ARTEMIS GOLD INC | Blackwater Mine

Blackwater Gold Mine Annual DS Follow-Up Report

April 1, 2022 – March 31, 2023

Executive Summary

The Blackwater Gold Project (the Project) is a gold and silver open pit mine currently under construction in central British Columbia (BC), approximately 112 kilometers (km) southwest of Vanderhoof, 160 km southwest of Prince George, and 446 km northeast of Vancouver. It is situated within the traditional territories of Lhoosk'uz Dené Nation, Ulkatcho First Nation, Skin Tyee Nation and Tsilhqot'in Nation. The Kluskus and Kluskus-Ootsa FSRs and Project transmission line cross the traditional territories of Nadleh Whut'en First Nation, Saik'uz First Nation, and Stellat'en First Nation (collectively, the Carrier Sekani First Nations) as well as the traditional territories of the Nazko First Nation, Nee-Tahi-Buhn Band, Cheslatta Carrier Nation and Yekooche First Nation.

Major mine components will include a tailings storage facility (TSF), ore processing facilities, waste rock, overburden and soil stockpiles, borrow areas and quarries, water management infrastructure, water treatment plants, accommodation camps and ancillary facilities. Limited early works construction activities to develop these components began in October 2022 and continued through December. Prior to this (January – September), the Project was in the pre-construction phase.

Development of this operation is facilitated by a number of approvals, including a Decision Statement (DS) issued under the *Canadian Environmental Assessment Act, 2012* in April 2019. Condition 2.11 of the DS requires the development of an Annual Follow-up Program Report (FUP), summarizing follow-up activities and monitoring results from a number of key monitoring programs required by the DS, including the:

- Air Quality and Fugitive Dust Management Plan;
- Aquatic Effects Monitoring Plan, including management of sediment and erosion.
- Caribou Mitigation and Monitoring Plan.
- Country Foods and Socio-economic Follow-up Program;
- Country Foods Monitoring Plan.
- Follow-up Program for Condition 3.14 of the Blackwater Gold Project.
- Follow-up Program for Condition 3.16 of the Blackwater Gold Project.
- Mine Site Water and Discharge Monitoring and Management Plan.
- Wetland Management and Offsetting Plan;
- Whitebark Pine Management Plan; and,
- Wildlife Mitigation and Monitoring Plan.

In general, limited construction activities occurred during the reporting period resulting in limited monitoring results. For those monitoring plans listed above only particulate matter monitoring through the *Air Quality and Fugitive Dust Management Plan* triggered adaptive management. This event occurred in December 2022, and resulted in a 'Low' trigger level exceedance, a summary of this result is in Section 8 of this document.

Several learnings did occur through implementation of the monitoring programs. These were based on observations made during monitoring events and through a review of monitoring results. Specifics are provided in the relevant sections of the FUP; however, they include adjusting sampling set ups, exploring relationships, and temporal shifts.

Résumé Exécutif

Le Projet Blackwater Gold (le Projet) est une mine à ciel ouvert d'or et d'argent en construction dans le centre de la Colombie-Britannique (C.-B.), à environ 112 kilomètres (km) au sud-ouest de Vanderhoof, 160 km au sud-ouest de Prince George et 446 km au nord-est de Vancouver. La mine est situé sur les territoires traditionnels de la Nation Lhoosk'uz Dené, de la Première Nation Ulkatcho, de la Nation Skin Tyee et de la Nation Tsilhqot'in. Le chemin forestier (FSR) de Kluskus et Kluskus-Ootsa et la ligne de transmission du projet traversent les territoires traditionnels de la Première Nation Nadleh Whut'en, de la Première Nation Saik'uz et de la Première Nation Stellat'en (collectivement, les Premières Nations du Nechako) ainsi que les territoires traditionnels de la Première Nation Nazko, de la bande Nee-Tahi-Buhn, de la Nation Cheslatta Carrier et de la Première Nation Yekooche.

Les composantes majeures de la mine comprendront une installation de stockage des résidus (TSF), des installations de stations d'épuration, des stocks de stériles, de morts-terrains et de sols, des zones d'emprunt et des carrières, des infrastructures de gestion de l'eau, des usines de traitement des eaux, des camps d'hébergement et des installations auxiliaires. Les premières activités de construction limitées pour développer ces composants ont commencé en Octobre 2022 et se sont poursuivies jusqu'en Décembre. Avant cela (Janvier – Septembre), le projet était en phase de pré-construction.

Le développement de cette opération est facilité par un certain nombre d'approbations, y compris une déclaration de decision fédéral (DS) émise en vertu de la Loi canadienne sur l'évaluation environnementale (2012) en avril 2019. La condition 2.11 de la DS exige l'élaboration d'un rapport annuel sur le programme de suivi (FUP), résumant les activités de suivi et les résultats de surveillance d'un certain nombre de programmes de surveillance clés requis par le DS, notamment:

- Plan de gestion de la qualité de l'air et des poussières diffuses;
- Plan de surveillance des effets aquatiques, y compris la gestion des sédiments et de l'érosion;
- Plan d'atténuation et de surveillance du caribou;
- Programme d'aliments traditionnels et de suivi socio-économique;
- Plan de surveillance des aliments traditionnels;
- Programmes de suivi pour la condition 3.14 du projet Blackwater Gold;
- Programmes de suivi pour la condition 3.16 du projet Blackwater Gold;
- Plan de surveillance et de gestion des eaux de contact avec la mine et des rejets du site minier;
- Plan pour les zones humides et la compensation;
- Plan de gestion du pin à écorce blanche; et,
- Plan d'atténuation et de surveillance de la faune.

En général, des activités de construction limitées ont eu lieu au cours de la période de référence, ce qui a donné lieu à des résultats de surveillance limités. Pour les plans de surveillance énumérés ci-dessus, seule la surveillance des particules dans le cadre du plan de gestion de la qualité de l'air et des poussières fugitives a déclenché une gestion adaptative. Cet événement s'est produit en Décembre 2022 et a entraîné un dépassement du niveau de déclenchement 'faible'. Un résumé de ce résultat se trouve à la Section 8.0 de ce document.

Plusieurs enseignements ont été tirés de la mise en œuvre des programmes de surveillance.Celles-ci étaient basées sur des observations faites lors d'événements de surveillance et sur un examen des résultats de la surveillance. Les détails sont fournis dans les sections pertinentes du FUP; cependant, ils incluent l'ajustement des configurations d'échantillonnage, l'exploration des relations et des décalages temporels.

WTP	Water Treatment Plant

1 Introduction

The Blackwater Gold Project (the Project) is a gold and silver open pit mine currently under construction in central British Columbia (BC), approximately 112 kilometers (km) southwest of Vanderhoof, 160 km southwest of Prince George, and 446 km northeast of Vancouver (Figure 1-1).

The Project is presently accessed via the Kluskus Forest Service Road (FSR), the Kluskus-Ootsa FSR and an exploration access road, which connects to the Kluskus-Ootsa FSR at km 142. The Kluskus FSR joins Highway 16 approximately 10 km west of Vanderhoof. A new, approximately 13.8 km road (Mine Access Road; MAR) will be built to replace the existing exploration access road, which will be decommissioned. The planned new access is at km 124.5 km on the Kluskus FSR. Driving time from Vanderhoof to the mine site takes roughly 2.5 to 3 hours depending on traffic and road conditions.

Major mine components include a tailings storage facility (TSF), ore processing facilities, waste rock, overburden and soil stockpiles, borrow areas and quarries, water management infrastructure, water treatment plants, accommodation camps and ancillary facilities (Figure 1-2). The gold and silver will be recovered into a gold-silver doré product and shipped by air and/or transported by road. Electrical power will be supplied by a new approximately 135 km, 230 kilovolt (kV) overland transmission line that will connect to the BC Hydro grid at the Glenannan substation located near the Endako mine, 65 km west of Vanderhoof.

The Blackwater mine site is located within the traditional territories of Lhoosk'uz Dené Nation, Ulkatcho First Nation, Skin Tyee Nation and Tsilhqot'in Nation. The Kluskus and Kluskus-Ootsa FSRs and Project transmission line cross the traditional territories of Nadleh Whut'en First Nation, Saik'uz First Nation, and Stellat'en First Nation (collectively, the Carrier Sekani First Nations) as well as the traditional territories of the Nazko First Nation, Nee-Tahi-Buhn Band, Cheslatta Carrier Nation and Yekooche First Nation (BC EAO, 2019a) (BC EAO, 2019b).

Project construction is anticipated to take two years. Mine development will be phased with an initial milling capacity of 15,000 tonnes per day (t/d) or 5.5 million tonnes per annum (Mtpa) for the first five years of operation. After the first five years, the milling capacity will increase to 33,000 t/d or 12 Mtpa for the next five-years, and to 55,000 t/d or 20 Mtpa in Year +11 until the end of the 23-year mine life. The Closure phase is from Year +24 to approximately Year +45, ending when the Open Pit has filled to the target closure level and the TSF is allowed to passively discharge to Davidson Creek via a closure spillway. Post-closure phase begins in Year +46.

New Gold Inc. (New Gold) received Environmental Assessment Certificate #M19-01 (EAC) on June 21, 2019 under the 2002 *Environmental Assessment Act* (BC EAO, 2019c) and a Decision Statement (DS) on April 15, 2019 under the *Canadian Environmental Assessment Act, 2012* (CEA Agency, 2019). In August 2020, Artemis Gold Inc. (Artemis) acquired the mineral tenures, assets and rights in the Blackwater Project that were previously held by New Gold Inc. On August 7, 2020, the Certificate was transferred to BW Gold LTD. (BW Gold), a wholly owned subsidiary of Artemis, under the 2018 *Environmental Assessment Act*. The Impact Assessment Agency of Canada notified BW Gold on September 25, 2020, to verify that written notice had been provided within 30 days of the change of proponent as required in Condition 2.16 of the DS, and that a process had been initiated to amend the DS.

This is the Blackwater Gold Mine annual follow-up program (FUP) report for the April 1, 2022 – March 31, 2023, reporting period (reporting period), required pursuant to the federal Environmental Assessment (EA) process.

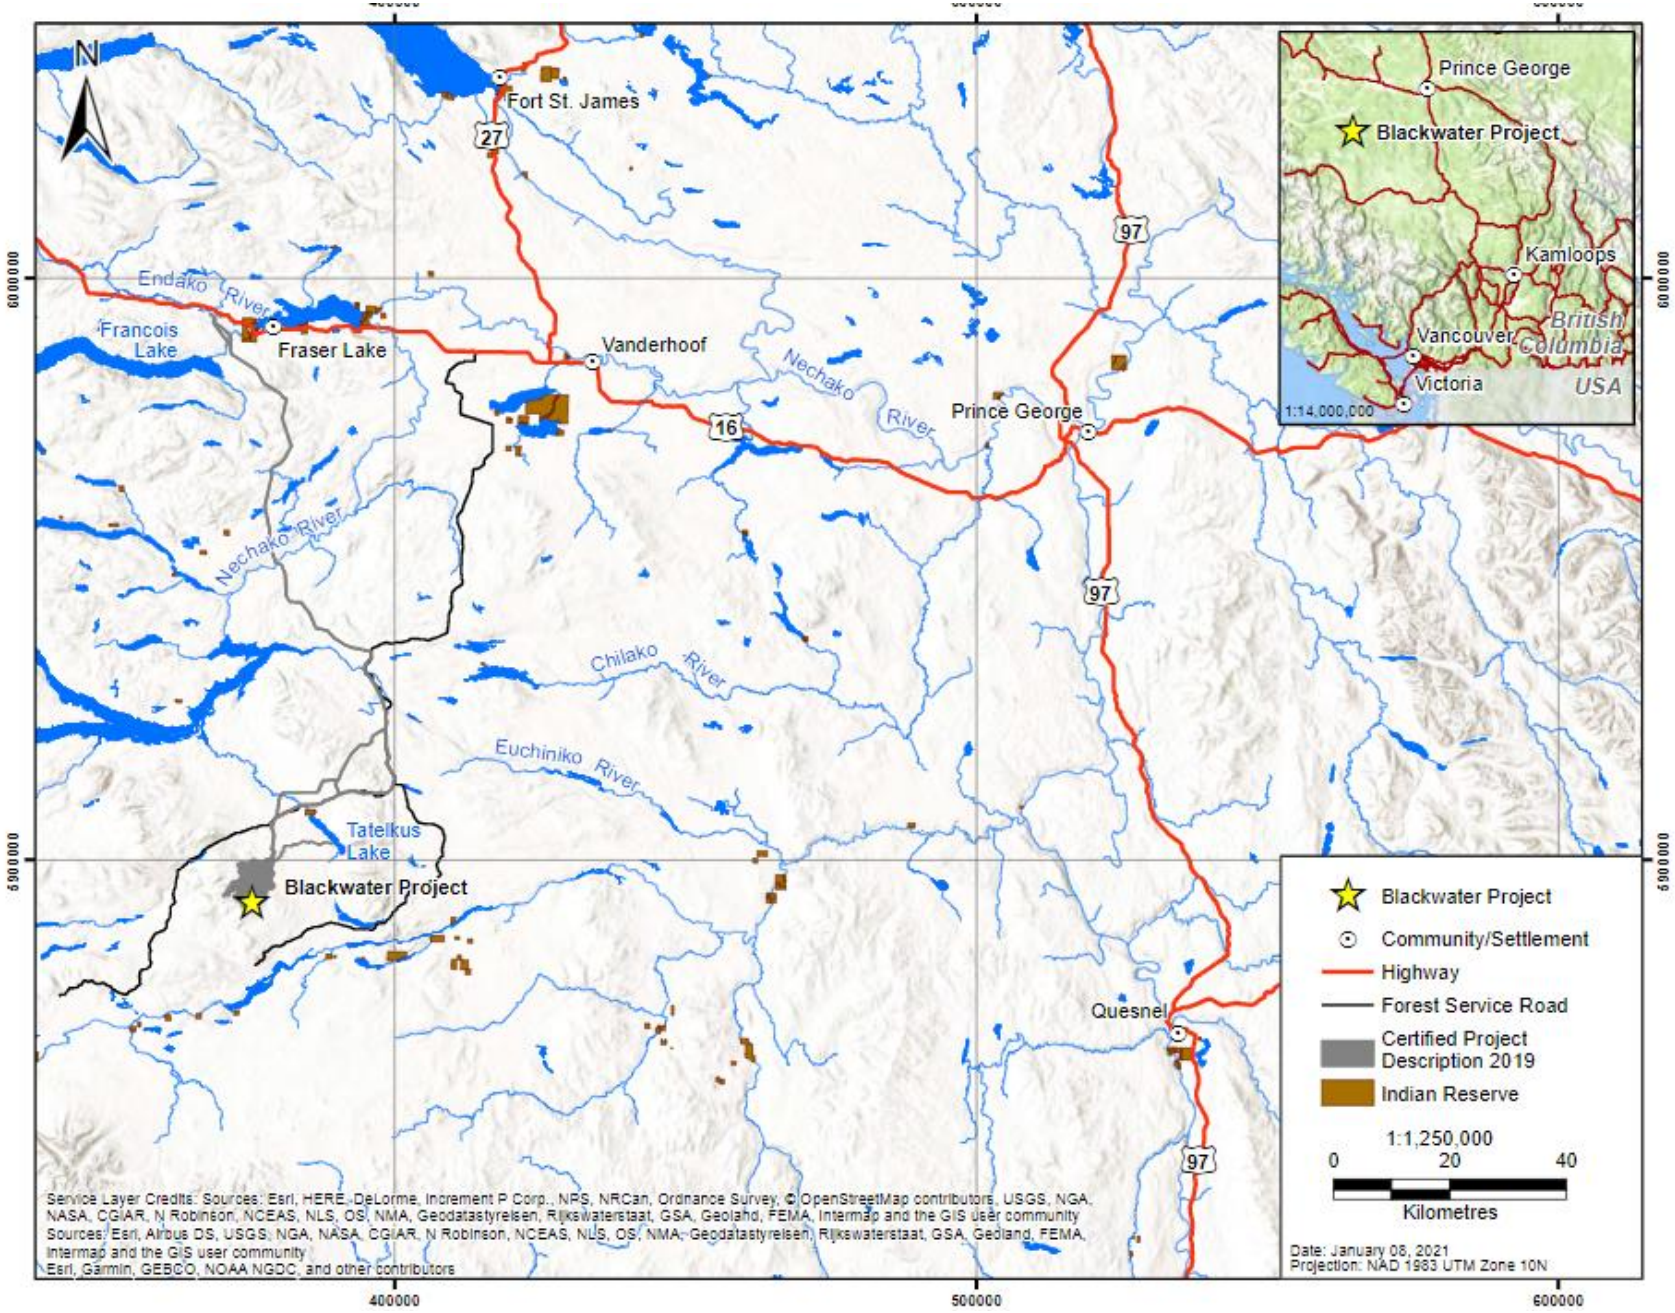

Figure 1-1: Project location

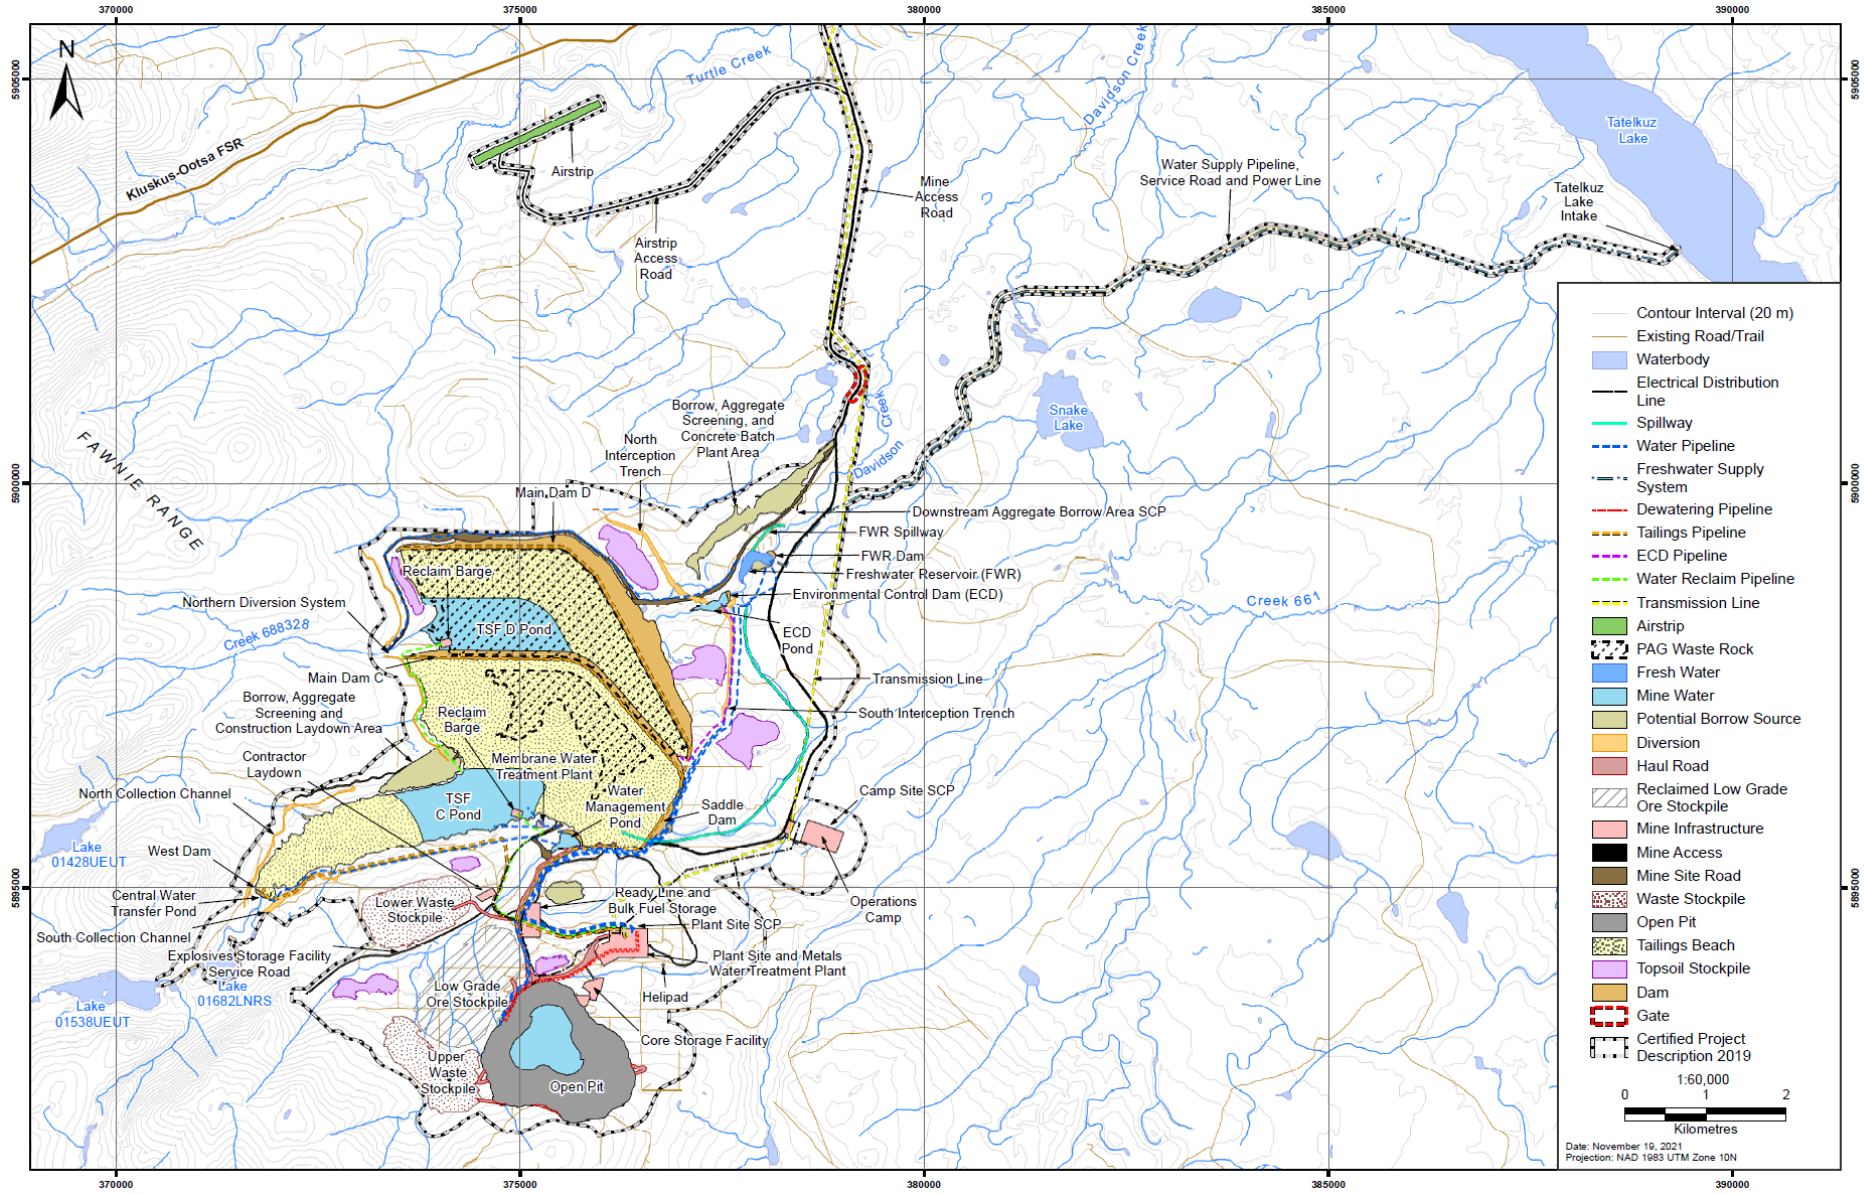

Figure 1-2: Overview of planned Project works

1.1 Project Activities

From January to September 2022, the Project was in the baseline (pre-construction) phase. Limited early works construction activities began in October 2022 concentrated in the proposed plant site area. These early works were the focus of activities as approval of major works was pursued through the Joint Mines Act/Environmental Management Act Permit process. Approval through the Mines Act was received on March 8th, 2023, while Environmental Management Act (EMA) permits for release of mine effluent and authorizing air emissions were received from the BC Ministry of Environment (ENV) in May 2023. There were no discharges to surface water from the Project during this reporting period.

Table 1-1 provides an overview of those activities through to March 31, 2023. Prior to the March 8th, 2023, issuance of the amendment to Mines Act Permit M-246 approving the mine plan and reclamation program, construction activities focused on site preparation.

A summary of specific activities undertaken to satisfy conditions of the DS conditions is presented in Appendix 14.

Table 1-1: Summary of 2022 Construction Phase activities

Component/Activity	Description	Activities Competed October 1 – March 31, 2023
Mine Access Road	• Kluskus-Ootsa Forest Service Road (FSR) km 124.5 plant site • Kluskus-Ootsa FSR to Mine Site boundary to be permitted under Special Use Permit • Mine Site boundary to mine site terminus to be permitted under Mines Act • 16 km single lane • Balanced cut and fill; no bedrock excavation/blasting • Located on mineral tenure held by BW Gold • Approximately 100 ha of disturbance; partially cleared	• No works completed
Mine Access Road Bridges	• Bridge 1: Steel concrete composite on precast spread footing • Bridge 2: Slab girder bridge on precast spread footing • Bridge 3: Skewed precast composite concrete deck panel. Steel superstructure. Precast concrete spread footings. • Bridge 4: Skewed precast concrete slab bridge. Precast spread footings. • Bridge 5: Skewed precast concrete slab bridge. Precast concrete spread footings.	• No works completed
Mine Site Roads (include mine haul roads, mine site service roads, exploration road upgrade within mine site)	• Clearing, grubbing and construction of roads to proposed Early Works on mine site. • Approximately 178.9 ha of disturbance • Estimated 7 clear-span bridges for fish stream crossings. • No bedrock excavation/blasting	• Clearing activities initiated in March 2023

Borrow Sources	• Clearing of trees for two borrow sources:
	  ○ Within footprint of the future Environmental Control Dam area – approximately 13.7 ha of disturbance.
	  ○ Southern borrow in TSF – approximately 7.5 ha of disturbance
		• A Borrow Pit located at 135KM on the Kluskus FSR was used as a source of gravel and rip rap.

Tailings Storage Facility (TSF)	• Clearing of trees in:
	  ○ TSF Site C dam footprint: 109.8 ha
	  ○ Aggregate screening site: 9.3 ha
		• Clearing activities initiated in March 2023

Water Management Structures	• Clearing of trees along water diversion channel route northeast of Site C starter dam: 47.1 ha of surface disturbance	• Clearing activities initiated in March 2023 • Plant site ditches and sediment pond earth works. • Installation of RIBs (Rabid Infiltration Basins)
Ore Stockpile Sites	• Adjacent to open pit and plant site • Clearing of trees • Future low grade ore stockpile base 4.5 ha of surface disturbance • Future high grade ore stockpile base 3.1 ha of surface disturbance	• Clearing activities initiated in March 2023
Open Pit and Overburden Dump Sites	• Clearing trees • Open pit stripping of overburden on 20.5 ha • Stockpile pit stripping overburden on 11.1 ha of surface disturbance	• Clearing activities initiated in March 2023
Water Supply	• Groundwater well east of camp provides sufficient water for portable water treatment plant for potable water. • If necessary, a second groundwater well will be drilled in this location. • No additional site clearing required	• Received Section 10 Short Term Use Approval under the Water Sustainability Act, for temporary use of TW-13-01 (File 7003004). Works began on piping.
Ancillary Building Sites	Clearing at multiple sites: • Explosives magazine site: 3.1 ha of surface disturbance • Truck shop and mine offices: 18.6 ha of surface disturbance • Operational camp: 33.9 ha of surface disturbance • Existing 250-person camp: 0 ha	• Preparing existing camp for expanded use (additional dorms, arctic corridor, snow roofs, utilities).
Plant Site	• Clearing, grubbing, site levelling, soil, overburden salvage. No bedrock excavation/blasting: ○ Plant site: 26.4 ha of surface disturbance	• Clearing, grubbing, cut to fill. The full 26.4 ha was cleared, excluding the wetland, which was buffered and flagged. • Additional earthworks and procurement in preparation of major works construction.

1.2 Report Scope and Navigation

On April 15, 2019, the Project was issued the DS (CEA Agency, 2019). Condition 2.11 of this document requires the development of an annual report summarizing the implementation of a number of monitoring programs (Table 1-2). This follow-up report has been developed to comply the following conditions:

> **2.11.** The Proponent shall, commencing in the reporting year during which the Proponent begins the implementation of the conditions set out in this Decision Statement, prepare an annual report that sets out:
>
> > ***2.11.1*** the activities undertaken by the Proponent in the reporting year to comply with each of the conditions set out in this Decision Statement;
> >
> > ***2.11.2*** how the Proponent complied with condition 2.1;
> >
> > ***2.11.3*** for conditions set out in this Decision Statement for which consultation is a requirement, how the Proponent considered any views and information that the Proponent received during or as a result of the consultation, including a rationale for how the views have, or have not, been integrated;
> >
> > **2.11.4** The information referred to in conditions 2.5 and 2.6 for each follow-up program;
> >
> > **2.11.5** The results of the follow-up program requirements identified in conditions 3.14, 3.15, 3.16, 4.5, 5.5, 6.11, 6.12, 6.13, 6.14, 8.18.6, 8.20.5, 8.21, and 8.22 if required;
> >
> > **2.11.6** Any update made to any follow-up program in the reporting year;
> >
> > **2.11.7** Any modified or additional mitigation measures implemented or proposed to be implemented by the Proponent, as determined under condition 2.9 and rationale for why mitigation measures were selected pursuant to condition 2.5.4; and
> >
> > ***2.11.8*** Any change(s) to the Designated Project in the reporting year.

As reflected in the headers of Table 1-2 below, several conditions have been addressed in the body of this report. Exceptions to this have been italicized in the list above.DS conditions 2.11.1 and 2.11.8 have been addressed in Appendix 14, DS condition 2.11.2 has been addressed in Section1.4, while DS condition 2.11.3 is summarized in the *2022 BW Gold Consultation Report* (Appendix 1).

As described in Section 1.1 limited early works activities occurred in 2022 with the Project entering the construction phase in October 2022. For this reason, the follow-up reports summarized in this document (Table 1-2) include work done to continue baseline and ongoing compliance monitoring in 2022 (January – September 2022). It is noted that the small amount of time in which the Project was in construction, limited the ability to detect environmental change relative to baseline conditions in 2022 and early 2023, per condition 2.5.4 cited by condition 2.11.7. Comparisons have been made to the extent feasible, as determined by the appropriate Qualified Professionals (QP). In summary, this report presents those monitoring activities from relevant monitoring programs between January 1, 2022, and March 31, 2023. Further context on information collected January 1– March 31, 2023, is presented in Section 1.3.2.

Table 1-2: DS condition navigation summary

Condition No.	Condition	Section (DS 2.11.4, 2.11.5, 2.11.6, 2.11.7, 2.11.8)	Appendix
3.14	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, Fisheries and Oceans Canada, and other relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to adverse environmental effects of the Designated Project on fish and fish habitat. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall…	2 Fish and Fish Habitat (3.14)	Appendix 2: FINAL REPORT Blackwater Gold Project Fish and Aquatic Resources 2022 Field Survey Report Appendix 3: Blackwater Gold Project Fish and Aquatic Resources 2021 Field Survey Report
3.15	The Proponent shall develop, in consultation with Indigenous groups and other relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to adverse environmental effects of the Designated Project on fish habitat in Davidson Creek, Creek 661 and Chedakuz Creek. The Proponent shall develop the follow-up program prior to construction and shall implement the follow-up program during all phases of the Designated Project. The Proponent shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall…	3 Water Quality and Quantity (3.15)	Appendix 5: 2022 Wildlife Mitigation and Monitoring Program Compliance Report Appendix 4: Follow-up Programs for Condition 3.15 of the Blackwater Gold Project Decision Statement issued under Section 54 of the Canadian Environmental Assessment Act, 2012
3.16	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to fish habitat in Tatelkuz Lake and Chedakuz Creek. The Proponent shall implement the follow-up program from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall:	4 Fish Habitat (3.16)	Appendix 2: FINAL REPORT Blackwater Gold Project Fish and Aquatic Resources 2022 Field Survey Report
4.5	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of all mitigation measures to avoid harm to migratory birds, including migratory birds that are listed species at risk, their eggs and nests. The follow-up program shall include the mitigation measures used to comply with condition 4.1 to 4.4. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.	5 Migratory Birds (4.5)	Appendix 5: 2022 Wildlife Mitigation and Monitoring Program Compliance Report
5.5	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, a follow-up program to verify the predictions of the environmental assessment as it pertains to the adverse environmental effects of the Designated Project on wetland functions and to determine the effectiveness of the mitigation measures as it pertain to wetlands. The Proponent shall implement the follow-up program during from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall…	6 Wetlands (5.5)	Appendix 9: Wetland Mapping and Assessment Baseline
6.11	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse environmental effects of the Designated Project on the health of Indigenous Peoples caused by changes in concentrations of contaminants of potential concern in water, soil, vegetation and wildlife, including fish, and determine the effectiveness of mitigation measures. As part of the development of the follow-up program, the Proponent shall identify the vegetation and wildlife species that shall be monitored, the locations where the monitoring will be conducted, the contaminants to be monitored and the frequency of the monitoring. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. In doing so, the Proponent shall…	7 Country Foods (6.11) (6.13)	Appendix 7: Country Food Monitoring Plan Annual Report 2022
6.12	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse environmental effects of the Designated Project on the health of Indigenous Peoples as a result of changes to air quality and determine the effectiveness of mitigation measures. As part of the implementation of the follow-up program, the Proponent shall monitor nitrogen dioxide (NO_2), sulfur dioxide (SO_2), fine particulate matter ($PM_{2.5}$), particulate matter (PM_{10}), dust, and carbon monoxide (CO) in air. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply	8 Air Quality (6.12)	Appendix 6: Air Quality and Fugitive Dust Management Annual Report 2022 Appendix 11: Air Quality Monitoring

8.21	The Proponent shall develop, in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to the effects of changes caused by the Designated Project on western toad (*Anaxyrus boreas*). The Proponent shall implement the follow-up program from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall…	12 Effects on Western Toad (8.21)	Appendix 5: 2022 Wildlife Mitigation and Monitoring Program Compliance Report
8.22	The Proponent shall develop, in consultation with Indigenous groups, and implement a follow-up program to monitor little brown myotis (*Myotis lucifugus*) and northern myotis (*Myotis septentrionalis*) usage of buffer zones established pursuant to condition 8.14 and roosting structures installed and maintained by the proponent pursuant to condition 8.15 to determine the effectiveness of the mitigation measures. The Proponent shall implement the follow-up program during construction and operation and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.	13 Effects on Bats (8.22)	Appendix 5: 2022 Wildlife Mitigation and Monitoring Program Compliance Report

1.3 Previous Submissions

BW Gold has made two (2) prior submissions that have influenced the content of this report. Details on these are provided below, however in both instances the IAAC and BW Gold were able to effectively communicate and align on next steps and required deliverables.

1.3.1 Pre-construction Compliance Summary

In September 2022 BW Gold submitted a pre-construction compliance document report submission pursuant to DS condition 11.3 and 11.4 which required:

- Updates to the schedules referred to in DS 11.1 and 11.2 no later than September 30 each year; and;
- Updates to the schedules referred to in DS 11.1 and 11.2 upon revision of the schedules.

As a result of a miscommunication and mislabeling of the electronic submission, this submission was interpreted as the annual report required for submission by condition 2.11. Following a detailed review of this submission with the understanding that it was the annual report, IAAC provided a series of information requests to BW Gold intended to address the perceived gaps (Hess, 2023). In subsequent communications, the misunderstanding associated with this submission was resolved and the information requests were rescinded with the understanding that they would be considered in the development of the annual report. In acknowledgement of that commitment, the information requests relevant to those conditions associated with this report have been summarized and addressed in Table 1-3.

Table 1-3: March 2023 information requests

Condition No.	Information Request	Response
2.3.2, 3.14	Provide the consultation records related to DFO's review of the follow-up program for condition 3.14 (e.g., BW Gold's communications to DFO requesting their review and outlining the deadline for comment).	Appendix 1: 2022 BW Gold Consultation Report
5.5, 5.5.1, 5.5.2, 5.5.3	a. Update the Wetland Management and Offsetting Plan (the follow-up program required by condition 5.5) to specify that "early works" are not exempt from follow-up requirements as per condition 5.2. b. Provide wetland survey results showing the location of red or blue listed wetlands within the mine site, as per condition 5.5.1. c. State when wetland monitoring commenced, and, if applicable, describe monitoring results for the 2021-22 reporting year as required by conditions 5.5.2, 5.5.3, and 2.11.5.	a. Condition 5.2 will be incorporated into the next schedule update of the *Wetland Management and Offsetting Plan* b. Section 6 Wetlands (5.5) c. Section 6 Wetlands (5.5)
6.14	Confirm the dates of the winter distribution and density surveys for moose that were conducted prior to construction as per condition 6.14 and provide the results of the surveys for the 2021-22 reporting year as required by condition 2.11.5.	Section 9 Effects on Moose (6.14)
8.16, 8.18, 8.18.4, 8.18.6	a. Indicate where the "schedule for implementation" is found for nonhabitat measures to be implemented, as required by condition 8.18.4. b. Identify where "the methods, timing and frequency for conducting winter surveys for caribou abundance and distribution within the Designated Project area" is located within the Caribou Mitigation and Monitoring Plan, as required by condition 8.18.6.	Section 10 Effects on Caribou (8.18.6)
8.20, 8.20.3, 8.20.5, 8.20.5.2	a. Identify the locations to plant whitebark pine (*Pinus albicaulis*) in undisturbed areas within the Designated Project area within the Whitebark Pine Management Plan, as required by sub-condition 8.20.3. b. Clarify how the "adequacy" of monitoring results will be determined regarding the monitoring of use of the reclaimed areas by Clark's nutcracker as required by condition 8.20.5.2.	a. See Figure 8.1-3 of the *Whitebark Pine Management Plan* (ERM, 2022h) b. See Section 10.2 of the *Whitebark Pine Management Plan* (ERM, 2022h)
2.5, 2.5.4, 8.21, 8.21.1	a. Indicate in the Wildlife Mitigation and Monitoring Plan the levels of environmental change relative to baseline conditions that would require the Proponent to implement modified or additional mitigation measure(s), including instances where the Proponent may require Designated Project activities to be stopped, for the follow-up monitoring for Western Toad, as required by condition 2.5.4. b. Provide the results of the annual western toad survey for the 2021- 22 reporting year, indicating whether toad breeding ponds were identified and their locations. c. Provide an unsecured, machine-readable version of the Wildlife Mitigation and Monitoring Plan for IAAC review purposes.	Section 12 Effects on Western Toad (8.21) Appendix 5: 2022 Wildlife Mitigation and Monitoring Program Compliance Report

1.3.2 2022 Blackwater Gold Mine Annual DS Follow-Up Report

On September 15, 2023, BW Gold submitted the 2022 Blackwater Gold Mine Annual DS Follow-Up Report which covered January – December 2022. IAAC responded to this submission noting that the reporting period defined by the FDS specifies April 1 – March 31. A path towards addressing the reporting gap was discussed with IAAC on September 27th and a summary of next steps was subsequently provided by BW Gold on September 30th.

This submission represents the revised version of the initial September 15th report submission and summarizes the results of the relevant monitoring programs between January 2022 – March 31, 2023.

It should be noted that not all reports presented in the appendices required revisions to reflect the updated reporting period. Table 1-4 below, summarizes the reporting year for each appendix.

As an additional consideration, many of the follow up programs referenced by condition 2.11 of the FDS have been developed to comply with conditions associated with the provincial authorizations, as well as these federal conditions as an initiative to simplify and streamline reporting as well as to prevent duplication of data and Indigenous Nation review efforts and resources required. The provincial reporting period for those documents, listed below, is January – December, annually.

- Accidents and Malfunctions Admin and Communications Plan;
- Air Quality and Fugitive Dust Management Plan;
- Aquatic Effects Monitoring Plan;
- Construction and Environmental Management Plan;
- Country Foods Monitoring Plan
- Cultural and Spiritual Resources Management Plan;
- Invasive Plant Management Plan;
- Mine Site Water and Discharge Monitoring and Management Plan;
- Noise and Vibration Effects Monitoring and Mitigation Plan
- Surface Erosion Prevention and Sediment Control Plan; and,
- Wildlife Mitigation and Monitoring Plan;

Table 1-4: Summary of reporting period by appendix.

Appendix	Reporting Period	Note

Appendix 14: Summary of DS Condition Activities (2.11.1)	April 1, 2022 – March 31, 2023	N/A

1.4 Implementation (2.1)

As required by DS condition 2.1 BW Gold has continued to design, permit, and construct the Project in a manner that considers and incorporates corporate standards and policies, the expertise of the selected consulting firms, continued involvement of a team of QPs, and ongoing engagement with Indigenous groups.

> **2.1.** The Proponent shall ensure that its actions in meeting the conditions set out in this Decision Statement during all phases of the Designated Project are considered in a careful and precautionary manner, promote sustainable development, are informed by the best information and knowledge available at the time the Proponent takes action (including community and Indigenous traditional knowledge), are based on methods and models that are recognized by standard-setting bodies, are undertaken by qualified individuals, and have applied the best available economically and technically feasible technologies.

QPs have developed and supported in the implementation of those programs that make up the basis of this document. Signatures have been provided on those finalized documents and reflect the requirements of this condition.

Appendix 1 outlines engagement that occurred in the development of these programs.

1.5 Consultation (2.12)

As required by condition 2.12, the *2022 Blackwater Gold Mine Annual DS Follow-Up Report* was provided in draft to Indigenous groups on June 30th, 2023, to facilitate consultation on the content and findings of the document.

> **2.12** The Proponent shall provide a draft annual report referred to in condition 2.11 to Indigenous groups, no later than June 30 following the reporting year to which the annual report applies. The Proponent shall consult Indigenous groups on the content and findings in the draft annual report.

Comments from Carrier Sekani First Nations were received July 31st, 2023, and discussed with the nation on September 13th, 2023. These comments related to fish and fish habitat, referring to the follow up programs for FDS Conditions 3.14, 3.15, and 3.16, as well as the *FINAL REPORT Blackwater Gold Project Fish and Aquatic Resources 2022 Field Survey Report*. Many of those comments received were addressed through small clarifications, such as reference to the appropriate section of a follow-up program. Opportunities to clarify wording in future iterations of the follow-up programs were identified as well, however no changes to those reports appended to this document have been made.

Following the reporting period revision of this document (Section 1.3.2), this report was re-issued to Indigenous groups on October 12th, 2023, for consultation. This process focused on those updates made to the document guided by a change log provided for reference. No comments were received during this 15 day review period.

An additional review period occurred following the finalization of the revised *Follow-up Programs for Condition 3.15 of the Blackwater Gold Project Decision Statement issued under Section 54 of the Canadian Environmental Assessment Act, 2012* (Appendix 4). This was incorporated into the annual report and these changes were provided to Indigenous groups for review on November 3rd, 2023. No comments were received during the 15 day review period.

BW Gold has developed those follow-up programs and the associated management plans described in this document in consultation with those nations. Appendix 1 provides a summary of this activity for context.

2 Fish and Fish Habitat (3.14)

The fish and fish habitat *Follow-up Program for Condition 3.14 of the Blackwater Gold Project* (Palmer, 2023b) was developed to address the conditions outlined in condition 3.14 of the DS. It was designed to first characterize baseline conditions for each of the indicators listed in the condition, and then monitor those indicators during all phases of the Project to determine, to the extent possible, if:

a) Variation from baseline conditions is occurring;

b) Mitigation measures are effective;

c) If the environmental assessment was accurate in terms of anticipated effects on the indicators; and,

d) Determine if additional mitigations should be taken pursuant to Condition 2.9.

Based on the progress of the project to date (Section 1.1), the field programs summarized in this report collected information intended to represent a pre-construction updated baseline for fish and fish habitat to inform long-term monitoring under this condition. The programs and their results are presented in those documents listed below:

- *FINAL REPORT Blackwater Gold Project Fish and Aquatic Resources 2022 Field Survey Report* (Appendix 2), which summarizes the monitoring and results of the program for 2022.
- *Blackwater Gold Project Fish and Aquatic Resources 2021 Field Survey Report* (Appendix 3), which outlines the field surveys that occurred in 2021, including winter surveys into March 2022 that are relevant to this section.

This section provides an overview of monitoring, results, and adaptive management that occurred during the reporting period to support compliance with DS 3.14. Full details can be reviewed in the documents listed above. Table 2-1 below summarizes this condition of the DS and where the full details can be found in the associated appendix of this document.

Table 2-1: DS condition 3.14 follow-up monitoring

Condition No.	Condition	Appendix	Section
3.14.	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, Fisheries and Oceans Canada, and other relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to adverse environmental effects of the Designated Project on fish and fish habitat. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall:	Described in the *Follow-up Programs for Condition 3.14 of the Blackwater Gold Project Decision Statement issued under Section 54 of the Canadian Environmental Assessment Act, 2012* (Palmer, 2023b)	
3.14.1.	Conduct parasite and pathogen inventories in Lake 01538UEUT and Lake 01682LNRS prior to enlarging Lake 01682LNRS and connecting it to Lake 01538UEUT pursuant to condition 3.13 and compare the results of the parasite and pathogen inventories for the two lakes;	Described in the *Follow-up Programs for Condition 3.14 of the Blackwater Gold Project Decision Statement issued under Section 54 of the Canadian Environmental Assessment Act, 2012* (Palmer, 2023b)	Complete in 2021 (Palmer, 2023b).
3.14.2.	Monitor, starting when the Proponent starts to pump water into Davidson Creek and continuing through until the freshwater supply system has been decommissioned, rainbow trout (*Oncorhynchus mykiss*) and Kokanee (*Oncorhynchus nerka*) populations in Davidson Creek, including	Appendix 2: FINAL REPORT Blackwater Gold Project Fish and Aquatic Resources 2022 Field Survey Report	2.1 Davidson Creek
3.14.2.1.	Community composition of rainbow trout (*Oncorhynchus mykiss*) and Kokanee (*Oncorhynchus nerka*), their absolute abundance, genetic structure and diversity;		2.1.2 Young-of-the-year and Juvenile Rainbow Trout Abundance 2.1.7 Rainbow Trout and Kokanee Genetic Structure
3.14.2.2.	Absolute abundance of overwintering rainbow trout juveniles; and		2.1.1 Overwintering Rainbow Trout Abundance 2.1.3. Rainbow Trout Adult Spawner Abundance
3.14.2.3.	Characteristics of spawner populations through surrogate monitoring metrics including size at 50% maturity, redd counts and spawner distribution.		2.1.4 Kokanee Adult Spawner and Redd Abundance 2.1.5 Kokanee Fry Outmigration 2.1.8 Dissolved Free Amino Acids Sampling

2.1 Monitoring and Analysis

As outlined in Table 2-1 above, detailed regarding the reporting period monitoring activities done in support of condition 3.14 are provided in Appendix 2 and Appendix 3. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results and recommendations. Table 2-2 below summarizes the monitoring results and recommendations for work done in Davidson Creek, it also specifies where further information on each item can be found in the Appendices.

