SGS	**Geochemistry** **Lakefield Laboratory**	Doc Type **Method Summary** Method No: Code **GC_ICP42C** Service **Testing** Issued Date **August 2022**
Natural Resources	**Multi-Element Preparation and Determination of Low Mineralized Samples by Strong Acid Digest and ICP-OES (ores, concentrates and metallurgical test products)** [Ag, Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, K, Li, Mg, Mn, Mo, Na, Ni, P, Pb, Sb, Se, Sn, Sr, Tl, Ti, V, Y, Zn; ICP-OES]	Approved by **S. Meyers**

1. **Parameter(s) measured, unit(s):**
   Silver (Ag), Aluminum (Al)*, Arsenic (As)*, Barium (Ba)*, Beryllium (Be), Bismuth (Bi), Cadmium (Cd), Calcium (Ca)*, Chromium (Cr)*, Cobalt (Co), Copper (Cu), Iron (Fe), Potassium (K)*, Lithium (Li), Magnesium (Mg)*, Manganese (Mn)*, Molybdenum (Mo), Sodium (Na), Nickel (Ni), Phosphorous (P), Lead (Pb)*, Antimony (Sb)*, Selenium (Se)*, Tin (Sn)*, Strontium (Sr), Thallium (Tl), Titanium (Ti)*, Vanadium (V), Yttrium (Y)*, Zinc (Zn) in g/t
   * digestion may not be complete and volatilization losses may occur for some mineral forms

2. **Typical sample size:**
   0.5 g

3. **Type of sample applicable (media):**
   Ores, concentrates and metallurgical test products

4. **Sample preparation technique used:**
   Sample is digested using a 4-acid mixture of HNO_3, HF, $HClO_4$, and HCl to obtain a near total digest of ores, concentrates and metallurgical products. Following digestion, the samples are read by ICP-OES.

5. **Method of analysis used:**
   Digested samples are analyzed by Inductively Coupled Plasma Optical Emission Spectroscopy (ICP-OES). These samples are analyzed as prepared and/or diluted within the linear range of the instrument calibration.

6. **Data reduction by:**
   Computer, on line, data fed to Laboratory Information Management System with secure audit trail

7. **Figures of Merit:**
   This method has been fully validated for the range of samples typically analyzed. Method validation includes the use of reference materials, replicates, duplicates and blanks to calculate

accuracy, precision, linearity, range, limit of detection, reporting limit, specificity and measurement uncertainty.

The Reporting Limit has been determined according to the following:

element	RL (g/t)	element	RL (g/t)
Ag	2	Mn	5
Al	100	Mo	5
As	30	Na	100
Ba	2	Ni	20
Be	0.05	P	30
Bi	20	Pb	20
Ca	100	Sb	10
Cd	2	Se	30
Co	4	Sn	20
Cr	10	Sr	1
Cu	5	Ti	5
Fe	100	Tl	30
K	20	V	2
Li	10	Y	0.5
Mg	40	Zn	10

Note: Report limits may be elevated for difficult matrices

8. Quality control:

Quality control materials include method blanks, replicates and reference materials and are randomly inserted with the frequency set according to method protocols at ~ 18% for process control analysis. Quality control materials will also include BRM (Barren reference materials, or preparations blanks) and preparation duplicates if samples have been taken through the sample reduction process. Calibration materials and secondary source solutions to cover the analytical range of ICP-OES analysis; reagent blank and drift check materials every 15 samples.

9. Accreditation:

SGS Natural Resources conforms to the requirements of ISO/IEC 17025. Scopes of Accredited tests are site specific, please visit https://www.scc.ca/en/search/laboratories

   Package A experiences interference from concentrated Ag, Pb, Se, Sn, W
   Package B experiences interference from concentrated Sb
   Package C experiences interference from concentrated Ta
   Package D experiences interference from concentrated Cu, Y, W

4. **Sample preparation technique used:**
   This method is used as an alternative to fusion for analytical contexts where the analyte is volatile or if levels of detection below that attainable by fusion are required.
   The internal standard preparation technique forms a powder pellet specimen consisting of sample thoroughly mixed with a known amount internal standard compound to correct for matrix effects. The internal standard mix is chosen to provide reference intensity as close to the analyte line wavelength as possible while avoiding interposing major element lines or absorption edges. Within an emission line series, this is usually the adjacent element in terms of atomic number.
   The internal standard in use determines which elements from the method can be reported within a package (package A reports As, Sb, Th, U; package B reports Sn; package C reports W; package D reports Ta, Nb)

5. **Method of analysis used:**
   Xray fluorescence spectrometry

6. **Data reduction by:**
   Computer, on line, data fed to Laboratory Information Management System with secure audit

trail.

Appendix E – Terminology for Liberation/Association

Modal Mineralogy

Note: The size of the minerals as shown in the modal mineralogy tables is calculated statistically from the length of all the horizontal intercepts through each particle. It uses an assumption of random sectioning of spherical particles having uniform size, to obtain an estimate of the stereologically-corrected grain size in microns. The size calculation is a statistical property, which means that it is only valid when applied to a population of particles, and its accuracy increases as the population size increases. The accuracy of the size calculation is extremely low if applied to just a single cross-section.

