emissions

Total GHG emissions from mobile fuel combustion:

$$E_{i,m.comb} = E_{CO_2,i,m.comb} + E_{CH_4,i,m.comb} \times GWP_{CH_4} + E_{N_2O,i,m.comb} \times GWP_{N_2O} \quad \text{(Equation 8)}$$

$$E_{m.comb} = \sum_i E_{i,m.comb} \quad \text{(Equation 9)}$$

Where factors in Equation (8) are mobile combustion equivalents to the factors in Equation (6).

5.4 Indirect Sources

There are many indirect sources that could be associated with the Project and in accordance with the provincial and federal reporting programs these are not included in the inventory boundary and are not included in this

assessment (i.e. electrical purchases or raw material inputs). However, two potential indirect sources are further discussed, namely land clearing and use of the access road to deliver raw materials and allow access to workers to the site. These are not significant in comparison to the direct emissions.

Based on the information provided by Osisko, the vehicle fleet will not change with season or day of the week. A summary of the daily access road fleet traffic is provided in Table 4.

Table 4: Access Road Fleet Traffic

Vehicle Type	Number of Trips per Day (1-way)
Pickup	3
Passenger Van	1
Passenger Car	85
Transport Truck	18

These indirect sources are considered to be insignificant sources of GHG emissions in comparison to the direct emissions from the project. Therefore, these sources have not been quantitatively assessed for the following reasons:

- The clearing of trees is one time activity and insignificant compared to the other GHG emitting activities that will emit for the lifetime of the Project; and
- The amount of traffic on the access road is insignificant to the mobile emissions associated with the hauling of waste rock and ore.

6.0 DATA REQUIREMENTS

6.1 Parameters used to Calculate GHG Emission Estimates

Data requirements to calculate GHG emissions at the Facility fall into two categories:

Site-Specific Input Parameters – Site-specific consumption data for processes resulting in GHG emissions.

Default Parameters – Emission factor data or physical data obtained from GHG emission estimation guidelines or reference material. Data sources for these parameters are provided in Table 5.

Table 5 presents the data required for calculating GHG emissions at the Facility, broken down into the above categories.

Table 5: Summary of data required for estimating GHG emissions

Data	Variable	Equation	Unit	Source of data	Note
Site-Specific Input Parameters					
Volume of diesel combusted during the year	*Diesel*	(2), (4)	mass or volume unit / year	**Diesel** Calculated from the Non-Road Engine Modelling NR-009d (July 2010) (U.S. EPA. 2010)	**Diesel** Calculated a total fuel requirement based on the horsepower of the engines (Section 7.1) and EPGs (Section 7.2)
Volume of propane combusted during the year	*Propane*	(2), (4)	mass or volume unit / year	**Propane** AP-42 Ch1.5 Liquefied Petroluem Gas Combustion (U.S. EPA AP-42. 2008)	**Propane** Calculated the fuel requirements based on the BTU requirements and the heating value of LPG (Section 7.3)
Quantity of Explosive detonated during year	$Qepxl_i$	(1)	tonnes / year	Project Description	Provided annual consumption of Emulsion in the Project Description

Table 5: Summary of data required for estimating GHG emissions (Continued)

Data	Variable	Equation	Unit	Source of data	Note
Default Parameters					
Default CO2 emission factor on a volume basis for Stationary Combustion	$EF_{CO2,I,s.comb}$	(1)	mass of CO_2 / unit of volume	O. Reg. 52/09 Guideline/ Appendix 10/ Table 20-3 (Natural Gas); Table 20-2 (Diesel and Gasoline) (2)	Fuel specific value

7.0 INPUT VALUE CALCULATIONS

The Project description did not provide estimated fuel consumption rates for the mining fleet, the EPGs, the regeneration furnace and the propane consuming comfort heating. Diesel and propane consumption calculations for the Project are presented in Section 7.1 to 7.3.

7.1 Mobile Diesel Fuel Consumption

As mentioned in Table 5, the diesel fuel consumption for the mining fleet was calculated using the steady state brake specific fuel consumption (BSFC) from Table A4 and load factors (LF) from Table F4 and Table F6 of Exhaust and Crankcase Emission Factors for Nonroad Engine Modeling — Compression-ignition (Report No. NR-009d, July 2010) (U.S. EPA. 2010).