Monitoring for parasites and pathogens in Lake 15 and 16, as required by DS condition 3.14.1. is occurred in September 2021 and is summarized in the *Follow-up Program for Condition 3.14 of the Blackwater Gold Project* (Palmer, 2023b). The study concluded that parasites and pathogens causing disease in fish are not present in Lake 15 or 16, and that no additional monitoring is required (Palmer, 2023b).

No adaptive management was required. Monitoring will continue as described in the *Follow-up Programs for Condition 3.14 of the Blackwater Gold Project* (Palmer, 2023b), with a few changes in the approach to monitoring. These changes are summarized in Table 2-1.

Table 2-2: Summary of DS condition 3.14 follow-up monitoring

Monitoring	Survey /Methodology	Dates	Results Summary	Adaptive Management/Recommendations
Overwintering Rainbow Trout Abundance	**Appendix 3, Section 2.2.2.1**	March 2022 (Palmer, 2022a)	**Appendix 3, Section 2.2.2.2** Fish were caught using minnow trapping at five of the six survey locations and a total of seven Rainbow Trout were captured. CPUE at the six overwintering survey locations was low, ranging from 0 to 0.021 fish per trap-hour. (Palmer, 2022a)	
	Appendix 2, Section 2.1.1.1	March 3 – 14, 2023 (Palmer, 2023a)	**Appendix 2, Section 2.1.1.2** Underwater camera deployment was used to determine Rainbow Trout presence and estimate abundance in (7) seven overwintering sites. Initially ten sites had been considered, however three could not be monitored as they had frozen to the bottom. Fish were observed on video footage at two sites. The max N value at the two sites ranged from 3 to 4. (Palmer, 2023a)	
Young -of-the-year and juvenile Rainbow Trout Abundance	**Appendix 2, Section 2.1.2.1** Summer low-flow survey (Palmer, 2023a)	July 21 – August 28. 2022 (Palmer, 2023a)	**Appendix 2, Section 2.1.2.2.1** A total of 176 Rainbow Trout and 1 adult kokanee were captured from electrofishing efforts at all ten sites. The CPUE ranged from 0.12 to 2.56 fish per 100 s of electrofishing effort. (Palmer, 2023a)	**Appendix 2 Section 3.0** To eliminate the potential for bias due to temporal mismatch and provide an understanding of population structure by age, subdivide and evaluate juvenile Rainbow trout abundance by age class rather than pooling catch. (Palmer, 2023a)
	Appendix 2, Section 2.1.2.1.2 Pre-winter survey (Palmer, 2023a)	October 2 – 9, 2022 (Palmer, 2023a)	**Appendix 2, Section 2.1.2.2.2** A total of 261 Rainbow Trout were captured from electrofishing efforts at the six sites. These fish were predominantly less than one year old based on measured size. The CPUE ranged from 1.32 fish per 100 s of electrofishing effort to 2.65 fish per 100 s of electrofishing effort. (Palmer, 2023a)	
	Appendix 2, Section 2.1.2.1.4 Mark-recapture pilot study (Palmer, 2023a)	July 21 – 22, 2022 October 4 – 5, 2022 (Palmer, 2023a)	**Appendix 2, Section 2.1.2.2.4** During initial sampling at Site DC-1 for the summer survey, a total of 8 fish were captured and marked on day 1, and a total of 2 fish were captured on day 2. None of the fish captured on day 2 were marked recaptures from day 1. During the initial sampling at Site DC-5 for the pre-winter survey, a total of 41 fish were captured and marked on day 1, and a total of 23 fish were captured on day 2. A total of 3 of the 23 fish captured on day 2 were marked recaptures from day 1. (Palmer, 2023a)	**Appendix 2 Section 3.0** Use closed-site depletion electrofishing instead of a mark-recapture survey for juvenile fish abundance surveys, as electrofishing has less uncertainty and is more efficient. (Palmer, 2023a)
Rainbow Trout adult spawner abundance	**Appendix 2, Section 2.1.3.1.1** Paired hoop net survey (Palmer, 2023a)	June 12 - 28 2022 (Palmer, 2023a)	**Appendix 2, Section 2.1.3.2.1** During a total fishing effort via trap (hoop) nets of 737.2 hours was completed at DC-8, resulting in the capture of 96 juvenile and 30 adult Rainbow Trout. CPUE is only reported for the adult fish captured, because the focus of this survey was on spawning migration. The average CPUE, measured as number of adult fish per net-hours, 0.04 at DC-8. (Palmer, 2023a)	**Appendix 2 Section 3.0** To improve data quality use an upstream and downstream facing rigid trap and fence instead of a mesh paired hoop net. To better capture the entire spawner migration period, shift the start date for the survey from mid-June to mid-May. (Palmer, 2023a)
	Appendix 2, Section 2.1.3.1.2 Visual spawner surveys (Palmer, 2023a)	June 20, 23, 26 2022 (Palmer, 2023a)	**Appendix 2, Section 2.1.3.2.2** One live Rainbow Trout was observed holding at DC-1 on June 20, 2022, and two live Rainbow Trout spawners were observed at DC-1 on June 26, 2022. No live or dead Rainbow Trout were observed at DC-8 on June 23, 2022, and no redds were observed during all three visual spawner surveys. The calculated linear and areal density of live Rainbow Trout counted at DC-1 was 0.40 fish per m and 0.07 fish per m2, respectively, on June 20, 2022, and 0.15 fish per m and 0.03 fish per m2 on June 26, 2022. (Palmer, 2023a)	**Appendix 2 Section 3.0** Eliminate visual spawner survey as a monitoring metric for spawner abundance as stream visibility and flow conditions are highly variable during the height of spawning run. (Palmer, 2023a)
Kokanee adult spawner and redd abundance	**Appendix 2, Section 2.1.4.1.1** Visual spawner surveys (Palmer, 2023a)	Mid-July to early October 2022 (Palmer, 2023a)	**Appendix 2, Section 2.1.4.2.1** This study encompassed the kokanee spawner migration such that 631 live fish were observed on the first survey day (July 22, 2022) and one live fish was observed on the last survey day (October 1, 2022). Among 16,827 cumulative live adult kokanee observations, 69.9%, 6.4%, 19.4%, and 4.3% of these occurred in Reach 1, Reach 2, Reach 3, and Reach 4, respectively. The linear and areal density of live kokanee ranged from 0 to 2.44 fish per m and 0 to 0.44 fish per m2, respectively. The linear and areal density of redds ranged from 0 to 0.29 fish per m and 0 to 0.05 fish per m2, respectively. The highest number of live kokanee counted in a single survey was 6,637 on August 30, which presumably represents a timepoint near peak spawning. A total of 254 spawned kokanee carcasses were recovered during the	**Appendix 2 Section 3.0** Exclude sections of reach 1 that have evidence of cattle instream activity from redd counts, as conditions do not allow for accurate counts. Combine holding and migration behaviours categories for visual spawner surveys instead of tallying the two separately, as they are difficult to distinguish. (Palmer, 2023a)

Monitoring	Survey /Methodology	Dates	Results Summary	Adaptive Management/Recommendations
			study period, including 67 males and 57 females among fish that were accurately sexed. (Palmer, 2023a)	
	Appendix 2, Section 2.1.4.1.2 Fish fence and underwater camera survey (Palmer, 2023a)	July 24 – September 8 2022 (Palmer, 2023a)	**Appendix 2, Section 2.1.4.2.2** Collectively, the number of adult kokanee migrating into Davidson Creek may have ranged from 1,223 to 1,493 in the daytime and 2,315 to 7,815 in the nighttime. (Palmer, 2023a)	**Appendix 2 Section 3.0** Implement a more modern, robust, and capable video monitoring system. (Palmer, 2023a)
	Appendix 2, Section 2.1.4.1.3 Trap net survey (Palmer, 2023a)	July 31 – August 1 2022 (Palmer, 2023a)	**Appendix 2**, **Section 2.1.4.2.2** A downstream-facing trap (hoop) net resulted in the capture of 108 fish (CPUE of 4.94 fish per net-hour). Of these, 77 were adult kokanee, 27 were adult rainbow trout and 4 were juvenile Longnose Sucker. (Palmer, 2023a)	
Kokanee fry outmigration	**Appendix 2, Section 2.1.5** (Palmer, 2023a)	June 15 – 19 2022 (Palmer, 2023a)	**Appendix 2, Section 2.1.5** Heavy debris accumulation occurred in the funnel net, only allowing for four days of operation during which no fish were captured. (Palmer, 2023a)	**Appendix 2 Section 3.0** Implement a novel floating trap and modified funnel net with increased cod-end dimensions to assess kokanee fry outmigration. (Palmer, 2023a)
Rainbow Trout and kokanee population dynamics	**Appendix 2, Section 2.1.6.1** (Palmer, 2023a)	June 12 - 28 2022 July 31 – August 1, 2022, (Palmer, 2023a)	**Appendix 2, Section 2.1.6.2** A total of 614 Rainbow Trout were captured in June 2022, 28 of which were spawning adults. Linear regression demonstrated a high correlation between weight and fork length, indicating proportional growth. Most Rainbow Trout captured in June 2022 had a measured fork length between 21 mm and 175 mm, which corresponds to four age class brackets, from Class 0 (i.e., young-of-the-year) to Class 3 (i.e., 3 years old). A total of 78 kokanee were captured in August 2022, 69 of which were considered to be spawning adults. Linear regression demonstrated a high correlation between weight and fork length, indicating proportional growth. Kokanee captured in August 2022 had a measured fork length between approximately 210 mm and 240 mm, which corresponds to an age class bracket of approximately three years old based on the mean length-at-age. (Palmer, 2023a)	
Rainbow Trout and kokanee genetic structure analysis	**Appendix 2, Section 2.1.6.1** (Palmer, 2023a)	June 13 – September 12, 2022, (Palmer, 2023a)	**Appendix 2, Section 2.1.7.2.** Completed genetic lab results for 2022 will be presented in the 2023 annual monitoring report for the 3.14 Follow-up Program. (Palmer, 2023a)	
Dissolved free amino acid sampling	**Appendix 2, Section 2.1.8.1** (Palmer, 2023a)	June 15 and August 17, 2022, (Palmer, 2023a)	**Appendix 2, Section 2.1.8.2.** Mean amino acid concentrations and standard deviations for 10 samples collected at DC-1 and 8 samples collected at DC-DFAA-US were identified. These results will be compared year-over-year to determine if changes occur during the Project. (Palmer, 2023a)	

3 Water Quality and Quantity (3.15)

Compliance with condition 3.15 of the DS is met through implementation of the *Aquatic Effects Monitoring Plan* (AEMP) (ERM, 2022b) and the memo regarding *Federal Decision Statement Condition 3.15* (Artemis Gold Inc., 2023). The AEMP addresses conditions 3.15.1 and 3.15.2, related to surface water quality/quantity monitoring in the receiving environment, this program was specifically designed to meet the following objectives:

- Detect Project related effects on the aquatic ecosystem components (including water quality);
- Confirm water quality predictions and effects assessments;
- Meet permit and regulatory requirements for effluent and receiving environment quality;
- Assess the performance of mitigation and management measures; and,
- Provide the necessary feedback and information for the adaptive management of potential Project-related effects.

While condition 3.15.3 is addressed through groundwater monitoring included in the MSDP.

Based on the progress of the project to date (Section 1.1), the program summarized in this report collected information intended to meet the objectives of the AEMP and MSDP relative to early works. A summary of the activities undertaken through these programs as they relate to condition 3.15 have been compiled in the *Follow-up Programs for Condition 3.15 of the Blackwater Gold Project Decision Statement issued under Section 54 of the Canadian Environmental Assessment Act, 2012* (Appendix 4).

This section provides an overview of monitoring, results, and adaptive management that occurred during the reporting period to support compliance with DS 3.15. Full details can be reviewed in Appendix 4. Table 3-1 below summarizes this condition of the DS and where the full details can be found in the associated appendix of this document.

Table 3-1: DS condition 3.15 follow-up monitoring

Condition No.	Condition	Appendix	Section
3.15.	The Proponent shall develop, in consultation with Indigenous groups and other relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to adverse environmental effects of the Designated Project on fish habitat in Davidson Creek, Creek 661 and Chedakuz Creek. The Proponent shall develop the follow-up program prior to construction and shall implement the follow-up program during all phases of the Designated Project. The Proponent shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall:	Described in the memo regarding *Federal Decision Statement Condition 3.15* (Artemis Gold Inc., 2023)	
3.15.1.	Monitor water flows in Davidson Creek during the open water season from construction until decommissioning, and temperature continuously from construction until decommissioning;	Appendix 4: Follow-up Programs for Condition 3.15 of the Blackwater Gold Project Decision Statement issued under Section 54 of the Canadian Environmental Assessment Act, 2012	2.0 Monitoring Flows and Temperature in Davidson Creek
3.15.2.	Monitor water quality in Davidson Creek, Creek 661 and Chedakuz Creek for contaminants of potential concern, including those identified in Table 5 of the environmental assessment report, during all phases of the Designated Project; and		3.0 Monitoring Water Quality in Davidson Creek, Creek 661, and Chedakuz Creek for Contaminants of Potential Concern
3.15.3.	Monitor, during all phases of the Designated Project, groundwater quality and quantity downstream of the tailings storage facility site D, open pit, west waste rock dump and low-grade ore stockpile to confirm that groundwater quantity and quality parameters are at or below the values identified by the Proponent in the modelled predictions in Section 5 of Blackwater Gold Project: Additional Water Quality Model Sensitivity Scenario (July 20, 2017) and Section 3 of Blackwater Gold Project: Water Treatment Responses for Comments 1266, 1270, 1271, 1272, and 1273 (February 15, 2017) for nitrite and contaminants of potential concern, and to verify the effectiveness of water management measures.		4.0 Monitoring Groundwater Quality and Quantity

3.1 Monitoring and Analysis

As outlined in Table 3-1 above, detailed regarding the reporting period monitoring activities done in support of condition 3.15 are provided in Appendix 4. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results and recommendations. Table 3-2 below summarizes the monitoring, results, and recommendations for work done in those areas required by condition 3.15, it also specifies where further information on each item can be found in the Appendices.

Table 3-2: Summary of DS condition 3.15 follow-up monitoring

Monitoring	Survey/Methodology	Timing	Results
Davidson Creek watershed flow	**Appendix 4 Section 2.0** Streamflow monitoring stations at four locations: - Upper Davidson Creek: H10, H2, DC-005 - Middle Davidson Creek: DC-15 Additional spot discharge measurements at DC-10. (ERM, 2023a)	**Appendix 4 Section 2.0** Open water period between October 2022– March 2023 (ERM, 2023a)	**Appendix 4, Section 2.0** Data collected in 2022 was incorporated into the existing baseline dataset and interpolated accordingly. Data collected January – March 2023 will be interpreted in the 2023 Hydrology and Water Temperature report when one year of data is available. The typical annual hydrograph also observed in 2022 for the site has an unimodal shape, with the peak occurring in May or June. One year on record, 2016, shows a bimodal shape with an initial peak in the spring due to snowmelt followed by a pronounced second peak in the summer due to unusually wet conditions. The hydrographs for 2019 and 2020 appear to have three high flow periods, with a primary peak during the spring freshet period followed by unusually high flow periods in July and again in the fall (ERM, 2023a)

Davidson Creek Watershed Temperature	**Appendix 4 Section 2.0**
	Temperature monitoring stations at 15 locations (ERM, 2023a):
	- Upper Davidson Creek
	  - H10
	  - ST-10
	  - H2
	  - DC-05
	  - ST-18
	- Middle Davidson Creek
	  - ST-17
	  - DC-15
	- Lower Davidson Creek
	  - ST-16 KO
	  - ST-16 DEEP
	  - ST-15 KO
	  - ST-15 DEEP
	  - ST-14 KO
	  - ST-14 DEEP
	  - ST-08 KO
	  - ST-08 DEEP
		Appendix 4 Section 2.0
		Continuous (15-min intervals) (ERM, 2023a)
			Appendix 4 Section 2.0
			Data collected in 2022 was incorporated into the existing baseline dataset and interpolated accordingly. Data collected January – March 2023 will be interpreted in the 2023 Hydrology and Water Temperature report when one year of data is available.
			
			The temperature records for all stations are typically characterised by near freezing temperatures prior to the spring freshet followed by a gradual warming period until July and August, which are the warmest months. Temperatures then decrease steadily back to near freezing temperatures by November or December. (ERM, 2023a).

Water quality in Davidson Creek Watershed	**Appendix 4 Section 3.2**
	Monitored at DC-05[M,5], DC-10[M], DC-15 [M], and DC-20 [M, 5] (ERM, 2023d)
	
	Appendix 4 Section 3.3.1.2
	Before-After-Control-Impact (BACI) Statistical Analysis on DC-05, DC-10, DC-15, and DC-20 (ERM, 2023d)
	
	Appendix 4 Section 3.3.2
	Comparison to Environmental Assessment on DC-05, DC-10, DC-15, and DC-20 (ERM, 2023d)
		Appendix 4 Section 3.2
		October 1 – March 31, 2022 (Monthly[M], 5-in-30[5]) (ERM, 2023d)
			Appendix 4, Section 3.3.1.1
			Data was collected for (ERM, 2023d):
			- Physical parameters
			  - Observed relatively low mean monthly pH value (within BC guideline range)
			  - Reduction in TDS values during freshet was more pronounced and can be attributed to the dilution of surface waters as a result of snowmelt and rainfall runoff inputs to the streams.
			- Suspended material was generally low in Project streamsMajor anions
			  - Monthly mean concentration of chloride, fluoride, and sulphate were low and did not exceed BC quality guidelines.
			- Nutrients and Organic Carbon
			  - All nitrogen species were below applicable water quality guidelines.

Monitoring	Survey/Methodology	Timing	Results
			o Phosphorous was generally oligotrophic to mesotrophic. o Organic carbon concentrations were seasonally variable; the highest concentrations of total organic carbon (TOC) and DOC were typically observed during freshet months (May and June). - Cyanides o Monthly mean total cyanide concentrations were less than detection limits. - Total and Dissolved Metals o Total and dissolved metals guideline exceedances were not observed. o In January 2023 the total aluminum and total iron WQG-AL was exceeded at DC-20. The dissolved aluminum SBEB was not exceeded at any of the Davidson Creek sites (DC-05, DC-10, DC-15, and DC-20). **Appendix 4 Section 3.3.1.2** BACI review showed some increases for fluoride, and total manganese concentrations. However, interpretation of these results relative to data at other sites, and the absence of exposure of ore or waste rock and the absence of any project-related effluent discharge indicate that these are unlikely to be Project related. An increase in orthophosphate relative the baseline was also observed. However, a similar change was not noted for total phosphorus, so the increase is likely related to annual variability. There was an increase in total uranium concentrations at Davidson Creek impact sites during early construction works (October 2022 to March 2023) when compared to the baseline period that was not observed at the regional control sites. Based on the graphical analysis the elevated total uranium concentrations at the Davidson Creek sites were restricted to the early works construction period at both near-field and mid-field sites when compared to the monthly concentrations observed during baseline years. Thus, the increase in total uranium concentrations may be concluded as a Project-related effect based on statistical significance and graphical analysis. However, the following observations suggest that the increasing uranium may not be as a result of early works construction activities: • There was no effluent discharge to surface waters during the early works construction period and there was limited clearing activities completed during the early works construction period with the majority of clearing activities initiated in March 2023. • Although not statistically significant, elevated total uranium concentrations during the early works construction activities (October 2022 to March 2023) in comparison to baseline years were also observed at far-field sites in Creek 661 and Chedakuz Creek and not at near-field sites (Figure B-33).

Monitoring	Survey/Methodology	Timing	Results
			The 2022 dissolved and total uranium concentrations in groundwater were not elevated in comparison to baseline years (KP in prep) suggesting that observed increases are not likely to be a result of groundwater (with elevated uranium concentrations) that has discharged into Davidson Creek surface waters. The observed concentrations are less than the total uranium BC WQG-AL thus no effects on aquatic life are expected as a result of the elevated concentrations. The continued monitoring of total uranium in surface water and groundwater during the early works construction period is expected to provide a better understanding of the trends in total uranium concentrations in surface waters downstream of the Project. (ERM, 2023d) **Appendix 4 Section 3.3.2** The mean monthly concentrations during the early works construction period were greater than the model prediction for the same month for several water quality parameters at Davidson Creek. This is likely a result of comparing the average monthly concentration for one year and is not indicative of a Project-related effect. Elevated concentrations of the water quality parameters also tended to be elevated at the upstream control site and regional control sites. (ERM, 2023d)

Water quality in Creek 661 Watershed	**Appendix 4 Section 3.2**
	Monitored at 661-01[M, 5] (upstream control), 661-03[M], 661-04[M], 661-05[M], 661-10[M, 5], 661-20[Q] (ERM, 2023d)
	
	Appendix 4 Section 3.3.1.2
	Before-After-Control-Impact Statistical Analysis on 661-05, 661-10, 661-20 (ERM, 2023d)
	
	Appendix 4 Section 3.3.2
	Comparison to Environmental Assessment on 661-05, 661-10, 661-20 (ERM, 2023d)
		Appendix 4 Section 3.2
		October 1 –March 31, 2022 (Monthly[M], 5-in-30[5], Quarterly[Q]) (ERM, 2023d)
			Appendix 4, Section 3.3.1.1
			Data was collected for (ERM, 2023d):
			- Physical parameters
			  o Observed relatively low mean monthly pH value (within BC guideline range)
			  o Suspended material was generally low in Project streams
			- Major anions
			  o Monthly mean concentrations of chloride, fluoride, and sulphate were low and did not exceed BC quality guidelines.
			- Nutrients and Organic Carbon
			  o All nitrogen species were below applicable water quality guidelines.
			  o Phosphorous was generally oligotrophic to mesotrophic.
			  o Organic carbon concentrations were seasonally variable; the highest concentrations of total organic carbon (TOC) and DOC were typically observed during freshet months (May and June).
			- Cyanides
			  o Monthly mean total cyanide concentrations were less than detection limits.
			- Total and Dissolved Metals
			  o Similar to baseline years (2016 to September 2022), the guideline exceedances for total and dissolved metals during the early works construction period was observed in the Creek 661 watershed. Guideline exceedance was observed for total aluminum at site 661-01 in January 2023 and dissolved aluminum at site 661-01 in December 2022 and in January, February, and March of 2023.

Monitoring	Survey/Methodology	Timing	Results
			Appendix 4 Section 3.3.1.2 BACI review showed an increase in orthophosphate relative the baseline. However, a similar change was not observed for total phosphorus, so the increase is likely related to annual variability. (ERM, 2023d) **Appendix 4 Section 3.3.2** The mean monthly concentrations during the early works construction period were greater than the model prediction for the same month for several water quality parameters at Creek 661. This is likely a result of comparing the average monthly concentration for one year and is not indicative of a Project-related effect. Elevated concentrations of the water quality parameters also tended to be elevated at the upstream control site and regional control sites. (ERM, 2023d)

Water quality in Chedakuz Watershed	**Appendix 4 Section 3.2**
	Monitored at CC-03 [M, 5], CC-05 [Q], CC-10 [Q], CC-15 [M, 5], CC-20 [M, 5], CC-30 [Q, 5], CC-40 [M, 5] (ERM, 2023d)
		Appendix 4 Section 3.2
		October 1 – December 31, 2022 (Monthly[M], 5-in-30[5], Quarterly[Q]) (ERM, 2023d)
			Appendix 4, Section 3.3.1.1
			Data was collected for (ERM, 2023d):
			- Physical parameters
			  o Observed relatively low mean monthly pH value (within BC guideline range)
			  o Moderate hardness was observed for some months.
			  o Suspended material was generally low in Project streams, peaks were observed at downstream sites in October and November
			- Major anions
			  o Monthly mean concentrations of chloride, fluoride, and sulphate were low and did not exceed BC quality guidelines.
			- Nutrients and Organic Carbon
			  o All nitrogen species were below applicable water quality guidelines.
			  o Phosphorus was relatively high at CC-10, mean values in fall were above trigger values for eutrophic conditions.
			  o Organic carbon concentrations were seasonally variable; the highest concentrations of total organic carbon (TOC) and DOC were typically observed during freshet months (May and June).
			- Cyanides
			  o Monthly mean total cyanide concentrations were generally less than detection limits. Detectable concentrations of total cyanide were observed at CC-05 in October 2022 (a single sample of the 5-in-30 was 0.0118 mg/L) and at CC-15 in January 2023.
			  o Cyanide is not yet being used on site to process ore as the site is still in construction.
			- Total and Dissolved Metals
			  o Guideline exceedances were observed for total aluminum and total iron.
			  o The October 2022 to March 2023 mean monthly metal concentration and seasonal trends at Chedakuz Creek sites were generally similar to those observed during the 2016 to September 2022 baseline period. Exceptions to this were total and dissolved aluminum, total beryllium, total molybdenum, and total uranium.

Monitoring	Survey/Methodology	Timing	Results
			Appendix 4 Section 3.3.1.2 An assessment of effects was not completed at the Creek 661 sites downstream of the Camp (661-03, 661-04) because sites were sampled for the first time in July 2022.(ERM, 2023d)

4 Fish Habitat (3.16)

The fish and fish habitat *Follow-up Programs for Condition 3.16 of the Blackwater Mine Project Decision Statement Issued under Section 54 of the Canadian Environmental Assessment Act, 2012* (Palmer, 2023c) was developed to address the conditions outlined in condition 3.16 of the DS. It was designed to first characterize baseline conditions for each of the indicators listed in the condition, and then monitor those indicators during all phases of the Project to:

a) Conduct, prior to the commissioning of the freshwater supply system (FWSS) as the main mitigation measure for loss of water in Davidson Creek, fish habitat and quality surveys in the Tatelkuz Lake littoral zone

b) Monitor Tatelkuz Lake littoral zone for the commissioning of the freshwater supply system until decommissioning.

c) Monitor water flows in lower Chedakuz Creek between Tatelkuz Lake and the confluence with Davidson Creek during the open water season from Construction until Decommissioning.

Based on the progress of the project to date (Section 1.1), the reporting period field programs collected information intended to represent a pre-construction updated baseline for fish and fish habitat to inform long-term monitoring under this condition. The programs and their results are presented in the *FINAL REPORT Blackwater Gold Project Fish and Aquatic Resources 2022 Field Survey Report* (Appendix 2).

This section provides an overview of monitoring, results, and adaptive management that occurred during the reporting period to support compliance with DS 3.16. Full details can be reviewed in the documents listed above. Table 4-1 below summarizes this condition of the DS and where the full details can be found in the associated appendix of this document.

Table 4-1: DS condition 3.16 follow-up monitoring

Condition No.	Condition	Appendix	Section
3.16.	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to fish habitat in Tatelkuz Lake and Chedakuz Creek. The Proponent shall implement the follow-up program from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall:	Described in the *Follow-up Programs for Condition 3.16 of the Blackwater Mine Project Decision Statement Issued under Section 54 of the Canadian Environmental Assessment Act, 2012* (Palmer, 2023b)	
3.16.1	Conduct, prior to the commissioning of the freshwater supply system, fish habitat quantity and quality surveys in the Tatelkuz Lake littoral zone;	Appendix 2: FINAL REPORT Blackwater Gold Project Fish and Aquatic Resources 2022 Field Survey Report	2.3 Tatelkuz Lake
3.16.2	Monitor the Tatelkuz Lake littoral zone from the commissioning of the freshwater supply system until decommissioning; and		1.2.1.2 Condition 3.16 Follow-up Program
3.16.3	Monitor water flows in Chedakuz Creek between Tatelkuz Lake and the confluence with Davidson Creek during the open water season from construction until decommissioning.		2.2 Lower Chedakuz Creek

4.1 Monitoring and Analysis

As outlined in Table 4-1 above, detailed regarding the reporting period monitoring activities done in support of condition 3.16 are provided in Appendix 2. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results and recommendations. Table 4-2 below summarizes the monitoring results and recommendations for work done in Davidson Creek, it also specifies where further information on each item can be found in the Appendices.

The results of these field programs provide a basis for long-term monitoring to determine changes in fish abundance and habitat during the Project.

No adaptive management was required. Monitoring will continue as described in the *Follow-up Programs for Condition 3.16 of the Blackwater Gold Project* (Palmer, 2023c), with a few changes in the approach to monitoring. These changes are summarized in Table 4-2.

Table 4-2: Summary of DS condition 3.16 follow-up monitoring

Monitoring	Survey/Methodology	Timing	Results	Adaptive Management/Recommendations
Chedakuz Creek – Fish Habitat	**Appendix 2, Section 2.2.1.1.1** Fish Habitat (Palmer, 2023a)	August 28, 2022, (Palmer, 2023a)	**Appendix 2, Section 2.2.1.2.1** An overview of the RISC (2001) Site Card data for sites CC_MT2, CC_MT3, and CC_MT6 on lower Chedakuz Creek was collected (Palmer, 2023a).	
	Appendix 2, Section 2.2.1.1.2 Water quality (Palmer, 2023a)	August 28, 2022 (Palmer, 2023a)	**Appendix 2, Section 2.2.1.2.2** Water Quality was collected at CC_MT2, CC_MT3, and CC_MT6. Data collected ranged between (Palmer, 2023a): - Temperature: 16.8 – 17.2ºC - pH: 8.17 – 8.19 - Specific Conductivity: 111.8 – 112.3 µS/cm - Dissolved Oxygen: 8.80 – 9.31 mg/L	
	Appendix 2, Section 2.2.1.1.3 Unmanned vehicle mapping (Palmer, 2023a)	July 2022 (Palmer, 2023a)	**Appendix 2, Section 2.2.1.2.3** Survey imagery from the UAV mapping was successfully compiled. (Palmer, 2023a)	
Chedakuz Creek - Fish community and abundance	**Appendix 2, Section 2.2.2.1** Minnow trap survey (Palmer, 2023a) Electrofishing (Palmer, 2023a)	September 15, 2022 (Palmer, 2023a)	**Appendix 2, Section 2.2.2.2** A total of 130 fish were captured in the lower Chedakuz Creek minnow trap survey, including: 76 sucker species, 20 Northern Pike Minnow, 8 Prickly Sculpin (*Cottus asper*), 1 Rainbow Trout, and 25 unidentified fish (Table 2.2-4). No mortalities were observed. A total of 91 fish were captured during the lower Chedakuz Creek electrofishing, including: 21 sculpin (*Cottus spp.*), 28 sucker species, 20 Northern Pike Minnow, 4 Rainbow Trout, 1 Mountain Whitefish, and 17 kokanee (Table 2.2-4). Two mortalities (one Prickly Sculpin and one kokanee) were observed. Fork lengths of those capture Rainbow Trout and Kokanee salmon corresponded with an age bracket of approximately 2 years (~180 mm). (Palmer, 2023a)	**Appendix 2, Section 2.2.2.2** Due to the small sample size, inferences relating to the age distribution of the Rainbow Trout population in Chedakuz Creek cannot be made. Additional fish sampling efforts are planned for the 2023 field program to collect more data.
Chedakuz Creek – Kokanee Spawner Survey	**Appendix 2, Section 2.2.3.1**	August 26, 2022, September 11, 2022, September 18, 2022 (Palmer, 2023a)	**Appendix 2, Section 2.2.3.2** Three visual spawner surveys found: - A total of 140 kokanee were observed on August 26, 2022. - A total of six kokanee were observed on September 11, 2022. - A total of 52 kokanee were observed on September 18, 2022. The majority of fish observed were holding or actively migrating upstream. No redds were observed in any of the surveyed areas, but the presence of kokanee indicate some spawning is occurring in lower Chedakuz Creek. (Palmer, 2023a)	
Chedakuz Creek – Overwintering Fish Habitat	**Appendix 2, Section 2.2.4.1**	March 8, 2023 (Palmer, 2023a)	**Appendix 2, Section 2.2.4.2** The overwintering sites ranged in depth from 0.25 m to undetermined, due to deep water conditions not allowing for a safe full measurement. Each of the three sites had open water with no ice or snow cover. Mean water temperatures ranged from 1.24 °C to 1.54 °C. Mean dissolved oxygen levels were generally low, ranging from 3.92 mg/L to 4.07 mg/L. These values are below the BCWQG for Aquatic Life (Long-term Chronic WQG for all life stages other than buried embryo/alevin: 8 mg/L for long-term chronic, 5 mg/L for instantaneous minimum; MECCS 2021). Mean pH values were circumneutral, ranging from 7.64 to 7.71. Conductivity and specific conductivity ranged from 87 µS/cm to 90 µS/cm and 159 µS/cm to 162 µS/cm, respectively. (Palmer, 2023a)	

Tatelkuz Lake – Fish Habitat and water quality assessments	**Appendix 2, Section 2.3.1** Limnology and ice conditions (Palmer, 2023a)	March 3 – 4, 2022 (Ice thickness) June, August, October 2022 (Surface water samples) (Palmer, 2023a)	**Appendix 2, Section 2.3.1.2** Thickness measured in Tatelkuz Lake at TLLit2 ranged from 0.32 m to 0.44 m. Tatelkuz Lake was thermally stratified at TLLim3 in June, August, and October in 2022 Dissolved oxygen levels at TLLim3 ranged from 7.44 to 12.52 mg/L in June, from 2.50 to 8.13 mg/L in August, and from 2.86 to 9.04 mg/L in October. Total phosphorus in surface water at TLLim3 was the lowest in August 2022 and highest in June 2022, while total nitrogen was lowest in October 2022 and highest in June 2022. Total phosphorus analytical results from the August and October 2022 samples fell within the BC WQG FAL (BC ENV 2021) guideline range for total phosphorus of 0.005 to 0.015 mg/L, however the June 2022 sample exceeded the upper limit by 0.8 mg/L. (Palmer, 2023a)	
	Appendix 2, Section 2.3.2.1 Littoral habitat assessment (Palmer, 2023a)	August 24-29, 2022 (In-situ water quality measurements) (Palmer, 2023a) October 2022 (UAV mapping) (Palmer, 2023a)	**Appendix 2, Section 2.3.2.2.1** Each site's littoral habitat characteristics were defined by depth range. Water quality variables were measured at the 11 littoral transect sites at a depth of 0.5 and 1 m. At 0.5 m, temperature across the lake ranged from 17.9 to 26.1ºC, pH ranged from 7.91 to 8.8, conductivity ranged from 113.6 to 133.6 µS/cm, specific conductivity ranged from 131.5 to 134.2 µS/cm, and dissolved oxygen ranged from 6.66 to 11.4 mg/L. At 1 m, temperature across the lake ranged from 17.7 to 24.7ºC, pH ranged from 7.89 to 8.79, conductivity ranged from 113.5 to 133.6 µS/cm, specific conductivity ranged from 130.9 to 134.4 µS/cm, and dissolved oxygen ranged from 7.33 to 12.59 mg/L. UAV mapping was completed for the Tatelkuz Lake littoral zone at the 11 fish habitat transects. (Palmer, 2023a)	
Tatelkuz Lake - Fish community and abundance	**Appendix 2, Section 2.3.3.1.1** Littoral fish community and abundance beach seines targeting larval life-stage Brassy Minnow (*Hyboganthus hankinsoni*) (Palmer, 2023a)	June 22 and 27, 2022 (Palmer, 2023a) July 31 and August 29, 2022, (Palmer, 2023a)	**Appendix 2, Section 2.3.3.1.2** An initial beach seining effort to assess presence of larval Brassy Minnow was conducted between June 22 and 27, 2022 at 10 of the 11 littoral fish inventory sites (TLLit2 was not sampled due to safety concerns regarding accessing steep banks). No larval Brassy Minnow were captured, and Palmer biologists determined that it was likely too early in the spawning season. Subsequent beach seining efforts, conducted on July 31 and August 29, 2022, resulted in fish captures at five of the 11 sites, including larval-stage fish. CPUA and fish density were highest at TLLit1 at 2.50 fish per m2 and 250 fish per 100 m2, respectively. Larval and juvenile Brassy Minnow represented 32.8% of the captured fish, sculpin species represented 56.5% of the captured fish, and other minnow species represented 10.8% of the captured fish in Tatelkuz Lake. (Palmer, 2023a)	**Appendix 2, Section 3.0** A recommendation for future field programs is to shift the timing of larval sampling until late July/early August to allow enough time for fish to spawn and larval fish to develop to a size suitable for identification. (Palmer, 2023a)
	Appendix 2, Section 2.3.3.2.1 Littoral fish community and abundance beach seines targeting adult life-stage Brassy Minnow (Palmer, 2023a)	August 24 - 29, 2022 (Palmer, 2023a)	**Appendix 2, Section 2.3.3.2.2** A total of 692 fish were captured during the Tatelkuz lake adult Brassy Minnow survey. Of the captured fish, 5.2% were identified as Brassy Minnow, 0.3% were identified as Mountain Whitefish, 6.1% were identified as Northern Pikeminnow (representing 6.1% of total captured), 16.9% were identified as Prickly Sculpin, 0.9% were identified as Rainbow Trout, 0.3% were identified as Longnose Sucker, 1.6% were identified as Largescale Sucker (*Catostomus macrocheilus*), 1.3% were identified as sculpin species, and 67.5% were identified as sucker species. (Palmer, 2023a)	

5 Migratory Birds (4.5)

The purpose of the *Wildlife Mitigation and Monitoring Plan* (WMMP) (ERM, 2022i) is to manage impacts on wildlife in the Blackwater Project area during Construction, Operations, Closure, and Post-closure.

The *2022 Wildlife Mitigation and Monitoring Program Compliance Report* (ERM, 2023b) (Appendix 5) summarizes and presents the results of the follow up programs and monitoring of mitigation measures during 2022. Pre-clearing surveys occurred in March 2023 (Appendix 13). This follow-up program includes monitoring for migratory bird species required by condition 4.5 of the DS is sections 3.6 (raptors), 3.7 (waterbirds), and 3.8 (upland birds):

> **4.5** The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of all mitigation measures to avoid harm to migratory birds, including migratory birds that are listed species at risk, their eggs and nests. The follow-up program shall include the mitigation measures used to comply with condition 4.1 to 4.4. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.

5.1 Monitoring and Analysis

As outlined above, details regarding the monitoring activities done in support of condition 4.5 are provided in Appendix 5 and Appendix 13. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results, and recommendations. Table 5-1 below summarizes the monitoring results and recommendations and identifies where further information on each item can be found in the Appendices.

Clearing was not completed at the Project during the bird sensitive period in 2022 and as a result no preclearing surveys or subsequent nest success surveys were completed (ERM, 2023b).

No adaptive management actions were required, and future monitoring will occur as described in the *Wildlife Mitigation and Monitoring Plan* (ERM, 2022i). This will include formal analysis during the operations phase of the Project, once data have been recorded for a sufficient number of years to conduct statistical modelling.

Table 5-1: Summary of DS condition 4.5 follow-up monitoring

Monitoring	Survey/Methodology	Timing	Results
Pre-clearing Surveys	**Appendix 5, Section 2.1.2** Pre-clearing surveys for birds (ERM, 2023b) **Appendix 13** Pre-clearing Surveys	September 13 – 14 2022 (ERM, 2023b) September 14 – 15 2022 (ERM, 2023b) March 2023	**Appendix 5, Section 2.1.3** Surveys did not identify any active or historical wildlife features or highly suitable habitat, with limited signs of wildlife use were identified (ERM, 2023b) **Appendix 13, *Wildlife Pre-clearing Surveys – BWG March 27 through 31, 2023*** Pre-clearing surveys were complete in March 2023 ahead of clearing activities. A white-wing crossbill nest was identified in Sequence 3. A 50 m buffer was established.
Raptors	**Appendix 5, Section 2.2.2** Habitat loss (ERM, 2023b)	September – December 2022 (ERM, 2023b)	**Appendix 5, Section 2.2.3** Clearing completed in 2022 was limited to the Plant Site area, which accounted for 26.4 ha of disturbance. There is no overlap between the 2022 clearing limits and fisher, short eared owl, yellow rail, or Wilson's snipe highly suitable habitat. The highest proportion of habitat loss was for moose growing season, wolverine growing season, and forest bird interior forest habitat. (ERM, 2023b)
	Appendix 5, Section 2.3.3 Bird mortality (ERM, 2023b)	2022 (ERM, 2023b)	**Appendix 5, Section 2.3.4** No interactions, incidents, mortalities, or vehicle collisions were recorded during 2022. (ERM, 2023b)
	Appendix 5, Section 2.5.2.1 Transmission line monitoring (ERM, 2023b)	July 10, 2022 (ERM, 2023b) September 10 and 11, 2022 (ERM, 2023b)	**Appendix 5, Section 2.5.3** The initial mortality surveys completed during the establishment of the permanent transects did not detect any signs of bird mortality. (ERM, 2023b)
	Appendix 5, Section 2.5.2.2 Electromagnetic field monitoring (ERM, 2023b)	N/A	**Appendix 5, Section 2.5.2.2** The literature review and follow-up recommendations for electromagnetic fields has not yet begun, but will commence during the construction phase, likely 2024 or 2025. (ERM, 2023b)
	Appendix 5, Section 3.6.2.1 Aerial stick nest survey (ERM, 2023b)	May 21, 2022 (ERM, 2023b)	**Appendix 5, Section 3.6.3.1** Surveys did not identify any new stick nests within the Local Study Area (LSA). One stick nest was identified during pre-construction surveys in December 2021. The nest was revisited during the May 2022 survey and was unoccupied. (ERM, 2023b)
	Appendix 5, Section 2.3.3.1 Incidental observations (ERM, 2023b)	N/A (ERM, 2023b)	**Appendix 5, Section 3.6.3.2** In total, 57 individuals and three stick nests were incidentally recorded. All three stick nests were determined to be occupied by osprey. The most frequently observed species was bald eagle, accounting for 42% of all raptor observations. Osprey were the second most frequently observed species, accounting for 25% of raptor observations. (ERM, 2023b)
Waterbirds	**Appendix 5, Section 2.2.2** Habitat loss (ERM, 2023b)	September – December 2022 (ERM, 2023b)	**Appendix 5, Section 2.2.3** Clearing completed in 2022 was limited to the Plant Site area, which accounted for 26.4 ha of disturbance. There is no overlap between the 2022 clearing limits and fisher, short eared owl, yellow rail, or Wilson's snipe highly suitable habitat. The highest proportion of habitat loss was for moose growing season, wolverine growing season, and forest bird interior forest habitat. (ERM, 2023b)
	Appendix 5, Section 2.3.3 Bird mortality (ERM, 2023b)	2022 (ERM, 2023b)	**Appendix 5, Section 2.3.4** No interactions, incidents, mortalities, or vehicle collisions were recorded during 2022. (ERM, 2023b)
	Appendix 5, Section 2.4 Facility waterbody monitoring (ERM, 2023b)	N/A (ERM, 2023b)	**Appendix 5, Section 2.4** Currently there are no facility waterbodies present at the Project. As a result, monitoring was not completed in 2022 and will commence once facility waterbodies are established at the site. (ERM, 2023b)
	Appendix 5, Section 2.5.2.1 Transmission line monitoring (ERM, 2023b)	July 10, 2022, (ERM, 2023b) September 10 and 11, 2022 (ERM, 2023b)	**Appendix 5, Section 2.5.3** The initial mortality surveys completed during the establishment of the permanent transects did not detect any signs of bird mortality. (ERM, 2023b)

Monitoring	Survey/Methodology	Timing	Results
		May 18 – 20, 2022 (Spring pair) (ERM, 2023b) July 8 – 12, 2022 (Summer brood) (ERM, 2023b) September 9 – 11, 2022 (Fall migration) (ERM, 2023b)	**Appendix 5, Section 3.7.3.1** Surveys identified a total of 35 species and 2,564 individuals from eight waterbird groups: dabbling ducks (n = 7), diving ducks (n = 9), geese and swans (n = 2), gulls and terns (n =3), loons and grebes (n = 4), riverine birds (n = 1), and shorebirds (n = 6), and other birds (n = 3). Ten groups of unspecified species were also recorded during surveys. Two species of conservation concern, killdeer (n = 1) and lesser yellowlegs (n = 8), were identified during the spring surveys. Three species of conservation, western grebe (n = 7), lesser yellowlegs (n = 1), and American white pelican (n = 7), were identified during the summer surveys. Three species of conservation concern, great blue heron (n = 2), western grebe (n = 7), and red-necked phalarope (n = 1), were identified during the fall surveys. The most commonly observed species were mallard (n = 483), bufflehead (n = 329), ring-necked duck (n = 234), and lesser scaup (n = 217). Waterbird groups were detected in varied habitat types including pond, lake, wetland, river, creek, swamp/bog, and other (gravel pit and ditch). Waterbirds were detected primarily in lakes (59%) and pond (32%) habitats (ERM, 2023b)
	Appendix 5, Section 2.3.3.1 Incidental observations (ERM, 2023b)	N/A (ERM, 2023b)	**Appendix 5, Section 3.7.3.2** An additional 36 individual waterbirds from six species were incidentally observed during 2022 surveys (ERM, 2023b)
	Appendix 5, Section 2.2.2 Habitat loss (ERM, 2023b)	September – December 2022 (ERM, 2023b)	**Appendix 5, Section 2.2.3** Clearing completed in 2022 was limited to the Plant Site area, which accounted for 26.4 ha of disturbance. There is no overlap between the 2022 clearing limits and fisher, short eared owl, yellow rail, or Wilson's snipe highly suitable habitat. The highest proportion of habitat loss was for moose growing season, wolverine growing season, and forest bird interior forest habitat.
	Appendix 5, Section 2.3.3 Bird mortality (ERM, 2023b)	2022 (ERM, 2023b)	**Appendix 5, Section 2.3.4** No interactions, incidents, mortalities, or vehicle collisions were recorded during 2022. (ERM, 2023b)
	Appendix 5, Section 2.5.2.1 Transmission line monitoring (ERM, 2023b)	July 10, 2022, (ERM, 2023b) September 10 and 11, 2022 (ERM, 2023b)	**Appendix 5, Section 2.5.3** The initial mortality surveys completed during the establishment of the permanent transects did not detect any signs of bird mortality. (ERM, 2023b)
Upland Birds	**Appendix 5, Section 3.8.2.1** Forest and grassland bird population monitoring (ERM, 2023b)	June 2022 (ERM, 2023b)	**Appendix 5, Section 3.8.3.1** During point count surveys, a total of 165 individual upland birds were recorded across 34 species. The most commonly observed species were; yellow-rumped warbler (n=38), dark-eyed junco (n=18), Canada Jay (n=17,), and varied thrush (n=14). Olive-sided flycatcher (n=3) and barn swallow (n=2) were the only upland bird species at risk recorded. Given that 2022 was the first year of the compliance monitoring program, detailed analysis cannot be completed yet, but will be conducted in future years as per the WMMP. (ERM, 2023b)
	Appendix 5, Section 3.8.2.2 Common nighthawk monitoring (ERM, 2023b)	N/A	**Appendix 5, Section 3.8.2.2** Common nighthawk monitoring was not completed in 2022 and is scheduled to commence in 2023. (ERM, 2023b)
	Appendix 5, Section 3.8.2.4 Clark's nutcracker monitoring (ERM, 2023b)	July – November 2022 (Camera and Autonomous Recording Unit (ARU) deployment) (ERM, 2023b) August 29 – 30, 2022 (Call playback) (ERM, 2023b)	**Appendix 5, Section 3.8.3.3** Clark's nutcrackers were identified in 187 ARU files across all sites with available data. All ARU sites had consistent Clark's nutcracker detections throughout deployment. None of the cameras detected Clark's nutcracker. Birds are difficult to monitor via remote camera due to their small size and fast movements. The lack of camera detections despite abundant Clark's nutcracker detections by ARU and call playback indicate that cameras are likely not a useful monitoring tool for this species. These surveys were conducted to obtain additional baseline data on the presence of Clark's nutcracker in the whitebark pine habitat on Mt Davidson. Three call playback (CPB) surveys were completed at every odd survey site along each transect. In summary, 55%

Monitoring	Survey/Methodology	Timing	Results
			of sites has responses. Transects with white bark pine on average had a higher percentage of call playbacks that elicited responses from Clark's nutcrackers. (ERM, 2023b)
	Appendix 5, Section 3.8.2.3 Swift and swallow monitoring (ERM, 2023b)	June 14 – 20, 2022 (ERM, 2023b)	**Appendix 5, Section 3.8.3.2** No habitat for bank swallow or black swift was identified in the RSA. Therefore, no specific surveys were conducted for these two species. Surveys for barn swallows were completed around the mine site infrastructure. No other suitable nesting buildings were found in the LSA. Three species of swallow were observed, including barn swallow (n = 6), tree swallow (n = 7), and violet-green swallow (n= 4). Three active barn swallow nests were identified, and two potential tree swallow or violet-green swallow nesting locations were identified, with several additional inactive nests noted. (ERM, 2023b)
	Appendix 5, Section 2.3.3.1 Incidental observations (ERM, 2023b)	N/A (ERM, 2023b)	**Appendix 5, Section 3.8.3.4** An additional 244 individual upland birds from 42 species were incidentally observed during the 2022 field season. Of the 42 species incidentally observed six were not observed during other upland field surveys in the 2022 season: pileated woodpecker, mountain bluebird, unknown ptarmigan, red breasted sap sucker, yellow warbler, and violet-green sparrow. The unknown sparrow (n=35), yellow rumped warbler (n=27), and Canada jay (n=21) were the most observed incidental species making up 34% of individuals observed. The only upland bird species of conservation concern that was incidentally observed was the olive-sided flycatcher. (ERM, 2023b)

6 Wetlands (5.5)

The *Wetland Management and Offsetting Plan* (WMOP) (ERM, 2022h) was developed to address a number of conditions, including those outlined in condition 5.5 of the DS. It was designed to monitor the aquatic receiving environment to provide the information needed to achieve the following objectives:

- Protect all wetlands until additional baseline studies can be complete;
- Avoid all potential wetland areas as mapped by Terrestrial Ecosystem Mapped (TEM) during early works and up until the necessary baseline information has been collected and reported out on;
- Provide pre-construction surveys to identify the extent and flag 30 m buffers around all TEM wetlands during early works and up until the necessary baseline information has been collected by a QP. Work with the IEM to schedule site visits when tree clearing is taking place in proximity to flagged wetland areas. Aboriginal Group Monitors on rotation at the time of the surveys will be invited to participate in surveys;
- Establish workplan objectives for baseline fieldwork to be conducted in the summer of 2022; and,
- Identify and establish a wetland offsetting program at Mathews Creek Ranch and other areas as required to meet offsetting objectives.