Liberation and Association

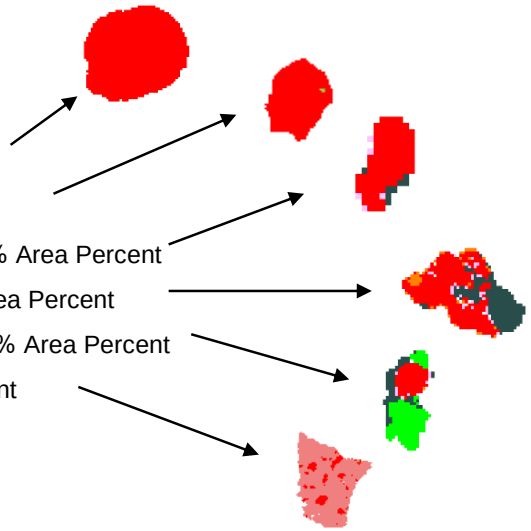
For the purposes of this analysis, particle liberation is defined based on 2D particle area percent. Particles are classified in the following groups (in descending order) based on mineral-of-interest area percent: free (≥95% of the total particle area) and liberated (≥80%). The non-liberated grains have been classified according to association characteristics, where binary association groups refer to particle area percent greater than or equal to 95% of the two minerals or mineral groups. The complex groups refer to particles with ternary, quaternary, and greater mineral associations including the mineral of interest.

The liberation and association characteristics of these minerals for each sample are given below. Note that when minerals are present in trace amounts, roughly <0.2 wt%, statistical data might not be adequate to calculate the liberation and association. Thus, results must be interpreted with caution.

Terminology developed for liberation and association presented in the report.

Liberation classes were defined as follows:

- **Pure:** A mineral with 100% Area Percent
- **Free:** A mineral with ≥95% Area Percent
- **Liberated:** A mineral with ≥80% but <95% Area Percent
- **Midds:** A mineral with ≥50% but <80% Area Percent
- **Sub-Midds:** A mineral with ≥20% but <50% Area Percent
- **Locked:** A mineral with <20% Area Percent



Association classes were defined as the follows:

- Pure Pyrite - a particle that has 100% of Pyrite
- Free Pyrite - a particle that has ≥95% of Pyrite
- Liberated Pyrite - a particle that has ≤95% to ≥80% of Pyrite
- Binary Pyrite: Chalcopyrite - a particle that has ≥95 area% of Pyrite: Chalcopyrite
- Binary Pyrite: Pyrrhotite - a particle that has ≥95 area% of Pyrite: Pyrrhotite
- Binary Pyrite: Sphalerite - a particle that has ≥95 area% of Pyrite: Sphalerite
- Binary Pyrite: Galena - a particle that has ≥95 area% of Pyrite: Galena
- Binary Pyrite: Arsenopyrite - a particle that has ≥95 area% of Pyrite: Arsenopyrite
- Binary Pyrite: Other Sulphides - a particle that has ≥95 area% of Pyrite: Other Sulphides (eg. chalcopyrite)
- Ternary Pyrite: Quartz/Feldspars - a particle that has ≥95 area% of Pyrite:Quartz:Feldspar (combined K-Feldspar and Plagioclase)
- Binary Pyrite: Micas - a particle that has ≥95 area% of Pyrite: Micas
- Binary Pyrite: Clays - a particle that has ≥95 area% of Pyrite: Clays
- Binary Pyrite: Other Silicates - a particle that has ≥95 area% of Pyrite: Other Silicates (clays/chlorite/amphibole ect.)
- Binary Pyrite: Carbonates - a particle that has ≥95 area% of Pyrite: Carbonates (combined calcite, dolomite and others)
- Binary Pyrite: Oxides - a particle that has ≥95 area% of Pyrite: Oxides (Fe-Oxides, Ilmenite or Rutile)
- Binary Pyrite: Other - a particle that has ≥95 area% of Pyrite: Other Minerals not listed above

Note: the complex category refers to ternary and quaternary particles, and does not necessarily reflect the complexity of the middling particles.

The same criteria were used for the liberation and association data for galena, sphalerite, arsenopyrite, pyrrhotite, carbonates, sulphides and oxides.

Introduction

This report describes a mineralogical test program using High Definition Mineralogy, including chemical assay, QEMSCAN technology (Quantitative Evaluation of Materials by Scanning Electron Microscopy) and electron microprobe analysis (EMPA). This is a continuation program from SGS project #19032-02 - MI5020-AUG23, where the samples are derived from Kinross Gold's Great Bear project located in Red Lake, Ontario. Twelve samples were submitted by representatives from WSP on behalf of Kinross. The purpose of this test program was to determine the overall mineral assemblage, and the liberation and association of sulphide, carbonate, and silicate minerals. The main objective was to use the QEMSCAN modal distribution along with the EMPA data in conjunction to determine the mineral hosts and elemental deportment of arsenic, cadmium, cobalt, copper, molybdenum, lead, arsenic, and zinc.

Testwork Summary

1. Sample Receipt and Preparation

Twelve samples were selected and submitted by representatives from WSP. The SGS project number 19032-02 and corresponding Mineralogy LIMS number MI5063-JUL24 were assigned to the testwork.

Each sample was submitted as coarse reject material at a nominal crush size of -9.5 mm or -6.3 mm. A 150-gram portion of the coarse reject samples was stage-crushed to a P_{80} (80% passing) of 150 µm for the polished section preparation for the QEMSCAN and EMPA analysis. Samples for chemical analysis were pulverized to 75 µm. The sample inventory is presented in Table 1.

Representative subsamples were micro-riffled for additional analysis which included the following:

- Graphite-impregnated polished epoxy grain mount preparation and subsequent PMA analysis by QEMSCAN.
- Assay cuts were submitted to SGS's Minerals analytical facility for the whole rock geochemistry (WRA by XRF - GC_XRF76V). Additional cuts were also submitted to SGS's Enviro group for trace metals scan using a strong 4-Acid digest and trace metals using aqua regia, total carbon (C), and total sulphur (S).

All QEMSCAN data is presented in Appendix A, the summary of results from the EMPA analysis conducted at Queen's University in Appendix B, the certificate chemical of analysis in Appendix C, and the terminology for liberation and association in Appendix D.