The BSFC factor is based on the horsepower of each engine. All the vehicles in the fleet had engines greater than 100 hp and the BSFC for engines greater than 100 hp is 0.367 lb/hp-hr. A diesel fuel density of 0.845 kg/L was used. The fuel consumption for a haul truck is calculated below. The load factors can be seen in Table 6.

$$\text{Fuel } Consumption = BSFC\ (\frac{lb}{hp-hr}) \times HP \times \frac{LF}{fuel\ density}$$

$$Fuel\ Consumption = 0.367\ \left(\frac{lb}{hp-hr}\right) \times 2650\ \frac{hp}{truck} \times \frac{0.58}{0.845\ (\frac{kg}{L})} \times 0.45359 \frac{kg}{lb}$$

$$\text{Fuel } Consumption = 302.8 \frac{L}{hr}$$

The annual fuel usage for the haul trucks is 302.8 L/hr x 20 trucks x 8760 hr/year, which equates to 53,085,600 L/year. The estimated annual diesel consumption for the fleet is approximately 61,774,000 L/year.

Table 6: Fuel usage for the mining fleet

Type	Load Factor	Number of Vehicles	Fuel [L/hr]	Engine Size [hp]	Annual Fuel Usage [L/year]
Drill Rig	0.43	6	67.8	800	3561940
Off Highway Truck	0.58	20	302.8	2650	53049439
Loader	0.48	2	189.1	2000	3313433
Track Dozer	0.58	1	73.8	646	646603
Grader	0.58	1	33.9	297	297277
Wheel Dozer	0.58	1	103.3	904	904843
Total					**61,773,535**

7.2 Stationary Diesel Fuel Consumption

The stationary diesel fuel consumption was calculated with the same method as the mobile fleet. The BSFC factor for the EPGs was 0.367 lb/hp-hr. It was assumed that the EPGs were tested once a week for one hour at an 80% load, therefore LF is equal to 0.8. The EPGs have a total of 10,192 hp. A diesel fuel density of 0.845 kg/L was used. The annual fuel consumption for the generator sets are calculated below.

$$Fuel\ Consumption = 0.367\ \left(\frac{lb}{hp-hr}\right) \times 10{,}192\ hp \times \frac{0.8}{0.845\ (\frac{kg}{L})} \times 0.45359 \frac{kg}{lb}\ \times 52\ \frac{hours}{year}$$

$$Fuel\ Consumption = 83{,}527 \frac{L}{year} \sim 84{,}000\ \frac{L}{year}$$

7.3 Stationary Propane Fuel Consumption

There were two sources of propane fuel combustion for the Project: the regeneration furnace that is part of the ore processing and comfort heating.

The consumption of propane in the regeneration furnace was calculated based on a daily energy requirement of 31.54 MMBTU/day and a propane heating value of 91.5 MMBTU/1000 gal (U.S. EPA AP-42. 2008). It was assumed that the regeneration furnace runs 90 days per year. The daily heating requirement of the regeneration furnace was based on Osisko's Malartic site. The estimated fuel consumption is below.

$$Fuel\ Consumption = 31.54\ \frac{MMBTU}{day}\ x\ \frac{1000\ gal}{91.5\ MMBTU}\ x\ 90\ \frac{days}{year}\ x\ 3.79\ \frac{L}{gal}$$

$$Fuel\ Consumption = 117{,}577 \frac{L}{year} \sim 118{,}000\ \frac{L}{year}$$

The consumption of propane for comfort heating was estimated with a similar method as the regeneration furnace. It was assumed that the buildings would require 143 BTU/ft^2-hr to heat plant buildings and 54 BTU/ft^2-hr to heat the residential buildings. Using this method, it was found that the site has a heating requirement of 121 MMBTU/hr. It was assumed based on the climate of Atikokan, that heating would operate 36% of the time.

$$Fuel\ Consumption = 121.1\ \frac{MMBTU}{hr}\ x \frac{24\ hr}{1\ day} x\ \frac{1000\ gal}{91.5\ MMBTU}\ x\ 365\ \frac{days}{year}\ x\ 36\%\ Annual\ Operation\ x\ 3.79\ \frac{L}{gal}$$

$$Fuel\ Consumption = 15{,}818{,}629\ \frac{L}{year} \sim 15{,}818{,}000\ \frac{L}{year}$$

8.0 GREENHOUSE GAS EMISSIONS

Once approved the Project may have GHG reporting responsibilities under various legislative GHG Reporting Programs. These GHG reporting programs (the GHG Reporting Programs) are as follows:

- Ontario's GHG Emissions Reporting Regulation (O. Reg. 452/09); and
- Government of Canada GHG Emissions Reporting Program (the GHGRP).