Based on those objectives and the progress of the Project to date (Section 1.1), the 2022 program included the collection of spatial data to complete an accurate map of all wetlands to the 1:5,000 scale within the mine site and transmission line footprints; collection of wetland health and function attributes, including wildlife habitat function, to inform baseline description of wetland type and function; and collection of wetland carbon sequestration data, specifically through an assessment of the peat layer. Field surveys were also completed to confirm wetland classification and status (red or blue-listed wetlands) within the mine site, including the proposed plant site, to support early works construction. These activities are summarized in the *Blackwater Gold Project Wetland Mapping and Assessment Baseline report* (Ecologic Consulting Ltd., 2023) (Appendix 9).

This section provides an overview of monitoring, results, and adaptive management that occurred during the reporting period support compliance with DS 5.5. Full details can be reviewed in Appendix 9. Table 6-1below summarizes this condition of the DS and where the full details can be found in the associated appendix of this document.

Table 6-1: DS condition 5.5 follow-up monitoring

Condition No.	Condition	Appendix	Section
5.5.	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, a follow-up program to verify the predictions of the environmental assessment as it pertains to the adverse environmental effects of the Designated Project on wetland functions and to determine the effectiveness of the mitigation measures as it pertain to wetlands. The Proponent shall implement the follow-up program during from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall:	Described in the WMOP (ERM, 2022h)	
5.5.1.	Conduct pre-construction surveys within the mine site to confirm the absence of red or blue-listed wetlands. The Proponent shall provide the results of the survey to the Agency and to Indigenous groups prior to the start of construction. If the results of the survey demonstrate the presence of red or blue-listed wetlands within the mine site, the Proponent shall develop, prior to construction, and implement additional mitigation measures;		1.2 Regulatory Requirements, Appendix B
5.5.2.	Monitor changes to wetland functions of wetlands located within the mine site and remaining after vegetation clearing required to construct project components during all phases of the Designated Project; and	Appendix 9: Blackwater Gold Project Wetland Mapping and Assessment Baseline	3.7.2 Wetland Function Assessment
5.5.3.	Monitor all compensatory wetland sites at a minimum annually, to ensure they meet or exceed performance standards for wetland functions established pursuant to condition 5.4 from the start of compensation until wetland functions are attained.		No compensation works have been actively constructed. Mathews Creek Ranch and Dykam Ranch baseline data was collected in 2022. (Ecologic Consulting Ltd., 2023)

6.1 Monitoring and Analysis

As outlined in Table 6-1 above, detailed regarding the monitoring activities done in support of condition 5.5 are provided in Appendix 9. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results and recommendations. Table 6-2 below summarizes the monitoring, results, and recommendations for work done in those areas required by condition 5.5, it also specifies where further information on each item can be found in the Appendices.

No adaptive management actions were required, and future monitoring will occur as described in the WMOP (ERM, 2022h).

Table 6-2: Summary of DS condition 5.5 follow-up monitoring

Monitoring	Survey/Methodology	Dates	Results Summary
Wetland Mapping	**Appendix 9, Section 2.1** Wetland Mapping (Ecologic Consulting Ltd., 2023)	Summer 2022 (Ecologic Consulting Ltd., 2023)	**Appendix 9, Section 3.1** All five wetland classes (bog, fen, marsh, swamp and shallow open water), along with floodplains and ponds, were mapped within the Project area, encompassing a total of 983.3 hectares (ha). Of these wetlands, there were seven bog site associations (384.2 ha), ten fen site associations (122.6), two marsh site associations (18.0 ha), six swamp associations (435.3 ha), and one open water class (23.2 ha). The most abundant wetland association was the Spruce – Common horsetail – Leafy moss swamp (Ws07), followed by the Black spruce – Water sedge – Peat-moss bog (Wb05), and then the Black spruce – Soft-leaved sedge – Peat-moss (Wb08) (Ecologic Consulting Ltd., 2023). Eight of the mapped site associations are blue-listed, including (Ecologic Consulting Ltd., 2023): • Two bogs: Lodgepole pine - Few-flowered sedge - Peat-moss Bog/Poor Fen (Wb10) and Shore sedge - Buckbean - Peat-moss Bog (Wb13); • Four fens: Slender sedge – Buckbean (Wf06), Shore sedge – Buckbean – Hook-moss (Wf08), Tufted clubrush – Star moss (Wf11), and Narrow-leaved cotton-grass – Shore sedge (Wf13); and • Two swamps: MacCalla's willow – Beaked sedge (Ws05), and Spruce – Common horsetail – Leafy moss (Ws07).
Field Verification	**Appendix 9, Section 2.2.1** Wetland Health Assessment (Ecologic Consulting Ltd., 2023)	Summer 2022 (Ecologic Consulting Ltd., 2023)	**Appendix 9, Section 3.7.1** Wetland Health assessments were completed at 96 full plots. Of these, 77% (74/96) were properly functioning, 8% (8/96) were functioning at risk, 8% (8/96) were functioning at high risk, and 6% (6/96) were not properly functioning. Wetlands that were not properly functioning were primarily bogs and swamps, with partial to 100% impact from logging. Four out of six of these sites represented blue-listed wetlands, Wb08 (Plot Identification: WT-22-190, WT-22-191) and WS07 (WT-22- 101, WT-22-311). (Ecologic Consulting Ltd., 2023)
	Appendix 9, Section 2.2.2 Wetland Function Assessment (Ecologic Consulting Ltd., 2023)	Summer 2022 (Ecologic Consulting Ltd., 2023)	**Appendix 9, Section 3.7.2, Appendices C - I** The four primary wetland functions (hydrological, biochemical, habitat and ecosystem) were assessed through identified data components based on data collected. Data collected in 2022 establishes baseline conditions for the 96 wetlands assessed. (Ecologic Consulting Ltd., 2023)
	Appendix 9, Section 2.2.3 Wildlife Habitat Assessment (Ecologic Consulting Ltd., 2023)	Summer 2022 (Ecologic Consulting Ltd., 2023)	**Appendix 9, Section 3.7.3** Wildlife health assessments were completed at 70 full plots. These assessments sought habitat for caribou, grizzly bear, little brown myotis, moose, muskrat, olive-sided flycatcher, ring-necked duck, and western toad. Suitable habitat was identified for most species, excluding muskrat. Bogs and swamps represented the most suitable habitat, providing food, thermal cover, and security cover. (Ecologic Consulting Ltd., 2023)
Carbon Analysis	**Appendix 9, Section 2.3** Carbon Analysis (Ecologic Consulting Ltd., 2023)	Summer 2022 (Ecologic Consulting Ltd., 2023)	**Appendix 9, Section 3.8** Wetlands with potential to store carbon were assessed during the field work. These were bogs and fen wetland classes. Eight were sampled for carbon characteristics. Both fens and bogs were identified to have significant peat stores, however, there were not enough samples to generate distinctions between these two wetland types with respect to carbon stores. (Ecologic Consulting Ltd., 2023)

7 Country Foods (6.11) (6.13)

The *Country Foods Monitoring Plan* (CFMP) (Entia Environmental Consultants Ltd., 2022) was developed to address a number of conditions, including those outlined in condition 6.11 of the DS. It was designed to identify and mitigate potential adverse effects on the health of Indigenous Peoples and other land users as a result of the Project.

The *2022 Country Foods Monitoring Plan Annual Report* (Entia Environmental Consultants Ltd., 2023)(Appendix 7) has been developed to summarize activities under the CFMP. Based on the progress of the project to date (Section 1.1), the program collected information intended to meet objectives relevant to early works. No additional monitoring occurred between January 1 and March 31, 2023, as monitoring specific to the CFMP requires snow free conditions and is scheduled for the summer months.

Supplementary to the CFMP is the *Country Foods and Scio-economic Conditions Follow-Up Program* (ERM, 2022d), which was developed to address condition 6.13 of the DS. This program is intended to monitor and adaptively manage potential adverse effects on the socio-economic conditions of Indigenous groups as a result of changes to access, availability, and quality of country foods due to the Project components and activities. The *2022 Country Foods and Socio-economic Conditions Follow-up Program: Current Conditions Report* (ERM, 2023c) (Appendix 8*)* has been developed to understand baseline conditions and provide context for identifying change following future monitoring.

This section provides an overview of monitoring, results, and adaptive management that occurred during the reporting period to support compliance with DS 6.11 and 6.13. Further details can be reviewed in Appendix 7. Table 7-1 below summarizes this condition of the DS and where the full details can be found in the associated appendix of this document.

Table 7-1: DS condition 6.11 follow-up monitoring

Condition No.	Condition	Appendix	Section
6.11.	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse environmental effects of the Designated Project on the health of Indigenous Peoples caused by changes in concentrations of contaminants of potential concern in water, soil, vegetation and wildlife, including fish, and determine the effectiveness of mitigation measures. As part of the development of the follow-up program, the Proponent shall identify the vegetation and wildlife species that shall be monitored, the locations where the monitoring will be conducted, the contaminants to be monitored and the frequency of the monitoring. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. In doing so, the Proponent shall:	*Country Foods Monitoring Plan* (Entia Environmental Consultants Ltd., 2022)	
6.11.1	Monitor, prior to construction, contaminants of potential concern in soil, vegetation, wildlife, including fish and water. The Proponent shall also co-locate soil sampling with vegetation samples and water sampling with fish samples;	Appendix 7: 2022 Country Foods Monitoring Plan Annual Report	1.2 Project Activities Completed in 2022
6.11.2	Monitor, during all phases of the Designated Project, contaminants of potential concern in water, soil, vegetation, and wildlife species;		3. Sampling under the CFMP in 2022
6.11.3	If the sampling and monitoring results referred to in condition 6.11.1 and 6.11.2 exceed the predictions made during the environmental assessment, implement any modified or additional mitigation measures pursuant to condition 2.9 based on the results of the follow-up program and update the human health risk assessment identified by the Proponent in Appendix 9.2.2A of the Environmental Impact Statement using the results of the sampling and monitoring. The Proponent shall integrate the current and predicted consumption patterns of each Indigenous group identified during the environmental assessment in the updated human health risk assessment and any updated consumption pattern information provided by Indigenous groups as part of the follow-up program.		4. Data Analysis and Interpretation
6.13	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse environmental effects of the Designated Project on the socio-economic conditions of Indigenous Peoples as a result of changes to access, availability and quality of country foods. The Proponent shall implement the follow-up program from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.	Appendix 8: 2022 Country Foods and Socio-economic Conditions Follow-up Program: Current Conditions Report	

7.1 Monitoring and Analysis

As outlined in Table 7-1 above, detailed regarding the 2022 monitoring activities done in support of condition 6.11 and 6.13 are provided in Appendix 7 and Appendix 8 respectively. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results, and recommendations. Table 7-2 below summarizes the monitoring results and recommendations for work, it also specifies where further information on each item can be found in the Appendices.

No adaptive management actions were required, and future monitoring will occur as described in the CFMP and the *Country Foods and Scio-economic Conditions Follow-Up Program.*

Table 7-2: Summary of DS condition 6.11 follow-up monitoring

Monitoring	Survey/Methodology	Dates	Results Summary
Surface Water Quality	Appendix 7, Section 3.1 (Entia Environmental Consultants Ltd., 2023)	October – December 2022 (Entia Environmental Consultants Ltd., 2023)	**Appendix 7, Section 2.2.2.2** Since there was no effluent discharge to surface water from the Project during the monitoring period, statistically significant changes to water quality would not be expected. It is possible that the apparent statistically significant changes in water quality for iron (decrease at control sites, slight increase at impact sites) and manganese (increase at control sites, no change at impact site) may be a result of seasonal differences. The monitoring period in 2022 (the "after" period) included October to December only, while the baseline datasets (the before" period) included all months of the year. This issue may be resolved in 2023, when the "after" monitoring period includes all calendar months rather than just the last quarter of the year. Since average (mean) COPC concentrations are less than baseline or predicted NPM concentrations, no change to mitigation is necessary. As there were no discharges to surface water from the Project during the monitoring period in 2022, the results of this year's monitoring program are in line with expectations (i.e.: no Project effects). (Entia Environmental Consultants Ltd., 2023)
Air Quality Monitoring	Appendix 7, Section 3.2 (Entia Environmental Consultants Ltd., 2023)	N/A	**Appendix 7, Section 3.2** As 2022 was a transitional period between baseline (January to September 2022) and Construction phase (October to December 2022) during which some early works construction activities were conducted, soil or dust fall data were not obtained during the early works construction period to derive estimates of inhalable PM10 associated metals. Soil and dustfall metal data were only obtained during baseline studies (august and September 2022), prior to initiation of early works construction activities. Soil and dustfall metal data are planned to be collected in 2023 and future CFMP annual reports will include analysis and reporting of inhalable PM10 associated metals. (Entia Environmental Consultants Ltd., 2023)
Country Foods Conditions	Appendix 8, Section 1.3 (ERM, 2023c)	2021 - 2022	**Appendix 8, Section 2.1** The current understanding of baseline conditions for the Lhoosk'uz Dené nation country foods relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 3.1** The current understanding of baseline conditions for the Ulkatcho nation country foods relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 4.1** The current understanding of baseline conditions for the Saik'uz First Nation country foods relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 5.1** The current understanding of baseline conditions for the Stellat'en First Nation country foods relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 6.1** The current understanding of baseline conditions for the Nadleh Whut'en nation country foods relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 7.1** The current understanding of baseline conditions for the Nazko First Nation country foods relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 8.1** The current understanding of baseline conditions for the Skin Tyee First Nation country foods relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 9.1** The current understanding of baseline conditions for the Nee-Tahi-Buhn Band nation country foods relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 10.1** The current understanding of baseline conditions for the Tŝilhqot'in Nation country foods relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 11.1** The current understanding of baseline conditions for the Métis nation country foods relative to the monitoring area are discussed. (ERM, 2023c)
Drinking Water Conditions	Appendix 8, Section 1.3 (ERM, 2023c)	2021 - 2022	**Appendix 8, Section 2.2** The current understanding of baseline conditions for the Lhoosk'uz Dené nation drinking water relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 3.2** The current understanding of baseline conditions for the Ulkatcho nation drinking water relative to the monitoring area are discussed. (ERM, 2023c)

Monitoring	Survey/Methodology	Dates	Results Summary
			Appendix 8, Section 4.2 The current understanding of baseline conditions for the Saik'uz First Nation drinking water relative to the monitoring area are discussed. (ERM, 2023c) **Appendix 8, Section 5.2** The current understanding of baseline conditions for the Stellat'en First Nation drinking water relative to the monitoring area are discussed. 8 Air Quality (6.12)

The *Air Quality and Fugitive Dust Management Plan* (AQDMP, (Blackwater Gold Ltd., 2023a)) was developed to address several conditions relating to air quality and fugitive dust, including 6.12 of the DS. It was designed to identify the Project's fugitive dust-emitting sources and mitigation and contingency measures if primary control measures are not effectively controlling dust emissions.

> **6.12** The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse environmental effects of the Designated Project on the health of Indigenous Peoples as a result of changes to air quality and determine the effectiveness of mitigation measures. As part of the implementation of the follow-up program, the Proponent shall monitor nitrogen dioxide (NO2), sulfur dioxide (SO2), fine particulate matter (PM2.5), particulate matter (PM10), dust, and carbon monoxide (CO) in air. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.

Based on the progress of the project to date (Section 1.1), the field programs collected information focused on monitoring the impacts of those activities summarized below:

- Land clearing and earthworks for the construction camp and plant site.
- Construction and use of unpaved access and mine roads.
- Material handlings.re-handling at aggregate and topsoil stockpiles.
- Parking lot and road grading

The *Air Quality and Fugitive Dust Management Annual Report 2022* (Blackwater Gold Ltd., 2023a)(Appendix 6) presents the results of the 2022 monitoring program, while the results of those monitoring activities driven by the DS between January 1 – March 31, 2023 are presented in Appendix 11.

This section provides an overview of monitoring, results, and adaptive management that occurred during the reporting period to support compliance with DS 6.12. Full details can be reviewed in Appendix 6 and Appendix 11.

8.1 Monitoring and Analysis

As outlined above, details regarding the monitoring activities done in support of condition 6.12 are provided in Appendix 6 and Appendix 11. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results and recommendations. Table 8-1 below summarizes the monitoring results and recommendations for work done, it also specifies where further information on each item can be found in the Appendices.

Particulate matter monitoring through the *Air Quality and Fugitive Dust Management Plan* triggered adaptive management. This event occurred in December 2022, and resulted in a ‘Low’ trigger level exceedance, details are presented in Table 8-1.

Table 8-1: Summary of DS condition 6.12 follow-up monitoring

Monitoring	Survey/Methodology	Dates	Results Summary	Adaptive Management/Recommendations
Dustfall Monitoring	Appendix 6, Section 6.4.2 (Blackwater Gold Ltd., 2023a)	August – September 2022 (Blackwater Gold Ltd., 2023a)	**Appendix 6, Section 6.4.2** Dustfall samples were collected from eight locations for baseline data for the baseline CFMP (August – September 2022). Results are presented in Appendix C. Station 027 had the highest total dustfall of 2.58 mg/dm2-day. Only five metals identified as a Contaminant of Potential Concern (COPCs) for human health (Entia 2021a, 2021b) were detectable in dust samples collected in both or one of the two areas (near-field or control): aluminum, cadmium, lead, manganese, and zinc. (Blackwater Gold Ltd., 2023a)	**Appendix 6, Section 8.0** The results from the CFMP Dustfall monitoring program should be used in conjunction with visual dust monitoring. (Blackwater Gold Ltd., 2023a)
Particulate Matter Monitoring	Appendix 6, Section 6.4.3 (Blackwater Gold Ltd., 2023a)	October – December 2022 (Blackwater Gold Ltd., 2023a) March 2023 (Blackwater Gold Ltd., 2023c)	**Appendix 6, Section 6.4.3** In total eleven particulate matter samples (PM2.5 and PM10) were collected between October and December 2022. No particulate matter samples exceeded any objective or standard. The highest concentration of both PM2.5 and PM10 was observed on December 19th, 2022, with a concentration of 14.8 µg/m^3. The high concentrations could be attributed to the construction fire that occurred at site on December 17. Baseline PM10 concentration (9 µg/m^3) was exceeded on December 19th, 2022, and PM2.5 baseline concentration (4 µg/m^3) was exceeded on November 14, December 1st, and 19th, 2022. The annual average PM2.5 concentration was 4.55 µg/m^3. The trigger level for this exceedance is low. (Blackwater Gold Ltd., 2023a) **Appendix 11, Section 1.0** In total four particulate matter samples (PM$_{2.5}$ and PM$_{10}$) were collected in March 2023. Particulate matter data was not collected between December 19th, 2022, and March 13th, 2023, due to a cassette installation error, system faults due to power outages, and user error. Based on the analytical results, no samples exceeded any of the applicable provincial or federal objectives or standards; however, the baseline PM_{10} concentration (9 µg/m^3) was exceeded on March 13th and 31st and the baseline $PM_{2.5}$ concentration (4 µg/m^3) was exceeded on March 13th, 19th and 31st. The highest $PM_{2.5}$ concentration was 6.6 µg/m^3 observed on March 13th and the highest PM_{10} concentration was 9.6 µg/m^3 observed on March 31st, 2023. The particulate matter samples compared to the predicted baseline concentrations are above; however, are below the federal and provincial objectives and standards. As such, no adverse health effects for human receptors are likely to occur. (Blackwater Gold Ltd., 2023c)	**Appendix 6, Section 7.7 and 8.0** The baseline PM10 concentration (9 µg/m^3) was exceeded on December 19th, 2022(14.8 µg/m^3), and the PM2.5 baseline concentration (4 µg/m^3) was exceeded on November 14 (5.9 µg/m^3), December 1st (6.4 µg/m^3) and 19th (14.8 µg/m^3), 2022. As per the TRP in the AQFDMP, monitoring via the Partisol sampler continued and a casual analysis was done to identify potential sources and mitigations. Through this process two potential causes were identified: - Operation of the wood burning furnace in the maintenance building during sampling events; and, - A construction fire on December 17th Based on these findings it was recommended that operation of the wood burning furnace not occur during sampling events, or the sampler be moved. These were proposed with the goal of supporting representative site samples (Blackwater Gold Ltd., 2023a). In was determined that the Partisol sampler will be relocated in 2023. **Appendix 11, Section 1.0** In 2023 training on the operation and maintenance of the sampling unit will be provided to relevant onsite personnel to reduce the likelihood of those preventable events in the future. (Blackwater Gold Ltd., 2023c)
Nitrogen dioxide and Sulfur Dioxide Monitoring	Appendix 6, Section 6.4.4 (Blackwater Gold Ltd., 2023a)	N/A	**Appendix 6, Section 6.4.4** Nitrogen dioxide (NO_2) and Sulfur Dioxide (SO_2) passive air samples were not collected as part of the air quality monitoring in 2022. The passive air sampling system (PASS) apparatus was installed at the exploration camp near the Partisol sampler(Blackwater Gold Ltd., 2023a) **Appendix 11, Section 2.0** The first sampling event for Nitrogen Dioxide (NO_2) and Sulfur Dioxide (SO_2) passive air samples initiated on February 23rd, 2023, with collection occurring on March 25th, 2023. No samples exceeded the applicable provincial or federal objectives or standards, although it was identified that the passive sampling units used on site should be collected following between 7 – 15 days. (Blackwater Gold Ltd., 2023c)	**Appendix 11, Section 2.0** Passive sampling units will be collected 7 – 15 days following deployment when safe to do so.(Blackwater Gold Ltd., 2023c)

Carbon monoxide	Appendix 6, Section 6.4.5 (Blackwater Gold Ltd., 2023a)	N/A	**Appendix 6, Section 6.4.5** Carbon monoxide monitoring was not completed in 2022. (Blackwater Gold Ltd., 2023a)	**Appendix 6, Section 8.0** CO monitoring has been implemented in 2023. Weekly sampling began in May and will continue as per the AQFDMP.

9 Effects on Moose (6.14)

The purpose of the *Wildlife Mitigation and Monitoring Plan* (WMMP) (ERM, 2022i) is to manage impacts on wildlife in the Blackwater Project area during Construction, Operations, Closure, and Post-closure.

The *2022 Wildlife Mitigation and Monitoring Program Compliance Report* (ERM, 2023b),(Appendix 5) summarizes and presents the results of the follow up programs and monitoring of mitigation measures during 2022, while the results of January – March 31, 2023 monitoring is presented in *Blackwater 2023 Q1 Wildlife Monitoring Activity* (Appendix 12). This follow-up program includes monitoring for moose required by condition 6.14 of the DS in Section 3.1.

> **6.14** The Proponent shall, prior to construction and in consultation with Indigenous groups and relevant authorities, develop a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse effects from the Designated Project on moose (*Alces alces*) and determine the effectiveness of mitigation measures. As part of the implementation of the follow-up program, the Proponent shall conduct winter distribution and density surveys for moose (*Alces alces*) starting prior to construction and until the end of operation. The Proponent shall implement the follow-up program from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.

9.1 Monitoring and Analysis

As outlined above, details regarding monitoring activities done in support of condition 6.14 are provided in Appendix 5 and Appendix 12. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results and recommendations. Table 9-1 below summarizes the monitoring results and recommendations and identifies where further information on each item can be found in the Appendices.

No adaptive management actions were required, and future monitoring will occur as described in the *Wildlife Mitigation and Monitoring Plan* (ERM, 2022i). This will include additional analysis of ungulate distribution and density when additional years of monitoring are completed, and snow track surveys in 2023.

Table 9-1: Summary of DS condition 6.14 follow-up monitoring

Monitoring	Survey/Methodology	Timing	Results
Moose	**Appendix 5, Section 2.2.2** Habitat Loss monitoring (ERM, 2023b)	2022 (ERM, 2023b)	**Appendix 5, Section 2.2.3** Clearing completed in 2022 was limited to the Plant Site area, which accounted for 26.4 ha of disturbance. It was determined that there was a reduction in moose habitat for the growing season (26.4 ha). (ERM, 2023b)
	Appendix 5, Section 2.3.3.3 Moose-vehicle collision monitoring (ERM, 2023b)	N/A	**Appendix 5, Section 2.3.4** No interactions, incidents, mortalities, or vehicle collisions were recorded during 2022. (ERM, 2023b)
	Appendix 5, Section 3.1.2.1 Ungulate pellet counts (ERM, 2023b)	June 2022 (ERM, 2023b)	**Appendix 5, Section 3.1.3.1** In total, 22 ungulate pellet count transects were established at varying distances from the proposed Project footprint. Moose pellets were detected at the majority of transects (17 of 22). Moose pellets were most commonly winter pellets (Distance = 66, Quadrat = 9), with some spring pellets (Distance = 29, Quadrat = 1) and fewer summer pellets (Distance = 11, Quadrat = 2). As this was the first year of surveying, pellet age varied. Nearly half of the pellet groups counted were expected to have been deposited within the last year. As such, results from the first year of sampling do not indicate overall density but provide an initial idea of moose distribution and relative density. (ERM, 2023b)
	Appendix 12, Section 2.2.1 Aerial-based winter ungulate survey (ERM, 2023j) **Appendix 12, Section 2.2.2** Ground-based ungulate winter survey (ERM, 2023j)	March 3 – 5, 2023	**Appendix 12, Section 2.3** A total of 37 individual track locations or animals were observed during ground-based surveys. Species included moose, lynx, wolf, coyote, porcupine, river otter, and deer. For ungulate species, a total of 21 moose and 1 deer tracks or animals were observed. A total of 560 individual track locations or animals were observed during aerial surveys. Species included moose, lynx, wolf, coyote, otter, and mountain goat. For ungulate species, a total of 390 moose and 10 mountain goat tracks or animals were observed. The most abundant species for both surveys were moose followed by lynx. Moose were most frequently recorded in the central and northern transects of the Study Area for both survey types. (ERM, 2023j)

10 Effects on Caribou (8.18.6)

The *Caribou Mitigation and Monitoring Plan* (CMMP) (ERM, 2022c) is intended to describe the mitigation and monitoring measures that will be implemented to avoid, reduce and offset the Projects adverse effects on caribou and their critical habitat as defined in the recover Strategy for the Woodland Caribou, Southern Mountain Population (*Rangifer tarandus caribou*) (Environment Canada 2014, or as updated from time to time). The caribou monitoring programs include adaptive management and details of the follow-up programs to address regulatory requirements, including DS condition 8.18.6:

> **8.18.6** For any offsetting required pursuant to condition 8.17, the Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, and to the satisfaction of Environment and Climate Change Canada, a compensation plan for southern mountain caribou (*Rangifer tarandus caribou*). When developing the compensation plan, the Proponent shall take into account habitat needs for migratory birds and listed species at risk. The Proponent shall implement the compensation plan from the beginning of construction. The compensation plan shall include… a description of the follow-up program the Proponent shall implement to determine the effectiveness of the mitigation measures included in the compensation plan. As part of the development of the follow-up program, the Proponent shall determine, in consultation with Indigenous groups, the methods, timing and frequency for conducting winter surveys for caribou abundance and distribution within the Designated Project area. The Proponent shall apply conditions 2.9 and 2.10 when implementing the follow-up program.

Section 6.2.2.2 of the CMMP specifically describes the methods, timing, and frequency for conducting winter surveys for caribou abundance and distribution in the Designated Project area.

The *2022 Wildlife Mitigation and Monitoring Program Compliance Report* (ERM, 2023b),(Appendix 5) summarizes and presents the results of the follow up programs and monitoring of mitigation measures during 2022, while the results of January – March 31, 2023 monitoring is presented in *Blackwater 2023 Q1 Wildlife Monitoring Activity* (Appendix 12). This follow-up program includes monitoring for caribou required by condition 8.18.6 of the DS in Section 3.2.

10.1 Monitoring and Analysis

As outlined above, details regarding the 2022 monitoring activities done in support of condition 8.16.8 are provided in Appendix 5 and Appendix 12. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results and recommendations. Table 10-1 below summarizes the monitoring results and recommendations and identifies where further information on each item can be found in the Appendices.

No adaptive management actions were required, and future monitoring will occur as described in the *Wildlife Mitigation and Monitoring Plan* (ERM, 2022i). This will include additional analysis of ungulate distribution and density when additional years of monitoring are completed, and snow track surveys in 2023.

Table 10-1: Summary of DS condition 8.18.6 follow-up monitoring

Monitoring	Survey/Methodology	Timing	Results
Caribou	**Appendix 5, Section 3.1.2.1** Ungulate pellet counts (ERM, 2023b)	June 2022 (ERM, 2023b)	**Appendix 5, Section 3.1.3.1** In total, 22 ungulate pellet count transects were established at varying distances from the proposed Project footprint. No caribou pellets were observed. (ERM, 2023b)
	Appendix 12, Section 2.2.1 Aerial-based winter ungulate survey (ERM, 2023j) **Appendix 12, Section 2.2.2** Ground-based ungulate winter (ERM, 2023j) survey	March 3 – 5, 2023	**Appendix 12, Section 2.3 and 3** No caribou tracks or other signs were observed during survey efforts, nor incidentally. (ERM, 2023j) These findings are consistent with baseline and existing field data collected for the Project between 2012 and 2021. Ground-based and aerial animal and track surveys completed in March 2012, December 2015, and February 2018 did not report any caribou. However, an aerial snow track survey in December 2021 reported a total of three caribou tracks. An incidental observation in February 2018 on top of Mt. Davidson also recorded a likely caribou track. Additionally, collar data (1980-2020) indicate that the Project is not within a current movement corridor and appears to only be used intermittently by caribou. (ERM, 2023j)
	Appendix 5, Section 3.2.2 Caribou offset monitoring program (ERM, 2023b)	N/A	**Appendix 5, Section 3.2.2** The caribou offset monitoring program consists of four separate monitoring programs, including road restoration monitoring, access monitoring, sight lines monitoring, and wildlife use monitoring. The caribou offset monitoring program was not implemented in 2022, although some modelling work and preliminary discussions took place and it's anticipated that further work will be completed in 2023 following the plan presented in the *Caribou Mitigation and Monitoring Plan*. (ERM, 2023b)
	Appendix 5, Section 2.3.3.1 Incidental Observations (ERM, 2023b)	N/A	**Appendix 5, Section 3.2.3.2** Two potential caribou game trails were identified during white bark pine and Clark's nutcracker surveys. No other caribou observations or signs were recorded in 2022. (ERM, 2023b)

11 Whitebark Pine (8.20.5)

The *Whitebark Pine Management Plan* (WPMP) (ERM, 2022h) was developed to address a number of conditions, including 8.20 and 8.20.5 of the DS. It was designed to mitigate the effects from the Project on whitebark pine (*Pinus albicaulis*); however, given that whitebark pine operates as a keystone and foundation species crucial to ecosystem function and that whitebark pine faces existential threats, goals and objectives beyond the scope of direct impact mitigation were required.

The overall goals of the WPMP are to:

- Mitigate impacts to whitebark pine caused by mine development;
- Mitigate potential impacts to regional Clark's nutcracker populations;
- Contribute to the knowledge base of deploying whitebark pine in mine reclamation;
- Contribute to the overall recovery of whitebark pine; and
- Understand baseline conditions and inform mitigation strategies implemented for whitebark pine and Clark's nutcracker.

Although reclamation has not began at site (Section 1.1), the *BW Gold Whitebark Pine Field Update – 2022* (Blackwater Gold Ltd., 2023b) (Appendix 10) summarizes the results implementing WPMP, while the *2022 Wildlife Mitigation and Monitoring Program Compliance Report* (ERM, 2023b) (Appendix 5) presents results relating to monitoring the baseline presence of the Clark's nutcracker. No additional monitoring occurred between January 1 and March 31, 2023.The results of these programs will be used to inform the analysis of future monitoring during reclamation activities.

Table 11-1 summarizes this condition of the DS and where the full details can be found in the associated appendix of this document

Table 11-1: DS condition 8.20.5 follow-up monitoring

Condition No.	Condition	Appendix	Section
8.20.5	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, a whitebark pine management plan to mitigate effects from the Designated Project on whitebark pine (*Pinus albicaulis*) and its critical habitat. The Proponent shall implement the plan during all phases of the Designated Project consistent with any applicable recovery strategy related to whitebark pine (*Pinus albicaulis*). As part of the whitebark pine management plan, the Proponent shall… develop and implement a follow-up program in consultation with Indigenous groups to determine the effectiveness of the mitigation measures included in the whitebark pine management plan. The Proponent shall apply conditions 2.9 and 2.10 when implementing the follow-up program. The follow-up program shall include:	Described in the WPMP (ERM, 2022h)	
8.20.5.1	Visual monitoring of populations of whitebark pine (*Pinus albicaulis*), including their health, within reclaimed areas at a minimum every five years; and	Appendix 10: BW Gold Whitebark Pine Field Update – 2022	
8.20.5.2	Monitoring of use of the reclaimed areas by Clark's nutcracker (*Nucifraga columbiana*) for the purpose of whitebark pine regeneration. Should the results of monitoring demonstrate that use of the reclaimed areas by Clark's nutcracker (*Nucifraga columbiana*) is not adequate, the Proponent shall implement additional mitigation measures.	Appendix 10: BW Gold Whitebark Pine Field Update – 2022 Appendix 5: 2022 Wildlife Mitigation and Monitoring Program Compliance Report	Section 3.8.3.3 Clark's Nutcracker Monitoring

11.1 Monitoring and Analysis

As outlined above in Table 11-1, details regarding the 2022 monitoring activities done in support of condition 8.20.5 are provided in Appendix 10. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results and recommendations. Table 11-2 below summarizes the monitoring results and recommendations and identifies where further information on each item can be found in the Appendices. For context, Table 11-1 summarizes all monitoring done through the WPMP in 2022, which addresses requirements outside of DS condition 8.20.5. However, the information collected through this program will be used to inform future reclamation activities that relate to condition 8.20.5.

No adaptive management actions were required relative to condition 8.20.5, and future monitoring will occur as described in the WPMP. (ERM, 2022h). However, through monitoring associated with the other conditions associated with the WPMP future recommendations were made, these are summarised in Table 11-1 for reference.

Table 11-2: Summary of DS condition 8.20.5 follow-up monitoring

Monitoring	Survey/Methodology	Timing	Results	Adaptive Management/Recommendations
Whitebark Pine	**Appendix 10, Section 3.1** Stand Assessments	2022 (Blackwater Gold Ltd., 2023b)	**Appendix 10, Section 3.1** DS Condition 8.20.(d) The inventory work showed that although whitebark pine is common to some degree across much of the landscape, its degree of occupation is highly variable. The most desirable scenario is for whitebark pine to be growing on productive sites unimpeded by competition; however, the high density of subalpine fir co-occurring on the landscape indicates that competition levels are likely to increase on most sites and in many cases subalpine fir will overtake whitebark pine and dominate many sites where the two presently co-occur. Stand assessments identified competition and mountain pine beetle are most manageable threats in the near term to cone production and use by Clark's nutcrackers.	**Appendix 10, Section 4.0** Apply verbenone to plus trees to minimize losses of reproductive trees to mountain pine beetle. Develop restoration prescriptions. Daylight whitebark pine to reduce competition levels and support current and future cone production.
	Appendix 10, Section 3.2 Seedling Translocation Surveys	2022 (Blackwater Gold Ltd., 2023b)	**Appendix 10, Section 3.2** DS Condition 8.20.(a) Previously translocated seedlings/saplings were surveyed, with two dead and the remainder classed as vigorous. Of the original 20 seedlings/saplings salvaged in 2013, 18 were transplanted in the field (two died in overwinter storage), and 13 survived 9-years for a 72% field transplant survival and 65% for overall survival.	**Appendix 10, Section 4.0** Transplant whitebark only within confirmed development areas. Follow transplant methods. Transplant recipient location identified on south side of mountain.
	Appendix 10, Section 3.3 Whitebark Pine Health Surveys	2022 (Blackwater Gold Ltd., 2023b)	**Appendix 10, Section 3.3** DS Condition 8.20.(b) A total of eight health plots were sampled, consisting of five permanent transects and three 100-tree surveys. All transects showed a decline in forest health since 2013 or 2014. The greatest was a 20% decline since 2014; all health declines were due to increases in white pine blister rust.	**Appendix 10, Section 4.0** Re-measures health in stands at 5-year intervals. Submit seed from highest infected stand (26% healthy) to provincial rust screening program. Establish field-based rust monitoring transects to study a greater sample of parent trees. Confirm field trial design, area required, and prepare field sites for trials.
	Appendix 10, Section 3.4 Whitebark Pinecone Collection	2022 (Blackwater Gold Ltd., 2023b)	**Appendix 10, Section 3.4** DS Condition 8.20.(b) In 2022, a large cone crop was present, and cones were collected from 26 permanently marked plus trees. An additional three trees were identified for cone collection, but no seeds were recovered from these trees due to poor cone condition. The cone collection yielded a total of 13.64 kg of seed with an estimated yield of 109,128 seeds.	
	Appendix 10, Section 3.5 Field Trial Location Identification	2022 (Blackwater Gold Ltd., 2023b)	**Appendix 10, Section 3.5** DS Condition 8.19. Field trial sites were identified for seedling/sapling transplants, climate change adaptation studies, and field monitoring for white pine blister rust tolerance. Establishing each of these trials on the mountain will also serve some level of restoration on undisturbed sites via seedling planting.	**Appendix 10, Section 4.0** Develop restoration trial study design, which will include current trials and future replications on reclamation sites. All trials should include study at the individual parent tree scale. Confirm trial site size and site preparation requirements.
	Appendix 10, Section 3.6 Planting Trial and Remeasurements (Blackwater Gold Ltd., 2023b)	2022 (Blackwater Gold Ltd., 2023b)	**Appendix 10, Section 3.6** DS Condition 8.19. Planting Trial Overall, 6-year planting survival was high at 81%, which fits well within the survival rates projected by others (e.g., Jenkins et al. 2022). No rust was observed on any seedlings live or dead; though at most	**Appendix 10, Section 4.0** Develop restoration trial study design, which will include current trials and future replications on reclamation sites. All trials should include study at the individual parent tree scale.

			locations dead seedlings had decayed and were absent thus no cause of death could be attributed to any seedlings. The high survival rate indicates that establishing seedlings through planting is a viable activity on disturbed sites and extensive trials can be developed. (Blackwater Gold Ltd., 2023b) <u>Whitebark Pine Blister Rust Screening Planting</u> In 2016 a series of six planting transects were established with individual parents tracked within each transect; each transect had five seedlings from each parent planted within it, with the exception of some parents that had insufficient seedlings. Overall survival across all transects was 72% with a parent tree survival ranging from 57% to 90%; no rust was observed on any seedlings and cause of death could not be determined for any seedlings.	Confirm trial site size and site preparation requirements.
	Appendix 5, Section 3.8.2.4 Clark's nutcracker monitoring (ERM, 2023b)	July – November 2022 (Camera and ARU deployment) (ERM, 2023b) August 29 – 30, 2022 (Call playback) (ERM, 2023b)	**Appendix 5, Section 3.8.3.3** Clark's nutcrackers were identified in 187 ARU files across all sites with available data. All ARU sites had consistent Clark's nutcracker detections throughout deployment. None of the cameras detected Clark's nutcracker. Birds are difficult to monitor via remote camera due to their small size and fast movements. The lack of camera detections despite abundant Clark's nutcracker detections by ARU and call playback indicate that cameras are likely not a useful monitoring tool for this species. These surveys were conducted to obtain additional baseline data on the presence of Clark's nutcracker in the whitebark pine habitat on Mt Davidson. Three call playback (CPB) surveys were completed at every odd survey site along each transect. In summary, 55% of sites has responses. Transects with white bark pine on average had a higher percentage of call playbacks that elicited responses from Clark's nutcrackers. (ERM, 2023b)	

12 Effects on Western Toad (8.21)

The purpose of the *Wildlife Mitigation and Monitoring Plan* (WMMP) (ERM, 2022i) is to manage impacts on wildlife in the Blackwater Project area during Construction, Operations, Closure, and Post-closure.

The 2022 *Wildlife Mitigation and Monitoring Program Compliance Report* (ERM, 2023b) (Appendix 5) summarizes and presents the results of the follow up programs and monitoring of mitigation measures during 2022. No additional monitoring occurred between January 1 and March 31, 2023. This follow-up program includes monitoring for moose required by condition 8.21 of the DS in Section 3.9.

Table 12-1 summarizes this condition of the DS and where the full details can be found in the associated appendix of this document.

Table 12-1: DS condition 8.21 follow-up monitoring

Condition No.	Condition	Appendix	Section
8.21.	The Proponent shall develop, in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to the effects of changes caused by the Designated Project on western toad (*Anaxyrus boreas*). The Proponent shall implement the follow-up program from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall:	Described in the WMMP (ERM, 2022i)	
8.21.1	Conduct western toad surveys annually in breeding habitat identified pursuant to condition 8.10 from the start of construction until the end of decommissioning;	Appendix 5: 2022 Wildlife Mitigation and Monitoring Program Compliance Report	3.9.2.2 Monitoring toad breeding ponds
8.21.2	Monitor western toad (*Anaxyrus boreas)* in relocation areas for western toad (*Anaxyrus boreas*) salvage conducted pursuant to condition 8.11; and	Appendix 5: 2022 Wildlife Mitigation and Monitoring Program Compliance Report	3.9.2.2 Monitoring toad breeding ponds
8.21.3	Monitor western toad (*Anaxyrus boreas*) mortality on project roads from the start of construction until the end of decommissioning.	Appendix 5: 2022 Wildlife Mitigation and Monitoring Program Compliance Report	3.9.2.1 Monitoring toad mortality on roads

12.1 Monitoring and Analysis

As outlined in Table 12-1 above, detailed regarding the monitoring activities done in support of condition 8.21 are provided in Appendix 5. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results and recommendations. Table 12-2 below summarizes the monitoring results and recommendations for work done, it also specifies where further information on each item can be found in the Appendices.

No adaptive management actions were required, and future monitoring will occur as described in the *Wildlife Mitigation and Monitoring Plan* (ERM, 2022i).