2. QEMSCAN Operational Modes

The mode of QEMSCAN analysis used for this project was Particle Mapping Analysis (PMA). PMA is a two-dimensional mapping analysis aimed at resolving liberation and locking characteristics of a generic set of particles. A pre-defined number of particles are mapped at a point spacing selected in order spatially resolve and describe mineral textures and associations. This mode is often selected to characterize feed and concentrate products, as both gangue and value minerals report in statistically abundant quantities.

It should be noted that the energy dispersive X-ray characteristics for magnetite, hematite, and to a lesser extent, goethite, are nearly identical and that these minerals cannot reliably be distinguished by QEMSCAN. Light elements such as lithium, boron, carbon, beryllium, oxygen, and hydrogen cannot be discriminated by the QEMSCAN analysis.

The assay results were also used for QEMSCAN data validation and reconciliation.

3. Mineral List Created with the iExplorer Software and Quality Control

Numerous mineral phases were detected in the suite of samples. A mineral list was developed with the iExplorer processing software and theoretical formula of each mineral is presented in Table 2. Key QEMSCAN mineralogically calculated assays have been regressed with the chemical assays for the samples, as presented in and Figure 1. Elemental deviation between the calculated QEMSCAN assays and actual assays may occur due to the solid solution chemistry of some minerals.

Table 2: Mineral List and Formulas

Mineral	Mineral Formula
Pyrite	FeS_2
Pyrrhotite	$Fe_{(1-x)}S$
Sphalerite	(Zn,Fe)S
Chalcopyrite	$CuFeS_2$

Summary of Results

Twelve samples, from Kinross Great Bear project in Red Lake Ontario, were submitted on behalf of WSP for a detailed mineralogical characterization to determine the mineral hosts of arsenic, cadmium, cobalt, copper, molybdenum, lead, arsenic, and zinc. This is a continuation program from SGS project 19032-02, MI5020-AUG23. The study included chemical assays, QEMSCAN, and electron microprobe analysis (EMPA). The objective of the QEMSCAN analysis was to determine the overall mineral assemblage with focus on the various sulphide and carbonate concentrations, and their liberation and grain size data. The objective of the EMPA was to quantify the overall composition of the minerals in various samples, and to also determine the trace elements hosted in the various phases (e.g., arsenic in low concentrations in pyrite). The QEMSCAN modal distributions along with the EMPA data were used in conjunction to determine the mineral hosts and elemental deportment of the aforementioned analytes.

The sample preparation and the details of the results are discussed in the main body of the report. The points of interest are discussed in this summary.

4. Sample Inventory and Select Chemical Assays

Table 3 presents the sample inventory and selected assays for each sample. Notes about the select assays:

- Antimony (Sb) assays for each sample are below the detection limits (DL's).
- Arsenic (As), averages 56.4 µg/g and ranges from 2 µg/g to 212 µg/g
- Cadmium (Cd) averages 0.1 µg/g and ranges from nil to 0.3 µg/g
- Cobalt (Co) concentrations average 12.8 µg/g and range from 3.6 µg/g to 37.0 µg/g .
- Copper (Cu) concentrations average 27.8 µg/g and range from 9.0 µg/g to 70.0 µg/g .
- Molybdenum (Mo) concentrations average 1.2 µg/g and range from 0.7 µg/g to 1.7 µg/g.
- Nickel (Ni) concentrations average 29.9 µg/g and range from 9 µg/g to 84.0 µg/g.
- Lead (Pb) concentrations average 4.7 µg/g and range from 2 µg/g to 15 µg/g.
- Zinc (Zn) concentrations average 58.3 µg/g and range from 27 µg/g to 110 µg/g.

5. Modal Mineralogy

Table 4 presents the minerals detected within the suite of samples displaying the overall average, minimum, and maximum concentrations within the 12 samples, where Table 5 presents the modal mineralogy for each sample.

Summary of the sulphide distribution:

- Pyrite is the main sulphide present within the suite of 12 samples, averages 1.05%, and ranges from nil% to 9.45%. Samples 31644, 31576, DX450213, and DX450183 have the highest pyrite concentrations at 1.09%, 0.78%, 9.45% and 1.01%, respectively.
- Pyrrhotite is the second most abundant sulphide and averages 0.26%, and ranges from nil to 0.97%. Samples with 0.1% or greater pyrrhotite include 31759, 31718, 31644, 31576, DX450213, DX450183, DX450174, 31787, and 31795.
- Sphalerite, chalcopyrite, galena, cobaltite/gersdorffite, molybdenite and pentlandite were not detected in concentrations greater than 0.05%.
- Arsenopyrite was detected in trace levels in samples 31759, 31782, 31644, 31576, and DX450174 at 0.07%, 0.08%, 0.01%, 0.01% and 0.02%, respectively.

Summary of the silicate distribution:

- The dominant silicate phases include quartz which averages 37.9%, and ranges from 19.2% to 48.8%, plagioclase (albite/oligoclase) which averages 23.2% and ranges from 1.4% to 38.4%, and sericite/muscovite which averages 13.3% and ranges from 0.77% to 32.17%.
- Other silicate minerals typically in moderate to traces levels include plagioclase (anorthite/bytownite – ave. 0.49%), plagioclase (labradorite – ave. 3.5%), K-feldspars (ave. 2.1%), biotite (ave. 9.7%), chlorite (ave. 1.6%), clays (ave. 1.9%), amphibole (ave. 1.5%), and garnet (ave. 0.81%).