Table 7 presents the estimated GHG emissions for the Project for the maximum operating year. As noted in the previous sections these values are based on estimate the emissions are based on the Project description and may significantly overestimate the actual emissions so any comparison to the reporting programs must be validated once actual consumption data is available as outlined in Section 8.1

Table 7: GHG Emissions for Maximum Operating Year by Emission Type

GHG	Emissions (t)	Emissions (tCO_2e)
Stationary and Process (no mobile)		
CH_4 (Methane)	0.391	8.207
N_2O (Nitrous Oxides)	1.742	540.003
CO_2 (Carbon Dioxide)	27,537	27,537
Total eCO2		**28,085**
All Sources		
CH_4 (Methane)	7.186	150.9
N_2O (Nitrous Oxides)	11.07	3,432
CO_2 (Carbon Dioxide)	192,041	192,041
Total eCO2		**195,624**

8.1 Conservatism in Emission Rate Calculations

Table 8 outlines the areas where conservatism was assumed in the emission rate calculations which results in an assessment that is not likely to under-predict the emissions associated with the Project.

Table 8: Areas of Conservatism in the Emission Rate Calculations

Area	Conservatism
Blasting	▪ All carbon was assumed to be converted to CO_2
EPGs	▪ Assumed testing of 1-hour occurs once a week with an 80% load. In reality, testing occurs monthly.

Table 8: Areas of Conservatism in the Emission Rate Calculations (Continued)

Area	Conservatism
Propane combustion for comfort heating	▪ Osisko has identified that some building heating will be electric however all buildings were assumed to be heated through propane combustion. ▪ A conservative heating requirement was assumed to be 143 BTU/ft^2-hr and 54 BTU/ft^2-hr for plant buildings and residential buildings, respectively. This estimate is conservatively based on a building height of 15 ft and 4 volumetric air exhanges per hour.
Mobile Fleet	▪ Fuel usage calculations were based on a 24-7 operation of the entire fleet operating simultaneously. In reality, this will likely near the end of the project life due to the increase in hauling length over time as the pit gets deeper.

8.2 GHG Reporting Status

Annual GHG releases have been screened for reporting under O. Reg. 452/09 and the GHGRP by first calculating the appropriate total GHG emission estimate (the Screening Level GHG Emission Estimate) in accordance with each program's respective GHG inventory boundary and guideline. The results of this screening assessment are presented in the Table 9.

Table 9: Summary of Greenhouse Gas Emissions and Screening Level Assessments for the Federal and Provincial Reporting Programs

Greenhouse Gas	Formula	CAS No.	100-year GWP	Aggregate Source Emissions [tonnes/yr]	Subtotal Emissions [kt/yr]	
					FEDERAL PROGRAM	PROVINCIAL PROGRAM
Carbon Dioxide (Combustion in Stationary Sources - Non Biomass)	CO_2	124-38-9	1	24,109	24.109	24.109
Carbon Dioxide (On-Site Transportation)				164,504	164.504	NR
Carbon Dioxide (Industrial Process)				3,428	3.428	NR
Methane (Combustion in Stationary Sources - Non Biomass)	CH_4	74-82-8	21	0.391	0.008	0.008
Methane (On-Site Transportation)				6.795	0.143	NR
Methane (Industrial Process)				NO DATA	NO ESTIMATE	NR

Table 9: Summary of Greenhouse Gas Emissions and Screening Level Assessments for the Federal and Provincial Reporting Programs (Continued)

Greenhouse Gas	Formula	CAS No.	100-year GWP	Aggregate Source Emissions [tonnes/yr]	Subtotal Emissions [kt/yr]	
					FEDERAL PROGRAM	PROVINCIAL PROGRAM
Nitrous Oxide (Combustion in Stationary Sources - Non Biomass)	N_2O	10024-97-2	310	1.742	0.540	0.540
Nitrous Oxide (Combustion in Non-Stationary Sources)				9.328	2.892	NR
Nitrous Oxide (Process Related)				NO DATA	NO ESTIMATE	NR
Screening Level GHG Emission Estimate [kt CO_2e]					**195.624**	**24.657**
Program Reporting Threshold [kt CO2e]					**50**	**25**
ARE SCREENING LEVEL GHG EMISSION ESTIMATES ABOVE PROGRAM REPORTING THRESHOLDS? [YES or NO]					**YES**	**NO**

However, it is important to note that the inputs used to estimate the emissions are based on the Project description and may significantly overestimate the actual emissions. Given the conservatism in the emission rates the reporting thresholds may not be met so any comparison to the reporting programs must be validated once actual consumption data is available.