Table 12-2: Summary of DS condition 8.21 follow-up monitoring

Monitoring	Survey/Methodology	Timing	Results
Western Toad	**Appendix 5, Section 3.9.2.1** Monitoring for Toad Mortalities on Road (ERM, 2023b)	N/A	**Appendix 5, Section 3.9.2.1** Monitoring of toad mortality on roads was not completed in 2022 because the Project had not begun Construction during the applicable monitoring period. (ERM, 2023b)
	Appendix 5, Section 3.9.2.2 Monitoring Toad Breeding Ponds (ERM, 2023b)	August 30 – September 10, 2022, (ERM, 2023b)	**Appendix 5, Section 3.9.3.1** Surveys were completed to confirm amphibian breeding locations at 109 sites within the LSA. In total, 36 amphibian breeding sites were identified. Western toads were recorded at 34 sites, with 21 confirmed breeding sites. Breeding was also confirmed at 19 sites for Columbia spotted frog, and 10 sites for wood frog. Six sites suitable as potential relocation sites for future amphibian salvage were also identified. Findings from this survey have been incorporated into the Amphibian Pre-Clearing and Salvage SOP (ERM, 2023b)
	Appendix 5, Section 2.1.2.1 Amphibian Salvage (ERM, 2023b)	September 14 and 15, 2022 (ERM, 2023b)	**Appendix 5, Section 2.1.3.1** Amphibian salvage was completed at the wetland southeast of the Early Works Plant Site. In total, 20 Columbia spotted frog metamorphs were salvaged and relocated without incident in accordance with general wildlife permit #SM22-746546. The relocation site was chosen by a QP Biologist based on the presence of various Columbia spotted frog life stages (current and historical), suitability for breeding and overwintering habitat, and similarity in pH and water temperature to the salvage site. (ERM, 2023b)
	Appendix 5, Section 2.3.3.1 Incidental Observations (ERM, 2023b)	N/A	**Appendix 5, Section 3.9.3.2 and 3.9.3.3** Amphibians, specifically Columbia spotted frog and western toad, were incidentally found at the wetland southeast of the Early Works Plant Site by onsite environmental personnel. This resulted in the amphibian salvage described above. One other incidental observation of western toad was recorded in 2022. Western toad eggs and tadpoles were observed in a ditch along a decommissioned spur in a large cut block at kilometre 6 of the mine site access road. (ERM, 2023b)

13 Effects on Bats (8.22)

The purpose of the *Wildlife Mitigation and Monitoring Plan* (WMMP) (ERM, 2022i) is to manage impacts on wildlife in the Blackwater Project area during Construction, Operations, Closure, and Post-closure.

The *2022 Wildlife Mitigation and Monitoring Program Compliance Report* (ERM, 2023b) (Appendix 5) summarizes and presents the results of the follow up programs and monitoring of mitigation measures during 2022. Pre-clearing surveys for bat hibernacula occurred in March 2023 (Appendix 13). This follow-up program includes monitoring for bats required by condition 8.22 of the DS in Section 3.5.

> **8.22** The Proponent shall develop, in consultation with Indigenous groups, and implement a follow-up program to monitor little brown myotis (Myotis lucifugus) and northern myotis (Myotis septentrionalis) usage of buffer zones established pursuant to condition 8.14 and roosting structures installed and maintained by the proponent pursuant to condition 8.15 to determine the effectiveness of the mitigation measures. The Proponent shall implement the follow-up program during construction and operation and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.

13.1 Monitoring and Analysis

As outlined above, details regarding the monitoring activities done in support of condition 8.22 are provided in Appendix 5 and Appendix 13. These programs were implemented and developed by QPs, and include detailed summaries of methodologies, study locations, results and recommendations. Table 13-1 below summarizes the monitoring results and recommendations and identifies where further information on each item can be found in the Appendices.

No adaptive management actions were required, and future monitoring will occur as described in the *Wildlife Mitigation and Monitoring Plan* (ERM, 2022i).

Table 13-1: Summary of DS condition 8.22 follow-up monitoring

Monitoring	Survey/Methodology	Timing	Results
Bats	**Appendix 13** Pre-clearing surveys	March 2023	**Appendix 13** Pre-clearing surveys were done in March 2023. No bat hibernacula were observed.
	Appendix 5, Section 3.5.2.1 Bat Distribution and Buffer Zone Monitoring (ERM, 2023b)	July 12 – November 2, 2022, (ERM, 2023b)	**Appendix 5, Section 3.5.3.1** Surveys were conducted as part of additional baseline data collection for bat species presence and distribution. No roost or hibernacula sites were buffered in 2022 so no monitoring of buffered areas occurred. A total of 6 ARUs were deployed to detect for the presence of bats. Three ARUs were deployed in wetlands within the Project LSA and three ARUs were deployed within the Matthews Creek Wetland Offset Area. Data in the mine site area were collected for additional baseline; no clearing or construction activities took place during the bat roosting season, so no compliance monitoring was completed. After analysis of ARU files using the Kaleidoscope Pro auto-ID function and manual vetting, three species were detected with high or moderately high confidence (i.e., had many clear diagnostic calls recorded) in the mine site area: little brown myotis, silver-haired bat, and western small-footed myotis. (ERM, 2023b)
	Appendix 5, Section 3.5.2.2 Bat Roosting Structures (ERM, 2023b)	September 1, 2022, (ERM, 2023b)	**Appendix 5, Section 3.5.3.2** Installation of three bat roosting structures (BrandenBark) were placed in semi-open and closed habitat types within the Matthews Creek Wetland Offset Area boundary. Each structure was attached to a tree approximately 3.5 m from the ground. (ERM, 2023b)
	Appendix 5, Section 3.5.2.3 NABAT Monitoring (ERM, 2023b)	N/A	**Appendix 5, Section 3.5.2.3** BW Gold is currently engaged with ECCC on the initiation of a NABAT monitoring program at the Project. The program is anticipated to follow the NABAT programs standard methods. The design process for the program is currently ongoing and was not initiated in 2022. The final design and implementation of the NABAT monitoring program will be included in future years. (ERM, 2023b)
	Appendix 5, Section 2.3.3.1 Incidental Observations (ERM, 2023b)	N/A	**Appendix 5, Section 3.5.3.3** No incidental observations or detections of bats were made in 2022. (ERM, 2023b)

Appendix 1: 2022 BW Gold Consultation Report

ARTEMIS GOLD INC

Memo

To: Impact Assessment Agency of Canada Date: 2023-06-29

From: BW Gold Ltd.

Subject: BW Gold Decision Statement Condition 2.11.3

This memorandum has been prepared to summarize the activities undertaken between April 1, 2022 and March 31, 2023 to fulfill condition 2.11.3 as set out in the Decision Statement **("DS")** received on April 15, 2019 under the *Canadian Environmental Assessment Act,* 2012. The DS relates to the Blackwater Gold Project (the "**Project**"), a proposed gold and silver open pit mine located in central British Columbia, owned by BW Gold Ltd. ("**BW Gold**"), a wholly-owned subsidiary of Artemis Gold Inc. ("**Artemis**"). Condition 2.11.3 requires BW Gold to report on the consultation that has occurred for each of the conditions set out in the DS that require consultation, and in particular:

> "how the Proponent considered any views and information that the Proponent received during or as a result of the consultation, including a rationale for how the views have, or have not, been integrated;"

1. Requirements of Condition 2.11.3

Condition 2.3 sets out the general framework for consultation with Lhoosk'uz Dené Nation ("**LDN**"), Ulkatcho First Nation ("**UFN**"), Nadleh Whut'en First Nation ("**NWFN**"), Saik'uz First Nation ("**SFN**"), Stellat'en First Nation ("**StFN**") or collectively with StFN, NWFN and SFN, the "**CSFNs**", Nazko First Nation ("**NFN**"), Skin Tyee Nation ("**STN**"), Tŝilhqot'in Nation ("**TN**"), Métis Nation British Columbia ("**MNBC**"), and Nee-Tahi-Buhn Band ("**NTBB**") (collectively, the "**Indigenous Groups**"), Fisheries and Oceans Canada ("**DFO**"), Environment and Climate Change Canada ("**ECCC**"), and other relevant authorities where consultation is a requirement of a condition set out in the DS. Condition 2.11.3 requires BW Gold to:

- for conditions set out in this Decision Statement for which consultation is a requirement, how the Proponent considered any views and information that the Proponent received during or as a result of the consultation, including a rationale for how the views have, or have not, been integrated;

2. Provision of Information

BW Gold provided information to the parties listed in Section 1 (above) as required by each applicable Condition. **Schedule "A"** attached to this Memo sets out the plans/documents that were distributed to such parties to fulfill the consultation requirement in the Decision Statement. **Schedule "A"** also provides a reference to an Issues Tracking Table ("**ITT**") where the comments received from the parties referred to in Section 1 of this Memo can be found in respect of such plans/documents. The comments and responses demonstrate how BW Gold considered views and information received as a result of the consultations. BW Gold's responses in the various ITTs provide a rationale for how the views have (or have not been) been integrated into the plans/documents. The ITTs are included in **Exhibits 1-17.**

Schedules Schedule "B" and **Schedule "C"** provide the following information related to consultation with Indigenous Nations and Regulators, respectively and contain the following information:

- Date at which consultation on each DS condition was initiated;
- Date by which comments were requested;
- Date at which comments were received; and
- Date at which responses to comments was provided.

Owing to the iterative nature of the consultation, in many instances multiple rounds of comments and responses occurred with the parties set out in Section 1 of this Memo. This is reflected in the multiple date entries in the tables in **Schedule "B"** and **Schedule "C".** In addition, many of the plans/documents that were used to fulfill Decision Statement consultation requirements were used in multiple regulatory decision processes and therefore were provided for consultation multiple times.

Examples of such plans/documents used in multiple regulatory decision processes include:

- the Fish Habitat Compensation Plan for the Schedule 2 amendment,
- the Fish Offsetting Plan for the Fisheries Act Authorization, and
- multiple plans submitted as part of the Mines Act permit process (note: the Mines Act permit consultation is explained in more detail in Section 3.0 below).

3. *For Plans and Documents fulfilling Decision Statement Conditions that were Also submitted as part of the BC Mines Act Permit Process*

In addition to the consultation described earlier in this memo and detailed in **Schedule "B" and Schedule "C",** BW Gold consulted with LDN, UFN, the CSFNs on the following plans as part of the joint Mines Act/Environmental Management Act permit review process. The technical review phase formally commenced in May 2022 and concluded in December 2022.

Condition	Plan Name
3.1	Surface Erosion Prevention and Sediment Control Plan Construction Environmental Management Plan
3.2	Construction Environmental Management Plan
3.3	Knight Piesold – FWSS Design Report
3.14	Aquatic Effects Monitoring Plan – Follow-up Program
3.15	Aquatic Effects Monitoring Plan
3.16	Aquatic Effects Monitoring Plan – Follow-up Program
4.2	Wildlife Mitigation and Management Plan
4.3	Wildlife Mitigation and Management Plan
4.5	Wildlife Mitigation and Management Plan
6.3	Air Quality and Fugitive Dust Management Plan
6.8	Invasive Plant Management Plan
6.12	Air Quality and Fugitive Dust Management Plan
6.14	Wildlife Mitigation and Management Plan
6.15	Wildlife Mitigation and Management Plan
8.2	Wildlife Mitigation and Management Plan
8.4	Wildlife Mitigation and Management Plan
8.6	Wildlife Mitigation and Management Plan

8.9	Wildlife Mitigation and Management Plan Caribou Mitigation and Monitoring Plan
8.10	Wildlife Mitigation and Management Plan
8.14	Wildlife Mitigation and Management Plan
8.16	Wildlife Mitigation and Management Plan
8.17	Caribou Mitigation and Monitoring Plan
8.18	Caribou Mitigation and Monitoring Plan
8.21	Wildlife Mitigation and Management Plan
8.22	Wildlife Mitigation and Management Plan

During the technical review, LDN, UFN and the CSFNs provided multiple rounds of comments on the plans and documents and BW Gold responded to each comment. These comments and responses were tracked in an ITT, the final master version of which is included in **Exhibit 1 of Schedule "A".**

A number of relevant authorities also participated in the joint Mines Act/Environmental Management Act permit review process, including:

- FLNRORD (now FOR and WLRUS),
- Northern Health and
- EAO

Any comments received from the relevant authorities are also included in **Exhibit 1 of Schedule "A".**

Note that the joint Mines Act/Environmental Management Act permit review process consultation record has not been added to **Schedule "B"** and **Schedule "C".**

Schedule "A"

Table of Concordance - Summary

DS Condition		Document Name	Location in Document	Attached Exhibit (ITT)
3.1	The Proponent shall implement measures to control erosion and sedimentation within the Designated Project area to avoid the deposit of deleterious substances in water frequented by fish. The Proponent shall submit these measures to the Agency and to Indigenous groups before implementing them.	Early Works Erosion Prevention and Sediment Control Plan (ESC EW Plan Rev 2)	Section 4, 5, 6	**Exhibit 1**
		Construction Environmental Management Plan	Section 9.12; see also Sections 9.7, 9.9 and 9.10, Section 15.6	**Exhibit 1** **Exhibit 2**
3.2	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and Fisheries and Oceans Canada, measures to protect fish and fish habitat when undertaking activities in or near water, taking into account Fisheries and Oceans Canada's *Measures to Avoid Causing Harm to Fish and Fish Habitat*. In doing so, the Proponent shall: ▪ 3.2.1 develop, to the satisfaction of Fisheries and Oceans Canada and any other relevant authorities, and in consultation with Indigenous groups, a proposal to salvage and relocate fish prior to conducting any Designated Project activity requiring removal of fish habitat. The Proponent, if authorized under the *Fisheries Act* and its regulations, shall salvage and relocate fish in a manner consistent with their authorization.	Construction Environmental Management Plan Blackwater Gold Project Application for Authorization under Paragraph 35(2)(b) of the Fisheries Act (Non- Emergency Situations) Blackwater Gold Project Fish Habitat Compensation Plan	Section 9.12 and Appendix F – Fish Salvage Plan Appendix I	**Exhibit 1** **Exhibit 2**
3.3	The Proponent shall design, install and operate the freshwater intakes for the freshwater supply system to avoid fish entry or reduce the incidental capture, death or injury of fish through entrainment and impingement.	Fresh Water Supply System Design Report FWSS CEMP	Sections 1.3.2 and 3.3.4 and Appendix A All Sections	**Exhibit 1**

3.11	The Proponent shall develop, to the satisfaction of Fisheries and Oceans Canada and Environment and Climate Change Canada and in consultation with Indigenous groups, and implement any offsetting plan(s) related to any residual adverse effects to fish and fish habitat associated with the carrying out of the Designated Project. The Proponent shall submit any approved offsetting plan(s) to the Agency prior to implementation.	Blackwater Gold Project Application for Authorization under Paragraph 35(2)(b) of the Fisheries Act (Non-Emergency Situations)	All Sections	**Exhibit 3**
		Blackwater Gold Project Fish Habitat Compensation Plan – Pursuant to Section 27.1 of the Metal and Diamond Mining Effluent Regulations	All Sections	**Exhibit 4**
3.12	The Proponent shall, for any fish habitat offsetting measure(s) proposed in any offsetting plan(s) referred to in condition 3.11 that may cause adverse environmental effects not considered in the environmental assessment, develop and implement, following consultation with Indigenous groups, Fisheries and Oceans Canada and Environment and Climate Change Canada, measures to mitigate those effects, including effects to Indigenous peoples' current use of lands and resources for traditional purposes. The Proponent shall submit these measures to the Agency before implementing them.	Blackwater Gold Project Application for Authorization under Paragraph 35(2)(b) of the Fisheries Act (Non-Emergency Situations)	All Sections	**Exhibit 3**
		Blackwater Gold Project Fish Habitat Compensation Plan - Pursuant to Section 27.1 of the Metal and Diamond Mining Effluent Regulations	All Sections	**Exhibit 4**
		Country Foods Follow-Up Program	Section 4, 5, 6	**Not Applicable**

3.14	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, Fisheries and Oceans Canada, and other relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to adverse environmental effects of the Designated Project on fish and fish habitat. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall: ▪ 3.14.1 conduct parasite and pathogen inventories in Lake 01538UEUT and Lake 01682LNRS prior to enlarging Lake 01682LNRS and connecting it to Lake 01538UEUT pursuant to condition 3.13 and compare the results of the parasite and pathogen inventories for the two lakes; ▪ 3.14.2 monitor, starting when the Proponent starts to pump water into Davidson Creek and continuing through until the freshwater supply system has been decommissioned, rainbow trout (Oncorhynchus mykiss) and Kokanee (Oncorhynchus nerka) populations in Davidson Creek, including: ○ 3.14.2.1 community composition of rainbow trout (Oncorhynchus mykiss) and Kokanee (Oncorhynchus nerka), their absolute abundance, genetic structure and diversity; ○ 3.14.2.2 absolute abundance of overwintering rainbow trout juveniles; and 3.14.2.3 characteristics of spawner populations through surrogate monitoring metrics including size at 50% maturity, redd counts and spawner distribution.	DS 3.14 Follow-up Program Plan Aquatic Effects Monitoring Plan	Entire document Sections 4, 6	**Exhibit 1** **Exhibit 5**
3.15	The Proponent shall develop, in consultation with Indigenous groups and other relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to adverse environmental effects of the Designated Project on fish habitat in Davidson Creek, Creek 661 and Chedakuz Creek. The Proponent shall develop the follow-up program prior to construction and shall implement the follow-up program during all phases of the Designated Project. The Proponent shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall: ▪ 3.15.1 monitor water flows in Davidson Creek during the open water season from construction until decommissioning, and temperature continuously from construction until decommissioning; ▪ 3.15.2 monitor water quality in Davidson Creek, Creek 661 and Chedakuz Creek for contaminants of potential concern, including those identified in Table 5 of the environmental assessment report, during all phases of the Designated Project; and ▪ 3.15.3 monitor, during all phases of the Designated Project, groundwater quality and quantity downstream of the tailings storage facility site D, open pit, west waste rock dump and low-grade ore stockpile to confirm that groundwater quantity and quality parameters are at or below the values identified by the Proponent in the modelled predictions in Section 5 of Blackwater Gold Project: Additional Water Quality Model Sensitivity Scenario (July 20, 2017) and Section 3 of Blackwater Gold Project: Water Treatment Responses for Comments 1266, 1270, 1271, 1272, and 1273 (February 15, 2017) for nitrite and contaminants of potential concern, and to verify the effectiveness of water management measures.	DS Condition 3.15 Data Reporting Aquatic Effects Monitoring Plan Mine Site Water and Discharge Plan (MSDP)	All sections Sections 4, 6, Appendix B of the AEMP Sections 7, 8, 9	**Exhibit 1**

3.16	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to fish habitat in Tatelkuz Lake and Chedakuz Creek. The Proponent shall implement the follow-up program from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall: ▪ 3.16.1 conduct, prior to the commissioning of the freshwater supply system, fish habitat quantity and quality surveys in the Tatelkuz Lake littoral zone; ▪ 3.16.2 monitor the Tatelkuz Lake littoral zone from the commissioning of the freshwater supply system until decommissioning; and ▪ 3.16.3 monitor water flows in Chedakuz Creek between Tatelkuz Lake and the confluence with Davidson Creek during the open water season from construction until decommissioning.	DS 3.16 Follow-up Program Plan Aquatic Effects Monitoring Plan	All sections Sections 4, 6 Attachment B of the AEMP	**Exhibit 1** **Exhibit 5**
4.2	The Proponent shall deter migratory birds from using or frequenting the tailings storage facility, reclamation wetlands, pit lake and sediment control ponds until such time that water quality in these structures meets legislative requirements and water quality objectives. The Proponent shall identify the water quality objectives using an ecological risk based approach, developed in consultation with Indigenous groups and relevant authorities.	Wildlife Mitigation and Management Plan	Section 3.10 -Deterrence of Wildlife Section 4.7.2.2 – Facility Waterbody Monitoring Section 4.7.3.9 - Facility Waterbody Monitoring	**Exhibit 1** **Exhibit 6**
4.3	The Proponent shall conduct pre-construction surveys for migratory birds and their habitat in the Designated Project area to validate the results of habitat suitability modelling for migratory birds, including migratory birds that are listed species at risk, conducted by the Proponent and presented in the Environmental Impact Statement and in the Blackwater Gold Project – Waterbird Memo (Response to LDN/UFN #684, 693, 697, and NWFN/StFN #964). As part of the pre-construction surveys, the Proponent shall validate the applicability of fisher (Martes pennant) habitat suitability modelling to migratory birds, as identified by the Proponent in the Blackwater Gold Project – Forest Birds (Supplemental Information in Response to 681, 683, 685, 694, 695, 703, 717, 936; and ECCC Annex 1, IR 21, 24, 25). Based on the results of the pre-construction surveys the Proponent shall, in consultation with Indigenous groups and relevant authorities, develop and implement mitigation measures for migratory bird habitat.	Wildlife Mitigation and Management Plan Construction Environmental Management Plan	Section 4.7 Table 9.9-2, Table 9-11.1, Section 13.1, Table 13.1-1, Section 15.9.1.7 Table 15.9.1	**Exhibit 1** **Exhibit 6**

4.5	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of all mitigation measures to avoid harm to migratory birds, including migratory birds that are listed species at risk, their eggs and nests. The follow-up program shall include the mitigation measures used to comply with condition 4.1 to 4.4. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.	Wildlife Mitigation and Management Plan	Section 4.7	**Exhibit 1** **Exhibit 6**
5.3	The Proponent shall, for adverse environmental effects from the Designated Project on wetlands that cannot be avoided or minimized pursuant to condition 5.1, set out mitigation measures in a wetland compensation plan. The Proponent shall develop the wetland compensation plan, prior to construction, in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, and taking into account Canada's Federal Policy on Wetland Conservation, Environment and Climate Change Canada's Operational Framework for Use of Conservation Allowances and habitat needs for migratory birds, moose (Alces alces) and listed species at risk. When identifying mitigation measures, the Proponent shall select wetland restoration over enhancement and wetland enhancement over wetland creation. The Proponent shall start the implementation of the wetland compensation plan prior to the wetlands being adversely affected.	Wetlands Management and Offsetting Plan BLW-007_MineSiteAdjWetlands BWG_Plant_Site_Wetlands_Memo_7Sept2022	Section 9, Section 10	**Exhibit 7**
5.4	For any wetland creation required pursuant to condition 5.3, the Proponent shall establish, prior to wetland creation and in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, performance standards for wetland functions.	Wetlands Management and Offsetting Plan	Section 11.6.1	**Exhibit 7**
5.5	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, a follow-up program to verify the predictions of the environmental assessment as it pertains to the adverse environmental effects of the Designated Project on wetland functions and to determine the effectiveness of the mitigation measures as it pertain to wetlands. The Proponent shall implement the follow-up program during from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall: ▪ 5.5.1 conduct pre-construction surveys within the mine site to confirm the absence of red or	Wetlands Management and Offsetting Plan BWG_Listed_Wetlands_Memo_18 Aug2022.pdf	Section 7 Section 11 Section 15 Addresses condition 5.5.1 Addresses	**Exhibit 7**

	blue-listed wetlands. The Proponent shall provide the results of the survey to the Agency and to Indigenous groups prior to the start of construction. If the results of the survey demonstrate the presence of red or blue-listed wetlands within the mine site, the Proponent shall develop, prior to construction, and implement additional mitigation measures; 5.5.2 monitor changes to wetland functions of wetlands located within the mine site and remaining after vegetation clearing required to construct project components during all phases of the Designated Project; and ○ 5.5.3 monitor all compensatory wetland sites at a minimum annually, to ensure they meet or exceed performance standards for wetland functions established pursuant to condition 5.4 from the start of compensation until wetland functions are attained.	2006504_Mathews Creek MP Install Memo_June 2022 Field Summary for Shallow Groundwater Well Installations within Selected Wetlands	condition 5.5.2 Addresses condition 5.5.2	
6.3	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, a protocol for receiving complaints related to the exposure to noise and dust from the Designated Project. The Proponent shall respond to any noise or dust complaint(s) within 48 hours of the complaint being received and shall implement corrective actions to reduce exposure to noise or dust in a timely manner. The Proponent shall implement the protocol during construction, operation and decommissioning.	Community Effects Monitoring and Management Plan	Section 11.2	**Exhibit 8**
		Air Quality and Dust Management Plan	Section 8.4	**Exhibit 1** **Exhibit 9**
		Noise and Vibration Management Plan	Section 11.1.4	**Exhibit 10**
6.5	The Proponent shall, in consultation with Indigenous groups, install and maintain signs indicating that consumption of surface water is not advisable in the tailings storage facility, the pit lake and Davidson Creek year-round at locations established in consultation with Indigenous groups.	Country Foods Monitoring Plan	Section 4.4	**Exhibit 11**
6.8	The Proponent shall develop and implement measures in consultation with Indigenous groups to manage invasive species within the Designated Project area.	Construction Environmental Management Plan A.1_Appendix Invasive Plant Mgmt_SOP A.1_Appendix H_Invasive Plant Monitoring SOP	Section 9.9 Vegetation Management, Table 9.9-3, Section 15.7 Vegetation Monitoring Entire document Entire Document	**Exhibit 1**
6.9	The Proponent shall determine the location of the transmission line towers in consultation with Indigenous groups, to mitigate visual effects of the transmission line where the transmission line crosses trails and sites of importance to Indigenous peoples, unless not technically and economically feasible.	Final Transmission Line Routing Plan	Sections 5.1.3 and 5.2 and Appendix B: Condition 43	**Exhibit 12**

			Mitigation	
6.11	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse environmental effects of the Designated Project on the health of Indigenous Peoples caused by changes in concentrations of contaminants of potential concern in water, soil, vegetation and wildlife, including fish, and determine the effectiveness of mitigation measures. As part of the development of the follow-up program, the Proponent shall identify the vegetation and wildlife species that shall be monitored, the locations where the monitoring will be conducted, the contaminants to be monitored and the frequency of the monitoring. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. In doing so, the Proponent shall: ▪ 6.11.1 monitor, prior to construction, contaminants of potential concern in soil, vegetation, wildlife, including fish and water. The Proponent shall also co-locate soil sampling with vegetation samples and water sampling with fish samples; ▪ 6.11.2 monitor, during all phases of the Designated Project, contaminants of potential concern in water, soil, vegetation, and wildlife species; ▪ 6.11.3 if the sampling and monitoring results referred to in condition 6.11.1 and 6.11.2 exceed the predictions made during the environmental assessment, implement any modified or additional mitigation measures pursuant to condition 2.9 based on the results of the follow-up program and update the human health risk assessment identified by the Proponent in Appendix 9.2.2A of the Environmental Impact Statement using the results of the sampling and monitoring. The Proponent shall integrate the current and predicted consumption patterns of each Indigenous group identified during the environmental assessment in the updated human health risk assessment and any updated consumption pattern information provided by Indigenous groups as part of the follow-up program.	Country Foods Monitoring Plan Country Foods and Socio-economic Conditions Follow-up Program	Section 3, Section 4, Section 6 Entire document	**Exhibit 11**
6.12	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse environmental effects of the Designated Project on the health of Indigenous Peoples as a result of changes to air quality and determine the effectiveness of mitigation measures. As part of the implementation of the follow-up program, the Proponent shall monitor nitrogen dioxide (NO_2), sulfur dioxide (SO_2), fine particulate matter ($PM_{2.5}$), particulate matter (PM_{10}), dust, and carbon monoxide (CO) in air. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.	Country Foods Monitoring Plan	Section 4.2	**Exhibit 11**
		Air Quality and Dust Management Plan	Section 8.3.5	**Exhibit 1** **Exhibit 9**
6.13	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse environmental effects of the Designated Project on the socio-economic conditions of Indigenous Peoples as a result of changes to access, availability and quality of country foods. The Proponent shall implement the follow-up program from construction through	Country Foods and Socio-economic Conditions Follow-up Program	Entire document	**Exhibit 13**

	decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.			
6.14	The Proponent shall, prior to construction and in consultation with Indigenous groups and relevant authorities, develop a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse effects from the Designated Project on moose (*Alces alces*) and determine the effectiveness of mitigation measures. As part of the implementation of the follow-up program, the Proponent shall conduct winter distribution and density surveys for moose (*Alces alces*) starting prior to construction and until the end of operation. The Proponent shall implement the follow-up program from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.	Wildlife Mitigation and Management Plan B.1_Blackwater Moose Bear HSM Report	Section 4.4 Entire Document	**Exhibit 1** **Exhibit 6**
6.15	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, and implement, during all phases of the Designated Project, a plan to communicate the results of the follow-up program referred to in conditions 6.11, 6.12, 6.13 and 6.14 in plain language to Indigenous groups and relevant authorities. The communication plan shall include the procedures to communicate, including the frequency of communication.	Country Foods Monitoring Plan	Section 8.2	**Exhibit 11**
		Wildlife Mitigation and Management Plan	Section 5.2	**Exhibit 1** **Exhibit 6**
7.1	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, and implement an archaeological impact assessment of the footprints of the final transmission line alignment and associated poles, roads and towers to help inform final placement of these features. The Proponent shall take into account British Columbia's Archaeological Impact Assessment Guidelines when developing and implementing the archaeological impact assessment. The Proponent shall apply the archaeological and heritage management plan pursuant to condition 7.2 to structures, sites, or things of historical, archaeological, paleontological, or architectural significance or physical or cultural heritage resources discovered within the footprint of the final transmission line alignment.	Cultural and Spiritual Resources Management Plan Final Transmission Line Routing Plan	Section 10	**Exhibit 14**
7.2	The Proponent shall have a Qualified Professional develop, prior to construction and in consultation with Indigenous groups and relevant authorities, and implement, during construction, operation and decommissioning, an archaeological and heritage management plan for any structures, sites, or things of historical, archaeological, paleontological, or architectural significance or physical or cultural heritage resources within the Designated Project area. The archaeological resources and heritage management plan shall include: ▪ 7.2.1 protocols to respect the discovery, handling, recognition, recording, transferring and safekeeping of structures, sites or things of historical, archaeological, paleontological or architectural significance; ▪ 7.2.2 procedures to record, analyze, and mitigate the effects on cultural heritage resources and historic heritage sites, cultural sites previously identified through the heritage effects assessments conducted by the Proponent during the environmental assessment and, if applicable, the archaeological impact assessment completed for the final transmission line alignment; ▪ 7.2.3 a process for reporting information about physical and cultural heritage features and structures, sites or things of historical, archaeological, paleontological or architectural	Cultural and Spiritual Resources Management Plan	Sections 6, 8, 9, 10, 11.1 and Appendix C	**Exhibit 14**

	significance to Indigenous groups; ▪ 7.2.4 a process for informing workers of sensitive cultural areas; and ▪ 7.2.5 a chance find procedure to apply in the event that previously unidentified physical or cultural heritage features or structures, sites or things of historical, archaeological, paleontological or architectural significance are discovered by the Proponent. As part of the chance find procedure the Proponent shall: ▪ 7.2.5.1 immediately halt work at the location of the discovery, except work required to be undertaken to protect the integrity of the discovery; ▪ 7.2.5.2 delineate an area of at least 30 metres around the discovery as a no-work zone; ▪ 7.2.5.3 conduct an assessment at the location of the discovery taking into account British Columbia's Archaeological Impact Assessment Guidelines; ▪ 7.2.5.4 inform the Agency and Indigenous groups within 24 hours of the discovery, and allow Indigenous groups to monitor any work related to this discovery; and ▪ 7.2.5.5 consult with Indigenous groups and relevant authorities on the manner by which to comply with all applicable legal requirements and associated regulations, customs and protocols respecting the discovery, handling, recognition, recording, transferring and safekeeping of previously unidentified structures, sites or things of historical, archaeological, paleontological or architectural significance; and 7.2.5.6 consult Indigenous groups on the manner by which to protect the confidentiality of the discovery. The Proponent shall protect the confidentiality of the discovery in a manner that is consistent with provincial laws.			
8.2	The Proponent shall, prior to construction and in consultation with Indigenous groups and relevant authorities, identify wildlife corridors that intersect project roads and shall install and maintain, during all phases of the Designated Project, wildlife crossing signs where the wildlife corridors intersect the project roads.	Wildlife Mitigation and Management Plan	Sections 3.6 and 4	**Exhibit 1** **Exhibit 6**
8.4	The Proponent shall, from the start of construction to the end of decommissioning, manage carrion on project roads in consultation with relevant authorities and Indigenous groups.	Wildlife Mitigation and Management Plan	Section 3.6	**Exhibit 1** **Exhibit 6**
8.6	The Proponent shall, prior to the start of construction, conduct mineral lick surveys within the Designated Project area. If the results of the surveys indicate the presence of mineral licks outside the area disturbed by Designated Project components, the Proponent shall, in consultation with Indigenous groups and relevant authorities, maintain the mineral licks in their natural state.	Wildlife Mitigation and Management Plan	Section 4.4	**Exhibit 1** **Exhibit 6**
8.9	The Proponent shall identify, prior to construction and in consultation with Indigenous groups and relevant authorities, time periods during which construction activities must be carried out to protect wildlife during sensitive life stages, including for grizzly bear (*Ursus arctos*), western toad (*Anaxyrus boreas*), wolverine (*Gulo gulo*), American marten (*Martes americana*), fisher (*Pekania pennanti*) and southern mountain caribou (*Rangifer tarandus caribou*). In doing so, the Proponent shall: ▪ 8.9.1 apply British Columbia's Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia. Interim Guidance, North Area when identifying these time periods; ▪ 8.9.2 notify, prior to construction, the Agency and Indigenous groups of these time periods	Wildlife Mitigation and Management Plan	Sections 3.3, 4	**Exhibit 1** **Exhibit 6**
		Caribou Mitigation and Monitoring Plan	Sections 3.1 and 3.2, 6.4	**Exhibit 1** **Exhibit 15**

	and of the areas within which each of these time periods shall apply; and 8.9.3 conduct construction activities during these time periods, unless not technically feasible.			
8.10	If construction during the time periods referred to in condition 8.9 for grizzly bear (*Ursus arctos*), western toad (*Anaxyrus boreas*), wolverine (*Gulo gulo*), American marten (*Martes americana*) and fisher (*Pekania pennanti*) is not technically feasible, the Proponent shall conduct pre-construction surveys to identify western toad (*Anaxyrus boreas*) breeding habitat and wolverine (*Gulo gulo*), American marten (*Martes americana*), fisher (*Pekania pennanti*) and grizzly bear (*Ursus arctos*) denning habitat and develop and implement additional mitigation measures, from construction until the end of operation, in consultation with Indigenous groups and relevant authorities. In doing so, the Proponent shall: ▪ 8.10.1 establish no work buffer zones for habitat identified during pre-construction surveys. The Proponent shall take into account British Columbia's Guidelines for Amphibian and Reptile Conservation during Urban and Rural Land Development in British Columbia when establishing buffer zones for western toad breeding habitat and shall take into account British Columbia's Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia. Interim Guidance, North Area when establishing buffer zones for wolverine (*Gulo gulo*), American marten (*Martes americana*), fisher (*Pekania pennanti*) and grizzly bear (*Ursus arctos*) denning habitat.	Wildlife Mitigation and Management Plan	Sections 3.3, 4	**Exhibit 1** **Exhibit 6**
8.11	The Proponent shall, in consultation with Environment and Climate Change Canada, have a qualified individual salvage and relocate western toad (Anaxyrus boreas) to suitable habitat, prior to clearing activities that cannot be scheduled outside of sensitive periods pursuant to condition 8.9.	Wildlife Mitigation and Management Plan	Section 4.1, Table 3.3-1	**Not Applicable**
8.14	The Proponent shall conduct pre-construction surveys to determine the distribution of little brown myotis (*Myotis lucifugus*) and northern myotis (*Myotis septentrionalis*), and establish from construction until the end of operation, in consultation with Indigenous groups and relevant authorities, buffer zones around active hibernacula and active roosts. The Proponent shall take into account British Columbia's Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia when identifying active hibernacula and active roosts and when establishing buffer zones.	Wildlife Mitigation and Management Plan	Section 3.3 and 4.2	**Exhibit 1** **Exhibit 6**
8.16	The Proponent shall, prior to construction and in consultation with Indigenous groups and relevant authorities, conduct pre-construction surveys to identify short-eared owl (*Asio flammeus*) moderate to high-value nesting and foraging habitat, and shall implement measures to mitigate the loss of short-eared owl (*Asio flammeus*) habitat caused by the Designated Project.	Wildlife Mitigation and Management Plan	Section 4.7	**Exhibit 1** **Exhibit 6**
8.17	The Proponent shall, during all phases of the Designated Project and in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, mitigate adverse environmental effects on southern mountain caribou (*Rangifer tarandus caribou*) and its habitat, including by carrying out construction activities during time periods referred to in condition 8.9 for southern mountain caribou (Rangifer tarandus caribou). In doing so, the Proponent shall give preference to avoiding the destruction or alteration of habitat over minimizing the destruction or alteration of habitat, to minimizing the destruction or alteration of habitat over restoring	Caribou Mitigation and Monitoring Plan	Sections 3, 3.1 and 3.2	**Exhibit 1** **Exhibit 15**

	altered or destroyed habitat on-site, and to restoring altered or destroyed habitat on-site over offsetting.			
8.18	For any offsetting required pursuant to condition 8.17, the Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, and to the satisfaction of Environment and Climate Change Canada, a compensation plan for southern mountain caribou (Rangifer tarandus caribou). When developing the compensation plan, the Proponent shall take into account habitat needs for migratory birds and listed species at risk. The Proponent shall implement the compensation plan from the beginning of construction. The compensation plan shall include: ▪ 8.18.1 mapping of critical habitat of southern mountain caribou (Rangifer tarandus caribou) altered or destroyed by the Designated Project; ▪ 8.18.2 an offsetting ratio for direct habitat loss and indirect (e.g. sensory) losses based on an assessment of options, including revegetation and road closures, that consider the types of offset, location, time lags, securement, technical and economic feasibility, and probability of success; ▪ 8.18.3 field verified suitability mapping of areas to be prioritized for offsetting; ▪ 8.18.4 if residual environmental effects cannot be fully offset with habitat-based measures, a description of non-habitat measures to be implemented by the Proponent and a description of how these measures will be implemented by the Proponent, including a schedule for implementation; ▪ 8.18.5 a description of performance indicators to be used by the Proponent to evaluate the effectiveness of habitat-based and non-habitat-based compensation measures; and ▪ 8.18.6 a description of the follow-up program the Proponent shall implement to determine the effectiveness of the mitigation measures included in the compensation plan. As part of the development of the follow-up program, the Proponent shall determine, in consultation with Indigenous groups, the methods, timing and frequency for conducting winter surveys for caribou abundance and distribution within the Designated Project area. The Proponent shall apply conditions 2.9 and 2.10 when implementing the follow-up program.	Caribou Mitigation and Monitoring Plan	Sections 4, 5, 6	**Exhibit 1** **Exhibit 15**
8.19	The Proponent shall conduct progressive reclamation of areas disturbed by the Designated Project. In doing so the Proponent shall identify, in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, plant species native to the Designated Project area to use for revegetation as part of progressive reclamation, including whitebark pine (*Pinus albicaulis*) and other conifers suitable to create habitat for southern mountain caribou (*Rangifer tarandus caribou*) and other species of interest to Indigenous groups.	Whitebark Pine Management Plan	Sections 2, 8.2.4 and 9.2.2 and Figure 8-2.3	**Exhibit 16**
	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, a whitebark pine management plan to mitigate effects from the Designated Project on whitebark pine (Pinus albicaulis) and its critical habitat. The Proponent shall implement the plan during all phases of the Designated Project consistent with any applicable recovery strategy related to whitebark pine (Pinus albicaulis). As part of the whitebark pine management plan, the Proponent shall: ▪ 8.20.1 establish criteria to be used to evaluate the health of whitebark pine trees and for	Whitebark Pine Management Plan	Sections 9, 9.1, 9.2, 9.3, 10, 10.1 and 10.2	**Exhibit 16**

8.20	the selection of whitebark pine (Pinus albicaulis) to be transplanted; ▪ 8.20.2 collect and preserve whitebark pine (Pinus albicaulis) rust-resistant seeds within the Designated Project area prior to vegetation clearing and use them for progressive reclamation pursuant to condition 8.19; ▪ 8.20.3 identify the locations to plant whitebark pine (Pinus albicaulis) in undisturbed areas within the Designated Project area prior to construction; ▪ 8.20.4 implement measures to support whitebark pine (Pinus albicaulis) growth and use by Clark's nutcracker (Nucifraga columbiana); ▪ 8.20.5 develop and implement a follow-up program in consultation with Indigenous groups to determine the effectiveness of the mitigation measures included in the whitebark pine management plan. The Proponent shall apply conditions 2.9 and 2.10 when implementing the follow-up program. The follow-up program shall include: ○ 8.20.5.1 visual monitoring of populations of whitebark pine (Pinus albicaulis), including their health, within reclaimed areas at a minimum every five years; and ○ 8.20.5.2 monitoring of use of the reclaimed areas by Clark's nutcracker (Nucifraga columbiana) for the purpose of whitebark pine regeneration. Should the results of monitoring demonstrate that use of the reclaimed areas by Clark's nutcracker (Nucifraga columbiana) is not adequate, the Proponent shall implement additional mitigation measures.			
8.21	The Proponent shall develop, in consultation with Indigenous groups, Environment and Climate Change Canada and other relevant authorities, a follow-up program to verify the accuracy of the environmental assessment and determine the effectiveness of the mitigation measures as it pertains to the effects of changes caused by the Designated Project on western toad (*Anaxyrus boreas*). The Proponent shall implement the follow- up program from construction through decommissioning and shall apply conditions 2.9 and 2.10 when implementing the follow-up program. As part of the follow-up program, the Proponent shall: ▪ 8.21.1 conduct western toad surveys annually in breeding habitat identified pursuant to condition 8.10 from the start of construction until the end of decommissioning; ▪ 8.21.2 monitor western toad (*Anaxyrus boreas*) in relocation areas for western toad (*Anaxyrus boreas*) salvage conducted pursuant to condition 8.11; and 8.21.3 monitor western toad (*Anaxyrus boreas*) mortality on project roads from the start of construction until the end of decommissioning.	Wildlife Mitigation and Management Plan	Section 3.10, 4.1	**Exhibit 1** **Exhibit 6**
8.22	The Proponent shall develop, in consultation with Indigenous groups, and implement a follow-up program to monitor little brown myotis (*Myotis lucifugus*) and northern myotis (*Myotis septentrionalis*) usage of buffer zones established pursuant to condition 8.14 and roosting structures installed and maintained by the proponent pursuant to condition 8.15 to determine the effectiveness of the mitigation measures. The Proponent shall implement the follow-up program during construction and operation and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.	Wildlife Mitigation and Management Plan	Section 4.2	**Exhibit 1** **Exhibit 6**
9.3	9.3 The Proponent shall require the independent environmental monitor to prepare reports at a frequency determined in consultation with the Agency and relevant authorities that include: a description, including through photo evidence, of the Designated Project activities that occurred and the mitigation measures that were applied during the period covered by the report; and	BW Gold IEM Terms of Engagement	Section 10	**Not Applicable**

	a description, including through photo evidence, of occurrence(s) of non-compliance related to the implementation of conditions set out in this this Decision Statement observed during the period covered by the report, including: 9.3.2.1 the date of the occurrence(s) of non-compliance; 9.3.2.2 whether Designated Project activities were changed or stopped as a result of the occurrence(s) of non-compliance; 9.3.2.3 how the occurrence(s) of non-compliance was or were corrected by the Proponent and the date that the corrective action(s) was or were completed by the Proponent; and 9.3.2.4 if any, the status of pending occurrences of non-compliance that have not been corrected yet by the Proponent and a description of any adverse environmental effects associated with the occurrences of non-compliance.			
10.2	The Proponent shall, prior to construction, consult with Indigenous groups and relevant authorities on the measures to be implemented to prevent accidents and malfunctions.	Accidents and Malfunctions Admin and Comms Plan	Section 5	**Exhibit 17**
10.3	The Proponent shall, prior to construction and in consultation with Indigenous groups and relevant authorities, develop an accident and malfunction response plan in relation to the Designated Project. The accident and malfunction plan shall include; ○ 10.3.1 the types of accidents and malfunctions that may cause adverse environmental effects; and ○ 10.3.2 the measures to be implemented in response to each type of accident and malfunction referred to in condition 10.3.1 to mitigate any adverse environmental effects caused by the accident or malfunction, including response plans for dam breaches, water treatment plant failures or shutdowns.	Accidents and Malfunctions Admin and Comms Plan	Sections 2, 7 and Table 2.2-3	**Exhibit 17**
10.5	The Proponent shall develop a communication plan in consultation with Indigenous groups. The Proponent shall develop the communication plan prior to construction and shall implement and keep it up to date during all phases of the Designated Project. The plan shall include: ▪ 10.5.1 the types of accidents and malfunctions requiring the Proponent to notify the respective Indigenous groups; ▪ 10.5.2 the manner by which Indigenous groups shall be notified by the Proponent of an accident or malfunction and of any opportunities for the Indigenous groups to assist in the response to the accident or malfunction; and ▪ 10.5.3 the contact information of the representatives of the Proponent that the Indigenous groups may contact and of the representatives of the respective Indigenous groups to which the Proponent provides notification.	Accidents and Malfunctions Admin and Comms Plan	Sections 2 and 7, Appendix D	**Exhibit 17**

[1] BW Gold received these comments after notifying the CSFNs that both the BC EAO and ECCC had approved the Plan in April 2022 and informed them that the comments would be considered during the 2023 annual review of the Plan.

[2] No comments received as part of the DS consultation process.

[3] This plan was also submitted for consultation as part of the Joint *Mines Act/Environmental Management Act* Application process that is described in section 3.0 of this memo.

[4] There was an ongoing process for discussing comments between the date comments were provided and final responses were sent back.

[5] This was consulted on as part of the phase 2 Final Transmission line routing plan.

[6] Submitted to regulatory process with its own timelines.

[1] BW Gold received notice from STN on December 10, 2021 that they do not intend to comment on the Plans at this time as it is practically impossible and financially prohibitive considering the number of Plans to review. STN stated that they would let BW Gold know when they are ready and able to re-engage.

[2] On December 15, 2021, in response to the above noted communication, BW Gold provided a two-week extension for review of these Plans. This extension is reflected in the noted date.

[3] No comments received as part of the DS consultation process.

[4] This was consulted on as part of the phase 2 Final Transmission line routing plan.

[1] Submitted to regulatory process with its own timelines.