Summary of the carbonate mineral distribution:

- Calcite is present as a minor to trace mineral in each sample, averaging 1.24% and ranges from 0.03% to 3.33%.
- Dolomite occurs in minor levels in sample DX450183 (1.05%).
- Ankerite occurs in trace levels in sample DX450174 (0.2%).

6. Electron Microprobe Analysis (EMPA)

The QEMSCAN modal mineralogy data was reviewed and nearly all the samples underwent EMPA analysis for select phases. The minerals selected for analysis and elements of concern include:

- Pyrite for low concentrations of Co, Ni, Cu, As and Se (n=89)
- Pyrrhotite for Co, Ni, Cu and Se (n=62)
- Arsenopyrite for Co, Ni, As, Sb and Se (n=9)
- Chalcopyrite for Co, Ni and Se (n=6)
- Cobaltite for Co, Ni, As, Sb and Se (n=2)

6.1. EMPA of Pyrite

Table 6 summarizes the EMPA data for pyrite presenting the global average, average composition of each sample, and the number of EPMA analyses per sample. The cobalt, nickel, and arsenic concentrations are variable within the suite of samples.

Samples that have average concentrations of pyrite with >0.07% cobalt include:

- 31644, 31787, and DX450213

Only sample 31795 had an average concentration with >0.1% nickel.

Samples that have average concentrations of pyrite with >0.1% arsenic include:

- 31644, DX450179, 31576, and 31795

The samples with the higher concentrations mentioned above are highlighted in blue in Table 6.

Table 7 summarizes the EMPA data for pyrrhotite. Cobalt and copper concentrations are typically below or near to the detection limits (0.03% and 0.05%, respectively). Nickel concentrations vary within the suite of samples.

Samples that have average concentrations of pyrrhotite with >0.1% nickel include:

- DX450183, 31718, DX450174, 31787, 31759, and 31623

The samples with the higher concentrations mentioned above are highlighted in blue in Table 7.

6.3. EMPA of Arsenopyrite

Table 8 summarizes the EMPA analyses for arsenopyrite presenting the global average, average composition of each sample, and the number of EPMA analyses per sample.

Arsenic concentrations averages 44.19% and ranges from 41.83% in sample 31644 up to 46.12% in sample 31782.

For most of the samples, nickel, and antimony concentrations are close or below the detection limits. Four samples have higher concentrations of cobalt and include 31644 (1.12%), DX450174 (1.09%), 31759 (1.2%), and 31782 (0.98%). Only two of the samples have nickel concentrations above the detection limits which include 31644 (0.44%) and 31782 (0.06%).

The samples with the higher concentrations mentioned are highlighted in blue in Table 8.

6.4. EMPA of Sulfarsenides - Gersdorffite and Cobaltite

Only two cobaltite grains were detected and analyzed in sample 31623. Cobalt, nickel, and arsenic concentrations average 13.96%, 12.99%, and 46.60%, respectively.

The average values of the EMPA are summarized in Table 9.

7. Elemental Deportment

The elemental deportment is calculated based on the mineral mass of each phase within each respective sample, the average composition of each phase from the EMPA data, and/or theoretical composition. The deportment data is presented in Appendix A for sulphur (S), arsenic (As), cobalt (Co), copper (Cu), molybdenum (Mo), lead (Pb), arsenic (Ni), and zinc (Zn).

In summary:

- Copper is primarily hosted by chalcopyrite.
- Molybdenite was the only host for molybdenum, and only detected in sample 31576.
- Galena was the only mineral host for lead, and only detected in samples 31644, 31576, and 31795.

There is more diversity on the mineral hosts and elemental deportment for sulphur, nickel, cobalt, and arsenic.

8. Sulphur Deportment

Table 11 presents the average, minimum, and maximum values for the suite of 12 samples and illustrates that pyrite and pyrrhotite are the dominate sulphur-bearing minerals for most of the samples. Figure 2 presents the elemental deportment of sulphur for each sample with the respective sulphur assay.

Pyrite accounts for an average of 48.7% of the total sulphur and ranges from nil% to 95.9%. The following samples have >50% of the sulphur hosted by pyrite:

- 31623 (69.3%), 31644 (84.6), 31576 (83.8%), DX450213 (93.2%), DX450179 (95.9%), and DX450183 (87.8%).

Pyrrhotite accounts for an average of 37.5% of the total sulphur, and ranges from 0.18 to 93.1%. The following samples have >50% of the sulphur hosted by pyrrhotite:

- 31759 (84.2%), 31718 (93.1%), DX450174 (92.9%), 31787 (52.2%), and 31795 (63.4%)

For sample 31782, arsenopyrite is the dominant host of sulphur accounting for 91.7%.

Chalcopyrite accounts for an average of 2.79% of total sulphur, and ranges from nil to 11.3%.

9. Nickel Deportment

Table 12 presents the average, minimum, and maximum values for the suite of 12 samples. Figure 3 presents the elemental deportment of nickel for each sample along with the respective nickel assay. A precautionary note is that most of the samples are very low grade in Ni (<0.01%) as per the assay presented in Table 3.

From the EMPA data, the following averages were used for pyrite:

- 0.34% Ni for sample 31795.
- 0.03% Ni for all the other samples.

From the EMPA data, the following averages were used for pyrrhotite:

- 0.15% Ni for samples DX450183, 31718, DX450174, 31787, 31759, and 31623
- 0.04% Ni for all the other samples.

Pyrite accounts for an average of 30.61% of the total nickel and ranges from nil% to 87.3%, where pyrrhotite averages 31.7% of the total nickel and ranges from nil to 99.5%.