8.3 Comparison of Project GHG Emissions to Canadian Emissions

For comparison purposes the annual GHG emissions in CO_2e for Ontario, Canada and globally are also provided in Table 10. Data for Ontario's and Canada's GHG is provided by Environment Canada (Environment Canada 2012).

Table 10: Comparison of Project GHG Emissions to Canadian Emissions

Source	Annual GHG Emissions (kt CO_2e/yr)	Project Total as a Relative Percentage
Direct Project Emissions	195.624	100%
Indirect Emissions	*	
Project Total	195.624	
Ontario (2010)	171300	0.1142%
Canada (2010)	692000	0.0283%

Notes:

* = Not quantitatively assessed but will not be significant to overall project emissions.

8.4 Comparison of project GHG Emissions to Global emissions

A review of literature from the IPCC confirms that the majority of scientists feel that there is compelling evidence to link observed and forecast changes in climate to the release of man-made GHG emissions. However, the FPTCCCEA indicates in its guidance document for practitioners (The Federal and Provincial Committee on Climate Change and Environmental Assessment. 2003) that "…unlike most project-related environmental effects, the contribution of an individual project to climate change cannot be measured."

To illustrate this, the GHG emissions associated with the project are compared to the 2000 global GHG emissions associated with the forecast changes in climate expected over the project life. Table 11 compares the global and Project-related emissions, and can be seen to reasonably support the conclusion that the GHG emissions from the Project will not have a measurable effect on climate. Therefore, the effect of the Project on climate can be considered to be negligible.

Table 11: Comparison of Project GHG Emissions to Changes used in the IPPC models

Parameter	SRES Scenario A1B	SRES Scenario A2	SRES Scenario B1	Project
Change in GHG emissions relative to the 2000 global baseline[(a)]	+59.7%	+109.3%	+18.6%	0.00116%
Change in annual temperature for the 2041 to 2070 horizon[(b)]	+2.5 – 3.0 °C		Cannot be measured [c]	
Change in annual precipitation for the 2041 to 2070 horizon[(b)]	+30 – 40 mm		Cannot be measured [d]	

Notes:

(a) The global baseline emissions for 2000 were listed by the IPCC as 16,927 MT CO_2e (Nakicenovic, N. and R. Swart 2000).

(b) Changes were calculated as the difference between the baseline and scenario forecasts for the 2041 to 2070 time horizon. Changes are shown for the ensemble results rather than per scenario, as discussed in Section 6.2.

(c) On the basis of proportionality, the GHG emissions from the Project could represent an increase of less than 0.000035 °C in the annual temperature. Such a change would not be measurable.

(d) On the basis of proportionality, the GHG emissions from the Project could represent an increase of less than 0.00046 mm in the annual precipitation. Such a change would not be measurable.

9.0 SUMMARY OF FINDINGS

This Appendix documents the methods, data and assumptions that were used to estimate the greenhouse gas (GHG) emissions for the Project. Based on the estimated GHG emissions the following comparison can be made. The assessment consisted of a three step process:

- The total emissions from the Project may be above the GHG reporting requirements under the federal and provincial reporting programs. However, it is important to note that the inputs used to estimate the emissions are based on the maximum operating year taken from the Project description and may significantly overestimate the actual emissions so any comparison to the reporting programs must be validated on a year by year basis once actual consumption data is available.
- The total emissions from the Project represent approximately 0.120% of Ontario's GHG inventory for 2010 or 0.029% of the Canadian inventory for that same year.
- The total emission from the Project are insignificant compared to the global emissions used in the assumptions to estimate climate change.

Since the predicted greenhouse gas emissions from this Project are insignificant in comparison to the global emissions and therefore, the Project will have virtually no impact on current estimates of future global climate change.

11.0 LIST OF ABBREVIATIONS, ACRONYMS AND INITIALISMS

Table 12: List of Abbreviations, Acronyms and Initialisms

Acronym	Definition
TSP	Total suspended particulates
PM_{10}	Particulate matter with an aerodynamic diameter less than 10 µm
$PM_{2.5}$	Particulate matter with an aerodynamic diameter less than 2.5 µm
DPM	Diesel particulate matter
NO_2	Nitrogen dioxide
NO_x	Oxides of nitrogen
CO	Carbon monoxide
SO_2	Sulphur dioxide
HC	Hydrocarbons
HCN	Hydrogen cyanide
HCl	Hydrochloric Acid
NH_3	Ammonia
NaOH	Sodium hydroxide