[2] BW Gold submitted the plan directly to ECCC who sought advice from DFO.

[3] No comments received from ECCC.

[4] Plan was provided 60 days prior to the start of construction as required by provincial EAC.

[5] Nothing to respond to with ECCC based on their letter.

1	Technical Assessment Memo Table 2-1 Design Basis	MWR	BC ENV (Breanne Hill)		Jun 01, 2022	1	New		No	The effluent classification in Table 2-1 Design Basis indicates an effluent of Class B. However, the TSS and BOD levels in that table do not match the requirements for Class B effluent. Please confirm the effluent classification and the plant effluent criteria.	Please see attachment "R1_BC ENV_Comment ID 1.pdf"		BC ENV (Breanne Hill)	WSP		Eric P	GM	Ready for Submission	GM; June 16	Ready for Publishing
2	Technical Assessment Memo Comment 102	MWR	BC ENV (Breanne Hill)		Jun 01, 2022	1	New		No	Comment 102 indicates that the lift station will be equipped with two pumps. Please outline where all pumps are needed in the system (including for dewatering) and indicate if there is redundancy for each of those pumps. Discuss the peak flow rate for the camp and if the pumps are capable of pumping peak flow design flows. Discuss if standby power is available.	Please see attachment "R1_BC ENV_Comment ID 2, 3, 4.pdf"		BC ENV (Breanne Hill)	WSP		Eric P	GM	Ready for Submission	RT: June 28	Ready for Publishing
3	Technical Assessment Memo	MWR	BC ENV (Breanne Hill)		Jun 01, 2022	1	New		No	Discuss why no disinfection is required.	Please see attachment "R1_BC ENV_Comment ID 2, 3, 4.pdf"		BC ENV (Breanne Hill)	WSP		Eric P	GM	Ready for Submission	RT: June 28	Ready for Publishing
4	Technical Assessment Memo Comment 103	MWR	BC ENV (Breanne Hill)		Jun 01, 2022	1	New		No	Discuss what happens to the chemicals that are added to the camp sewage system. The response to Comment 103 only discusses what happens to the sewage that is deposited in the TSF.	Please see attachment "R1_BC ENV_Comment ID 2, 3, 4.pdf"		BC ENV (Breanne Hill)	WSP		Eric P	GM	Ready for Submission	RT: June 28	Ready for Publishing
5	Operating Plan	MWR	BC ENV (Breanne Hill)		Jul 22, 2022	2	Follow Up		No	Please ensure that the operating plan is up to date and discusses the operation of the proposed plant. Ensure that the operating plan includes all the applicable requirements outlined in Division 4 of the MWR. If BWG deems that any of the requirements are not applicable please include a short memo that outlines the reasoning for that decision.	Please see attachment "R2_ENV Comment ID 5.pdf"		BC ENV (Breanne Hill)	WSP		Eric P	GM	Ready for Submission	GM; August 10	Ready for Publishing
5	Operating Plan	MWR	BC ENV (Breanne Hill)		Jun 01, 2022	1	New		No	Provide ENV with an updated operating plan that is specific to the new treatment system. The updated operating plan is required prior to decision on the new MWR registration.	BW Gold understands this is required prior to a decision, and targets submission of the updated plan before the end of the Round 2 response period.		BC ENV (Breanne Hill)	WSP		Eric P	GM	Ready for Submission	GM; June 16	Ready for Publishing
6	Appendix 9-O TBD	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	I recommend noting extra dust control measures and performance monitoring on the FSR and MAR sections near Tatelkuz Lake 28 / Resort.	The AQDMP will be updated to include specific mention of dust control and visual monitoring near Tatelkuz Lake 28/Resort. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 18	Ready for Publishing
7	Appendix 9-O page 8-1 Table 8.2-1	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	Under 'Production blasting', 'check weather conditions' and 'until weather conditions improve': please include additional details in the document to briefly define the parameters of such weather conditions. Under 'Low Grade Ore Stockpile': please provide reference/justification for the definition of a hot and dry day (also in Appendix D, Section 4)	AQDMP will be updated to : Where dust or fume impacts on employees and environment cannot be avoided, blasting must be postponed until wind direction does not disperse emissions towards employees or local sensitive receptors. The Mine Drill and Blast Superintendent and Mine manager will ultimately decide when to postpone blasting (the EM and Health and Safety can inform this decision)		BC ENV (Tarek Ayache)	ERM		Andres	AT	Ready for Submission	AT, June 25	Ready for Publishing
8	Appendix 9-O section 8.3	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		Yes	1st paragraph: whereas it is stated that 'air quality monitoring program will be initiated prior to the start of construction', no timeline is specified. To the extent possible, it is highly recommended that such monitoring program be initiated at least 1 year prior to construction to obtain adequate baseline data.	AQ monitoring will begin in fall 2022 with a Thermo Scientific Partisol unit being used to capture PM2.5 and PM10. BW Gold will also be using a radiello device to collect passive NO2 and SO2 AQ samples. The filters are deployed for 30 days and then sent to an accredited lab for analysis. As part of the Country Foods Monitoring Program, dustfall containers will also be installed at various locations in 2022 to collect additional baseline information.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	TD, Jun 27	Ready for Publishing
9	Appendix 9-O sections 8.3.3 and 8.3.4	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	Whereas two air quality monitoring sites are identified in Figure 8.3-1, references are made only to the camp site(s) (exploration and operations). Please revise to include the other monitoring site near Tatelkuz Lake 28 / Resort.	There is no plan to add in AQ monitoring at Tatelkuz Lake, the Figure (8.3-1) will be updated to represent this on future versions of the AQDMP.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT: June 25	Ready for Publishing
9	Appendix 9-O sections 8.3.3 and 8.3.4	Air	BC ENV (Tarek Ayache)		Jul 22, 2022	2	Follow Up	Potential Permit Condition	Yes	Given the relatively small concentrations predicted by modelling at that site, I understand this feedback. That being said, in addition to the extra dust control and monitoring measures noted in comment #6, I believe that the management plans need to emphasize absolute readiness to deploy additional AQ monitoring to Tatelkuz Lake 28 / Resort, in the event there are any indications of dust impacts at that	A dustfall station has been set up this summer at Tatelkuz Lake that will provide data on dustfall and metals. This location will be added to Fig 8.3-1. If air quality monitoring at other locations indicates that additional monitoring at Tatelkuz Lake is required BW Gold will repond quickly by deploying appropriate instrumentation in accordance with the Air Quality and Dust Management Plan.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT/ Aug. 7	Ready for Publishing
10	Appendix 9-O section 8.3.3	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	Please provide justification for the change in PM2.5/PM10 alternation schedule, from every other 3rd day May-Oct to weekly Nov-April	During Nov - Apr, due to snow cover, it is anticipated that fugitive emissions will decrease significantly and therefore a less frequent sampling schedule will be sufficient to characterize PM concentrations onsite.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 18	Ready for Publishing
10	Appendix 9-O section 8.3.3	Air	BC ENV (Tarek Ayache)		Jul 22, 2022	2	Follow Up		No	Whereas I understand and agree with this justification, Nov-Apr sampling frequency needs to be every 1 in 6 days to ensure adequate representation (as opposed to fixed weekly schedule)	The AQDMP will be updated to indicate a six day schedule. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; Aug. 7	Ready for Publishing

11	Appendix 9-O section 8.3.6	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	For point source monitoring, it is stated that 'sampling and analysis must be conducted once every five years'. Such a period is fairly long, please provide justification. Shorter sampling periods are typically recommended during the initial project phases to ensure proper operations of pollution control equipment, which may then be extended to longer sampling periods.	The sampling and analysis will be conducted after the first year of operation and every five years after that, unless sampling indicates higher frequency is needed. With new equipment onsite, it is expected that this level of frequency will be sufficient for determining if emissions exceed permitted rates.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 18	Ready for Publishing
12	Appendix 9-O page 8-8 Table 8.3-2	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	For the Fire Assay Main Lab and Propane smelting furnace, only Total Particulate Matter is listed as a parameter for monitoring. Please provide justification for not including other gaseous parameters, such as SO2.	The amount of other gaseous parameters, such as SO2, that would be emitted by fire assaying ore would be insignificant. BW Gold has refined the project design and now intends to use an electric smelting furnace, eliminating the need for the propane smelting furnace. This makes the air emissions assessment conservative. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 20	Ready for Publishing
13	Appendix 9-O section 8.3.7	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	'Duplicate dustfall metals samples collected at each dustfall monitoring site': In section 8.3.2, it is stated that dustfall monitoring will not be conducted. Please explain or revise this discrepancy.	Earlier versions of the AQMP included dustfall monitoring, as this type of monitoring is required under the Country Foods Monitoring Program (EAC Condition 41); it was included in both plans for consistency. However, because dustfall monitoring is no longer recommended for routine air quality monitoring (EMPR/ENV 2018), this monitoring was removed from the AQMP and included only in the CFMP. This in-text reference in the AQMP to "duplicate dustfall metals samples collected at each dustfall monitoring site" will be removed from the final version of the AQMP, as it was a remnant of text that has otherwise been removed.		BC ENV (Tarek Ayache)	ERM	Entia	Andres/Leslie y	RT	Ready for Submission	TD, 15-Jun	Ready for Publishing
14	Appendix 9-O section 9.1 page 9-2	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	2nd paragraph, 'measurements at the operations camp': please include the Tatelkuz Lake site as per my previous comment. 4th paragraph, 'the frequency of elevated 24-hour fine PM concentrations and the rolling average of fine PM concentrations will be tracked and evaluated': - if PM is to include PM2.5 and PM10, please remove 'fine' here and thereafter, as fine would refer to PM2.5 only (PM10 is referred to as coarse PM)	Monitoring will not occur at Tatelkuz Lake, it will only at the operations camp. The 4th paragraph will be updated to state "PM2.5 and PM10" instead of "fine PM". The analysis to develop a causal relationship between PM and operations/external factors will be conducted as part of annual reporting. This will be more explicitly stated in the updated AQDMP. The term "analysis of trends" will be substituted for rolling average in future versions of the AQDMP		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 18	Ready for Publishing
15	Appendix 9-O Table 9.1-1	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	Location: - the Tatelkuz Lake site is not included. Trigger - in reference to PM, SO2 & NO2: - Instead of 'Baseline Case', baseline concentrations obtained at the specific locations prior to the project's onset would be a better reference - should location-specific baseline concentrations be obtained from monitoring, including predicted concentrations cannot be reasonably justified given their inherently high uncertainties. Only references to baseline concentrations and Ambient Air Quality Objectives would suffice and are adequate. Fine PM: - remove 'Fine' as per previous comment - in addition to annual average PM10 and PM2.5 concentrations, please add reference to daily average	Monitoring will not occur at Tatelkuz Lake only at the operations camp. References to "Baseline Case" cannot be changed to "baseline concentrations at the monitoring station prior to construction" because pre-construction monitoring is not possible. Predicted concentrations will be used because pre-construction monitoring will not be possible as the start of construction is imminent. "Fine" will be removed in future versions of the AQDMP. The 24-hour CAAQS for PM2.5, NO2 and SO2 cannot be compared against monitoring data until 3 years of data have been collected so at this point including references to these AQO is not appropriate. In addition, PASS monitoring which provides monthly average concentrations for NO2 and SO2 cannot be used to compare against 24-hour AQO. The modelling of SO2 and NO2 does not suggest that exceedances of the 24-hour objectives will occur at sensitive receptors therefore the longer averaging period of the PASS		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT: June 25	Ready for Publishing
15	Appendix 9-O Table 9.1-1	Air	BC ENV (Tarek Ayache)		Jul 22, 2022	2	Follow Up		No	Understanding the provided justification, I am still concerned about using predicted concentrations given their inherently high uncertainties. Moreover, baseline concentrations used in the application's assessment are almost 10 years old (2013), and I'm concerned about their representativeness of present conditions. Would it be possible to consider a baseline monitoring site that is little affected by construction activities? Could the Tatelkuz Lake 28/Resort site be an option? Perhaps this critical matter can be resolved through discussions with Ministry staff. 24-hr PM2.5 data can be compared against BC AQOs (not CAAQS) on an individual and an annual basis. Please revise accordingly.	Based on discussions with BC ENV on August 11th, the AQDMP will be updated to remove comparison to predicted concentrations in the TARP (Table 9.1-1). Rather, monitored results will be compared to baseline concentrations and fractions of the applicable air quality objective. The None trigger will be: Less than 50% of the annual PM10 or PM2.5 AQO The Low trigger will be: greater than 50% of the annual PM10 or PM2.5 AQO The Medium trigger will be: greater than 80% of the annual PM10 or PM2.5 AQO The High trigger will be: greater than the annual PM10 or PM2.5 AQO Similar changes will also be applied to SO2 and NO2 triggers. No further baseline monitoring is required.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	TD, Aug 11	Ready for Publishing
16	Appendix 9-O page 9-7	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	1st & 2nd paragraphs: - what is the justification for '3-month rolling average PM2.5 concentration', especially based on non-continuous data? - 'elevated 24-hour fine PM concentrations': relative to what? Baseline, exceedances? - 'dust management monitoring': is that a typo? - 'compare measurements to predictions from the effects assessment': revise reference to 'predictions' as per my previous comment. - 'If there is an air quality advisory issued ... the EM will determine': how will such determination be made?	A rolling average does not require continuous data, see discussion in Comment #14. The three-month period was chosen so that analysis could occur as data became available and not wait until annual reporting. "Elevated" will be based on the numerical value of the 24-hour standards. The word "monitoring" will be removed from "dust management monitoring". Measurements cannot be compared to pre-construction monitoring, because the start of construction is imminent. The determination will be made based on consultation with an air quality QP. The AQDMP text will be updated to reflect this change in future versions of the AQDMP		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 18	Ready for Publishing

16	Appendix 9-O page 9-7	Air	BC ENV (Tarek Ayache)		Jul 22, 2022	2	Follow Up		No	Baseline concentrations, as per previous comment.	Based on discussions with BC ENV on Aug 11 no further baseline monitoring is required.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	TD, Aug 11	Ready for Publishing
17	Appendix 9-O section 9.2	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	1st paragraph, 'The predicted concentrations are considered to be baseline concentrations for the purposes of the FUP': measured baseline concentrations instead of predicted concentrations, as per my previous comment.	Measured pre-construction monitoring concentrations will not be possible to use, because the start of construction is imminent. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 18	Ready for Publishing
17	Appendix 9-O section 9.2	Air	BC ENV (Tarek Ayache)		Jul 22, 2022	2	Follow Up		No	Baseline concentrations, as per previous comment.	Based on discussions with BC ENV on August 11 no further baseline monitoring is required.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	TD, Aug 11	Ready for Publishing
18	Chapter 5 Section 5.2.2.4	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	For the incinerator please provide the following information: a.How many chambers are in the incinerator, b.The residence time and temperature in the secondary chamber, if it is present, c.The temperature in the primary chamber, and d.The oxygen concentration in the incinerator.	a. two chambers b. the secondary chamber temperature is >875C and can reach temperatures of 1000C. Please note this is dependent on the waste stream that is being input c. The temperature in the primary chamber can be >500 C; please note this is dependent on the waste stream that is being input. d. 9.6 vol% dry air but also depends on the nature of the waste stream		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 23	Ready for Publishing
18	Chapter 5 Section 5.2.2.4	Air	BC ENV (Tarek Ayache)		Jul 22, 2022	2	Follow Up		No	please indicate the residence time in the secondary chamber. Please note that the secondary chamber should reach a temperature of 1000 degrees C or higher for the entire burn period to allow for adequate combustion of potential contaminants of concern.	The residence time in the secondary chamber is approximately 1 second. It is noted that the temperature should reach 1000C or higher for the duration of the burn.		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; Aug. 14	Ready for Publishing

19	Chapter 5 Section 5.2.2.4	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	The maximum concentrations of emissions for the incinerator were calculated using AP-42. Please confirm the maximum concentration of emissions with the manufacturer.	Particulate (mg/Sm3) - 22.0 Particulate (mg/Sm3 @11% O2) - 19.1 Particulate (w/back-half @ 11% O2) - 27.0 HCl (mg/Sm3 @ 11% O2) - 1.2 SOx (mg/Sm3 @ 11% O2) - 21 NOx (mg/Sm3 @ 11% O2) - 66 CO (mg/Sm3 @ 11% O2) - 37		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 23	Ready for Publishing
20	Chapter 5 Section 5.2.2.4	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	Please indicate if there is pollution control equipment on the incinerator.	No pollution control devices		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 23	Ready for Publishing
21	Chapter 5 Section 5.2.2.2	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	Please discuss what contaminants may be contained in the effluent from the wet scrubbers and where the effluent is going to be discharged.	The wet scrubber is used to remove acid fumes given off by the acid digests. The liquid waste from the scrubber is very weak acid, close to pH7, and will be captured in the scrubber recycle tank. The scrubber recycle tank solution will be monitored and neutralized as needed in the tank to pH7. Neutralized scrubber recycle tank solution will be combined in the plant with mine tailings and ultimately disposed of to the TSF. Volume of neutralized scrubber recycle tank solution discharged will represent a negligible fraction of the tailings stream.		BC ENV (Tarek Ayache)	BWG		Klaus	TD	Ready for Submission	RT; June 13	Ready for Publishing
22	Chapter 5 Section 5.2.2.2	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	Please indicate what actions will be taken if there is a malfunction in one of the wet scrubbers or the dust collectors.	In the event of any assay lab dust collector or scrubber malfunctioning, work will be stopped and the problem corrected.		BC ENV (Tarek Ayache)	BWG		John	TD	Ready for Submission	RT; June 13	Ready for Publishing
23	Chapter 5 Section 5.2.2.1	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	Please indicate what type of pollution control equipment will be used for the carbon reactivation kiln. Please provide justification if no pollution control equipment will be used on the carbon reactivation kiln.	The regeneration kiln off-gas composition is 85.5% water vapor, 13.4% CO2, 0.17% CO, 0.125% CH4 and 9 ppm NH3, with less than 0.2% particulate matter. This is similar to the discharge from a domestic natural gas home heating furnace, except for the high water vapor content. As such, no pollution control equipment is planned or considered necessary.		BC ENV (Tarek Ayache)	BWG		John	TD	Ready for Submission	RT; June 13	Ready for Publishing
23	Chapter 5 Section 5.2.2.1	Air	BC ENV (Tarek Ayache)		Jul 22, 2022	2	Follow Up		No	The TSP concentration for the reactivation kiln is 436 mg/m3, which is very high compared to the other discharge sources. Please outline what can be done to reduce the amount of TSP discharged.	We have looked at ways to reduce TSP emissions and also reduce the use of fossil fules within the process plant in general and are now planning to install an electrically-heated reactivation kiln. The carbon reactivation kiln will now be electrically heated (external to the tube) and the off gases are only water vapor As such, TSP emissions from the EA levle modelling are a very conservative estimate. The electrically heated kiln is expected to have near zero TSP emissions.		BC ENV (Tarek Ayache)	BWG		John T	TD	Ready for Submission	TD, Aug 11	Ready for Publishing
24	Appendix 5-A Table 5.3-1	Air	BC ENV (Tarek Ayache)		Jun 01, 2022	1	New		No	Please discuss why the Tatelkuz Lake Reserve 28 was not included in the sensitive receptors.	The Tatelkuz Lake Resort and Reserve 28 are in the same location (the properties are immediately adjacent).		BC ENV (Tarek Ayache)	ERM		Andres	RT	Ready for Submission	RT; June 18	Ready for Publishing
25	Appendix 5E - SBEB Summary Figure 1-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. Please confirm the location of the headwaters for Creek 661. 2. Which map or figure in the application accurately shows Creek 661 and its tributaries?	1 and 2. Figure 4.2-2b will be provided in the updated Aquatic Effects Monitoring Program Plan, Version 1.0 to show the headwaters of Creek 661 and its tributaries. The figure is provided in the memo titled: Blackwater_AEMP_Comment Responses 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, and 61		BC ENV (Andrew Foster)	ERM	KP	Tonia	RT	Ready for Submission	RT: June 28	Ready for Publishing
26	Appendix 5E - SBEB Summary Figure 1-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Based on information in the rest of the application, my understanding is WQ3 is on Creek 505659, WQ4 is on Creek 146920, and Creek 661 is located south of those tributaries; please confirm this is correct and correct the statement if needed.	BW Gold confirms that the reviewer is correct and is referred to the map provided in response to comment ID# 45 (provided in memo titled: Blackwater_AEMP_Comment Responses 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, and 61). Although the map does not include WQ4 located on Creek 146920, it does show WQ3 (as 661-05 on Creek 505659) and WQ5 (as 661-10 on Creek 661 mainstem) along with the creek names and flow directions.		BC ENV (Andrew Foster)	ERM	KP	Tonia	RT	Ready for Submission	RT: June 28	Ready for Publishing
27	Appendix 5E - SBEB Summary Figure 1-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. Please provide rationale for combing WQ3 and WQ5 into one proposed SBEB value. 2. Please discuss dilution at the confluence of Creek 50569/146920; and Creek661/146920 in both proposed SBEB periods (i.e.., April-July and August-December) in your rationale. If WQ3 and WQ5 are on different waterbodies, separate SBEB values may be more appropriate.	Please see attachment "R1_ENV Comment ID 27, 84, 85, 88.pdf"and "R1_ENV Comment ID 27, 84, 85, 88.xls"		BC ENV (Andrew Foster)	Lorax		Meghan	GM	Ready for Submission	GM; June 27	Ready for Publishing

27	Appendix 5E - SBEB Summary Figure 1-1	Effluent	BC ENV (Andrew Foster)		Aug 19, 2022	2	Follow Up		No	1. ENV recommends setting SBEB concentrations at set locations on watercourses that will be protective of all receptors and that those concentrations are site specific (e.g., WQ5 data used only for WQ5.) 2. ENV does not support combining WQ3/WQ5 data into a single SBEB value to apply to Creek 661 and its tributaries 3. SBEBs must be protective of the receiving environment, specifically, the most sensitive life stage of the most sensitive species present. I must assume all sensitive species are present until shown otherwise (e.g., all streams assumed to be fish bearing).The SBEB background approach is reliant on site-specific concentrations at or below the 95th percentile +20% representing a minimal difference from background concentrations within variability of laboratory replication and therefore a protective threshold. Anything above this calculated threshold and BC WQG represents concentrations where	Please refer to attachment "R2_ENV Comment ID 27_R3_ENV Comment ID 34(2), 34(10) and 2177.pdf".		BC ENV (Andrew Foster)	Lorax		Meghan		Ready for Submission	GM; Sept 20	Ready for Publishing
28	Appendix 5E - SBEB Summary 4.1.1 - SBEB development approach	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Please provide rationale for why water quality data from multiple stations was combined to generate the SBEB values. For example, for stations such as WQ3/WQ5 the SBEB values derived from each station are substantially different and combining the values doesn't appear to generate a suitable value for either station. On Davidson Creek WQ28 and WQ7 are nearly 10 km apart and aluminum concentrations are quite different for August 1 - December 31. ENV is interested in setting SBEBs at specific locations	This comment is acknowledged. Please refer to the response to Comment 27.		BC ENV (Andrew Foster)	Lorax		Meghan	GM	Ready for Submission	GM; June 21	Ready for Publishing
28	Appendix 5E - SBEB Summary 4.1.1 - SBEB development approach	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	2	Follow Up		No	Submitted with ENV Round 2b comments: Please see comment 27.	Please refer to the response to Comment 27.		BC ENV (Andrew Foster)	Lorax				Sept. 20	GM; Sept 21	Ready for Publishing
29	Appendix 5E - SBEB Summary 4.1.1 - SBEB development approach	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. Is it known where high aluminum concentrations at WQ5 from August 1- December 31 originate or the relative contributions from each source (e.g., Creek 505659)? 2. Is there any historic water quality data in Creek 661 upstream of WQ5 in Creek 661 mainstem?	1. Baseline D-Al concentrations WQ3 (on the tributary 505659 mainstem) and WQ4 (in the upper reach of tributary 146920), both of which contribute to WQ5 flow, are elevated above the BC long-term water quality guideline, including during the August to December period (see Figure 4.1-18 of Appendix 2-H, 2011 to 2020 Baseline Water Quality Report). The relative aluminum load contribution of the different Creek 661 tributaries to WQ5 is uncertain at this time. Baseline concentrations of D-Al above the BC long-term water quality were observed at water quality stations in Davidson Creek, Creek 661, Creek 705, and Turtle Creek, reflecting generally elevated Al levels in and around the Project area. 2. Historic water quality data in Creek 661 upstream of WQ5 in the Creek 661 mainstem is not available.		BC ENV (Andrew Foster)	Lorax		Meghan	GM	Ready for Submission	GM; June 21	Ready for Publishing
30	Appendix 5E - SBEB Summary 4.1.1 - SBEB development approach	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. How could SBEBs be adapted to changes in water quality (e.g., climate change) if unimpacted upstream locations are not available (e.g., engulfed within mine footprint)? For example if Creek 661 tributary flows naturally decline and aluminum concentrations become more concentrated is there a method or plan to adjust the SBEB if needed? 2. Is there a suitable reference stream that could be used to monitor flow declines?	1. The ENV Technical Guidance document "A Framework for the Development and Use of Freshwater Science-Based Environmental Benchmarks for Aquatic Life in Environmental Management Act Permitting for Mines" does not contain guidance on the adaptation of SBEBs in the specific event of changes to background water quality, such as effects related to climate change. BW Gold will work within the adaptive management framework presented in the SBEB application documents and the AEMP to evaluate the appropriateness of SBEBs as new scientific information and monitoring program results become available. If the need to adjust the SBEB is identified, BW Gold will work with ENV to develop an updated SBEB or an alternative framework from which to evaluate D-Al concentrations. 2. An extensive hydrological monitoring network has been established for the Project, and will continue to be monitored as the project progresses. Notably, hydrology and water quality will continue to be measured at stations established in reference streams identified in the AEMP - Turtle Creek and Creek 705 - both of which show dissolved aluminum concentrations above the BC long-term water quality guideline. Monitoring results from these stations may support the evaluation of the appropriateness of the SBEB.		BC ENV (Andrew Foster)	Lorax		Meghan	GM	Ready for Submission	GM; June 21	Ready for Publishing
30	Appendix 5E - SBEB Summary 4.1.1 - SBEB development approach	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. BW Gold may want to be proactive in determining a way to adjust SBEB values as upstream background sites will become engulfed by the project and a simple recalculation of background concentrations will not be possible. (Comment, no action needed) 2. It is my understanding Creek 705 is expected to see an increase flow to mine activities and therefore may not be a preferred reference site in the example scenario. (Comment, no action needed)	1. Thank you for this comment. The need to be proactive to ensure the SBEB appropriately reflects background conditions is noted. 2. Thank you for this comment. As a result of this and related comments, the AEMP wording will be adjusted to clarify that monitoring stations in Creek 705 are currently identified as reference locations but project effects to flow may result in these stations no longer being appropriate for use as reference sites. A tributary to Fawnie Creek (FC-01) and Turtle Creek (TC-01) will continue to be monitored as a reference sites. A new station in the upper Creek 661 mainstem (661-01) has also been added to the AEMP and may be used to support the evaluation of potential changes to background conditions.		BC ENV (Andrew Foster)	Lorax		Meghan	GM	Ready for Submission	GM; Aug 4	Ready for Publishing
31	Appendix 5E - SBEB Summary Appendix H - Water Quality predictions for Al	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. Are model predictions accurate for WQCK661 and other model nodes driven by data collected during baseline sampling? 2. Is there any uncertainty associated with WQCK661 or other model node values? For example, the Al values between WQ5 and WQCK661 are nearly identical even though there appear to be substantial inputs from streams downstream of WQ5. I'm concerned the model predictions for nodes, such as WQCK661, may be misleading and potentially replicate WQ5 data.	1. All model predictions are based on empirical data, as available and as appropriate, and professional judgement. As such, model predictions represent a conservative best-estimate of future conditions at the subject property. For model nodes at which the primary loading source is background, the reviewer correctly notes that water quality predictions at these stations are driven by the node's background term, which is based on baseline water quality data (or the baseline water quality dataset for the most appropriate proxy station, if a baseline dataset is not available for a given node). 2. There is uncertainty associated with all model node values. As noted above, all model predictions are based on empirical data, as available and as appropriate, and professional judgement to generate an estimate of future conditions. Please refer to the response to Comment 32 for further detail on the information used to develop the WQ5 and WQCrk661 model nodes. 31	Appendix 5E - SBEB Summary Appendix H - Water Quality predictions for Al	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Thank-you for the clarification. Comment closed.	Blackwater acknowledges that the comment is closed.		BC ENV (Andrew Foster)	Lorax				Ready for Submission	GM; July 29	Ready for Publishing
32	Appendix 5E - SBEB Summary Appendix H - Water Quality predictions for Al	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Please provide additional explanation how these nodes were generated using WQCK661 as an example and discuss confidence in WQCK661 data predictions. Is WQCK661 robustly characterized by the model?	The following bullet points discuss relevant data, assumptions and uncertainties regarding the WQCK661 node: •WQCK661 (Creek 661 above confluence with Chedakuz Creek) is an ~58 km2 drainage basin. Further upstream is the WQ5 node (drainage area ~25 km2). Approximately 43% of the total flow reporting to WQCK661 is generated within the WQ5 catchment. •Contact groundwater volumes are predicted by the WBM to report to two headwater tributaries in the Creek 661 basin: H1 catchment (9 km2) and H11 catchment (15 km2). •A short distance downstream of the H1 and H11 confluence (~100 m) is the WQ5 surface water quality sampling station and model node. •The H1 hydrometric gauge was installed in May 2011 and remains active. Rating curve data and computed discharge data for the station through 2020 is summarized in the baseline hydrology report that accompanied Section 2 (Existing Conditions) of the Application. •The H11 hydrometric gauge was installed in May 2013 and remains active. Rating curve data and computed discharge data for the station through 2020 is also summarized in the baseline hydrology report that accompanied the Application. •The sum of flow at the H1 and H11 gauges roughly approximates the flow at the WQ5 node. •Using the wealth of hydrometric data collected at the mine site, representative background flows reporting from the remainder of the WQCk661 catchment are computed by a watershed model. •A baseline water quality dataset is not available for WQCk661. Therefore, the background term applied to WQ5 (generated using the WQ5 baseline water quality dataset) was used as the background term for WQCk661. While this imparts a degree of uncertainty to water quality predictions for WQCk661, WQ5 was		BC ENV (Andrew Foster)	Lorax		Colin	GM	Ready for Submission	GM; June 21	Ready for Publishing
32	Appendix 5E - SBEB Summary Appendix H - Water Quality predictions for Al	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	This seems like a reasonable approach from a flow perspective, but I'm not convinced this approach is well supported from a water quality perspective. I'll factor this response into my assessment. Thank-you for the response.	Thank you for the response. Blackwater acknowledges that this comment is closed.		BC ENV (Andrew Foster)	Lorax				Ready for Submission	GM; Aug 4	Ready for Publishing
33	Appendix 5E - SBEB Summary 4.1.1 - SBEB development approach	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	"Three datapoints within the WQ5 baseline dataset exceed the proposed SBEB during the fall/early winter season, which reflect natural variability in D-Al concentrations." 1. Were these data points assessed to determine if they were outliers and should be removed from the dataset? 2. Could you briefly outline your rationale for keeping these data points (e.g., December value 0.38 mg/L vs 0.063 mg/L)? 3. Do you have sufficient data to identify outliers and reject them?	1. Yes. The quality assurance/quality control evaluation of the surface water quality baseline dataset did not identify the three particular data points in question as outliers (Application Appendix 2-H). Dissolved Al values above the 95th percentile + 20% seasonal benchmarks were scrutinized to determine whether the data points could be non-representative of the environment (i.e.., potential outliers/errors attributed to sampling error, sample contamination, high suspended sediments load, data entry error, etc...). 2. Data points were included because there was insufficient rationale to exclude them. Of the three WQ5 values noted, two fell within the range of concentrations measured during WQ5 freshet months. The third and highest value (0.38 mg/L) falls within the range of D-Al concentrations measured at other sites (WQ11 and WQ1) and therefore falls within the range of plausible concentrations that may occur at WQ5. 34	Appendix 5E - SBEB Summary 5 Summary of SBEB applicability	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Please provide a table summarizing how frequently (e.g., percentage) the proposed SBEBs are predicted to be exceeded by station and season (proposed SBEB period)?	Please refer to attachment "R1_ENV Comment ID 34.pdf".		BC ENV (Andrew Foster)	Lorax		Jorgelina	GM	Ready for Submission	GM; June 21	Ready for Publishing
34	Appendix 5E - SBEB Summary 5 Summary of SBEB applicability	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. Can recent data collection (e.g., from 2022) be used to revise and further refine the proposed SBEB? 2. Please provide a count for number of samples from each sampling site by month. I am concerned some uncertainties associated with proposed SBEB concentrations partially stem from a low number of data points in certain months. 3. Please provide the rationale for splitting the months into segments the way you've done it (e.g., why is December lumped in with summer months instead of January/February?). Is this rationale supported by natural processes (e.g., delayed winter) or were these time periods modified based on data? Essentially will how you split the months make sense when more data is available? 4. Please provide a detailed plan for how BW Gold will determine if an exceedance of the Al BC WQG or	Please refer to attachment "R2_ENV Comment ID 34.pdf".		BC ENV (Andrew Foster)	Lorax				Ready for Submission	GM; Aug 11	Ready for Publishing

34	Appendix 5E - SBEB Summary 5 Summary of SBEB applicability	Effluent	BC ENV (Andrew Foster)		Aug 25, 2022	3	Follow Up		No	Thank-you for your response. Below are comments addressing both comment 34 and 35. Some of the following questions were answered in the August 24 Al SBEB meeting, but please provide a written response for documentation purposes. 1.Did the "round 2a response to comment 35" incorporate data up to July 2022? [Clarification] 2.In "Response to Round 2 Review Comment 34" are tables 2-1 and 2-2 reporting "95th percentile concentrations plus 20%" or "95th percentile concentrations" at individual sites (the table caption and headings don't match)? Can tables 4-1 and 4-2 in Appendix 5E be compared directly to tables 2-1 and 2-2 in "Response to Round 2 Review Comment 34"? [Clarification] 3.In "Response to Round 2 Review Comment 34" is the value for "all stations" the 95th percentile of the	1 - Yes. Please refer to the response to Round 3 Comment 2176. 2 - Please refer to the response to Round 3 Comment 2177. To confirm, Tables 2-1 and 2-2 represent the 95th percentile concentrations for individual stations, and the 95th percentile plus 20% under "All Stations". The requested comparison of Tables 4-1 and 4-2 of Appendix 5-E, and Tables 2-1 and 2-2 of "R2_ENV Comment ID 34.pdf" is presented in the forthcoming response to Round 2 Comment 27. See attachment "R2_ENV Comment ID 27_R3_ENV Comment ID 34(2), 34(10) and 2177" 3 - Yes, confirmed. Please refer to the response to Round 3 Comment 2178. 4 - Please refer to the reply for Round 3 Comment 2179. 5 - Comment noted.		BC ENV (Andrew Foster)	Lorax		Georges		Ready for Submission	GM; Sept 20	Ready for Publishing
34	Appendix 5E - SBEB Summary 5 Summary of SBEB applicability	Effluent	BC ENV (Andrew Foster)		Oct 24, 2022	4	Follow Up		Yes	1. For Davidson Creek why are maximum predicted Al concentrations in April to July substantially lower than proposed SBEBs? Is this due to proposed water treatment? [Clarification] 2. I will likely recommend ENV accept the proposed Al SBEBs for Davidson Creek pending First Nation review and that these benchmarks be used to support proposed permit conditions. [Comment] 3. As part of the SBEB process, a ENV EIA biologist (me), EIA biologist section head (Sheldon Reddekopp), and First Nations all review and comment on the SBEBs. To facilitate a review by First Nations and the EIA section head, please submit an updated SBEB submission summary report that captures changes that occurred during the review process. [Information Requirement]. The other intent of this request is for ENV to have a clear record of what may be approved and the supporting document for reference in the future. As part of this document, ENV will require a map that clearly shows the proposed SBEB breaks and associated values so it can be easily understood by multiple	1. Maximum predicted concentrations are lower due to Project discharges, which contain lower D-Al concentrations compared to naturally-elevated background concentrations on which the proposed SBEB values are based. 2. This comment is acknowledged. 3. As discussed between ENV, BW Gold, and Lorax in a meeting on November 3, 2022, Lorax will submit an updated SBEB submission summary report that captures the changes that have occurred during Review since the original submission summary was submitted with the Joint Application. The delivery date for the updated submission summary report will be on or before November 30, 2022. 4. This comment is acknowledged. We understand that BW Gold has committed to developing triggers that consider mine waters, discharges, and the receiving environment (per the AEMP). Triggers in the receiving environment are anticipated to reflect BC WQGs. It is anticipated the proposed SBEBs would be considered in		BC ENV (Andrew Foster)	Lorax		Georges			GM; Nov 4	Ready for Publishing
35	Appendix 5E - SBEB Summary 4.1.1 - SBEB development approach	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Were any Al trends apparent when comparing historical to recent data or was any trend analysis conducted (e.g., increasing/decreasing aluminum concentrations over time)?	Long-term temporal trends in D-Al concentrations were not discerned within or between stations. This is illustrated in the SBEB Development Plan Figure 2-2 and Figure 2-8, which show time series for water D-Al concentrations in Davidson Creek stations and Creek 661 stations, respectively, for the baseline period. These figures demonstrate the variable ranges of annual D-Al concentrations that have been recorded in the baseline record.		BC ENV (Andrew Foster)	Lorax		Meghan	GM	Ready for Submission	GM; June 21	Ready for Publishing
35	Appendix 5E - SBEB Summary 4.1.1 - SBEB development approach	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Visually, based on Figure 2-8 it looks like Al concentrations could have decreased over time at WQ3. Have you conducted analysis (e.g., seasonal Kendall analysis) to show there are no trends or are you basing the lack of trends on visual inspection?	Dissolved aluminum (D-Al) is expected to be present in colloidal form and hence temporal variations observed in the concentrations of this element are considered natural responses to flow and turbidity fluctuations. Statistical explorations of the WQ3 data using a one-way ANOVA showed no significant differences in D-Al concentrations among years ($p = 0.12$). Spearman's test is often used interchangeably with Kendall's given the incredible similarities shared between these tests. Analysis of trends for WQ3 using Spearman's non-parametric correlation analysis indicated that there are no significant relationships between variables ($p > 0.050$). This further supports the lack of significant long-term temporal trends in D-Al concentrations previously stated.		BC ENV (Andrew Foster)	Lorax				Ready for Submission	GM; Aug 12	Ready for Publishing
36	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	What is the rationale for having toxicity testing and temperature data collection at 661-10 in Creek 661 mainstem, rather than in upstream tributaries closer to sediment control ponds (e.g., 661-05, camp site tributary)? My understanding is upstream tributaries are fish bearing or potentially fish bearing and toxicity testing in the mainstem would cause substantial dilution.	Please see the memo titled: Blackwater_AEMP_Comment Responses 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, and 61 for additional information on updated monitoring sites in upper Creek 661. The Camp Site sediment control pond (SCP) discharge location is located upstream of the Aquatic Effect Monitoring Program 661-04 monitoring site. The discharge location and the monitoring site 661-04 are located in Creek 146920 (a tributary to Creek 661). As indicated in response to comment ID #s 151 and 151, the Plant Site SCP will not directly discharge to surface water during any phase of the Project. Site 661-10 was selected for temperature monitoring because temperature monitoring stations are co-located with hydrometric stations. However, as identified in response to comment IDs #39 and 45, hydrometric and temperature monitoring stations will be located at sites 661-09 (on Creek 505659, upstream of the confluence with Creek 661) and 661-01 (on Creek 661 mainstem, upstream of the confluence with Creek 505659). Site 661-09 (temperature) and site 661-10 (toxicity testing) were selected because these locations are downstream from both point source (Camp Site SCP) and non-point source (seepage) sources. In addition,		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	RT; June 21 Edits made after Ryan's review on June 21 to reflect changes in locations of Camp Site SCP discharge and monitoring locations	Ready for Publishing

36	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Aug 25, 2022	3	Follow Up		No	Awaiting response from BW Gold	Please refer to response in memo titled: R2_ENV_Comment IDs 36 and 88.		BC ENV (Andrew Foster)	Entia	ERM	Travis		Ready for Submission	RT/TD; Sept 1	Ready for Publishing
36	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. Does 661-10 represent worst case water quality conditions (i.e., site where toxicity effects are most likely to occur)? 2. If not, where and when (time of year) would the worst-case water quality conditions occur? This is when and where I'd potentially recommend doing additional toxicity testing. 3. Is there toxicity testing planned when the Camp Site SCP is discharging, if so what? Any acute toxicity testing could be supplemented with annual chronic toxicity tests in the immediate receiving environment downstream of the SCP. 4. I am concerned that although 661-10 may capture all sources that substantial dilution may occur between tributaries and Creek 661 mainstem resulting in less concentrated POCs or impacted temperatures at 661-10 and provide a misleading toxicity assessment of water quality. Please provide rationale as to why my concern is not valid with respect to water quality throughout the year. Item 3 may partially address this.	BW Gold will provide a response to comments related to the Camp Site SCP in a follow-up response on the date provided to the MMO in the most recent version of the Round 2 BW workplan.		BC ENV (Andrew Foster)	Entia	ERM			Ready for Submission	TD, Aug 16	Ready for Publishing
37	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. What is the rationale for having DC-15 (far field impact site) so far downstream (~6km downstream of near field)? 2. What additional mine effects are being captured or what aquatic values are important to capture at this station? 3. Are there non-mine inputs between DC-15 and DC-10?	1 and 2. Table 4.2-1 of the Aquatic Effects Monitoring Program (AEMP) Plan indicates that DC-15 is a near field impact site on Davidson Creek. The site, DC-05 (approximately 100 m downstream of the freshwater reservoir (FWR), equivalent to WQ28 from the baseline program), and DC-10 (downstream of FWR and the Downstream Aggregate Borrow Area SCP discharge, equivalent to WQ27 from the baseline program) are near-field sites for point source discharges. DC-15 (equivalent to WQ26 from the baseline program) is a near field site for non-point source discharges in Davidson Creek because there are seepage pathways that could transport unrecovered seepage. It was predicted that unrecovered seepage may enter Davidson Creek at varying distances from the sources at the mine site (see Appendix 5-D [Water Balance and Water Quality Model Report], Table 3-27). Therefore, monitoring at a location further downstream in Davidson Creek (DC-15) that captures influence of both point and non-point source discharges has been included in the AEMP. Monitoring multiple locations downstream of a point source discharge is also consistent with a gradient sampling design, in the event that understanding the extent of effects is necessary in the interpretation of AEMP data. 3. Forestry activities have occurred and may occur in the future along much of Davidson Creek. Overland flows and small tributaries may enter Davidson Creek between DC-10 and DC-15 and could introduce non-mine inputs from naturally-occurring or non-mining activities into Davidson Creek.		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	RT; June 21	Ready for Publishing
37	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. What is the furthest downstream location before non-mine activities would influence water quality? I'm interested in where an observed anthropogenic aquatic impact would likely be related to the mine and at what point it would become more uncertain due to other influences (e.g., forestry, agriculture, etc..) 2. Is there any trigger or mechanism in place to monitor aquatic receptors at DC-10 if impacts are observed or suspected at DC-05? Thank you for your response and your response in comment 74.	1. The updated Table 2.7-1 provided in response to comment 74 in Round 1, indicates that past activities have occurred throughout Davidson Creek. In upper Davidson Creek or areas closer to the mine site (e.g., DC-05, DC-10, DC-15), forestry activities along Davidson Creek have occurred in the past. Baseline studies have likely captured the influence of these activities because they initially occurred more than 15 years ago. At DC-20, forestry and agriculture activities have recently occurred or are currently active therefore potential effects on the aquatic environment may be occurring now. Specific locations for forestry or agricultural activities in the future are difficult to predict. Logging could occur in the future throughout the Davidson Creek watershed, or agricultural activities could be further expanded. In this area cattle are on range and do move around. Any non-Project related activities that occur in the future that have the potential to affect the aquatic receiving environment will be identified and documented in all Aquatic Effects Monitoring Program (AEMP) reports. 2. The trigger response framework described in the Adaptive Management program (Section 6 and Tables 6.2-1 to 6.2-6 of the AEMP Plan; Appendix 7-A) includes management responses to plan and/or implement sampling programs to define "the magnitude, spatial extent, and reversibility of the effect". Under this management response, additional sampling (beyond that monitoring defined in Section 4 of the AEMP Plan; Appendix 7-A) would be planned and conducted to better understand the scope, scale, and extent of an effect. Depending on the likely cause or source of the effect, targeted sampling of various aquatic components (which could include sediment, primary producers, benthic invertebrates, and/or fish) would be completed to supplement data collected under the regular AEMP sampling program.		BC ENV (Andrew Foster)	Entia	ERM			Ready for Submission	RT; Aug. 7	Ready for Publishing
38	Appendix 7-A AEMP Figure 3.1-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Why were the Kuyakuz and Tatelkuz Lake sampling sites shifted from baseline locations?	Baseline sampling of both Tatelkuz Lake and Kuyakuz Lake was completed in 2012 to 2014 at locations near the outlet of each lake. In 2021, quarterly baseline sampling was re-initiated at the new sites at the deepest part of each lake (near the center). Water quality sampling at the deepest part of the lake provides a general representation of the overall mixed lake chemistry (i.e., not influenced by lake inflows). Baseline sampling locations are also located in Chedakuz Creek at the outlet of Tatelkuz Lake (CC-10 in the AEMP, WQ8 in the baseline program) and at the inlet of Tatelkuz Lake (CC-05 in the AEMP). Kuyakuz Lake is the reference lake for Tatelkuz Lake, therefore the water quality monitoring station was also moved to the deepest part of the lake, representing the water quality of the entire waterbody.		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
38	Appendix 7-A AEMP Figure 3.1-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Thank-you for the response. In the updated baseline report and AEMP please include this rationale so future reviewers will be aware.	The requested information will be added to the 2022 Cumulative AEMP Baseline report (to be prepared in 2023) and to the next version of the AEMP Plan.		BC ENV (Andrew Foster)	Entia				Ready for Submission	RT; Aug. 2	Ready for Publishing
39	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Why hasn't an upstream reference site for Creek 661 been proposed?	Please refer to response in the attachment "R1_BC ENV_Comment ID 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, 61.pdf"		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	TD, June 28	Ready for Publishing
39	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. Why is 661-04 450m downstream of the discharge location? Is an initial dilution zone (IDZ) being proposed? 2. Is it possible to use an alterative colour for the invertebrate metal sampling symbol? (For ease of future reviewers; request/comment not requirement)	1. 661-04 is located approximately 450 m downstream of the proposed Camp Site Sediment Control Pond discharge location because this is the first point outside of the mine site boundary on Creek 146920. Sampling closer to the discharge point would be within the mine site boundary, which is fish habitat that is assumed to be lost (see *Fisheries Act Authorization Application*). Sampling within the mine site boundary is not considered the 'aquatic receiving environment'. 2. BW Gold will change the colours for the different AEMP components to make them more distinctive in the next iteration of the Aquatic Effects Monitoring Program Plan. See also the updated map in the attachment "R2_ENV_Comment ID 58 and 64" in response to comment ID #58.		BC ENV (Andrew Foster)	Entia	ERM			Ready for Submission	RT; Aug. 11	Ready for Publishing