- Samples that have >10% of the nickel hosted by arsenopyrite include 31759 (49.0%), 31782 (29.0%), and DX450174 (11.5%).
- Samples that have >10% of the nickel hosted by pentlandite include 31623 (21.9%), DX450179 (96.6%), 31787 (20.5%,) and 31795 (57.3%).
- Samples that have >10% of the nickel hosted by cobaltite/gersdorffite include 31782 (70.5%), 31623 (71.5%), and 31795 (11.5%).

10. Arsenic Deportment

Table 13 presents the average, minimum, and maximum values for the suite of 12 samples. Figure 4 presents the elemental deportment of arsenic for each sample with the respective arsenic assay. A precautionary note is that arsenic is below 0.02% for most of the samples (Table 3).

- From the EMPA data, the following arsenic averages were used for pyrite:
    - 0.15% arsenic for samples 31644, DX450179 and 31576 and 31795
    - 0.03% arsenic for all other samples

Pyrite accounts for an average of 40.4%, and ranges from nil% to 100% of the total arsenic in the samples. Samples that have pyrite as the main host of arsenic include 31718, DX450213, DX450179, and 31787.

Arsenopyrite accounts for an average of 47.9%, and ranges from nil% to 100% of the total arsenic in the samples. Samples that have arsenopyrite as the main host of arsenic include 31759, 31782, 31644, 31576, DX450183, and DX450174.

Cobaltite/gersdorffite accounts for an average of 12.1%, and ranges from nil% to 77.6% of the total arsenic in the samples. Samples that have cobaltite/gersdorffite as the main host of arsenic include 31623 and 31795.

11. Cobalt Deportment

Table 14 presents the average, minimum, and maximum values for the suite of 12 samples. Figure 5 presents the elemental deportment of cobalt for each sample. A precautionary note is that cobalt is below 0.01% in all samples (Table 3).

- From the EMPA data, the following cobalt averages were used for pyrite:
    - 0.13% Co applied for samples 31644, 31787 and DX450213
    - 0.03% for all other samples.
- From the EMPA data, the following cobalt averages were used for arsenopyrite:
    - 1.10% Co for samples 31644, DX450174, 31759, and 31782.
    - 0.09% for all sample 31576.

Pyrite accounts for an average of 57.7%, and ranges from nil% to 100% of the total cobalt in the samples. Samples that have pyrite as the main host of cobalt include 31718, 31644, 31576, DX450213, DX450179, DX450183, and 31787.

Arsenopyrite accounts for an average of 25.5%, and ranges from nil% to 100% of the total cobalt in the samples. Samples that have arsenopyrite as the main host of cobaltc include 31759, 31782, and DX450174.

Cobaltite/gersdorffite accounts for an average of 16.6% of total cobalt, and ranges from nil% to 99.2% of the total cobalt in the samples. Samples that have cobaltite/gersdorffite as the main host of cobalt include 31623 and 31795.

EMPA - Pyrite

Accelerating potential = 15 kV, beam current = 20 nA; focused beam.
Standards and matrix corrections are listed above.
Precision is given in columns T-Z and detection limit in columns AJ-AP.

High Definition Mineralogical Analysis using QEMSCAN (Quantitative Evaluation of Materials by Scanning Electron Microscopy)

EMPA - Pyrite

Accelerating potential = 15 kV, beam current = 20 nA; focused beam.
Standards and matrix corrections are listed above.
Precision is given in columns T-Z and detection limit in columns AJ-AP.

Accreditation Descriptions

SCC:
SGS Canada Minerals Lakefield conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation found at https://www.scc.ca/en/seach/laboratories/sgs. Analytes and SGS Method Codes marked with a "Y" in the "SCC" column in the table denote ISO/IEC17025 accreditation

Appendix D – Terminology for Liberation/Association

Modal Mineralogy

Note: The size of the minerals as shown in the modal mineralogy tables is calculated statistically from the length of all the horizontal intercepts through each particle. It uses an assumption of random sectioning of spherical particles having uniform size, to obtain an estimate of the stereologically-corrected grain size in microns. The size calculation is a statistical property, which means that it is only valid when applied to a population of particles, and its accuracy increases as the population size increases. The accuracy of the size calculation is extremely low if applied to just a single cross-section.

Liberation and Association

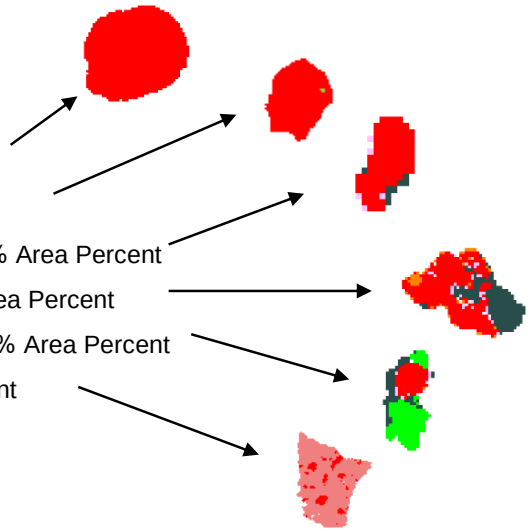
For the purposes of this analysis, particle liberation is defined based on 2D particle area percent. Particles are classified in the following groups (in descending order) based on mineral-of-interest area percent: free (≥95% of the total particle area) and liberated (≥80%). The non-liberated grains have been classified according to association characteristics, where binary association groups refer to particle area percent greater than or equal to 95% of the two minerals or mineral groups. The complex groups refer to particles with ternary, quaternary, and greater mineral associations including the mineral of interest.

The liberation and association characteristics of these minerals for each sample are given below. Note that when minerals are present in trace amounts, roughly <0.2 wt%, statistical data might not be adequate to calculate the liberation and association. Thus, results must be interpreted with caution.

Terminology developed for liberation and association presented in the report.