39	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Aug 25, 2022	3	Follow Up		No	Thank-you for your response, 1. ENV will follow up with Federal Agencies to confirm mine boundaries and considered habitat lost at a later date. 2. This approach seems to contradict how aquatic effects monitoring is conducted on Davidson Creek, as DC-05 is within the illustrated mine boundary. Please provide further clarification on your response (i.e., is the mine boundary under the fisheries act different from what has been shown in this application?). Is it different from figure 1.3-1 in chapter 1?	Please refer to response in the attachment "R3_ENV_Comment ID 39 and 46.pdf'		BC ENV (Andrew Foster)	Entia	ERM	Travis		Ready for Submission	RT Aug 30	Ready for Publishing
39	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Sep 27, 2022	4	Follow Up		No	1. If Creek 146920 still functions as a stream and provides habitat for environmental receptors, ENV will likely still consider the area upstream of the mine boundary to be the aquatic receiving environment. ENV may recommend water quality and AEMP sampling further upstream near the edge of the IDZ. 2. Will Creek 146920 or other Creek 661 tributaries still function as watercourses and provide habitat for environmental receptors? 3. Further recommendations may be provided when the plan for Camp Site SCP and associated discharge is submitted.	Thank you for your comments. An IDZ or discharge point for the Camp Site SCP has not been defined as BW Gold is withdrawing the application for effluent discharge for the Camp Site SCP from the Joint Application. These comments will be considered when BW Gold applies for an effluent discharge authorization for the Camp Site SCP in early to mid-2023, well in advance of the anticipated construction activities at this location (late 2023 or early 2024) when water management would be required.		BC ENV (Andrew Foster)	Entia	ERM			Ready for Submission	TD, Sept 28	Ready for Publishing
40	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	What is the rationale for not conducting aquatic resources and fish inventory tissue at DC-10? This appears to be a good spot to capture all mine related effects in Davidson.	Station DC-05 is approximately 130 m downstream of the freshwater reservoir (FWR). A full suite of aquatic monitoring is proposed at DC-05 (sediment, water toxicity testing, aquatic resources, and fish inventory and tissue sampling), as this is expected to be the primary compliance point in the receiving environment, immediately downstream of the FWR. DC-10 is located approximately 1.4 km downstream of the FWR and approximately 100 m downstream of the Aggregate Borrow Area Sediment Control Pond (SCP). Relative to the FWR discharge, discharge quantity from the SCP is small and may not occur all the time. Also, given the proximity to DC-05, the mobility of fish, and absence of fish barriers between DC-05 and DC-10, sampling of fish tissue/fish inventory at these two sites may not yield independent samples. In addition, unrecovered seepage (non-point source discharge) may enter Davidson Creek downstream of DC-10. The water balance model suggests that seepage may enter Davidson Creek throughout its length.		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	TD, 15-Jun; Edits made after Travis' review, SCP discharge point confirmed	Ready for Publishing
40	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Depending on the response to comment 37, I may recommend invertebrate community and sediment sampling at DC-10 for 2022 baseline collection only. This could be useful in future comparisons to track the extent of mine impacts before non-mine sources impact water quality. Thank-you for your response.	Baseline sampling of sediment quality and aquatic resources (periphyton biomass, periphyton and benthic taxonomy, and benthic invertebrate tissue metals) was completed at DC-10 (formerly site WQ27) in 2017. Baseline sampling of sediment quality and aquatic resources (periphyton and benthic invertebrates) at this location can be included in the planned program for 2022. Baseline data for all Aquatic Effects Monitoring Program (AEMP) sampling sites (regardless of whether they are part of the regular AEMP monitoring, such as sediment quality and aquatic resources at DC-10) will be included in the 2022 Cumulative AEMP Baseline Report that will be prepared in 2023. No edits will be made to the AEMP Plan (Appendix 7-A) based on the reviewer comment.		BC ENV (Andrew Foster)	Entia	ERM			Ready for Submission	RT; Aug. 7	Ready for Publishing
41	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	For monitoring sites located close to Forest Service Roads (e.g., TC-15, CC-15), it is recommended they are moved further upstream (e.g., 100m upstream of roads) to avoid detecting impacts from the road. Please provide rationale for why these sites need to be so close to the road or proposed relocating them further upstream.	CC-15 is an impact site on Chedakuz Creek because it is downstream of the confluence with Davidson Creek. This site is located within 10 m of the FSR. The adjacent Kluskus-Ootsa FSR road will be used by the Project and any potential effects from increased Project-related traffic is useful to capture in the sampling. In addition, this is a long-term monitoring site (equivalent to WQ9 in baseline studies) that has been regularly sampled on a monthly frequency since 2011, including 5-in-30 sampling. Relocating this site is not recommended. TC-15 is a potential impact site downstream of the airstrip. The adjacent Kluskus-Ootsa FSR will be used by the Project and any potential effects from increased Project-related traffic is useful to capture in the sampling if 10 m or 50 m u/s of d/s. This site is located approximately 50 m from the FSR. Relocating this site is not recommended.		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	RT; June 28	Ready for Publishing

41	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. Is the purpose of the site to capture road effects, mine effluent effects, or both? Please explicitly state in the final AEMP. This would be so future reviewers/writers don't overlook potential road impacts when analyzing the data.	The purpose of the Aquatic Effects Monitoring Program (AEMP) sites is to monitor for potential effects due to the Project, which could include both discharge of mine effluent and increased traffic on the roads. However, run-off (quality and quantity) from sites near the FSR is not expected to change as a result of the Project, and would be the same under both existing and future conditions. The potential Project-related effect from roads is from increased traffic and the associated potential increase in dust deposition. While potential effects on the aquatic environment from dust deposition from roads is likely to be negligible relative to mine effluent, it is still a potential Project-related effect. A note will be added to Table 4.2-1 in the rationale column for the sites located proximal to roads (please see the revised Table 4.2-1 that was provided in response to comment ID #58 in the attachment "R2_ENV_Comment ID 58 and 64").		BC ENV (Andrew Foster)	Entia				Ready for Submission	RT; jul 2	Ready for Publishing
41	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Aug 25, 2022	3	Follow Up		No	1. I am concerned if the intent is to capture road runoff quality as a mine effect that having a site too close to the road (e.g., 10m) would potentially miss plumes from the road or would reflect water quality that is not fully mixed. Please provide rationale for why my concerns are not valid. 2. I understand it would be beneficial to maintain site continuity.	1. The primary intent of the monitoring locations is not to monitor for road runoff quality, particularly from the existing Kluskus-Ootsa Forest Service Road (FSR) where no physical changes to the road are proposed. For sites that are close to the Kluskus-Ootsa FSR, monitoring for effects associated with increased traffic (i.e., dust deposition) could be a secondary purpose for monitoring. However, deposition of dust generated from the road, even with increased traffic, is expected to result in negligible loading of POPCs into adjacent waters, particularly for flowing water courses like Chedakuz Creek or Turtle Creek. Given the negligible loading contributed by dust deposition on flowing water, changes to water chemistry from dust deposition is not expected to be measurable, whether the dust is fully mixed or not. 2. BW Gold acknowledges ENV's comment.		BC ENV (Andrew Foster)	Entia		Ryan		Ready for Submission	RT; aug 30	Ready for Publishing
41	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Sep 27, 2022	4	Follow Up	Comment and Clarification	No	1. CC-15 is located upstream of the bridge, not downstream? [Clarification] 2. Typically ENV recommends site selection that is representative of broader conditions within the creek and is not likely to be skewed by potential road impacts (e.g., runoff). The typical ENV recommendation would be to shift the CC-15 site 50-100m if water quality differences are negligible and data continuity can be preserved. [Comment] 3. It would be beneficial in the 2022 Cumulative AEMP Baseline Report to assess if water quality from this site is potentially skewed by road impacts and representative of broader stream conditions. [Comment]	1. CC-15 is located upstream of the bridge. 2. Run-off from the road will not report to the CC-15 site, as the water quality sampling site is located upstream of the bridge. The only potential road influence would be from dust deposition, and the contribution from dust to water chemistry collected from a flowing stream is negligible. Water quality is the only analytical sample collected at this location; other monitoring includes hydrology, water temperature, and kokanee spawning/escapement surveys which would not be affected by dust deposition from the road. 3. Based on an initial visual examination of water chemistry data presented in Figures 4.1-1 to 4.1-33 in Appendix 2-K (Surface Water Quality Cumulative Baseline Report) for sites WQ9 (CC-15) and WQ13 (CC-20, the next downstream site from WQ9 on Chedakuz Creek), mean concentrations of most parameters are similar between the two sites. Water chemistry between WQ9 (CC-15) and WQ8 (CC-10, located upstream from WQ9 at the outlet of Tatelkuz Lake) is similar for most parameters, except certain parameters such as dissolved aluminum which have elevated concentrations in Davidson Creek (Davidson Creek enters Chedakuz Creek between sites WQ9 and WQ8). No impacts from the road are apparent in the water chemistry data for site WQ9 (CC-15).		BC ENV (Andrew Foster)	Entia				Ready for Submission	TD, Sept 28	Ready for Publishing

42	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. Does Rainbow Trout spawning occur closer to the mine site on Creek 661 or DC-20? 2. If so please propose a near field Rainbow Trout spawning monitoring location or provide rationale for why a closer location is not appropriate.	1. Spawning may occur in areas closer up to the mine site, but the quality of spawning habitat is better in the lower reaches of Creek 661 (i.e.., there is a general trend of decreasing spawning habitat quality towards the upper reaches of Creek 661). 2. As indicated in the Aquatic Effects Monitoring Program Plan (Appendix 7-A), the purpose of the spawning survey is to "provide data on the movement of spawning rainbow trout from Tatelkuz Lake and Kuyakuz Lake into specific watersheds". The sampling in lower Davidson Creek uses channel-spanning hoop nets, which will allow enumeration of migrating fish moving into the Davidson watershed to spawn, rather than directly trying to enumerate spawning sites (which is challenging in this watershed). Conducting the surveys in the lowest reach of the watershed (in Davidson Creek or Creek 661) will allow enumeration of spawning fish because they migrate to all upstream locations, rather than just enumerating a small subset of fish that might spawn in one of the higher-up reaches. 42	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Thank you for the response	BW Gold acknowledges the response.		BC ENV (Andrew Foster)	Entia				Ready for Submission	rt; Aug. 2	Ready for Publishing
43	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Is it possible to have AEMP Creek 661 tributary sampling sites closer to the sediment control pond discharge?	The Camp Site sediment control pond (SCP) discharge location is located approximately 480 m upstream of the new Aquatic Effect Monitoring Program 661-04 monitoring site. The discharge location and the new monitoring site 661-04 are located in Creek 146920 (a tributary to Creek 661). Please also refer to response in the memo titled: Blackwater_AEMP_Comment Responses 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, and 61 for additional information on monitoring sites in upper Creek 661. As indicated in response to comment ID#s 151 and 152, the Plant Site SCP is no longer proposed to directly discharge to surface water during any phase of the Project.		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	RT: June 28	Ready for Publishing
43	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Thanks for your response. Additional questions are addressed in other comment numbers.	BW Gold acknowledges that the comment is closed.		BC ENV (Andrew Foster)	Entia				Ready for Submission	TD, Aug 2	Ready for Publishing
44	Appendix 7-A AEMP Table 4.2-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. Please provide and update this table in the final AEMP to explicitly state which references sites are associated with which impact sites (e.g., what is 705-05 a reference site for?). 2. Please update this table to include a station description (e.g., X Xkm downstream of discharge point Y above confluence of Z).	Please refer to response in the attachment "R1_BC ENV_Comment ID 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, 61.pdf"		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	TD, Jun 28	Ready for Publishing
44	Appendix 7-A AEMP Table 4.2-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Thank-you for the response this is very helpful. 1. In the final AEMP, for sites that are a reference location for other streams (e.g., 705-10 for Davidson Creek), please include a table comparing the physical characteristics of the sites (e.g., substrate, water chemistry, stream width, etc..). This could be included in invertebrate community analysis section and is typically covered under the CABIN habitat variables. 2.In the final AEMP, please discuss why each reference site is appropriate and any caveats (e.g., good comparison for water chemistry but stream width is 50% smaller). Addressing these comments gives ENV reviewers perspective when comparing environmental receptor data between sites.	BW Gold acknowledges the reviewer's recommendations. However, BW Gold recommends that the requested information be provided in the 2022 Cumulative AEMP Baseline Report (to be prepared in 2023 once baseline data from 2022 are available, as described in the Round 1 attachment"R1_BC ENV_Comment ID 64 to 67, 77 to 82.pdf). The intent of the 2022 Cumulative AEMP Baseline Report is to provide baseline information to form the "before" component of the before-after-control-impact analysis proposed in the AEMP Plan. Therefore it is appropriate that the detailed rationale for the selection of reference sites, such the requested table showing physical characteristics of the sites, can be provided in the baseline report. The purpose of the AEMP Plan is to provide the framework for the monitoring program, primarily locations, sampling methods, proposed analysis, and adaptive management. The AEMP Plan would be updated to refer to the requested information about reference locations that would be provided in the 2022 Cumulative AEMP Baseline Report. 49	Appendix 7-A AEMP Table 5-2	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Why wasn't higher frequency of monitoring proposed when temperatures are close or at potential acute effects?	Please refer to response in the attachment "R1_BC ENV_Comment ID 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, 61.pdf"		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	TD, Jun 28	Ready for Publishing
50	Appendix 7-A AEMP Table 5-2	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Have effluent water temperatures been modelled and are they predicted to exceed BC WQG in the receiving environment?	Modelled predictions from the Application/EIS indicated there will be changes in water temperature in Davidson Creek due to flow augmentation from the FWR (Section 5.3.3.3.8.4.2 Application/EIS). Predicted water temperature values are within the optimal temperature range for all life stages of Rainbow Trout (Comparative Thermal Requirements of Westslope Cutthroat Trout and Rainbow Trout: Implications for Species Interactions and Development of Thermal Protection Standards, Bear et al., Jan. 2011) and for Kokanee eggs and fry in the lower reaches of Davidson Creek (Enhanced Incubation Success for Kokanee		BC ENV (Andrew Foster)	Palmer		Glenn Wagner	TD	Ready for Submission	RT; June 14 TD, Jun 28	Ready for Publishing
50	Appendix 7-A AEMP Table 5-2	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. Additional comments may be provided following meetings with EAO/LWRS. 2. Are there any temperature, timing, and fish species combinations on Davidson Creek where it is impossible to achieve both optimum conditions simultaneously (e.g., BC WQG for Kokanee adult spawning vs Rainbow Trout rearing)? 3. Please create a table comparing BC WQG to the optimum temperatures in the literature referenced with timing periods included. 4. Please provide copies of the referenced literature.	2. The water temperatures for the optimal growth of Kokanee eggs and fry (3 to 14 °C) does not overlap with the optimal growth range for Rainbow Trout juveniles (15-19°C)(see attachment: R2_ENV Comment ID 50 Water Temp Comparison Table.pdf; Table 1. Blackwater Water Temperature Comparison for Fish, Palmer 2022). The periodicity of Kokanee eggs and fry (mid-August to the end of April) overlaps with juvenile Rainbow Trout rearing (July to the end of November) for 3.5 months (mid August to the end of November (Figure 5.10-3 of the Application/EIS). Therefore, during this period of overlap, it will not be possible to achieve both optimum conditions simultaneously. However, this type of optimization does not occur under current baseline conditions. 3. A table comparing BC WQG to the optimum temperatures from the cited literature has been attached. 4. The cited literature has been attached.		BC ENV (Andrew Foster)	Palmer			TD	Ready for Submission	TD; Aug 16	Ready for Publishing
51	Appendix 7-A AEMP Table 5-2	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	This trigger response plan should be re-evaluated as substantial measures addressing the issue (i.e.., temperature) should be made well before lethal effects are possible. 52	Appendix 7-A AEMP Table 6.2-5	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Triggers need to be clear and well-defined. How are changes to invertebrate indicators being defined for each indicator (e.g., +/- 2 standard deviations) for each trigger level?	Please refer to response in the attachment "R1_BC ENV_Comment ID 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, 61.pdf"		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	TD, Jun 28	Ready for Publishing
52	Appendix 7-A AEMP Table 6.2-5	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up	Potential Permit Condition	Yes	1. Triggers should be clear and well defined in the Trigger response section (i.e., Attachment B). That is, this table or preceding text needs to have sufficient information to be a stand-alone section. For example, what is O:E close to 1 (+/- 0.05, 0.1%)? How is the reference range being defined (+/- 2 SD from reference group mean)? How is the background range being defined? Are you looking at the overall O:E ratio or the ratio for specific groups? What qualifies as EPT losses? This is partially captured in the revised section 4.7.1 but would be good to capture in either the text before the table or immediately following the table. 2.For simplicity, it be better to split out tissue sampling from community metrics. 3. Is the intent for periphyton and invertebrate plans to have clear triggers with a clear response or general guidance? 4. ENV may suggest these issues associated with triggers be addressed on a case-by-case basis using a weight of evidence approach given the variability of invertebrate community metrics. ENV would likely not incorporate this approach as a true "trigger response plan" (i.e., based on Technical Guidance 12: Trigger Response Plans).	As discussed during a clarification meeting with ENV on July 28, 2022, the adaptive management plan in Section 6 of the AEMP Plan was drafted to meet the requirements outlined in EAC Condition 26 and the federal Decision Statement related to adaptive management and quantitative triggers. The triggers, action levels, and responses identified in Section 6 were not necessarily intended to be used by ENV for EMA effluent discharge authorization purposes. BW Gold understands that BC ENV has recently issued new guidance documents for development of trigger response plans (Technical Guidance 12 issued March 2022) and adaptive management plans (Technical Guidance 20 issued June 2022), which were issued after the AEMP was drafted. ENV considered these new guidance documents in their review of the AEMP Plan and found that the AEMP Plan adaptive management described in Section 6 (as well as the Trigger Action Response Plan in Section 5 of the AEMP Plan) does not align with these new guidance documents. BW Gold understands that there are differences between expectations of different regulators (e.g. ENV, EAO, IAAC) in relation to how the results of the AEMP will be interpreted, actioned, and reported. BW Gold is working to try to prepare an AEMP Plan that will meet all regulatory requirements without having to produce multiple different AEMP Plans. To this end, BW Gold proposes to substantially restructure the latter sections of the AEMP and make minor revisions to the earlier sections of the AEMP to try to clarify which components of the AEMP are applicable to which regulatory requirements. Sections 1 to 4 of the AEMP Plan which provide an introduction, overview of consultation and engagement, existing conditions and concerns, and the details of the design of the monitoring program would be relevant to meeting requirements for each regulatory regime (EAC, federal Decision Statement, and EMA permit receiving environment monitoring). Sections 5 through 7 would be substantively restructured and edited so that there are separate sections for EAC Condition 26, Federal Decision Statement, and EMA Permit requirements. This would mean that there would be at least two and potentially three different AEMP annual reports (or sections of a single AEMP report) that would be required that would provide the required information, analysis, and interpretation expected by each regulator to satisfy the different regulatory requirements. Furthermore, as previously mentioned, BW Gold proposes to provide a revised AEMP report to coincide with the end of		BC ENV (Andrew Foster)	Entia				Ready for Submission	TD, Aug 11	Ready for Publishing
53	Appendix 7-A AEMP Table 6.2-5	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	What changes are considered to be "of concern" and what CABIN status is associated with a given trigger level?	Please refer to response in the attachment "R1_BC ENV_Comment ID 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, 61.pdf"		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	TD, Jun 28	Ready for Publishing

53	Appendix 7-A AEMP Table 6.2-5	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	See comment 52. CABIN thresholds clear now, thanks.	BW Gold acknowledges that the comment is closed.		BC ENV (Andrew Foster)	Entia				Ready for Submission	TD, Aug 11	Ready for Publishing
54	Appendix 7-A AEMP Table 6.2-5	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Please provide justification for the selection of invertebrate metrics. You could consider adding specific metrics that sensitive to certain contaminants of concern (e.g., abundance for increases in nutrients).	Please refer to response in the attachment "R1_BC ENV_Comment ID 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, 61.pdf"		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	TD, Jun 28	Ready for Publishing
55	Appendix 7-A AEMP Table 6.2-5	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	The idea of having an invertebrate trigger response plan is interesting and a challenge given natural fluctuations in invertebrate communities and associated metrics. [Comment -no action needed]	BW Gold acknowledges the comment.		BC ENV (Andrew Foster)	ERM		Lesley/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
56	Appendix 7-A AEMP Table 6.2-2, 6.2-3	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	For simplification of triggers, it would be useful to set triggers as percentages (e.g., 80% of a BC WQG or SBEB concentration) and then explain changes with additional statistics or comparison to background/reference. Triggers must be clear, well-defined, and enforceable to be approved.	Please refer to response in the attachment "R1_BC ENV_Comment ID 39, 44, 45, 46, 47, 49, 51, 52, 53, 54, 56, 57, 61.pdf"		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	TD, Jun 28	Ready for Publishing

58	Appendix 7-A AEMP 4.7.1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Thank-you for the response. 1. In "Responses for Chapter 2, Comment ID #s 64 to 67 and 77 to 82" in figure 1 please update the inset map to include benthic metal testing (discrepancy between map and inset map) in the final AEMP document. 2. In "Responses for Chapter 2, Comment ID #s 64 to 67 and 77 to 82" Table 1 appears to be missing 661-20. Please ensure the table isn't missing any information.	Please refer to response in the attachment "R2_ENV_Comment ID 58 and 64".		BC ENV (Andrew Foster)	Entia				Ready for Submission	TD, Aug 11	Ready for Publishing
58	Appendix 7-A AEMP 4.7.1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Benthic invertebrate sampling is typical in most environmental monitoring programs and I may recommend it is required in this program as well. Benthic invertebrate tissue monitoring may provide insight into environmental trends and can be used to supplement or support trends in water or sediment quality. Delaying invertebrate tissue data collection until a trend is identified in another monitoring component would result in the inability to compare trends between water, sediment, and tissue through time.	Rationale for not including benthic invertebrate tissue sampling was provided in Section 4.7-1 of the C.1 version of the Aquatic Effects Monitoring Program (AEMP) Plan (March 2022); however, based on comments 57 to 59, we understand that ENV is not satisfied with the rationale. Therefore, the AEMP Plan will be revised to include benthic invertebrate tissue sampling for metals and moisture content analysis at near field sites on Davidson Creek (DC-05 and DC-15) and Creek 661 (661-04, 661-05 and 661-10) and at reference sites (FC-01 and 661-01) at the same frequency as fish tissue metal sampling. 59	Appendix 7-A AEMP 4.7.1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. I would consider avoiding sampling in sensitive areas and alternative sampling methods to be valid mitigation (comment). 2. I support invertebrate sampling focused on near field locations where effects directly related to mining are more likely to occur and where no spawning habitat has been identified (comment). Thank-you.	BW Gold acknowledges that the comment is closed.		BC ENV (Andrew Foster)	Entia				Ready for Submission	TD, Aug 11	Ready for Publishing
59	Appendix 7-A AEMP 4.7.1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Please provide additional information on: 1) If there have been any issues to date collecting an adequate amount of invertebrates for tissue sampling, 2) What damage has been done during sampling (if any), 3) If damage to the creeks can be mitigated, and 4) Which sites have high value habitat (e.g., spawning substrate) that are considered to be at risk to intensive sampling. A modified invertebrate sampling program may need to be considered or proposed.	1) There have not been issues collecting sufficient benthic invertebrates for tissue analysis, although 2011/2012 samples were often a single composite sample. 2) Our experience at this and other Project sites is that significant disturbance of creek substrate is required to obtain sufficient sample volumes for tissue metals analysis, even for "micro-prep" analysis of tissue samples (e.g., ALS requires 0.5 g of tissue minimum for micro-prep). Samplers will 'kick up' the substrate for large sections of creek around a sampling site to obtain sufficient sample volumes per replicate. 3) Damage cannot be mitigated other than avoiding sampling altogether in sensitive spawning habitat (e.g., kokanee spawning habitat). It is likely that the stream would recover over time after the sampling event, but any damage to fish eggs already deposited within the substrates at the time of sampling would be permanent. 60	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. Are there any wetlands close to the mine site (i.e.. upper Creek 661 watershed and upper Davidson Creek) that could be impacted by mine effluent? 2. If so please provide their locations and rationale for why or why not wetlands and their associated receptors should be included in the AEMP.	1. Wetlands are present close to the mine site and have the potential to be affected by the Project (surface water discharge and/or seepage). Wetlands were mapped during spring 2011 and fall 2013 in conjunction with TEM mapping efforts to classify wetland ecosystems (Appendix 2-T of the Application). 2. Wetland sampling locations have not been considered in the Aquatic Effects Monitoring Program (AEMP) because there is a hydrological connection between the creeks sampled as part of the AEMP and the associated wetlands. Therefore any Project related changes observed at water quality monitoring locations on the creeks can be extrapolated to assess potential water quality changes in connected wetlands. In addition, water-dependent wildlife will be monitored as part of the AEMP if triggered through the response framework to aid in the understanding of the effects of water quality guideline exceedances and/or significant Project related changes in water quality. 60	Appendix 7-A AEMP Figure 4.2-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. Wetlands may act as a sink for parameters of concern (POC) and therefore increase POC sediment concentrations above sediment guidelines which in turn may have an impact on environmental receptors. Sampling on creeks only may not capture these trends or potential impacts. Limited AEMP wetland sampling may be recommended on Davidson Creek. 2. Are there any near field wetlands on Davidson Creek that are likely to act as sinks? 3. Please clarify "hydraulic connection" (groundwater? runoff? stream flows through wetland?) specific to near field Davidson Creek wetlands. Do these wetlands impact water flow or are you suggesting the wetlands are riparian in nature and largely only present because of the creek and associated elevated water table. That is, Davidson Creek flows through the wetland and flow is largely unaffected making it unlikely that the wetlands will act as POC sinks. This would contrast with something like a beaver pond where flow velocity would be greatly reduced and result in increased sedimentation.	1. BW Gold acknowledges the potential recommendation for limited sampling in wetlands near Davidson Creek for the purpose of the Aquatic Effects Monitoring Program (AEMP). However, BW Gold believes that wetland sampling for sediment and aquatic resources is not required because the wetland areas adjacent to Davidson Creek are not likely to be receiving water from Davidson Creek. 2. and 3. As part of the baseline assessments completed in 2013, wetlands were identified in the area of upper Davidson Creek area outside the mine site boundary using Terrestrial Ecosystem Mapping (TEM) (see Figure 3.3-10 in Appendix 2-T of the Application). However, based on the landscape/topography of Davidson Creek, the wetlands are likely discharging to Davidson Creek ("riparian in nature", as referred to by the reviewer) rather than Davidson Creek water discharging into a wetland complex (such as a marsh, swamp, or ponds). Furthermore, EAC Condition 24 Wetlands Offsetting and Management Plan required the monitoring of hydrological function at select wetlands across all types on the mine site by installing shallow groundwater piezometers. The piezometers were installed between June 20 - 30. Please refer to the *'R2 - ENV Groundwater Comment ID 60.pdf' for more information.* If the wetlands are characterized as marshes, swamps, and shallow open water wetlands (and recieving flows from Davidson Creek) there is a potential for an increase in parameters of concern (POC) in wetland sediments (i.e., they act as a POC sink; Hanson et al. 2008). Revisions to the AEMP Plan would be proposed to focus on sampling of inflows and outflows of wetlands characterized as potential sinks in Davidson Creek, if any are identified during 2022 surveys. Hanson, A.L., Swanson, D. Ewing. Grabas, S. Meyer, L. Ross, M. Watmough, and J. Kirby. 2008 Wetland Functions Assessment: An Overview of Approaches. 68	CH2 - Baseline Information 2.9.4, table 2.9-7	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Was any tissue analysis completed on high site fidelity fish species that would reflect data characteristic of specific waterbodies?	Rainbow trout (primarily juvenile fish) were selected for fish tissue sampling at stream locations in 2011, 2012, and 2021. AMEC (2013, provided as Appendix 2-O) indicated that “These samples were collected because the 2011 surveys had shown that the fish community in streams and lakes of the LSA was dominated by one species – rainbow trout. There were no other small, resident fish species such as sculpins that could be sampled for tissue metals concentrations.” Adult rainbow trout, kokanee, and mountain whitefish in 2013 and 2021 were collected from lake sites for fish tissue analysis; these fish species were selected based on input from UFN/LDN. Data from juvenile rainbow trout at the stream sites would be reasonably representative of the waterbody in which they were collected because the fish would have hatched and spent time rearing in their natal streams.		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	TD, 15-Jun	Ready for Publishing
68	CH2 - Baseline Information 2.9.4, table 2.9-7	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. Is it possible to collect tissue data on streams from a high site fidelity fish species such as sculpin? If so, on which waterbodies? Sculpin opposed to Rainbow Trout juveniles would provide temporal cumulative exposure effects rather than data from a single year. 2. My understanding is Slimy Sculpin are not present in Davidson or 661 Creeks; is this correct?	AMEC (2013, provided as Appendix 2-O of the Joint Application) provided the rationale for targeting Rainbow Trout rather than sculpin or other fish species. AMEC (2013) indicated that “These samples were collected because the 2011 surveys had shown that the fish community in streams and lakes of the LSA was dominated by one species – rainbow trout. There were no other small, resident fish species such as sculpins that could be sampled for tissue metals concentrations.” It is not possible to collect tissue data on stream from a high fidelity fish species such as sculpin. Sculpin or other high fidelity fish species are not present to support an ongoing fish tissue sampling program in streams adjacent to the mine site (i.e., Davidson Creek, Creek 661). 69	CH2 - Baseline Information Figure 2.9-6	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	What caused the substantial increase in Chironomidae between 2012 and 2017 at WQ10?	Chironomidae are often found in large numbers in freshwater systems, as they have a variety of adaptations that allow them to live in a wide variety of environments. Thus, there are number of reasons that could result in a shift in the community composition and without confirmation of a trend it is not possible to assign a cause. The site is not being used as baseline conditions for the Aquatic Effects Monitoring Program (AEMP; Appendix 7-A), thus additional analysis to determine if data collected at the site in 2017 is truly representative of baseline conditions is not warranted at this time. See response to comments #64 to 67 for how benthic invertebrate baseline data will be reviewed for analysis in the AEMP.		BC ENV (Andrew Foster)	ERM		Tonia	RT	Ready for Submission		Ready for Publishing
70	CH2 - Baseline Information Figure 2.9-6	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	What caused drastic shift in invertebrate abundance in 2011/2012 at WQ13 in Chedakuz Creek compared to 2017?	There are a number of reasons that could be related to changes in invertebrate abundance. However, given that the diversity measures or community composition (Figures 2.9-6 and 2.9-7 in Chapter 2) did not vary considerably between sampling years, it would suggest that the shift was not caused by a loss or gain in one or more species. The site is not being used to define baseline conditions for the Aquatic Effects Monitoring Program (AEMP; Appendix 7-A) because aquatic resources sampling is not proposed at this site in the future. Thus, additional analysis to determine if data collected at the site in 2017 is truly representative of baseline conditions is not warranted at this time. See response to comments #64 to 67 for how benthic invertebrate baseline data will be reviewed for analysis in the AEMP.		BC ENV (Andrew Foster)	ERM		Tonia	RT	Ready for Submission		Ready for Publishing
71	CH2 - Baseline Information Figure 2.9-6	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. Were CABIN laboratory methods followed when including/excluding certain taxa groups (e.g., Arachnida)? 2. Please comment on how this may have impacted the CABIN classification particularly for WQ8. 3. Please provide rationale for including crustacea and arachnida.	1. Environment Canada CABIN laboratory methods (at the time of reporting the 2014 version was applicable) were followed to identify invertebrates to the lowest possible taxonomic level. The 2014 CABIN database recognized Arachnida as a taxonomic group. Ostracoda, Cladocera/Rotifera, Copepoda, Porifera, Nemata, Platyhelminthes and non-aquatic taxa (e.g., earth worms, spiders) were excluded from abundance and diversity calculations following the Environment Canada CABIN protocols. 2. The same methods (using Environment Canada CABIN protocols) were used in each of the sampling years (2011, 2012, and 2017). At WQ8 in 2017, there was a large number of Hyallela in the sample that were also unique to WQ8 in 2017 (i.e.., no other occurrence of amphipods at other sampled sites). Site WQ8 is at the outflow of Tatelkuz Lake, meaning that this benthic invertebrate composition may differ from other stream sites. The site (new baseline sample name CC-10) will not be sampled again as part of the Aquatic Effects Monitoring Program. Thus, additional analysis to determine if data collected at the site in 2017 is truly representative of baseline conditions is not warranted at this time. See response to comments #64 to 67 for how benthic invertebrate baseline data will be reviewed for analysis in the AEMP. 3. As stated in response to question #1, the exclusion of taxa from analysis followed CABIN protocols. Both crustaceans (e.g., amphipods) and arachnida (e.g., water mites) are considered benthic invertebrates in accordance with CABIN protocols. 73	CH2 - Baseline Information 2.7.1, 2.9.1, 2.9.2	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	The temporal and spatial gap wording for section 2.7.1 is different from other sections as it refers to no "significant" spatial or temporal gaps. 1. Please elaborate how a lack of significance was determined (e.g., statistical analysis). 2. If gaps are present that aren't statistically significant but impacted analysis please elaborate on these gaps and how they impacted analysis or caused uncertainty in the data.	1. Significance does not refer to statistical significance in this statement. There was no statistical analysis of baseline data completed other than summary statistics for the purpose of model inputs for the water quality model (see Section 5.4 of Chapter 5, Modelling, Mitigation, and Discharges). Instead, BW Gold identified no significant gaps in reference to identification of gaps that could be interpreted with data from other stations or months. For example, there were instances in which some monitoring stations did not have complete monthly water quality datasets and, to obtain a monthly background term, an average of the two shoulder months was used in the model. There were also instances identified where some stations had longer monitoring records than others. Specifically, WQ5 (Creek 661) background terms were applied to both WQ5 and WQCk661 model nodes, and WQ13 (Chedakuz Creek) background terms were applied to WQ13, ChedakuzMidway, and ChedakuzOutlet model nodes. 2. As identified in Section 5.4.12 of Chapter 5 (Modelling, Mitigation, and Discharges), no uncertainties related to the water quality model predictions were associated with gaps in baseline data collection. 74	CH2 - Baseline Information Table 2.7-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Please provide a version of this table that comments on what sites are impacted by previous development (e.g., site located within pasture, site downstream of septic effluent, etc...)	Please see response in attachment "R1_BC ENV_Comment ID 72, 74, 92 Part 1 & 2.pdf"		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission		Ready for Publishing
74	CH2 - Baseline Information Table 2.7-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Thank-you for the response. Please ensure key information from this table is captured and kept up to date in the AEMP. For example, knowledge of recent agricultural and forestry activity at WQ7, WQ8 and WQ9 may aid in interpretation of data (e.g., increasing invertebrate abundance due to nutrient enrichment from farming activity).	The information presented in Table 2.7-1 will be incorporated into the 2022 Cumulative AEMP Baseline Report (to be prepared in 2023). Non-Project activities that occur in the study area that have the potential to affect the aquatic environment (e.g., new forestry or agricultural activity) will be identified and reported in future AEMP reports.		BC ENV (Andrew Foster)	Entia				Ready for Submission	RT; Aug. 2	Ready for Publishing
75	CH2 - Baseline Information Figure 2.9-14	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. Why was there so much variability in Se liver tissue concentrations on Chedakuz Creek? 2. Is this related to fish age, size, or sampled locations?	1. Chedakuz Creek fish tissue concentrations were based on 8 rainbow trout sampled in 2012. One fish (ID# 7-008, Rainbow Trout) had unusually high selenium liver tissue concentrations of 41.4 mg/kg ww relative to the other seven fish (2.4 times greater than the next highest concentration of 17.1 mg/kg ww and 4 times greater than the mean of 0.3 mg/kg ww). Concentrations of several other parameters (aluminum, cadmium, copper, tellurium, vanadium) in this fish tissue were also more than 1.5 times greater than the next highest concentration measured in any sample from any other fish collected for analysis of fish tissue metal concentrations in 2012. 2. Although this fish (ID# 7-008, Rainbow Trout) was relatively large, it was not the largest or oldest fish		BC ENV (Andrew Foster)	Entia	ERM	Lesley/Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing

76	CH2 - Baseline Information Figure 2.9-14	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Why were liver concentrations so high compared to muscle tissue concentrations in Chedakuz Creek?	See also response to comment #75. The difference between liver concentrations in Chedakuz Creek relative to other sites is because one fish (ID #7-008, Rainbow Trout) had unusually high liver concentrations of selenium and other metals relative to other fish sampled in Chedakuz Creek; however, the concentration of selenium and other metals in muscle from this fish was similar to other fish sampled in Chedakuz Creek. Including fish #7-008 in the summary statistics yields a mean selenium concentration of 13.3 mg/kg ww in liver. Excluding this fish from the summary statistics yields a mean selenium concentration of 9.3 mg/kg ww. Although 9.3 mg/kg ww is still highest among the stream sites, it is in the range of liver selenium concentrations in fish sampled at other sites. If this one fish was excluded, the difference between liver and muscle tissue in fish from Chedakuz Creek would be more similar to other sites. In addition, tissue concentrations in Figure 2.9-14 (Chapter 2) are presented in mg/kg wet weight, as these are the units provided in the AMEC (2013) baseline report (see Appendix 2-O). Wet weight concentrations are influenced by the moisture content in tissues, which may be unintentionally altered by sampling, storage, or transport conditions prior to analysis. In future AEMP analyses, use of dry weight tissue concentrations is recommended to eliminate the confounding variable of moisture content. Additional fish tissue metal baseline data were collected in 2021 and additional sampling is planned at all Aquatic Effects Monitoring Program (AEMP) fish tissue sampling sites in 2022. Upon completion of the 2022 sampling campaign, all available baseline data will be compiled for use in future AEMP analyses (See response to comments #77, 78, 79, 80, 81, and 82). 83	Appendix 2-O Figure 5.10-24	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Have enough fish tissue samples been collected in each waterbody to provide sufficient baseline characterization and provide sufficient statistical power in future analysis?	Baseline sampling of fish tissue metals has been completed in each of the waterways that will be sampled as part of the Aquatic Effects Monitoring Program (AEMP). In Davidson Creek, 8 rainbow trout were sampled at various locations in both 2011 and 2012. In Creek 661, 8 rainbow trout were sampled at various locations in 2012. In 2013, 10 rainbow trout and 10 mountain whitefish were sampled from Tatelkuz Lake. Sampling was also completed in 2021 and included 8 rainbow trout per site at the following AEMP sampling		BC ENV (Andrew Foster)	Entia	ERM	Lesley	RT	Ready for Submission	RT; June 27	Ready for Publishing
83	Appendix 2-O Figure 5.10-24	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Thank-you for the response. Given the temporal gap between fish tissue sampling events combining data from 2011-2013 with 2021/2022 data may not be appropriate. The 2022 sampling program should ensure recent sampling size (i.e., 2021/2022) is adequate for baseline characterization and is likely to achieve statistical power necessary for future analysis.	Thank you for your comment. Part of the analysis to be completed in the 2022 Cumulative AEMP Baseline Report will be an evaluation of whether the older 2011-2013 data can be used together with the newer data (2021, 2022) to form a baseline dataset. It is possible that due to the temporal gap and differences in sampling methodologies that combining these datasets may not be appropriate. A clear recommendation will be made in the 2022 Cumulative AEMP Baseline Report regarding the use of the available baseline data		BC ENV (Andrew Foster)	Entia				Ready for Submission	RT; Aug. 2	Ready for Publishing

86	Appendix 5-D 4.1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	"Aquatic life guidelines used for model screenings were calculated using the corresponding baseline dataset (i.e.., per location), using the same-month median statistic (e.g., for hardness, chloride, etc...), as relevant, for receiving environment nodes. This approach differed slightly for model node WQCk661, for which the WQ5 baseline dataset was used, and for the mid- and lower Chedakuz model nodes for which the WQ13 dataset was used (Figure 3-3 and Figure 3-6). This approach was adopted due to the limited baseline dataset for these nodes, as they reflect locations established for the purpose of water balance model development rather than baseline monitoring locations for the surface water quality discipline.." In my opinion based on the quote above, these nodes are not suitable locations to assess potential environmental impacts until additional data is collected. 1. Could you clarify whether water quality predictions for these model nodes are accurate or reliable	With respect to Question 1), relating to the accuracy and reliability of water quality predictions, we kindly direct the reader to responses provided to Comments 31 and 32. With respect to Question 2), model nodes for WQCk661 and lower Chedakuz Creek were developed to support the characterization of the spatial extent of potential Project effects. Baseline data from WQ5 (for WQCk661) and from WQ13 (for the mid- and lower-Chedakuz nodes) were used as reasonable proxies of background water quality for WQCk661, and mid- and lower-Chedakuz Creek nodes, respectively. These stations were considered to represent reasonable proxies for their corresponding model nodes, as they occur within the same respective watersheds, are subject to similar climatic conditions and local water quality influences, and reflect similar sensitive water uses. 90	CH6-Environmental Effects Predictions 6.3.4.3, TDS	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	ENV does not allow for effects within 50% of a populations and sets thresholds using much lower EC values and through safety factors. An EC10 or NOEC would be a more appropriate proposed threshold. 1. Did a review of the literature find a lower benchmark or can any of the benchmarks (e.g., EC50) be back calculated to a EC10 or NOEC? 2. Does Weber Scannel and Duffy (2007) have a threshold value below an EC50 calculated?	1. To our knowledge, a low number of values below the proposed benchmark exist in the scientific literature, but these values are considered inappropriate to use as the basis for a benchmark in the Project area. The proposed benchmark of 500 mg TDS/L was selected because it is based on the most sensitive endpoint available in acceptable literature for species relevant to the Project area. The calculation of EC10 from reported benchmarks (e.g., EC50) is not feasible, given that EC_x values are generally derived using a dose		BC ENV (Andrew Foster)	Lorax		Jorgelina	GM	Ready for Submission	GM; June 14	Ready for Publishing

91	CH6-Environmental Effects Predictions Figure 6.3-7	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. How did the model adjust for concentrations of aluminum or other parameters between WQ5 and WQCK661? Or does WQCK661 just use WQ5 data? 2. If WQ5 and WQCK661 have identical values for metals what value does having a node at WQCK661 have? 3. Are the predicted values at WQCK661 likely to reflect field conditions? I am concerned WQCK661	1. The current configuration of the water quality model assigns WQ5 background water quality for both the WQ5 and WQCK661 nodes. 2. The WQCK661 node gives an indication of further change/dilution of contact water signature evident at WQ5 (drainage area approximately 25 km2) to WQCK661, which is further downstream (drainage area >58		BC ENV (Andrew Foster)	Lorax		Colin	GM	Ready for Submission	GM; June 21	Ready for Publishing
92	CH6-Environmental Effects Predictions Table 6.3-5,	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	1. Please provide an updated version of this table (or summary) that has a comment column outlining existing impacts (if any) for each station (e.g., WQ9 nutrient enrichment from septic fields from X) and another column indicating if the station data reflects unimpacted nutrient baseline conditions (e.g., free from agricultural or cattle). 2. If the station has known enrichment impacts please state this (e.g., increased invertebrate	Please see response in attachment "R1_BC ENV_Comment ID 72, 74, 92 Part 1 & 2.pdf" for responses to 1) and 2). Please refer to attachment "R1_ENV Comment ID 89 92(3) 93.pdf" for the response to 3).		BC ENV (Andrew Foster)	Lorax	ERM	Meghan/Tonia	GM	Ready for Submission	GM; June 23	Ready for Publishing

93	CH6-Environmental Effects Predictions Table 6.3-4, Table 6.3-8, Figure 6.3-11	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	Thank-you for your response. Please include both benchmarks (i.e., baseline mean + 50% and CCME Trophic Status Category Benchmark) in the AEMP for future reference.	Thank you for the response. Both benchmarks will be included in the next iteration of the AEMP for reference.		BC ENV (Andrew Foster)	Lorax	Entia	Meghan/Lesley		Ready for Submission	GM; Aug 4	Ready for Publishing
94	CH6-Environmental Effects Predictions 6.3.4.3 - Aluminum	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	"In the case of the March background term, the value is based on the average of the February (0.032 mg/L) and April (0.119 mg/L) terms as no March samples were collected during the baseline program." "As such, the background terms for March and December for Creek 661 model nodes reflect limited datasets that require verification through ongoing monitoring." I would consider having no aluminum water quality data for March a gap in data that needs to be acknowledged, especially given a SBEB was developed for Al. This would contradict earlier screening responses that there were no data gaps. 1. Please reassess if any gaps in data are present, summarize them in a table, outline how these gaps impacted your analysis, and if any additional data collection is needed. If creek 661 has a limited data set, I see this as a source of uncertainty that needs to be assessed and discussed when outlining potential environmental impacts. 2. Is this limited dataset restricted to aluminum or all parameters? 3. Why wasn't data collected in March?	1. See also the response to comment #73, whereby no significant gaps were identified in the baseline data in reference to identification of gaps that could be interpreted with data from other stations or months. For example, there were instances in which some monitoring stations did not have complete monthly water quality datasets and, to obtain a monthly background term, an average of the two shoulder months was used in the model. There were also instances identified where some stations had longer monitoring records than others. Specifically, WQ5 (Creek 661) background terms were applied to both WQ5 and WQCk661 model nodes, and WQ13 (Chedakuz Creek) background terms were applied to WQ13, ChedakuzMidway, and ChedakuzOutlet model nodes. 2. BW Gold does not see baseline data as a limited dataset. As identified in Section 5.4.12 of Chapter 5 (Modelling, Mitigation, and Discharges), no uncertainties related to the water quality model predictions were associated with gaps in baseline data collection. 3. Beginning in 2017, Stations in Creek 661 were sampled on a quarterly basis (and prior to this, the was sampled monthly beginning in May to December). However, beginning in 2021, with the development of the		BC ENV (Andrew Foster)	Lorax	ERM	Meghan/Tonia/Lesley	GM	Ready for Submission	GM; June 15	Ready for Publishing