Liberation classes were defined as follows:

- **Pure:** A mineral with 100% Area Percent
- **Free:** A mineral with ≥95% Area Percent
- **Liberated:** A mineral with ≥80% but <95% Area Percent
- **Midds:** A mineral with ≥50% but <80% Area Percent
- **Sub-Midds:** A mineral with ≥20% but <50% Area Percent
- **Locked:** A mineral with <20% Area Percent



Association classes were defined as the follows:

- Pure Pyrite - a particle that has 100% of Pyrite
- Free Pyrite - a particle that has ≥95% of Pyrite
- Liberated Pyrite - a particle that has ≤95% to ≥80% of Pyrite
- Binary Pyrite: Chalcopyrite - a particle that has ≥95 area% of Pyrite: Chalcopyrite
- Binary Pyrite: Pyrrhotite - a particle that has ≥95 area% of Pyrite: Pyrrhotite
- Binary Pyrite: Sphalerite - a particle that has ≥95 area% of Pyrite: Sphalerite
- Binary Pyrite: Galena - a particle that has ≥95 area% of Pyrite: Galena
- Binary Pyrite: Arsenopyrite - a particle that has ≥95 area% of Pyrite: Arsenopyrite
- Binary Pyrite: Other Sulphides - a particle that has ≥95 area% of Pyrite: Other Sulphides (eg. chalcopyrite)
- Ternary Pyrite: Quartz/Feldspars - a particle that has ≥95 area% of Pyrite:Quartz:Feldspar (combined K-Feldspar and Plagioclase)
- Binary Pyrite: Micas - a particle that has ≥95 area% of Pyrite: Micas
- Binary Pyrite: Clays - a particle that has ≥95 area% of Pyrite: Clays
- Binary Pyrite: Other Silicates - a particle that has ≥95 area% of Pyrite: Other Silicates (clays/chlorite/amphibole ect.)
- Binary Pyrite: Carbonates - a particle that has ≥95 area% of Pyrite: Carbonates (combined calcite, dolomite and others)
- Binary Pyrite: Oxides - a particle that has ≥95 area% of Pyrite: Oxides (Fe-Oxides, Ilmenite or Rutile)
- Binary Pyrite: Other - a particle that has ≥95 area% of Pyrite: Other Minerals not listed above

Note: the complex category refers to ternary and quaternary particles, and does not necessarily reflect the complexity of the middling particles.

The same criteria were used for the liberation and association data for galena, sphalerite, arsenopyrite, pyrrhotite, carbonates, sulphides and oxides.

(1) Maximum Potential Acidity calculated as 31.25*Total S.
(2) Acid Potential calculated as 31.25*Sulphide S.
(3) Carbonate Neutralization Potential calculated from TIC.
(4) Neutralization Potential measured by the Modified Sobek Method.
(5) Total S measured by Leco furnace; Sulphate S measured by HCl leach; Sulphide S calculated by difference (Total S - Sulphate S).
(6) Assumed sulphate as gypsum.
(7) Other acid generating sulphides including chalcopyrite, arsenopyrite, gersdorffite-cobaltite, pentlandite and molybdenite.
Mineral abbreviations: Arsenopyrite (Apy), Ankerite (Ank), Calcite (Cal), Chalcopyrite (Ccp), Dolomite (Dol), Galena (Gn), Gersdorffite-Cobaltite (Gdf-Cbt), Molybdenite (Mol), Pentlandite (Pn), Pyrite (Py), Pyrrhotite (Po), Sphalerite (Sp)