96	CH6-Environmental Effects Predictions 6.3.4.3, Table 6.3-7	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Almost half (5/12) months of data for WQ5 on Creek 661 are missing in this assessment. I would consider this a gap in data that needs to be acknowledged. Please reassess if any gaps in data are present, summarize them in a table, outline how these gaps impacted your analysis, and if any additional data collection is needed. If creek 661 has a limited data set, I see this as a source of uncertainty that needs to be assessed and discussed when outlining potential environmental impacts.	The baseline T-N/T-P ratios shown in Section 6.3.4.3 are calculated from baseline data from 2016 to 2020. The phosphorus parameters orthophosphate and total dissolved phosphorus were monitored at WQ5 from May 2011 to December 2014. The phosphorus parameters orthophosphate and total phosphorus have been monitored at WQ5 since 2016. Therefore, monitoring of phosphorus parameters at WQ5 has occurred since 2011 (from which nutrient status may be estimated), and was not therefore identified as a surface water quality data gap. See also the response to comment #73, whereby no significant gaps were identified in the baseline data from which gaps could be interpreted with data from other stations or months. It is noted that baseline T-N/T-P ratios presented for WQ5 in Table 6.3-7 fall within the same magnitude as ratios calculated for other stations in the project area. The months for which baseline T-N/T-P ratios are not available can be generally inferred to fall within similar ranges as ratios shown for other stations. There are no known sources or activities in the Creek 661 watershed that would suggest baseline T-N/T-P ratios for those months would substantially differ from those calculated for other stations. 97	CH6-Environmental Effects Predictions 6.3.4.3, Table 6.3-7	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Please provide additional information on why WQ5 was removed from the data set and why nitrate may have been elevated in 2013 and 2014 compared to more recent years?	The baseline T-N/T-P ratios shown in Section 6.3.4.3 are calculated from baseline data collected from 2016 to 2020. It is acknowledged the sentence referred to in this comment is misleading and should be rephased to: "*Certain WQ5 samples collected in 2013 and 2014 contained elevated nitrate concentrations compared to samples collected in later years, which are* ***not reflected in*** *baseline ratios shown in Table 6.3-7* ." These values **are** reflected in T-N/T-P ratios calculated for WQ5 for Construction and Operations in Table 6.3-7, however (because those nitrate concentrations would be included in background model terms), and are drivers of the differences between the baseline and Construction/Operations ratios. The WQ5 2013 and 2014 nitrate concentrations referenced in the above statement (January 13, 2013: 0.12 mg-N/L; April 15, 2013: 0.16 mg-N/L; April 13, 2014: 0.27 mg-N/L) are higher relative to concentrations typically measured in other WQ5 baseline samples (median=0.009 mg-N/L). The reason for these small increases is unclear and may be attributed to natural variability. These sample concentrations fall at least one order of magnitude below the BC long-term water quality guideline. 98	Response to ENV Screening Comment 64 Table 3-1	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Why do T-Cr, T-Fe, and T-Zn concentrations increase substantially between WQ27 and WQ7	Elevated concentrations of certain metals at WQ7 compared to upstream stations were noted in the baseline surface water quality report (Application Appendix 2-H) but the cause of the elevated concentrations was not identified. Excerpt from Application Appendix 2-H: *"Guideline exceedances were also observed at the furthest downstream site on Davidson Creek (WQ7). Water quality guideline exceedances for total chromium, total copper, total iron, and total and dissolved zinc were observed at this site at frequencies greater than at the upstream sites. Mean monthly concentrations of total zinc exceeded the hardness-dependent BC water quality guideline at this site in several months (Figure 4.1-32). However, sample-specific of exceedances of total and dissolved zinc were restricted to those collected during 2011 - 2014 and analyzed by AMEC. The maximum measured zinc concentration at WQ7 (0.133 mg/L, June 2012) is greater than the 99th percentile of values for this site and is therefore an outlier. Previous assessments of elevated metals in lower Davidson Creek (AMEC 2013, ERM 2018) that included this data point likely overestimated baseline zinc concentrations at this site. Total chromium and total iron exceedances were not observed elsewhere in Davidson Creek. The cause of elevated metal concentrations at WQ7 was not identified."*		BC ENV (Andrew Foster)	Lorax		Meghan	GM	Ready for Submission	GM; June 21	Ready for Publishing
98	Response to ENV Screening Comment 64 Table 3-1	Effluent	BC ENV (Andrew Foster)		Jul 22, 2022	2	Follow Up		No	1. Is there any concern that data collected in 2011-2014 is less reliable than more recent data? 2. Is there a likely explanation why 2011-2014 data contained all the exceedances? 3. Are there any suspected sources of Cr, Fe, and Zn between WQ27 and WQ7? 101	CH6 - Environmental Effect Predictions 6.3.4.3, Figure 6.3-3	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	The aluminum SBEB has not been accepted and aluminum is not exempt from an effects assessment.	This comment is acknowledged. Dissolved aluminum was included in the aquatic effects assessment presented in Section 6.3 of the Application.		BC ENV (Andrew Foster)	Lorax		Meghan	GM	Ready for Submission	GM; June 17	Ready for Publishing
102	CH6 - Environmental Effect Predictions 6.3.4.3	Effluent	BC ENV (Andrew Foster)		Jun 01, 2022	1	New		No	Provide an effect assessment for POCs that exceed BC WQG in closure and post closure. Emphasis should be placed on those parameters (e.g., Cd) that exceed acute guidelines. ENV is concerned about the high concentrations of POCs predicted in closure and post closure and this may be factored into EMA permit decisions for the construction and operations phases.	Version 12b water quality model results (as presented in the Application) were computed on October 26, 2021. Since that time, BW Gold Ltd. and their consultants have revised the site-wide water balance model and the site-wide water quality model with a focus on mitigating Project changes for the Closure and Post-closure phases. Updated water quality predictions that reflected optimized water management and quality were presented to EMLI, ENV and First Nations on June 15, 2022, and are summarized in Lorax (2022), as part of BW Gold Ltd. (2022). Those documents demonstrate Project-influenced parameters that were previously predicted to exceed their BC WQGs in Closure and Post-Closure (Application version 12b) are no longer predicted to exceed BC WQGs. Please refer to BW Gold Ltd. (2022) for further information. References: BW Gold Ltd. 2022. Revised Base Case Closure and Post-Closure WQ Predictions. Prepared for ENV and EMLI. June 30, 2022. 105	Joint MA/EMA Permits Application Chapter 1, Table 1.3-5	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please clarify and include the consultant responsible for the design of the two Membrane Water Treatment Plants in this table.	Table 1.3-5 has been revised to include information regarding the consultant responsible for the design of the Membrane Water Treatment Plants: Consultant - BQE Water Area of Responsibility - Membrane Water Treatment Plant design		BC ENV (E.Rainy)	ERM		Tonia	RT	Ready for Submission	TD, Jun 28	Ready for Publishing
106	Joint MA/EMA Permits Application Chapter 3, Section 3.4.1.4	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	Please demonstrate that the discharge from the Davidson Creek Diversion System to Davidson Creek downstream of the Stage 1 Main Dam C is considered to be a clean water (non-contact) diversion, i.e.., does not require authorization under the Environmental Management Act.	The Davidson Creek Diversion System (DCDS) is a construction diversion to route runoff from the upstream catchment area of the Main Dam C around the construction work area. The Diversion Berm will impound natural flows (non-contact waters) upstream of the construction area and return them into the creek downstream of the construction area. The berm will be constructed with locally sourced materials. Overburden sourced for construction of the berm will undergo solid phase monitoring as described in the ML/ARD Management Plan prior to use to confirm that the material is NPAG with low metal leaching potential, which will limit the effect on water quality of the water diverted by the DCDS to downstream of the construction work area.		BC ENV (E.Rainy)	KP	Lorax	Dan/Greg/Meghan	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
107	Joint MA/EMA Permits Application Chapter 3, Section 3.4.2.6	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	The application is not clear on the sequence of commissioning and discharge to the receiving environment during construction. Please confirm if the TSF seepage water collected in the IECD in Year -1 will be pumped back to the Stage 1 TSF pond? Or will it be allowed to discharge via the spillway to Davidson Creek? Direct discharge to Davidson Creek may require authorization under the Environmental Management Act during this period if the FWR is not fully commissioned.	Any water collected at the IECD prior to waste placement in the TSF (i.e.. construction area runoff) will either be released via the spillway or otherwise managed by temporary pump systems and conveyed to the pond upstream of the Diversion Berm for release via the Davidson Creek Diversion System. Once PAG waste rock placement begins between Main Dam C and the Diversion Berm and water is allowed to accumulate to saturate the waste rock voids, water quality from any seeps discharging upstream of the IECD pond and at the IECD pond will be monitored to evaluate if seepage of contact water is contributing to the IECD. Any		BC ENV (E.Rainy)	KP		Cindy/Dan	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
108	Joint MA/EMA Permits Application Chapter 3,	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	The application states that during Year -1 the WMP will discharge to the Davidson Creek downstream of the (future?) FWR, and the open pit will be dewatering, treated and sent to the WMP (Chapter 5). If there is potential for mine site runoff (contact water) in the WMP, then discharge of the WMP directly to Davidson Creek may require authorization under the Environmental Management Act during this period. This potential source of effluent discharge to the receiving environment during construction	The WMP Discharge System will likely discharge flows to Davidson Creek prior to completion of construction at the FWR. The initial discharge from the WMP will effectively be a construction diversion similar to the Davidson Creek Diversion System (DCDS), but will manage flows from the mine area creek and convey them around the Main Dam C construction area. Any flows in excess of the WMP storage capacity that are not diverted by the WMP Discharge System will flow via the pipe outlet from the WMP towards the DCDS where		BC ENV (E.Rainy)	KP	Lorax	Cindy/Dan, Meghan	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
109	Joint MA/EMA Permits Application Chapter 3, Section 3.5.6.6	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	It is recommended that the applicant confirm with Environment and Climate Change Canada, prior to this application going to the ENV statutory decision maker, that the use of the Freshwater Reservoir as a collection point for both contact and non-contact water complies with the Metal and Diamond Mining Effluent Regulations (MDMER), which specifies that the owner or operator of a mine must "not combine effluent with water or any other effluent for the purpose of diluting effluent before it is deposited" (MDMER section 6).	BW Gold met with Environment and Climate Change Canada (ECCC) on October 20, 2021, to discuss the effluent discharge plan in the context of the Metal and Diamond Mining Effluent Regulations (MDMER). The presentation by BW Gold included the description of the proposed Final Discharge Points (as listed in Table 5.8-1 of Chapter 5) and flexibility of the water management process through Operations to meet site water demands (i.e.., mill water demands) and environmental objectives (i.e.., instream flow needs in Davidson Creek). On November 24, 2021, ECCC provided a response to BW Gold that they acknowledged the discharge plan as described in the presentation and had no further questions regarding the proposed Final Discharge Points for the Blackwater Gold Project.		BC ENV (E.Rainy)	ERM		Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
110	Joint MA/EMA Permits Application Chapter 5, Section 5.3.2	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	Related to the above comment, discrepancies have been noted in application sections regarding the timing and assumptions of the construction and commissioning of WMP and FWR. The water balance model assumes the FWR is commissioned and storing water as of Year -1, with the WMP constructed in Year -1, then storing and discharging to FWR. This is opposite of what is described in Chapter 3, where the WMP is constructed and commissioned prior to FWR. Please confirm the sequence of construction, commissioning and discharge timing of the WMP and FWR during construction (Years -2 and -1).	The water balance modelling presented in the Application was based on the assumed sequence of construction, which will continue to be refined in the lead up to construction of the project facilities. It is currently anticipated that the WMP will be constructed prior to the FWR as it is needed to divert flows for construction of Main Dam C and to temporarily store flows to facilitate and limit risk during certain aspects of FWR construction, such as diversion of Davidson Creek through the low-level outlets prior to substantial dam construction. The WMP will be constructed in Year -2 and the FWR in Year -1. Please see the additional discussion provided in response to Comment ID #108. 111	Joint MA/EMA Permits Application Chapter 5, Section 5.3.2.1	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please clarify when (i.e., mine year, month) the membrane and metals water treatment plants are assumed to be commissioned and operating to treat mine contact water? It is noted that the water balance model assumes that pit dewatering will be treated and discharged to the WMP in Year -1.	The Metals WTP is assumed to be commissioned in Year -1 to treat water collected from the open pit. The Membrane WTP is assumed to be available in Year 1 to treat surplus water in the TSF, if required.		BC ENV (E.Rainy)	KP		Cindy	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
112	Joint MA/EMA Permits Application Chapter 5, Table 5.3-3	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	It is noted that the units for the dry ore production in this table should be million tonnes per year (e.g., 15,000 tpd*12 months = 5.5 Mtpy) not million tonnes per day, as shown.	BW Gold acknowledges this comment. Thank you for pointing out the discrepancy and the correct units.		BC ENV (E.Rainy)	KP		Cindy	AT/KP	Ready for Submission		Ready for Publishing
113	Joint MA/EMA Permits Application Chapter 5, Section 5.3-3	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please clarify where the tailings consolidation seepage is assumed to contribute to in the water balance model? It is noted that this section mentions that it contributes to both the TSF ponds, as well being captured in the IECD and ECD (Section 5.3.3.7). What proportion of the consolidation seepage is assumed to contribute to each TSF pond, versus as seepage lost from the facilities?	The water balance model assumes 80% of the consolidation seepage in each TSF reports to the respective TSF Pond. The remaining 20% seepage from TSF C is assumed to flow in the subsurface beneath the dam. TSF C Consolidation seepage contributes to the IECD prior to Year 7, to the TSF D Pond from Year 7 to Year 22 when tailings is placed in TSF D, and to the ECD from Year 22 on. Approximately 10% of the TSF C consolidation seepage that flows in the subsurface beneath the dam is assumed to flow beneath the West Dam and report to the West Dam seepage sump starting in Year 10. The remaining 20% consolidation seepage from TSF D that does not contribute to the pond is assumed to flow beneath Main Dam D and contribute to the ECD. 114	Joint MA/EMA Permits Application Chapter 5, Section 5.6.3	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please provide the name and qualifications of the person(s) that completed the Best Achievable Technology assessments for the Metals WTP and Membrane WTP.	The assessment of best achievable technology for sulphate control (membrane WTP) was documented in a report titled "Sulphate Removal from Blackwater Tailings Storage Facility Supernatant and Seepage during Closure and Post-Closure" (BQE Water, 2017).		BC ENV (E.Rainy)	BQE	McCue	V. Sundar	GM	Ready for Submission	GM, June 16	Ready for Publishing
114	Joint MA/EMA Permits Application Chapter 5, Section 5.6.3	Effluent	BC ENV (E.Rainy)		Jul 22, 2022	2	Follow Up		No	Please provide the BAT report for the Membrane WTP, or otherwise indicate where in the application this report is located. Similarly, please provide the BAT report for the Metals WTP. For both, please indicate where the QP qualifications are listed for the authors of these reports.	Please see attached "R2_BC ENV_Comment ID 114.pdf" Additionally, Section 5.6.3 in Chapter 5 (Modelling, Mitigation and Discharges) does also include a BAT for both metals WTP and Membrane WTP Furthermore, two memos, by the water treatment plant designers, will be provided that presents additional details on the costing of alternative technologies in alignment with ENV's BAT factsheet. One of the memos will be provided by Aug 16th but the other will be provided from BQE on Aug 26th		BC ENV (E.Rainy)	BQE		GM	GM	Ready for Submission	GM; July 27	Ready for Publishing
114	Joint MA/EMA Permits Application Chapter 5, Section 5.6.3	Effluent	BC ENV (E.Rainy)		Aug 25, 2022	3	Follow Up		No	Awaiting response from BW Gold	Please see attachment "R3_ENV Comment ID 114.pdf"		BC ENV (E.Rainy)	BQE		V. Sundar	GM	Ready for Submission	GM; Sept 7	Ready for Publishing

115	Joint MA/EMA Permits Application Chapter 5, Section 5.6.3	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please provide further rationale for how the criteria were weighted in relation to relevancy to the project.	The criteria weight provides a number expressing the relevance/priority of the criteria sub-categories within the Project. A numerical scale spanning from 1 to 3 was developed at the beginning of the assessment for criteria weighting. This scale provided a quantitative means of prioritizing criteria sub-categories, with “1” being the least relevant to the Project and “3” being the most relevant. For example, Effectiveness within the Technical Factors was assigned a value of “2” because discharge limits are very strict, while Scalability was assigned “1” because it is not expected that a Water Treatment Plant (WTP) train will need to be scaled up or down (this refers to the ability of scaling each individual WTP train. It is not related to the planned staged installation of multiple trains, which is inherent to the design). As another example, under the Environmental Factors, Energy was assigned a value of “1” because power is readily available on-site, whereas Waste Management is a concern and therefore has been classified as “3” for criteria weight.		BC ENV (E.Rainy)	ERM	McCue	Tonia	RT	Ready for Submission	GM; June 15	Ready for Publishing
116	Joint MA/EMA Permits Application Chapter 5, Section 5.6.4.3	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Table 5.6-5 lists both Inlet Surge Ponds for the Metals WTP at a volume of 4600 m3, however the site-wide water balance model (Section 5.3.3.8) assumes Ponds 1 and 2 will be 4600 m2 and 4400 m3, respectively. Please confirm the correct proposed volumes for each of the Metals WTP Inlet Surge Ponds.	Table 5.6-5 incorrectly stated the Pond 2 Volume. The correct volumes are Pond 1 at 4600 m^2 and Pond 2 at 4400 m^2. The volumes were correctly stated in Appendix 5-G and were provided as the volume assumptions in both the water balance and water quality model predictions.		BC ENV (E.Rainy)	ERM		Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
117	Joint MA/EMA Permits Application Chapter 5, Section 5.6.4.3	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please describe how the discrepancy in volume assumptions for the Metals WTP Inlet Surge Ponds will affect the water balance/water quality model predictions in terms of discharge and receiving environment.	Please see the response to Comment 116. There is no discrepancy in volume assumptions for the Metals WTP Inlet Surge Ponds in either the water balance nor water quality model predictions.		BC ENV (E.Rainy)	ERM		Tonia	RT	Ready for Submission	AT, June 08	Ready for Publishing
118	Joint MA/EMA Permits Application Chapter 5, Section 5.6.4.3	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Table 5.6-4 summarizes the Metals WTP Installation Plan, which shows that treatment is expected to continue from Years 18 to 23. However, it does not appear that the site-wide water balance and/or water quality assume the benefit of metals treatment during this period (Figure 5.3-7). Please explain this discrepancy.	Table 5.6-4 is outdated. Treating water at the Metals WTP is not part of the proposed water management strategy after Year 18. All streams of water that received treatment at the Metals WTP in earlier years of Operations are directed elsewhere starting in Year 18. Water from the Upper Waste Stockpile and Open Pit contribute to pit filling. Water from the Lower Waste Stockpile is directed to TSF C.		BC ENV (E.Rainy)	Lorax	KP	Meghan, Cindy	GM	Ready for Submission	GM; June 15	Ready for Publishing
119	Joint MA/EMA Permits Application Chapter 5, Section 5.6.4.3	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please comment on how the discrepancy of duration of operating the Metals WTP assumed in the water balance/water quality model will affect the model predictions in terms of implications to the discharge and receiving environment.	The volume for Pond 2 is a typo in Table 5.6-5. Please refer to Table 2.1-3 of the original WTP Detailed Design Report in Appendix 5-G. The table indicates Pond 1 and Pond 2 have volumes of 4,600 and 4,400 m3, respectively, consistent with the assumption in the Water Balance Model. The pond volumes included in the water balance are correct and there is no implication to the discharge or the receiving environment.		BC ENV (E.Rainy)	Lorax	KP	Meghan, Cindy	GM	Ready for Submission	GM; June 15	Ready for Publishing
120	Joint MA/EMA Permits Application Chapter 5, Section 5.8	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please provide proposed maximum discharge flow rate for each of the sediment control ponds that corresponds to the proposed discharge limits provided in the application (i.e.., TSF Stage 1 SCP, Downstream Aggregate Borrow Area SCP, Camp Site SCP and Plant Site SCP)	The maximum discharge flow rates for each sediment control pond is as follows: •Stage 1 SCP: 91,000 m3/mo •Downstream Aggregate Borrow Area SCP: 31,400 m3/mo •Camp Site SCP: 19,000 m3/mo •Plant Site SCP: 14,600 m3/mo For updated Sediment Control Ponds (SCP) discharge locations, please see the attachment "R1_BC ENV_Effluent_Comment IDs 120,122,139,150,151,152.pdf"		BC ENV (E.Rainy)	KP		Jordan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing

121	Joint MA/EMA Permits Application Chapter 5, Section 5.8	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	The proposed maximum discharge rate from the FWR is listed as up to 1.68 m3/s, however the discharge factor form submitted with the EMA final application forms lists a proposed maximum discharge rate of 33.95 m3/s (88,000,000 m3/month). Please clarify the proposed maximum discharge flow rate for Freshwater Reservoir that corresponds to the proposed maximum concentration discharge limits in Table 5.8-4.	The discharge rate of 1.68 m3/s only considers the conveyance capacity of the FWR discharge pipes. The 88,000,000 m3/mo listed on the discharge factor form submitted with the EMA final application is a typo that includes an extra "0". The (correct) maximum discharge from the FWR is estimated at 8,800,000 m3/mo (3.3 m3/s) based on water balance modelling.		BC ENV (E.Rainy)	KP		Cindy	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
121	Joint MA/EMA Permits Application Chapter 5, Section 5.8	Effluent	BC ENV (E.Rainy)		Jul 22, 2022	2	Follow Up		No	Appendix 3-O, Section 3.6.3 states "two sets of FWR outlet works (a surface level outlet and low level outlet) consist of three identical pipes, each sized to individually provide the largest IFN of 0.56 m3/s, for a combined total of 1.68 m3/s." Please clarify if this means the total capacity of the FWR outlets (not including the overflow spillway) is a total of 3.36 m3/s (6 x 0.56 m3/s), which approximately equals the stated maximum discharge capacity estimated by the water balance model (3.3 m3/s)?	There are three outlet pipes from the reservoir. Each outlet pipe is designed to discharge up to 0.56 m3/s with a water surface elevation in the reservoir of 1,154.5 meters above sea level (masl), and the combined total design discharge from the FWR piped outlets is 1.68 m3/s at that pond elevation. The FWR outlets are capable of discharging up to approximately 6 m3/s at the maximum normal water surface elevation of 1,166 masl defined by the spillway invert. The discharge from the FWR spillway would be in addition to the discharge through the piped outlets. The maximum discharge from the FWR predicted with the water balance model of 3.3 m3/s could be discharged through the piped outlets or by a combination of the piped outlets and discharge via the spillway, depending on the water surface elevation in the reservoir and how the piped outlets are operated. For reference, design details of the low-level and surface level outlets are shown on Drawings C4310 to C4312 in Appendix D of Appendix 3-O (Water Management Structures Detailed Design Report) of the Application. 122	Joint MA/EMA Permits Application Appendix 5-B, Table E1.1.	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	In a format similar to Table E.1.1, please provide the base case model monthly flow discharge volumes for the TSF Spillway, Water Management Pond and all Sediment Control Ponds (i.e., TSF Stage 1 SCP, Downstream Aggregate Borrow Area SCP, Camp Site SCP and Plant Site SCP).	Please see attachment "R1_BC ENV Effluent Comment IDs 122 123.pdf". For updated Sediment Control Ponds (SCP) discharge locations, please see the attachment "R1_BC ENV_Effluent_Comment IDs 120,122,139,150,151,152.pdf"		BC ENV (E.Rainy)	KP		Cindy	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
123	Joint MA/EMA Permits Application Appendix 5-B, Table E5.2	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	The losses shown in this table for Years 50, 75 and 100 only add up to 5 Mm3/year, however the total losses are shown as 6.1 Mm3/year. Is there an additional loss from the TSF C that is not accounted for in this summary table? Given that the inputs during these years are greater than the losses, one would assume that there would have to be more overflow via the closure spillway to the receiving environment, which is a concern to ENV given the current base case predicted water quality exceedances of BC water quality guidelines in post-closure.	Please see attachment "R1_BC ENV Effluent Comment IDs 122 123.pdf".		BC ENV (E.Rainy)	KP		Cindy	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
124	Joint MA/EMA Permits Application Appendix 5-D, Section 4.2	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please provide a table which shows a comparison of the base case water quality model results (95th percentile values of VCC model) for the WMP and FWR to the Federal Metal and Diamond Mine Effluent Regulations maximum authorized concentrations. Sections 4.2.6 and 4.2.7 indicate that this internal screening was completed already however the results could not be located in this report.	Please refer to attachment "R1_ENV Comment IDs 124, 127.pdf".		BC ENV (E.Rainy)	Lorax		Meghan	GM	Ready for Submission	GM; June 21	Ready for Publishing
125	Joint MA/EMA Permits Application Appendix 5-D, Section 4.3.2	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	ENV would like to understand the source of water discharged to Davidson Creek during closure which results in exceedances of the short and long-term BCWQGs? For example, Section 4.3.2.5 notes that exceedances in post-closure for dissolved cadmium are due to TSF C pond overflow via the spillway, however the TSF spillway is not being utilized in closure.	Please refer to attachment "R1_ENV Comment IDs 125, 128 and 129.pdf".		BC ENV (E.Rainy)	Lorax		Colin	GM	Ready for Submission	GM; June 21	Ready for Publishing
125	Joint MA/EMA Permits Application Appendix 5-D, Section 4.3.2	Effluent	BC ENV (E.Rainy)		Jul 22, 2022	2	Follow Up		No	Based on the recently updated water balance model for closure/post-closure (v13e), does the overburden seepage pathway still report to the WMP during these mine phases, i.e., have any changes to the model resulted in different water quality predictions in Davidson Creek? Please provide updated figures that show the water quality predictions at WQ28 for D-Cd, T-Zn, T-Sb (Figure 2-1) and T-Zn loading plots for WMP (Figure 2-2) to confirm.	Please see attachment "R2_ENV Comment ID 125.pdf"		BC ENV (E.Rainy)	Lorax				Ready for Submission	GM; Aug 11	Ready for Publishing
126	Joint MA/EMA Permits Application Appendix 5-D, Section 4.3.2	Effluent	BC ENV (E.Rainy)		Aug 19, 2022	2	Follow Up		No	Awaiting response to EMLI comment 417 submitted August 5, 2022.	This comment is acknowledged.		BC ENV (E.Rainy)	Lorax	KP	Meghan/Cindy		Ready for Submission	GM; Aug 30	Ready for Publishing
126	Joint MA/EMA Permits Application Appendix 5-D, Section 4.3.2	Effluent	BC ENV (E.Rainy)		Aug 25, 2022	3	Follow Up		No	Submitted with ENV Round 2b comments: Awaiting response to EMLI comment 417 submitted August 5, 2022.	Please refer to attachment "R2_EMLI_Geoscience_Comment ID 417.pdf" submitted August 25, 2022, which addresses items a) through f) , h), and i) of Round 2 Comment 417. It is noted that responses to items g) and j) of Comment 417 were under development at the time of writing. Please refer to responses provided to corresponding Round 2b comments for further detail.		BC ENV (E.Rainy)	Lorax		Meghan		Ready for Submission	GM; Sept 16	Ready for Publishing

126	Joint MA/EMA Permits Application Appendix 5-D, Section 4.3.2	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	ENV has concerns regarding the discharge scenarios presented for closure and post-closure which represents unmitigated discharge to Davidson Creek. These discharge scenarios are shown to result in consistent predicted exceedances of BC water quality guidelines for protection of aquatic life (BCWQGs), which increases the likelihood of adverse effects downstream. More specifically, exceedances of short-term maximum (acute) BCWQGs for unmitigated effluent discharge does not align with ENV policy and more information is required as part of this application.	Version 12b water quality model results (as presented in the Application) were computed on October 26, 2021. Since that time, BW Gold Ltd. and their consultants have revised the site-wide water balance model and the site-wide water quality model with a focus on mitigating Project changes for the Closure and Post-closure phases. Updated water quality predictions that reflected optimized water management and quality were presented to EMLI, ENV and First Nations on June 15, 2022, and are summarized in Lorax (2022), as part of BW Gold Ltd. (2022).		BC ENV (E.Rainy)	Lorax	KP	Meghan/Cindy	GM	Ready for Submission	GM; June 23	Ready for Publishing
127	Joint MA/EMA Permits Application Appendix 5-D, Section 4.4	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please provide a table which summarizes a comparison of the Scenario 1 and Scenario 4 model inputs in terms of predictions for total seepage, unrecoverable seepage and estimated travel time to discharge location for the TSFs, Upper Waste Stockpile, Lower Waste Stockpile and LGO stockpile.	Please refer to attachment "R1_ENV Comment IDs 124, 127.pdf".		BC ENV (E.Rainy)	Lorax	KP	Meghan, Cindy	GM	Ready for Submission	GM; June 28	Ready for Publishing
127	Joint MA/EMA Permits Application Appendix 5-D, Section 4.4	Effluent	BC ENV (E.Rainy)		Jul 22, 2022	2	Follow Up		No	The response only partially addressed this comment. For clarity, I am seeking the predicted seepage concentrations and volumes from these mine facilities prior to reaching the receiving environment. Please provide the predicted water volumes and water quality concentrations of the total seepage and unrecoverable seepage estimated from the TSFs, Upper Waste Stockpile, Lower Waste Stockpile and LGO stockpile based on the recently updated water balance/water quality model (WB v13e, average climate with base case source terms) from construction to post-closure: Scenario 1 (revised base case) compared to the requested sensitivity scenario in Comment 130 (upper bound seepage rates for TSFs only).	Please see attachment "R2_ENV Comment ID 127.pdf"		BC ENV (E.Rainy)	Lorax	KP			Ready for Submission	GM; Aug 11	Ready for Publishing
128	Joint MA/EMA Permits Application Appendix 5-D, Section 4.4	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	Please provide similar plots to Figure 4-36 based on Sensitivity Scenario 4 to Average Climate Base Case results for TSF pond C, TSF pond D, Environmental Control Dam (ECD) and FWR. ENV would like to understand the impact of the increased seepage rates from the TSF to these facilities as well.	Please refer to attachment "R1_ENV Comment IDs 125, 128 and 129.pdf".		BC ENV (E.Rainy)	Lorax		Colin	GM	Ready for Submission	GM; June 21	Ready for Publishing
129	Joint MA/EMA Permits Application Appendix 5-D, Section 4.4	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	It is not clear from the sensitivity seepage scenario results and interpretation why the LGO stockpile was assumed to have the greatest influence on the predicted water quality at the WMP and WQ28, given that Sensitivity Scenario 4 assessed the potential upper bound seepage from the TSFs, Upper Waste Stockpile, and Lower Waste Stockpile as well. Please expand on this interpretation.	Please refer to attachment "R1_ENV Comment IDs 125, 128 and 129.pdf".		BC ENV (E.Rainy)	Lorax		Colin	GM	Ready for Submission	GM; June 21	Ready for Publishing
130	Joint MA/EMA Permits Application Appendix 5-D, Section 4.4	Effluent	BC ENV (E.Rainy)		Jun 01, 2022	1	New		No	ENV has noted relatively high uncertainty in the modelled seepage rates from TSF and has recommended a more conservative approach using upper bound seepage rates to assess impacts to the environment. Therefore, please complete an additional seepage sensitivity scenario that evaluates the upper bound seepage estimates for both total and unrecoverable seepage from the TSF. Please illustrate the predicted water quality results in figures for the TSF C pond, TSF D pond, ECD, FWR and WQ28 compared to Scenario 1. ENV would like to understand if the upper bound seepage rates result in predicted exceedances of the proposed effluent permits limits at the FWR under this more conservative scenario during construction and operations.	BW Gold acknowledges the noted uncertainty in TSF seepage and potential changes to predicted receiving environment water quality and quantity. This sensitivity will be conducted to address Comments 130, 142, and 417. The predicted water quality results of model output will be presented in a memorandum provided to MRC on or before July 20, 2022.		BC ENV (E.Rainy)	Lorax	KP	Meghan, Cindy	GM	Ready for Submission	TD, 15-Jun-22	Ready for Publishing
130	Joint MA/EMA Permits Application Appendix 5-D, Section 4.4	Effluent	BC ENV (E.Rainy)		Aug 19, 2022	2	Follow Up		No	It is noted that in Table 3-4 (Memo "R1_ENV Comment ID 130 and 417_FINAL_Vs.pdf") for the FWR results the frequency of exceedances of WQG-AL BC LT for D-Cd during operations is 0% for both Upper Seepage Sensitivity and Base Case (v13e). However, Figure 3-2 (upper plot) clearly shows exceedances of the WQG-AL BC LT during operations for both model cases (at least 4 occurrences). Please explain this discrepancy and provide a revised Table 3-4.	Please refer to attachment "R2_ENV Comment ID 130.pdf"		BC ENV (E.Rainy)	Lorax	KP	Meghan, Cindy		Ready for Submission	GM; Aug 30	Ready for Publishing
131	Appendix 2-B 2020 Hydrometeorology Report 2.2 Air Temperature	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Are the titles for Figure 2.5 and Figure 2.6 incorrect? The text indicates that these figures show the air temperature correlation between Vanderhoof (ECCC site 1098D90) and site climate stations; however, the figures titles reference other regional climate stations. Please confirm these figures show the relationship between site and Vanderhoof air temperature data.	Figure 2.5 and Figure 2.6 were mislabeled. The axis titles on the figures are correct.		BC ENV (Anna Ackerman)	KP		Jaime	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing
132	Appendix 2-B 2020 Hydrometeorology Report & Appendix 5-C Baseline Watershed Model Report 2.6 Evaporation	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	The evaporation characterization in the hydrometeorology report states that "the Thornthwaite model has been found to typically underestimate PET in semi-arid climates, such as that at Blackwater, and therefore the values likely represent a lower bound of PET estimates for site". This characterization is in conflict with the decision to use the Thornthwaite model to estimate PET within the baseline and LOM watershed models. Please indicate why the Thornthwaite model was deemed appropriate for the watershed model, but wasn't included in the site estimate of PET in the hydrometeorology characterization, which settled on the average of the estimates from the Hargreaves-Samani and the Penman-Monteith models. I understand that the two selected models predict PET in the winter months which was been interpreted as a potential sublimation estimate; however, annual sublimation (63 mm for Blackwater High) does not account for the full difference between the estimated PET for site (554 mm for Blackwater High) and the estimate from the Thornthwaite model	Please see attachment "R1_BC ENV Effluent Comment IDs 132-137.pdf".		BC ENV (Anna Ackerman)	KP		Jaime	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
133	Appendix 2-B 2020 Hydrometeorology Report 2.7.3 Wet and Dry Year Precipitation	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	The text indicates a normal distribution was selected to characterize the range of probable precipitation conditions at site. It is somewhat unusual to see the normal distribution selected to predict extremes for water resources dataset. I note elsewhere in this report that the Gumbel, GEV and Log Pearson Type III distributions were selected to character the range of snowpack, monthly discharge and 7-day low flows, respectively. What statistical tests were performed to confirm that the annual precipitation dataset are normally distributed? If another distribution is selected, is there a notable difference in the predicted wet and dry values?	Please see attachment "R1_BC ENV Effluent Comment IDs 132-137.pdf".		BC ENV (Anna Ackerman)	KP		Jaime	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing

134	Appendix 2-B 2020 Hydrometeorology Report 2.7.3 Wet and Dry Year Precipitation	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Please provide monthly wet and dry precipitation estimates for Blackwater High with a short description of how the estimates were developed.	Please see attachment "R1_BC ENV Effluent Comment IDs 132-137.pdf".		BC ENV (Anna Ackerman)	KP		Jaime	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
135	Appendix 2-B 2020 Hydrometeorology Report 3.2.2 Frequency Paired Regression and 3.2.3 Winter Runoff	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Please provide figures of all seasonal, monthly or paired station frequency pairing regression relationships used the develop the long-term synthetic records. This should include winter specific relationships as discussed in Section 3.2.3.	Please see attachment "R1_BC ENV Effluent Comment IDs 132-137.pdf".		BC ENV (Anna Ackerman)	KP		Jaime	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
136	Appendix 2-B 2020 Hydrometeorology Report 3.2.4 Long-term Discharge and Unit Runoff	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Please provide model fit statistics (NSE or similar) for the calibration and validation periods for the synthetic daily flow records.	Please see attachment "R1_BC ENV Effluent Comment IDs 132-137.pdf".		BC ENV (Anna Ackerman)	KP		Jaime	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
137	Appendix 2-B 2020 Hydrometeorology Report 3.3.2 Wet and Dry Return Period Flows	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	The mean annual results presented in Table 3.5 appear to be mean values for a year consisting of 12 months each at a given return period. For example, the mean annual flow presented for the 50 year return period appears to be the average of 50 year dry months (Jan through Dec). Typically, annual return period values are based on a distribution fit to an annual series and would be less extreme than the values presented. Please update the table to provide annual wet and dry return period flows.	Please see attachment "R1_BC ENV Effluent Comment IDs 132-137.pdf".		BC ENV (Anna Ackerman)	KP		Jaime	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
138	Appendix 5-B LOM Water Balance Model 4.4.2 TSF Seepage	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	The text references a predicted advective travel time for seepage from the TSF to reach Davidson Creek (>100 years). Were travel times predicted by the numerical groundwater model used in any way in the LOM watershed model?	All predicted seepage pathways were included in the LOM WBM, regardless of the simulated travel time. As discussed in the Water Quality Model Report (Appendix 5-D), seepage pathways with a median travel time less than 125 years were assigned seepage source terms. Seepage pathways with a median travel time greater than 125 years were not assigned source terms in the water quality model (they were considered inert).		BC ENV (Anna Ackerman)	KP		Cindy	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
139	Appendix 5-B LOM Water Balance Model 4.6 Waste	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Sections 4.61 and 4.62 describe runoff, toe discharge and seepage from the stockpile footprints contributing to sediment control ponds. Are these SCPs designed to settle sediment as per ENV guidance, like the SCPs that will discharge to the environment (e.g. Camp SCP) or are these SCPs more like collection ponds as this contact water is transferred and often treated (depending on mine phase)?	These are collection ponds where contact water is transferred via pump systems for treatment. For updated Sediment Control Ponds (SCP) discharge locations, please see the attachment "R1_BC ENV_Effluent_Comment IDs 120,122,139,150,151,152.pdf"		BC ENV (Anna Ackerman)	KP		Dan	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
140	Appendix 5-B LOM Water Balance Model 4.10 Tatelkuz Lake	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	I'm not sure I understand how streamflow in Chedakuz Creek was modeled. Are baseline streamflow at H5 and 15-CC represented as mean monthly flows in all model scenarios, including the variable climate model and the climate change model? For example, does "H5 Baseline" in the equation for H5 flows represent the same August flow for all years? Is the "Change in 1-661 flows" the change from the 17-year baseline period in the LOM watershed model? Please confirm or provide additional information	Baseline streamflows at H5 and 15-CC are represented as mean monthly flows in the base case average climate water balance model (i.e..., January flows are the same for all years). Baseline streamflow at H5 and 15-CC are represented as monthly average flows in the Variable Climate Case (VCC) water balance model (i.e..., each month of the historic series is unique) and each monthly flow occurs in the VCC Model consistent with the climate month it is associated with.		BC ENV (Anna Ackerman)	KP		Cindy	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing

141	Appendix 5-B LOM Water Balance Model 4.10 Tatelkuz Lake and Chedakuz Creek Flows	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Does this approach to modeling streamflow at H5 and 15-CC match measured data at these locations for the baseline period? If yes, please describe the comparison using figures or tables. If no, please explain why not.	Baseline flows at H5 and 15-CC are represented using the long-term synthetic series of flows at the respective hydrology stations (15-CC is represented using the synthetic flow series for the "L1-Outlet" station). A comparison between the measured streamflows and the synthetic streamflow series at the two stations is provided on Figures A.9 and A.19 in the 2020 Hydrometeorology Report in Appendix 2-B of the Application.		BC ENV (Anna Ackerman)	KP		Cindy	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing
142	Appendix 5-B LOM Water Balance Model 7.0 Seepage Sensitivity Analysis	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	ENV has noted relatively high uncertainty in the modelled seepage rates from TSF and has recommended a more conservative approach using upper bound seepage rates to assess impacts to the environment. Therefore, please complete an additional seepage sensitivity scenario that evaluates the upper bound seepage estimates for both total and unrecoverable seepage from the TSF (only). Please illustrate the predicted water quantity results using variable climate in figures for the TSF C pond (like Figure 6.19), TSF D pond (Figure 6.20), Metals WTP capacity (Figure 6.24), WMP (Figure 6.28, 6.29) and FWR (Figure 6.31, 6.32, 6.36). I would like to compare the predicted water management results under the upper bound TSF seepage rate scenario during construction and operations to similar figures developed for the base seepage case.	BW Gold acknowledges the noted uncertainty in TSF seepage and potential changes to predicted receiving environment water quality and quantity. This sensitivity will be conducted to address Comments 130, 142, and 417. The predicted water quality results of model output will be presented in a memorandum provided to MRC on or before July 20, 2022. Please see attachment "R1_ENV_Comment ID 147.pdf"		BC ENV (Anna Ackerman)	KP	Lorax	Cindy, Jen	AT/KP	Ready for Submission	TD, 15-Jun-22	Ready for Publishing
142	Appendix 5-B LOM Water Balance Model 7.0 Seepage Sensitivity Analysis	Effluent	BC ENV (Anna Ackerman)		Aug 19, 2022	2	Follow Up		No	Awaiting response to EMLI comment for IR 417 a) (August 5, 2022) and hopes the QP will provide schematics similar to Appendix D2 of Appendix 5-B showing the changes in water management associated with the Upper Bound TSF Seepage Scenario	Please see attachment "R2 BC ENVIEffluent Comment ID 142.pdf". 143	Appendix 5-B LOM Water Balance Model 9.3 Gaps and Uncertainties	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Under the section about freshwater needs to meet IFN in Davidson Creek, the last bullet states "model results suggest there is a 15-25% likelihood that the FWSS (or alternative source) will be needed to increase streamflow to meet IFN during any non-freshet month during the first five years of Operations". The text goes on to indicate that the FWSS isn't slated to be constructed and operational until Year 6 and no other source of make-up water has been explicitly identified. My understanding is that the water balance model logic allows the IFN to be met in all scenarios by assuming the FWSS is constructed and operational in Year -1. This logic allows the modelling team to calculate the likelihood the FWSS is needed, as indicated above. Based on my reading of Section 6.3.2 Mill Water Sources, there are no modelled scenarios where make-up water is needed for the process water before Year 11. However, all water quality results for the FWR and W28 assume that the IFN is met under all modeled climate conditions for Years 1 to 5, which doesn't align with the proposed mine plan. Please provide water quality predictions for FWR and W28 for the first five years from a scenario where the model logic is changed to match the mine plan - for Years 1-5, in dry conditions, no additional source of water is used to supplement flows and IFN targets are not met. Please provide these water quality results for two seepage cases: the base seepage case and upper bound seepage case from the TSF (only) as described in the request above.	This sensitivity will be conducted and include the two seepage cases identified. The results of model output will be presented in a memorandum provided to MRC on or before July 20, 2022. Update: Please see attachment "R1_ENV Comment ID 143.pdf"		BC ENV (Anna Ackerman)	KP	Lorax	Cindy, Jen	AT/KP	Ready for Submission	TD, 15-Jun-22	Ready for Publishing
144	Appendix 5-B LOM Water Balance Model Appendix B Baseline Flow Comparison	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Please provide the baseline flow comparison for 1-DC or indicate why it cannot be provided.	Please see attachment "R1_BC ENV Effluent Comment IDs 144 145.pdf".		BC ENV (Anna Ackerman)	KP		Cindy	AT/KP	Ready for Submission	KP, June 21	Ready for Publishing
145	Appendix 5-B LOM Water Balance Model Appendix D Detailed Schematics	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Many of the flow paths on these figures are numbered. Is there a missing table that provides additional flow path information based on these numbers? If so, please provide.	Please see attachment "R1_BC ENV Effluent Comment IDs 144 145.pdf".		BC ENV (Anna Ackerman)	KP		Cindy	AT/KP	Ready for Submission	KP, June 21	Ready for Publishing