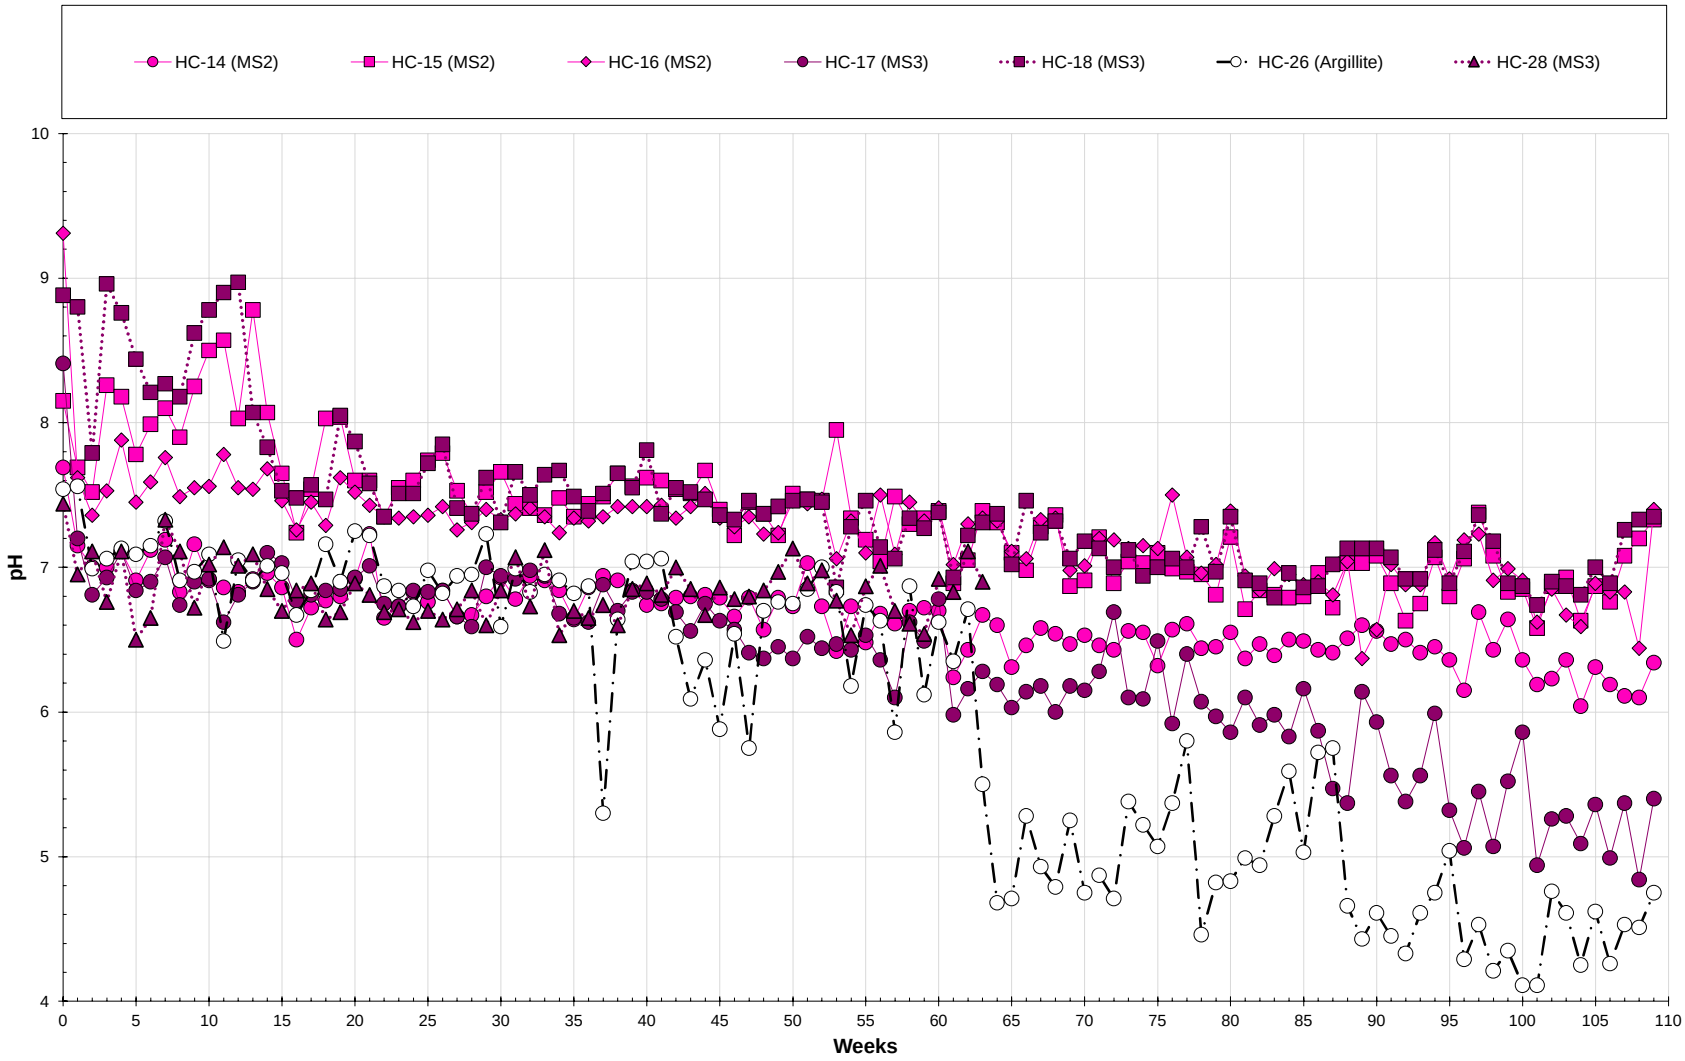
Project Number		OMEMA2303	
Date		November 2025	
Drawn	MS	Reviewed	KG



Notes
Tests generated from LP Zone samples shown with solid lines.
Tests generated from Limb Zone samples shown with short dashed lines.
Tests generated from Hinge Zone samples shown with dashed and dotted lines.
Test generated from AEX samples shown as dotted line.

*Median steady unscaled concentrations use the last 5 weeks (weeks 22 to 26) unless cell is going acid (e.g., COL-2 - weeks 13 to 17, COL-3 - weeks 11 to 15, COL-4 - weeks 10 to 14, COL-26 - weeks 11 to 15).

Steady unscaled concentrations in shaded cells primarily based on detection limit values.

Notes:

(1) Total S measured by Leco furnace. Sulphate S measured by HCl leach. Sulphide S calculated by difference (Total S - Sulphate S = Sulphide S)

(2) Acid Potential calculated as 31.25*Sulphide S by difference

(3) Maximum Potential Acidity, calcuated as 31.25*Total S by Leco furnace

(4) Total Carbon measured by Leco furnace. Total Inorganic Carbon, measured by HCl leach and Leco furnace

(5) Carbonate Neutralization Potential, calculated from TIC (TIC*10*(100/12.01)=CarbNP)

(6) Sobek Neutralization Potential

(7) NPR calculated as NP/AP. CarbNP calculated as CarbNP/AP. Median CarbNP and NP values were utilized in place of average values for some tests based on the distribution of NP among the subsamples (including FLB-05, FLB-06, FLB-07, FLB-12, FLB-13, FLB-14, and FLB-15).

(8) Weighted average composition for each barrel based on the interval length of individual grab samples. Median values shown for TIC, NP, and CarbNP for FLB-05, FLB-06, FLB-07, FLB-12, FLB-13, FLB-14, and FLB-15 based on distribution of TIC and NP data.

Notes:

(1) Total S measured by Leco furnace. Sulphate S measured by HCl leach. Sulphide S calculated by difference (Total S - Sulphate S = Sulphide S)

(2) Acid Potential calculated as 31.25*Sulphide S by difference

(3) Maximum Potential Acidity, calcuated as 31.25*Total S by Leco furnace

(4) Total Carbon measured by Leco furnace. Total Inorganic Carbon, measured by HCl leach and Leco furnace

(5) Carbonate Neutralization Potential, calculated from TIC (TIC*10*(100/12.01)=CarbNP)

(6) Sobek Neutralization Potential

(7) NPR calculated as NP/AP. CarbNP calculated as CarbNP/AP. Median CarbNP and NP values were utilized in place of average values for some tests based on the distribution of NP among the subsamples (including FLB-05, FLB-06, FLB-07, FLB-12, FLB-13, FLB-14, and FLB-15).

(8) Weighted average composition for each barrel based on the interval length of individual grab samples. Median values shown for TIC, NP, and CarbNP for FLB-05, FLB-06, FLB-07, FLB-12, FLB-13, FLB-14, and FLB-15 based on distribution of TIC and NP data.

Notes:

(1) Total S measured by Leco furnace. Sulphate S measured by HCl leach. Sulphide S calculated by difference (Total S - Sulphate S = Sulphide S)

(2) Acid Potential calculated as 31.25*Sulphide S by difference

(3) Maximum Potential Acidity, calcuated as 31.25*Total S by Leco furnace

(4) Total Carbon measured by Leco furnace. Total Inorganic Carbon, measured by HCl leach and Leco furnace

(5) Carbonate Neutralization Potential, calculated from TIC (TIC*10*(100/12.01)=CarbNP)

(6) Sobek Neutralization Potential

(7) NPR calculated as NP/AP. CarbNP calculated as CarbNP/AP. Median CarbNP and NP values were utilized in place of average values for some tests based on the distribution of NP among the subsamples (including FLB-05, FLB-06, FLB-07, FLB-12, FLB-13, FLB-14, and FLB-15).

(8) Weighted average composition for each barrel based on the interval length of individual grab samples. Median values shown for TIC, NP, and CarbNP for FLB-05, FLB-06, FLB-07, FLB-12, FLB-13, FLB-14, and FLB-15 based on distribution of TIC and NP data.

(1) Based on crustal abundance provided by Price (1997) excluding major elements.

Blue shading indicates concentrations greater than 10x Crustal Abundance values.

Blue highlight indicates samle is greater than the PWQO screening value.

Bold italicized text indicates value is greater than the interim PWQO screening value.

PWQO and interim PWQO values comparison is for screening purposes only. Screening holds no regulatory significance.

Blue highlight indicates samle is greater than the PWQO screening value.

Bold italicized text indicates value is greater than the interim PWQO screening value.

PWQO and interim PWQO values comparison is for screening purposes only. Screening holds no regulatory significance.

Blue highlight indicates samle is greater than the PWQO screening value.

Bold italicized text indicates value is greater than the interim PWQO screening value.

PWQO and interim PWQO values comparison is for screening purposes only. Screening holds no regulatory significance.

(1) Total sulphur determined by Leco analyzer.
(2) Sulphate sulphur determined by Leco following HCl leach for desulphurized tailings, concentrate tailings, and paste backfill samples WSP 01 and WSP 03. Whole tailings and paste backfill sample WSP 02 were analyzed by turbidimeter following HCl leach.
(3) Sulphate sulphur by Na_2CO_3 leach and turbidimeter.
(4) Sulphide sulphur by HNO_3 leach and turbidimeter.
(5) Sulphide sulphur determined by difference (total sulphur - sulphate sulphur).
(6) Acid potential calculated as 31.25*Sulphide S.
(7) Maximum potential acidity, calculated as 31.25*Total S.
(8) Total Carbon determined by Leco analyzer.
(9) Total inorganic carbon (as C) determined by HCl leach and Leco analyzer.
(10) Total inorganic carbon (as C) determined by $HClO_4$ leach and coulometer.
(11) Carbonate neutralization potential, calculated as TIC*10*(100/12.01); For the samples with TIC results by HCl leach / Leco and $HCLO_4$ leach / coulometer (e.g. F9-RO through F6-R-RO), TIC results by HCl leach / Leco were used to calculate CarbNP. CarbNP for Terraflow Binder based on mass balance calculations (see text).
(12) Modified Sobek neutralization potential.
(13) Neutralization potential ratio, calculated as NP/AP.
(14) Carbonate neutralization potential ratio, calculated as CarbNP/MPA.
(15) ARD classification based on NPR value; for the purposes of this assessment, an NPR threshold of 2 was used to distinguish between PAG and NPAG samples (see text).
(16) ARD classification based on CarbNPR value; for the purposes of this assessment, a CarbNPR threshold of 2 was used to distinguish between PAG and NPAG samples (see text).

1. Based on crustal abundance provided by Price (1997) excluding major elements.
2. Shading indicates concentrations greater than 10x crustal abundance values.

Bolded text indicates metals concentrations greater than interim PWQO screening value.

Shaded cells indicate metal concentrations greater than in-place PWQO screening value.

Screening values are for qualitative assessment only and hold no regulatory significance.

*Cyanide destruction conducted prior to flotation.

Bolded text indicates metals concentrations greater than interim PWQO screening value.

Shaded cells indicate metal concentrations greater than in-place PWQO screening value.

Screening values are for qualitative assessment only and hold no regulatory significance.

(1) Due to the limited mass of sulphide concentrate tailings available, modified SFE testing using reduced sample mass was conducted on these samples (3:1 ratio of DI water: sample was maintained).

Bolded values indicate metal concentration greater than interim PWQO screening value.

Shaded cells indicate metal concentrations greater than in-place PWQO screening value.

Screening values are for qualitative assessment only and hold no regulatory significance.