146	Appendix 5-C 2020 Baseline Watershed Model 2.3.1 Temperature	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	The baseline watershed model text indicates that a synthetic air temperature record was developed from a relationship based on concurrent daily air temperature data at Blackwater High and Vanderhoof. The hydrometeorology report states that a synthetic air temperature record was developed using concurrent mean monthly data. The mean monthly values presented in Appendix A.1 (Appendix 5-C) and Table 2.2 (Appendix 2-B) are very similar but not the same. Please confirm if the synthetic dataset developed as described in the hydrometeorology report was used in the baseline watershed model, or if there are two similar synthetic air temperature records for Blackwater High.	The mean monthly temperature and precipitation values developed for the Hydrometeorology Report were used for the Baseline Watershed model. The mean monthly values presented in the two references differ slightly due to the range of dates included in the calculation of the mean. The mean monthly temperature and precipitation values presented in the Baseline Watershed Model Report (Tables A.1 and Table A.2 of Appendix A of Appendix 5-B) were calculated over the period of October 1980 through October 2020. The mean monthly temperature and precipitation values presented in the Hydrometeorology Report (Tables 2.2 and Table 2.9 of Appendix 2-B) were calculated over the period of January 1981 through November 2020.		BC ENV (Anna Ackerman)	KP		Cindy	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing
147	Appendix 5-C 2020 Baseline Watershed Model 2.3.1 Temperature	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	The baseline watershed model text indicates a summer and winter lapse rate were used to calibrate the model. The hydrometeorology report provides a relationship to estimate air temperature at Blackwater Low using data from Blackwater High (Figure 2.2 and surround text in Appendix 2-B). These data could be used to develop a site specific lapse rate. Was this relationship considered during watershed model calibration?	Yes, data from Blackwater High and Blackwater Low climate stations were considered when developing the lapse rate in the baseline watershed model. As discussed in Section 2.3.1 of the Baseline Watershed Model Report (Appendix A of Appendix 5-B), the temperature data collected from the stations indicates the lapse rate is seasonally dependent, and suggests an approximate decrease in temperature of 0.6°C per 100 m increase in elevation in the winter and a lesser decrease in temperature in the winter months, attributed to inversions. A lapse rate of 6°C/1,000 m of elevation is assigned to the baseline watershed model for the summer and shoulder months (April to October) and a lapse rate of 5°C/1,000 m was assigned during winter months.		BC ENV (Anna Ackerman)	KP		Cindy	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing
148	Appendix 5-C 2020 Baseline Watershed Model 2.3.2	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	The mean monthly precipitation values for Blackwater High presented in Appendix A.2 (Appendix 5-C) and Table 2.9 (Appendix 2-B) are very similar but are not the same (October, November and December are different). Please confirm if the synthetic dataset developed as described in the hydrometeorology report was used in the baseline watershed model, or if there are two similar synthetic precipitation records for Blackwater High.	Same response as Comment 146: The mean monthly temperature and precipitation values developed for the Hydrometeorology Report were used for the Baseline Watershed model. The mean monthly values presented in the two references differ slightly due to the range of dates included in the calculation of the mean. The mean monthly temperature and precipitation values presented in the Baseline Watershed Model Report (Tables A.1 and Table A.2 of Appendix A of Appendix 5-B) were calculated over the period of October 1980		BC ENV (Anna Ackerman)	KP		Cindy	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing
149	Appendix 5-C 2020 Baseline Watershed Model 5.0 Long-term Streamflow Estimates	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	The baseline watershed model was calibrated and validated to relatively short-term measured streamflow datasets from site. Were the long-term synthetic streamflow records used to calibrate or validate the long-term estimates provided in Appendix F? If yes, please describe the comparison using figures or tables. If no, please provide a rationale.	Please see attachment "R1_BC ENV Effluent Comment ID 149.pdf".		BC ENV (Anna Ackerman)	KP		Cindy	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
150	Chapter 5 Modelling, Mitigation and Discharges 5.9.2 Sediment Control Ponds	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Based on the proposed permit limits, ENV notes that the applicant is expecting to rely on dilution to meet BC WQGs downstream of the SCPs. My colleagues and I have asked some preliminary questions to clarify the proposed discharges and we will likely require additional information on this topic in subsequent rounds of review. [Comment]	BW Gold acknowledges this comment. For updated Sediment Control Ponds (SCP) discharge locations, please see the attachment "R1_BC ENV_Effluent_Comment IDs 120,122,139,150,151,152.pdf"		BC ENV (Anna Ackerman)	Lorax		Meghan	GM	Ready for Submission	GM; June 15	Ready for Publishing

151	Chapter 5 Modelling, Mitigation and Discharges 5.9.2.2 Plant Site Sediment Control Pond	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Please indicate where on Creek 505659 the Plant Site SCP is anticipated to discharge into the creek. Figure 5.9-2 shows the proposed location of the Plant Site SCP but does not indicate the discharge location during Construction. I understand from Section 5.8.3.2 that this pond has not been designed. I'm not certain what "subsequent regulatory application" will provide these designs as I understand the applicant is asking for regulatory approval to discharge from this pond in this current application. ENV needs to understand where this discharge is proposed in order to consider permitting this discharge.	The Plant Site SCP will not have a discharge to surface water during any phase of the Project. During Construction phase, the Plant Site SCP will continue discharging to ground via the rapid infiltration basins (as already permitted for Early Works), with expansion of the rapid infiltration basins if needed. During Operations, water from the Plant Site SCP will either be used for mining activities or transferred to the Water Management Pond. For updated Sediment Control Ponds (SCP) discharge locations, please see the attachment "R1_BC ENV_Effluent_Comment IDs 120,122,139,150,151,152.pdf"		BC ENV (Anna Ackerman)	BWG	ERM/KP/Lorax	Travis	TD	Ready for Submission	TD, Jun 28	Ready for Publishing
152	Chapter 5 Modelling, Mitigation and Discharges 5.9.2.4 Camp Site Sediment Control Pond	Effluent	BC ENV (Anna Ackerman)		Jun 01, 2022	1	New		No	Please indicate at where on Creek 505659 the Camp Site SCP is anticipated to discharge into the creek. Figure 5.9-2 shows the proposed location of the Camp Site SCP but does not indicate the discharge location. Further it appears from this figure that the Camp Site SCP is closer to an unnamed tributary to the Creek 661 mainstem. A similar impression is made by Figure 2.7-1 in Chapter 2. Again, I understand from Section 5.8.3.4 that this pond has not been designed; however, ENV needs to understand where this discharge is proposed.	The camp site SCP is planned to discharge to 378,545 E, 5,896,015 N in Creek 146920. For updated Sediment Control Ponds (SCP) discharge locations, please see the attachment "R1_BC ENV_Effluent_Comment IDs 120,122,139,150,151,152.pdf"		BC ENV (Anna Ackerman)	BWG	ERM/KP/Lorax	Travis	TD	Ready for Submission	TD, Jun 23	Ready for Publishing
153	Appendix 2-J	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	Comment	No	The Groundwater Baseline Report (Appendix 2-J) has assembled hydrogeological information from exploration boreholes, test pits, piezometers, and monitoring wells over several years of site investigations and describes hydrogeological aspects needed to conceptualize groundwater conditions and interactions with neighbouring surface waters. However, as noted in several of the Application documents, there is currently incomplete understanding of surficial sediments within Davidson Creek valley, specifically as it relates to seepage losses and potential transport pathways from the Tailings Storage Facility (TSF) to the downstream environment.	Thank you for your comment. As discussed in the 2020 Groundwater Baseline Report (Appendix 2-J of the Application), the extent and thickness of the surficial deposits along Davidson Creek valley will be assessed during construction of the embankments. A low permeability core zone within each Main Dam will extend into the lower permeability subgrade material at depth with the excavation of cut-off trenches.		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
154	Appendix 3-L	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	Application documents (i.e.. the Dam Site Characterization Report, Appendix 3-L) recommend additional investigations to progressively refine the geological model near and downstream of the TSFs. The recommended investigations should be designed such that they improve hydrogeological understanding to support future seepage modelling and groundwater interception (if required). To that end, please describe the specific groundwater investigation efforts (installation and testing of large diameter pumping wells, for example) that will provide additional information on the extent and connectivity of permeable sediments and groundwater interception	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 154 155 159 169.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 28	Ready for Publishing
155	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	The conceptual hydrogeological model described in the Numerical Groundwater Modelling Report (Appendix 5-F) is limited to current (greenfield) site conditions. Conceptualising the influence of proposed mining activities (i.e.. open pit dewatering, lateral and vertical seepage from the TSFs, etc...) on groundwater flow is typically assessed using analytical equations before developing a numerical model. Please describe the general influence of proposed mining on groundwater flow in the vicinity of the project and how analytical results (seepage from the TSFs and pit inflows) compare to numerical model results during mine operations.	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 154 155 159 169.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 28	Ready for Publishing
156	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	Please provide information on the process to develop/interpolate hydrostratigraphic surfaces from observed borehole data, the spatial distribution of control points for each surface, and identify where surfaces may have increased uncertainty.	Please see attachment "R1_BC ENV Hydrogeology Comment ID 156.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission		Ready for Publishing

157	Appendix 2-J	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	Information Requirement	No	The Groundwater Baseline Report describes several areas where loss of drill water occurred when higher permeability zones, such as faults, were intercepted within Davidson Creek valley. Faults, however, are only considered for the deposit area and rationale for their exclusion elsewhere is needed. Please provide rationale why faults were not considered below the TSF and the Davidson Creek valley (and excluded from the sensitivity analysis).	Based on the available information, faults in the Davidson Creek valley are not noted to influence groundwater flow. Details of each fault zone intercepted during drilling is summarized in Table 2.2 of the Groundwater Baseline Report (Appendix 2-J). Drillhole circulation losses were not noted to have occurred within fault zones while drilling in the TSF area. Hydraulic conductivity test results completed in possible fault zones encountered in drillholes yielded results in the typical range of values observed for tests completed in bedrock; with the exception of one fault zone encountered in drillhole GT13-20 which yielded an elevated hydraulic conductivity in a response test (2E-6 m/s) and packer test that may be related to the fault (9E-7 m/s). Drillhole GT13-20 is located near the TSF D south abutment. A standpipe piezometer installed in the fault at GT13-20 reports a water level that is only 5 mbgs; the relatively shallow water level does suggests the screen is not installed in a permeable pathway. Even though a fault may consist of broken rock and exhibit permeability at the local scale it may not have hydraulic continuity along its length due to pinch out. Groundwater levels in the Davidson Creek valley were able to be calibrated sufficiently without the		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan	AT/KP	Ready for Submission	KP, June 30	Ready for Publishing
158	Appendix 2-J	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	Clarification	No	The inferred hydraulic behaviour of faults is not clear. Please provide clarity on whether faults are interpreted to have low or high permeability	As discussed in the response to Comment ID 157, available information for faults encountered in the TSF area does not support that any one particular fault influences groundwater flow. The results of permeability testing together when considered with water level data available in fault zones does not suggest any of the identified faults in the TSF area are conduits for groundwater flow. Faults in the TSF area are therefore interpreted to have lower permeabilities similar to the host bedrock. Available data for faults in the deposit area indicate that faults act as conduits for groundwater flow and as barriers to flow. Faults in the deposit area locally compartmentalize groundwater flow as evidenced by measured water levels that differ by 70 m across a fault located in the southern portion of the deposit. Other available data indicates faults in the deposit area are permeable, such as observations of drill water circulation losses while drilling that were attributed to fault or shear zones. Often however, drillholes advanced in the central portion of the deposit encountered intervals of broken bedrock with higher permeability and it was difficult to attribute the influences of permeability to any single structure or separate from the bulk broken nature of the bedrock. Faults in the deposit area are interpreted to have both high and low permeabilities; faults with low permeability have been interpreted along the north and south boundaries of the deposit and faults with higher permeability have been interpreted in the central portion of the deposit. The higher permeability faults in the central portion of the deposit may not exert much influence on		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan	AT/KP	Ready for Submission	KP, June 30	Ready for Publishing
159	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	The conceptual hydrogeological model does not describe the potential effects of open pit blasting on local scale hydraulic conductivity. Impacts of blasting and load removal can extend well beyond the pit shell and influence local hydraulic properties of host rock and groundwater flow patterns. Given that the proposed open pit is located near several drainage divides, please describe how the effects of potential pit shell overbreak may influence hydraulic heads, groundwater flow patterns, pit flooding and its post-closure fluxes to the neighbouring drainages.	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 154 155 159 169.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 28	Ready for Publishing
159	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jul 22, 2022	2	New	Information Requirement	No	Thank you for providing the information about the potential effects of the pit shell over-break on groundwater conditions, as well as the numerical groundwater update related to the pit lake/groundwater sink simulations. Given that the pit lake flooding will be accelerated using mine water from several sources, hence the pit will be a major storage facility of mine water, the following is seeking additional clarity and information about the hydrogeological concepts and evaluations related to the potential hydraulic connections between the pit lake water and downslope drainages located east of the proposed pit	Please see attachment "R2_ENV Hydrogeology Comment IDs 159 163.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, Aug 16	Ready for Publishing
160	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	Please provide information on the code selection process and why the selected code was deemed to be best suited to address the objectives.	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 160-168.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
161	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	Please provide rationale for assigning larger recharge to competent bedrock than to lacustrine units despite the assigned hydraulic conductivity of lacustrine units being much larger than the assigned hydraulic conductivity of competent bedrock.	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 160-168.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing

162	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	Drain boundary conditions were used to represent the stream network and gaining vs. losing/neutral stream reaches are presented in a subsequent figure. Drain boundary conditions allow one-directional flow from the subsurface to streams and therefore do not allow flow from streams to the subsurface. It would be prudent to consider the use of general head boundary conditions, stream boundary conditions, river boundary conditions, or the streamflow routing package to allow bi-directional flow between the stream and subsurface. Although drain boundary conditions may be suitable to meet the current objectives of the numerical model, they are not suitable to simulate surface water and groundwater interactions and modification may be required for more detailed future studies. For example, the current configuration of the numerical model only allows pit dewatering to entrain groundwater that would have otherwise discharged to a stream but not pull stream water into the subsurface towards dewatering wells. Similarly, utilizing the unstructured grid capabilities of MODFLOW-USG would allow increased refinement near hydrologic features. Please address these observations and clarify whether the specified boundary conditions adequately represent water interactions.	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 160-168.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
163	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	The numerical model is missing information and discussion regarding mass balance error. It is not possible to evaluate the model, and therefore its predictive capability, without this information. Please provide a mass balance table summarizing simulated inflows and outflows for the model, each boundary condition, etc... for the baseline, mine operations and closure conditions.	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 160-168.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
163	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 30, 2022	2	Follow Up	Information Requirement	No	The provided table is great and shows good mass balance but the reviewer is wondering how the flow that goes into the drain boundary conditions is differentiated between flow to the streams and flow to the open pit. It would be helpful to split those out for each mine stage. Further to the above, it would also be helpful to be able to compare the flow into the streams for each	Please see attachment "R2_ENV Hydrogeology Comment IDs 159 163.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, Aug 16	Ready for Publishing
164	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	The calibrated baseline numerical model presents a normalized root mean square error of 3.0% but no other calibration statistics are provided. Please provide additional calibration statistics including minimum residual, maximum residual, mean residual, root mean square error, and the correlation coefficient.	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 160-168.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
165	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	It is difficult to assess the adequacy of calibration with the D1 series of figures in Appendix 5-F. It is industry standard to depict hydraulic head targets with both observed and simulated groundwater elevations. Please update the D1 figures (i.e.. magnitude/sign of residuals and their location in relation to boundary conditions).	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 160-168.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing

166	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	The groundwater model is calibrated to simulated baseflow from a watershed model as secondary calibration targets. The "baseline watershed model was calibrated to four gauging stations located on Davidson Creek and there is a higher confidence in the watershed model baseflow estimates. Simulated baseflows at the outlet of Creek 705 vary by about 50 percent from the watershed model estimates" (Page 39, Appendix 5-F). Please provide rationale for comparing simulated baseflow from the groundwater model to simulated baseflow from the watershed model rather than directly to the observed/analytical baseflow data considering the watershed model appears to be calibrated to only four locations and has discrepancy with observed/analytical data	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 160-168.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
167	Appendix 5-F	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	The "model calibration to simulated baseflows is considered suitable for the purpose of the model" (Page 39, Appendix 5-F) but the relative percent difference between the watershed model baseflow and groundwater model baseflow ranges to more than 100% at one station and by more than 10% at the vast majority of stations. Please provide additional information on why this was considered suitable for the purpose of this model considering that simulating baseflow reduction for predictive scenarios is an objective of the study.	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 160-168.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
168	Figure 2.9, Appendix 2-J	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	The surficial geology and landform map provided in the Groundwater Baseline Report (Figure 2.9, Appendix 2-J) indicates that the depositional environment at and downstream of the TSF footprint is highly complex. Hydraulically conductive sediments appear to underly large portions of the TSF footprint, which may restrict water retention in the TSF and produce high seepage losses (both lateral and vertical). In contrast, the C series figures in the Numerical Groundwater Modelling Report notably simplify the depositional environment near the TSF. Such simplification raises concerns regarding how well the surficial geology is translated into the numerical model and its predictive capability for seepage analysis. Furthermore, given that the distribution, extent, and continuity of surficial sediments near the TSF are poorly understood, and hence are unlikely to be adequately represented in the numerical model, the modelled seepage rate results may be considerably uncertain. This observation is supported by the model sensitivity analysis, which indicates substantially increased seepage losses	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 160-168.pdf".		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
169	-	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	QP Response Required	No	The groundwater model indicates high seepage capture efficiency (>90%) by the seepage collection system and only small quantities of unrecoverable seepage are predicted to migrate to the downstream receiving waters. Although the predictions may be supported by particle tracking, in reality, seepage interception ponds are usually much less efficient. Experience from mines in similar topographic and geologic settings suggests that seepage plumes that develop below tailings dams expand beyond downstream interception ponds and reclaim dams. The possibility of larger quantities of seepage bypassing the collection system is further complicated by the current uncertainty in the hydrogeological understanding of the Davidson Creek valley. Accordingly, please describe how the additional geological investigations downslope the TSF footprint will be designed to inform potential groundwater interception measures	Please see attachment "R1_BC ENV Hydrogeology Comment IDs 154 155 159 169.pdf". 170	Appendix 9-E	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	Clarification	No	The Mine Site Water and Discharge Monitoring and Management Plan (Appendix 9-E) describes contact water discharge from the toes of both the Upper and Lower Waste Stockpiles. Please clarify whether foundation underdrains will be installed at the base of these facilities to collect infiltrated water and control pore water buildup within the stockpiles.	As discussed in Appendix 3-Y, non-contact water is to be diverted around the facility to natural drainages that flow to the WMP. Surface contact water will be managed in a manner that allows for safe containment and control. NAG waste rock will be selectively placed along the base of the piles to convey infiltrated water and control pore water buildup within the stockpiles. All contact water is to be collected and conveyed by collection channels to a collection pond where flows can be pumped to the Metals WTP influent pond for treatment.		BC ENV (R.Martinka, C. Donnelly)	KP		Cindy	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing

171	Appendix 9-E	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	Information Requirement	No	Monitoring groundwater levels near an open pit during its dewatering is commonly used to evaluate potential seepage pathways after closure once a pit lake develops. There is only a single groundwater monitoring location proposed east of the open pit (once MW12-11 is destroyed by the advancing pit). Please comment if a single well installation will be adequate to monitor groundwater levels east of the pit considering it is located near drainage divides and pit shell overbreak may affect groundwater flow patterns.	Water levels surrounding the open pit will be monitored during advancement of open pit mining to collect data to support characterizing the hydrogeology surrounding the open pit. Water levels will be monitored at the following sites surrounding the Open Pit as stated in Section 7.3.4.3 of Appendix 9-E: MW12-03D, DK/MW-05, and GT-A. Water levels will also be monitored in the 18 proposed observation wells planned to be located around the perimeter of the open pit, 10 of which are proposed to be installed in the east sector of the pit. The locations of these observation wells are shown on Figure 6.1 of the Open Pit Slope Design Report in Appendix 3-B. Water levels will continue to be monitored at MW12-04D/S until construction of the Upper Waste Stockpile encroaches on the location of the monitoring wells sometime in or after Year 11.		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan	AT/KP	Ready for Submission	KP, June 30	Ready for Publishing
172	-	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	Information Requirement	No	The closure plan for the open pit prescribes assisted flooding that may take about 25 years to complete. This may produce long term risks and liabilities for the mine closure, particularly related to the pit lake water quality and its post-flooding discharges to the downstream receiving waters. Please describe potential options and considerations to shorten the flooding time frame and maximize the filling rates (for example, additional water supplied from Tatelkuz Lake).	The water management strategy already includes directing surplus water from the ECD, TSF, and Upper Waste Stockpile to the Open Pit from the end of open pit mining in Year 18 through Closure to assist with pit filling. Directing additional sources of water to the Open Pit could be considered an option if downstream IFN flows can be maintained. Additional sources of water at the Project that could be considered to assist with pit filling include runoff from the Lower Waste Stockpile, water directed to the WMP, and water diverted around the TSF via the North Diversion System.		BC ENV (R.Martinka, C. Donnelly)	KP		Cindy	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing
173	-	Hydrogeology	BC ENV (R.Martinka, C. 174	-	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	Information Requirement	Yes	Existing and proposed monitoring wells near the LGO and two waste stockpiles appear to be clustered around the LGO Collection Pond. Based on the topography and particle tracking presented in the Numerical Groundwater Modelling Report, some groundwater monitoring should be considered along the topographic depression between the LGO and Lower Waste Stockpile. Please address this comment and provide the relevant rationale.	The location recommended by the reviewer is a good site for a monitoring well. The location of the proposed nearby monitoring well MW-R is downgradient of material initially placed in the LGO in Year 1, as shown on Figure 7.3 6 of Appendix 9-E and is intended to monitor for seepage from the LGO Stockpile and/or Collection Pond. Access to this area is difficult due to the wet conditions and limited work area and may not be possible until after construction of the Collection Pond. Ability to access the area downslope of the LGO Stockpile and Collection Pond to install monitoring sites will be assessed during the proposed site investigation in 2022. However, the area identified by the reviewer may be a better location than MW-R for a monitoring well. The valley immediately downslope of the LGO Stockpile is well-defined and contains a drainage, and as a result, if any potential seepage bypasses the LGO Stockpile liner and collection system it will discharge to the drainage that flows to the Water Management Pond. Surface water sampling at the Water Management Pond will be conducted monthly as described in the Mine Site Water and Discharge Monitoring Plan (Appendix 9-E) and may be a more effective method for identifying potential seepage bypass than monitoring wells located downgradient of the stockpile footprint that are restricted to monitoring groundwater along isolated flow paths.		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan	AT/KP	Ready for Submission	KP, June 30	Ready for Publishing

175	-	Hydrogeology	BC ENV (R.Martinka, C. Donnelly)		Jun 01, 2022	1	New	Information Requirement	No	The Mine Site Water and Discharge Monitoring and Management Plan describes installations of several new monitoring wells during the construction phase of the mine to facilitate tracking of groundwater evolution between future mine water sources and downstream receiving waters. In support of advancing hydrogeological conceptualization and modelling at the mine, new monitoring wells should be tested for hydraulic conductivity. Please clarify if hydraulic testing will be completed for new installations.	Yes, hydraulic conductivity testing (response testing) is planned at monitoring wells installed during construction of the project.		BC ENV (R.Martinka, C. Donnelly)	KP		Jordan	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
176	Section 4.1.2.2 Post-mine Land Capability	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	Section 4.1.2.2 Post-mine Land Capability states that the ecohydrological model updates will be submitted with the Five Year Mine Plan and Reclamation Program update. EMLI supports updates informed by reclamation trails.	BW Gold acknowledges this comment and confirms that its intention is to submit updates to the ecohydrological model, where applicable, to Five Year Mine Plan and Reclamation Program updates. Updates to the Five Year Plan will be informed by ongoing research and updates to management practices and standards. 177	Table 4.1-5 RCP Ecosystem Summary for Vegetation and Wildlife –Comparing Pre-disturbance Ecosystems with Projected Post-closure Ecosystems	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Table 4.1-5 RCP Ecosystem Summary for Vegetation and Wildlife –Comparing Pre- disturbance Ecosystems with Projected Post-closure Ecosystems predicts the changes likely to occur from of the project. Please clarify if the changes in ecosystems predicted by the model are expected to support focal species life requisites post closure.	The Post-Closure Ecosystems are expected to support focal species life requisites. While it is not possible to entirely replicate the pre-development landscape and its ecosystems as a result of the substantive landscape-level changes involved in the mining process, substantial effort has gone into iterative attempts to reduce differences between pre-development and post-mining conditions. BW Gold will actively look for opportunities to continue this reduction throughout LoM through reclamation research trials and other initiatives, addressing the challenges outlined in section 4.1.4. Despite differences between pre-development and post-closure conditions, the established ecosystems on the post-mining landscape will provide substantial value for intended land uses and focal species.		EMLI (Liz Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 22	Ready for Publishing
178	Section 4.2.1.4 Reclamation-materials Balance	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Section 4.2.1.4 Reclamation-materials Balance explains a slight deficit in glaciofluvial soil with adequate mixed-parent-material surface soil and OVB to address the deficit on sites targeted for glaciofluvial coverage. It is understood that the estimate is conservative and therefore adequate glaciofluvial may be available at closure. However, if the mixed- parent-material soil is used where glaciofluvial is optimal, please comment on how this change may impact target ecosystems.	The mixed-parent-material mineral soil has a greater AWSC (approximately 120 mm/m versus 75 mm/m), which translates to an increase in soil moisture regime. Depending on the topography and underlying waste material, this can shift the site series to a wetter site series (e.g., ESSFmv1-02 to ESSFmv1-03). This would result in minor shifts in the overall post-closure ecosystem distribution. For example, a deficit of 0.02 Mm^3 corresponds to an area of 4 ha assuming a cover depth of 50 cm, so 4 ha of the 2,100 ha of disturbed area (0.2% of the area) may have a wetter soil moisture regime. Note that the ecosystems projected for both glaciofluvial and mixed-parent-material mineral soil are present in the pre-mine landscape and provide valuable habitats.		EMLI (Liz Murphy)	IEG		Justin Straker (IEG)	TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
179	Section 4.2.1.6	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	Section 4.2.1.6 states “Road construction during the Early Works disturbance resulted in the creation of windrows along road edges. These windrows will be transferred to soil stockpiles for use in reclamation. Any new roads that are created during the life of the Project will be salvaged and stockpiled (i.e.., not stored in windrows) to ensure that this material is not degraded or lost.” This may form a permit condition	Noted.		EMLI (Liz Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 22	Ready for Publishing
180	Section 4.2.2.4	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Section 4.2.2.4 indicates that the Pit Lake is likely to require treatment; stratification of pit water is later discussed with a goal to improve surface quality. Section 4.7.7.2 Post- closure Ecosystems and Habitats indicates that riparian and aquatic vegetation is planned for the pit area. Please clarify if the goal of reclamation for the areas influenced by the pit water is to create habitat or deter wildlife and specify how the goal of reclamation in the areas adjacent to the pit links to the mitigations mentioned in the Appendix 9-H Wildlife (and Caribou) Mitigation and Monitoring Plans at closure. (Specifically, deterrence.)	The pit lake surface water quality model projections are not a guarantee of the eventual water quality, and recognizing this, BW Gold (see section 4.7.7.1) plans to conduct research trials on amendments that could improve surface water quality and thereby reduce WTP requirements of water pumped from the pit to maintain prescribed surface water levels. The final prescribed pit lake water level will determine the configuration of the littoral zone. As surface water quality improves, the potential for natural re-establishment of vegetation in some areas of the littoral zone may occur, and reduced use of wildlife deterrence mechanisms could result. Monitoring of		EMLI (Liz Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 21	Ready for Publishing
181	Section 4.2.3.2	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification and Potential Permit Condition	Yes	EMLI understands a reclamation trial is planned to begin in year 1 of mine operations. Section 4.2.3.2 states “Seed collection programs in areas adjacent to the mine site, with LDN and UFN involvement, should be initiated to improve availability of target species, and seedlings from this stock will have the added benefit of being adapted to local climate conditions. Small-scale nursery and/or field trials as part of the reclamation research program are recommended to test germination rates and vigor of seedlings grown from collected seeds well before the date at which seedlings are required for large-scale reclamation planting (Section 4.2.5.1, Vegetation and Cover Trials).” Please provide a schedule for when these activities, including a course nursery or construction plans, will commence and a rationale	BW Gold plans to construct the mine site nursery in Y-1 / Y+1, and to establish initial field trial sites at the same time (Section 4.2.5 and 4.2.5.1). Seed collection programs and propagation programs will be initiated at this time to ensure that early reclamation trial knowledge is available for progressive reclamation opportunities, or in the unlikely event of site care and maintenance early in mine life. (Note this would be required to support the Y+3 reclamation scenario).		EMLI (Liz Murphy)	ERM	IEG	Rolf	RT	Ready for Submission	AT, June 21	Ready for Publishing
182	Section 4.3 Trace Element Uptake in Soils and Vegetation	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Section 4.3 Trace Element Uptake in Soils and Vegetation states “Results of the updated baseline sampling are not yet available, but a cumulative baseline report that includes data from all soil, plant, and berry samples from 2011, 2012, and 2021 will be prepared, including statistical summaries, early in 2022, subject to data availability.” EMLI assumes the updated information will be submitted with the Annual Reclamation Report, please clarify if this is correct	Sampling completed in 2021 was completed outside of the Certified Project Description boundaries. The last paragraph in Section 4.3 indicates that the results of this monitoring will be reported in CFMP (Country Foods Monitoring Plan) reports. A cumulative soil and vegetation baseline report that includes 2011, 2012, and 2021 data is in final preparation and is planned to be available during application review. This report will also be submitted with the Annual Reclamation Report.		EMLI (Liz Murphy)	Entia	ERM	Lesley	RT	Ready for Submission	RT; June 19	Ready for Publishing

183	Section 4.2.6 Reclamation Monitoring	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Potential Permit Condition and Clarification	Yes	Section 4.2.6 Reclamation Monitoring states that "Details of the monitoring plan, including criteria and indicators of reclamation success and associated measures and thresholds will be developed as more detailed reclamation planning and implementation is conducted, and based on ongoing collaboration with Aboriginal Groups. The reclamation research and monitoring programs will be integrated into the overall design." Please provide a date for when these details will be provided	Appendix 4-G "Possible Reclamation Success Criteria" provides a table listing "Potential ecosystem characteristics that could be included during or after initial placement, or to evaluate reclamation success". The proposed table has been shared with Indigenous groups and agencies in the joint MA-EMA Application for review and BW Gold welcomes comments and suggestions to continue to refine the proposed table and criteria.		EMLI (Liz Murphy)	ERM		Rolf	RT	Ready for Submission	RT; June 22	Ready for Publishing
184	Section 4.7.3	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Section 4.7.3 states "The profile of the waste stockpiles has been engineered to minimize planar surfaces and create sigmoidal slopes with 20% gradient toe slopes, 30 to 40%-gradient short main slopes, and rounded crests similar to natural landforms." Although this information provides landform design objectives, please clarify site preparation activities planned for the waste stockpile slope faces.	Planned site preparation methods are described in Section 4.2.1.7 (Reclamation-materials Replacement) as copied below. "Placement of reclamation materials will be accomplished using large equipment, primarily bulldozers and loaders with shovels, in a manner that generates microtopography to improve microsites for plants and reduces erosion. Equipment operators should not seek to create planar surfaces with exact material depths, rather it is preferable to have surface roughness and undulations. The 'rough and loose' technique (Polster 2009), ripping, surface loosening with an excavator bucket, or other means of site preparation may be applied if additional decompaction is necessary or further creation of microtopography is desired. The following considerations will inform selection of appropriate decompaction and/or site preparation techniques:		EMLI (Liz Murphy)	IEG		Justin Straker (IEG)	TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
185	Section 5.3 of the End Land Use Plan	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	Section 5.3 of the End Land Use Plan indicates that community engagement will commence in year 3 to inform updates to the plan required in year 5. This may form a permit condition	BW Gold acknowledges the comment, and wishes to clarify that year 5 means the end of the first 5 year detailed mine plan, otherwise referred to as Y+3. Hence, the commitment to community engagement is intended to commence in Y+1, the first year of mine operations (Y-2 and Y-1 are construction years).		EMLI (Liz Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
186	Appendix 4-H: Trace Element Uptake in Soils and Vegetation	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Appendix 4-H: Trace Element Uptake in Soils and Vegetation indicates that one sedge species was sampled. Please clarify if additional aquatic or wetland vegetation will be included in future samples and provide a rationale with the response (why or why not).	Sampling outside of the Mine Site is proposed under the Country Foods Monitoring Plan (CFMP; EAC condition 41). Under the CFMP, monitoring of three vegetation and three berry species is proposed, including sedge (Carex spp.) and willow (Salix spp.) species. Willow species are also typically associated with wet soils or wetlands. In addition, under the Aquatic Effects Monitoring Plan (AEMP), periphyton (aquatic plant) sampling is proposed in Davidson Creek and Creek 661 (and other waterways). Both the CFMP and AEMP include adaptive management plans that allow for additional sampling to be implemented (both in terms of locations and types of media sampled) if unexpected changes due to the Project are identified. For reclamation monitoring, while a majority of the reclaimed Mine Site area will be upland terrestrial areas, wetland vegetation will be sampled where such ecosystems exist. As indicated in Section 4.3, "Target vegetation species will be synchronized between reclaimed areas and outside the CPD boundary where possible", thus sedge and willow species will similarly be targeted.		EMLI (Liz Murphy)	Entia	IEG	Lesley, ??	RT	Ready for Submission	RT; June 19	Ready for Publishing
187	Appendix 4-E Detailed Post-Closure Mapping Methodology	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Please clarify how site preparation is considered in the model summarized in Appendix 4-E Detailed Post-Closure Mapping Methodology.	Site preparation is not included as a component of the ecohydrological model, but is considered as an additional or post-modelling factor. While site preparation can certainly influence reclamation success by, for example, creating protective microsites and reducing erosion, there are limited mechanisms that would contribute to altering soil moisture regime (SMR). It is possible that capturing additional snow may retain sufficient additional moisture to shift SMR, but this is likely only in scenarios with large-scale site preparation--to the extent that the site preparation is forming meso-topography.		EMLI (Liz Murphy)	IEG		Justin Straker (IEG)	TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
188	-	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Please clarify which inputs to the ecohydrological model are considered ground truthed from baseline data and which inputs will be verified in the field to refine and confirm model outputs.	Waste rock: not ground-truthed--a hypothetical particle-size distribution and organic-matter/nutrient content were used and model inputs will need to be refined through sampling. Overburden: samples from two geotechnical drill holes were available; however, further sampling during operations will collect organic-matter and nutrient data, as well as verify if these samples represent the variability of overburden across the full site. Surface soil: model inputs representing surface soil were based on field measures (texture and coarse-fragment content) and lab data (organic-matter and nitrogen content). While these samples encompass the spatial extent of the site, further sampling that includes laboratory analysis of soil particle-size distribution will inform model refinements. Additional detail on data assumptions that require validation and further refinement through sampling are		EMLI (Liz Murphy)	IEG		Justin Straker (IEG)	TD	Ready for Submission	TD, 14-Jun	Ready for Publishing

189	Appendix 4-J Temporary Shutdown Section 2.1	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Comment	No	Appendix 4-J Temporary Shutdown Section 2.1 entitled Legislation, lists 10.6.1 and 10.6.2 as relevant sections of the Health, Safety and Reclamation Code for Mines in BC. EMLI notes that 10.6.9 will also apply to any specific closure scenario.	BW Gold acknowledges the comment, and the section of the code (10.6.9, On-going Management Requirements) will be added to the Care and Maintenance Plan (EAC Condition 11). 190	Section 6 of the Surface Erosion and Sediment Control Plan	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Section 6 of the Surface Erosion and Sediment Control Plan includes a list of generic construction activities and potential effects. Please comment on any site-specific higher risk areas known at this time.	Baseline terrain stability ratings (completed in 2013; Appendix 2-D of the Application) indicate that the majority of the Project study areas are rated as stable (Class rating I, II, and III) in terms of slope stability and accelerated erosion, with unstable (Class rating V) or potentially unstable slopes (Class rating IV)occurring locally. Terrain stability classes (based on potential for surface erosion to occur following disturbance) are quantified within the RSA in Table 3.2-4 and illustrated in Annex 6 of Appendix 2-D. The majority of the RSA and mine site area have been assigned Terrain Stability Class II (stable). Unstable terrain (Class V) occupies less than 1% of the mine site study area, and is generally located along over-steepened river banks where the slope is actively being undercut by fluvial action, or very steep slopes where previous stability issues were identified (see Section 3.3.6 and Annex 6 of Appendix 2-D).		EMLI (Liz Murphy)	ERM	KP	Stephanie	RT	Ready for Submission	rt; June 20	Ready for Publishing
191	Section 6.2 of the Surface Erosion and Sediment Control Plan	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Section 6.2 of the Surface Erosion and Sediment Control Plan indicates the Revised Universal Soil Loss Equation will be used to guide controls implemented and that “erosion potential will be established for disturbance areas and included in the design criteria of Issued for Construction (IFC) Drawings.” Please clarify when this information will be available for the disturbance areas within this Application area.	The soil erosion potential is an estimate of the quantity of soil that could be removed from a construction area due to erosion and transportation by unconcentrated surface water flow. The soil erosion potential is not calculated for the entire mine site - it is calculated for individual work areas, since the factors that are used to calculate the erosion potential (type and depth of soil, slope length, slope steepness, vegetation, and "support practice factor"), as well as construction activities, are highly variable. The "support practice factor" refers to measures that will be implemented to reduce the amount and rate of the runoff water by modifying the flow pattern, grade, or direction of surface runoff, thereby reducing the amount of erosion (i.e.., those outlined in Section 7 of the SECPCP (Appendix 9-A of the Application)). The soil loss estimates will be supplemented with judgement and experience of the QP (i.e.., the Environmental Manager or delegate), so that the erosion potential assessment is appropriate for each individual work area. The overall objective of the SEPSCP is to manage surface water flow within the project footprint so as to prevent sediment-laden runoff from potentially impacting adjacent watercourses. The plan outlines measures and procedures to be followed - it is not meant to be prescriptive, as erosion potential will vary by work area. A QP (i.e.., a Certified Professional in Erosion and Sediment Control (CPESC)) will direct selection and installation of BMPs, and monitoring will be conducted as outlined.		EMLI (Liz Murphy)	KP		Jim/Stephanie	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing
192	Surface Erosion and Sediment Control Plan Figure 8-5	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Surface Erosion and Sediment Control Plan Figure 8-5: Tailings Storage Facility Mine Area Creek Diversion, illustrates a collection ditch and a diversion ditch. The collection ditch appears to discharge to a relatively level area above a silt fence upslope of riparian areas and the diversion ditch discharges below the silt fence. Please clarify controls to mitigate scour and erosion that are planned for discharge sites based on site specific conditions and expected flow volumes and velocities.	All diversion ditches will discharge through a stabilized outlet designed to handle the expected runoff velocities and volumes from the ditch without scouring (Section 7.3.3 of Appendix 9-A). A runoff collection ditch intercepts contact water runoff from disturbed areas and diverts it to a stabilized area where it can be effectively managed - collection ditches are used within construction areas to collect runoff and convey it to appropriate sediment control measures (Section 7.3.4 of Appendix 9-A). Energy dissipators are described in Section 7.3.7 of Appendix 9-A as pools used to dissipate the energy of fast flowing water and control erosion at the outlet of a ditch or a conduit passing water to minimize erosion of natural stream channels downstream. These measures will be field-fit and approved by the Environmental Manager (EM) or a delegate.		EMLI (Liz Murphy)	KP		Jim/Stephanie	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing
193	Appendix 9-B Soil Management Plan	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	Appendix 9-B Soil Management Plan did not include a storage location for hydrocarbon contaminated soil. The Application indicates that contaminated soil will be removed for treatment at closure. Please confirm whether treatment of hydrocarbon contaminated soil during operations will be considered. If a landfarm is not planned, please clarify plans to store hydrocarbon contaminated soils on site during operations.	Appendix 9-B of the Soil Management Plan is correct in that there is presently no landfarm identified for the mine site. Hydrocarbon contaminated soil resulting from activities at the mine site will be excavated and stored in lined containment at the waste management facility and periodically trucked from the site when sufficient volumes warrant. BW Gold will continue to consider whether treatment of hydrocarbon contaminated soil during operations is		EMLI (Liz Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
194	Appendix 9-C Construction Environmental Management Plan	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	Yes	Appendix 9-C Construction Environmental Management Plan (CEMP) indicates that the plan submitted can be “adapted to support” discrete construction but that “standalone construction environmental management plans will be developed for specific components in conjunction with Issued for Construction plans and the construction execution plan.” Based on the construction activities listed in Table 6-1 Preliminary Project Construction Schedule, please clarify which projects (or group of projects) will include submission of a standalone CEMP.	A standalone Construction Environmental Management Plan (CEMP) has been developed for the early works activities and for the transmission line. BW Gold does not anticipate submission of standalone CEMPs for any activities taking place within the Mine Site.		EMLI (Liz Murphy)	ERM		Jesse	RT	Ready for Submission	RT; June 14	Ready for Publishing

194	Appendix 9-C Construction Environmental Management Plan	Reclamation	EMLI (Liz Murphy)		Jul 22, 2022	2	Follow Up	Potential Permit Condition	Yes	Based on the quote in EMLI's round 1 comment, site-specific plans will be prepared for "specific components" with IFCs. The June 30th response indicates additional site-specific CEMPs are not expected to be required. Please clarify if, when and for which components site-specific CEMPs are planned to be submitted with IFCs.	BWG contends that the current Appendix 9-C CEMP is sufficiently comprehensive and detailed to provide the necessary requirements for all construction sites. EPCM contractors, may, however provide their own environmental management plans based on the construction plan for specific components, and issues which are to be managed at individual sites, at which time BWG will review the contractors' plan for alignment with, at a minimum, the CEMP requirements including the 20 supporting management plans and 10 Standard Operating Procedures (Table 2-1). At this time, EPCM contractors are not engaged at the stage where BWG has received information on whether construction contractors will be submitting additional specific plans for individual construction sites listed in Table 6-1.		EMLI (Liz Murphy)	ERM		Tonia/Mark	RT	Ready for Submission	AT, Aug 09	Ready for Publishing
195	CEMP Section 7 Environmental Constraints Mapping	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	CEMP Section 7 Environmental Constraints Mapping indicates that mapping updates will be made to incorporate baseline information from 2021 and 2022. a.EMLI understands that the mapping updates will inform site-specific CEMPs. Please provide a date for when the updates will be submitted and clarify if the updated mapping is expected to be submitted with the site-specific CEMPs.	Mapping updates will be incorporated as required through the annual review process as described in Section 18 (Plan Revision) of the Construction Environmental Management Plan (CEMP). Where updated mapping is relevant to site-specific CEMPs (e.g., Transmission Line) or discipline-specific management plans (e.g., Wetland Management and Offsetting Plan), the mapping will be provided in those plans.		EMLI (Liz Murphy)	ERM		Jesse	RT	Ready for Submission	RT; June 14	Ready for Publishing
196	CEMP Table 8	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	CEMP Table 8-1 entitled Risk Management Ratings includes a decision hierarchy and general information on mitigations proposed for sensitive areas and species. The actual decisions, timing and mitigations based on this process will be required for site-specific CEMPs.	All Construction Environmental Management Plans (CEMPs) prepared for the Project will include the specific timing and mitigations that adhere to the Risk Management Ratings indicated in Table 8-1 of the CEMP.		EMLI (Liz Murphy)	ERM		Jesse	RT	Ready for Submission	RT; June 14	Ready for Publishing
197	Appendix 9-F Vegetation Management Plan	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Appendix 9-F Vegetation Management Plan indicates that the federal Decision Statement requires a white bark pine management plan. Please provide the standalone white bark pine management plan.	The Whitebark Pine Management Plan is not required as part of the BC permitting process. It is required by the federal Decision Statement Condition 8.20. The draft plan was submitted to ECCC, Indigenous groups and BC FLNRORD for review on February 23, 2022 as required by the Decision Statement. Comments were received from FLNRORD on March 29, 2022. While the Plan does not form part of the application and BW Gold is still finalizing the plan based on feedback received, BW Gold will provide the final plan directly to the reviewer for information and to support future engagement on reclamation.		EMLI (Liz Murphy)	ERM		Jesse	RT	Ready for Submission	RT; June 14	Ready for Publishing
197	Appendix 9-F Vegetation Management Plan	Reclamation	EMLI (Liz Murphy)		Jul 14, 2022	2	Follow Up		No	It is EMLI's understanding that proposed research trials in the "SBSmc3 will incorporate whitebark pine to assess viability for planting on xeric and subxeric sites." As whitebark pine is a component of reclamation, the management plan should be included with other management plans for the project. Please provide the plan for future reference and understanding.	BW Gold acknowledges the comment. The Whitebark Pine Management Plan was completed and approved in accordance with the federal Decision Statement Condition 8.20 will be an integral part of the mine site reclamation plan (see Section 4.2.3.2 and Section 4.2.5.2 of Chapter 4). The details of the whitebark pine management measures supporting reclamation research and progress on its implementation will be recorded in the Annual Reclamation Report. The mine site will have all management plans on file as part of the EMS, regardless provincial or federal requirements. While the Plan does not form part of the application and BW Gold is still finalizing the plan based on feedback received, BW Gold will provide the final plan directly to the reviewer for information and to support future engagement on reclamation.		EMLI (Liz Murphy)	ERM		Tonia	RT	Ready for Submission	RT; Aug. 14	Ready for Publishing
198	Table 8.2-1 of Appendix 9-O Air Quality and Fugitive Dust Management Plan	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Table 8.2-1 of Appendix 9-O Air Quality and Fugitive Dust Management Plan indicates that planned best management practices for dust control at the Low Grade Ore stockpile will be forming low horizontal piles and spraying water on hot dry days. Given the timeframe the stockpile is expected to be in place, please clarify how consistent application of water will occur when required.	For daily management of the active tip head, water trucks will be used for dust suppression along the traffic areas and the dump face. For management of fugitive dust off the larger stockpile, a sprinkler system would be installed for problem areas. Water would be utilized from the collection pond and pumped to feed the system. For large flat areas exposed over the longer term, a chemical treatment (calcium or magnesium chloride) would be utilized.		EMLI (Liz Murphy)	ERM		Andres	RT	Ready for Submission	AT, June 18	Ready for Publishing

199	Table 8.2-1 of Appendix 9-O Air Quality and Fugitive Dust Management Plan	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Table 8.2-1 of Appendix 9-O Air Quality and Fugitive Dust Management Plan indicates that planned best management practices for dust control on upper and lower waste rock piles include watering stockpiles on dry windy days or applying calcium chloride or magnesium chloride in freezing conditions. Please clarify how spraying will occur on these sites.	For daily management of the active tip head, water trucks will be used for dust suppression along the traffic areas and the dump face. For management of fugitive dust off the larger stockpile, a sprinkler system would be installed for problem areas. Water would be utilized from the collection pond and pumped to feed the system. For large flat areas exposed over the longer term, a chemical treatment (calcium or magnesium chloride) would be utilized. 200	Appendix 9-H Section 3.1 Deterrence of Wildlife	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Clarification	No	Appendix 9-H Section 3.1 Deterrence of Wildlife states that wildlife will be deterred from some areas such as the TSF, pit lake and control ponds. Please clarify how deterrence will occur and in what areas specifically this will be required post closure	Section 3.10 Deterrence of Wildlife includes subsection 3.10.3 with details on when and how deterrence will be necessary, based on an ecological risk assessment and water quality monitoring data. Deterrence requirements post-closure will also be based on these data and assessments, therefore it is not possible to currently say which areas will require deterrence in the future. If deterrence of any Project waterbodies is required post-closure, methods will be determined in the same manner as described in Section 3.10.3, with deterrents selected based on the types of species present, operations experience on site, and the success of the mitigation completed during operations.		EMLI (Liz Murphy)	ERM		Greg/Rolf	RT	Ready for Submission	RT; June 14	Ready for Publishing
200	Appendix 9-H Section 3.1 Deterrence of Wildlife	Reclamation	EMLI (Liz Murphy)		Jul 14, 2022	2	Follow Up	Potential Permit Condition	Yes	Thank you for clarifying. Please summarize how the potential for wildlife deterence in these areas post closure is captured in the bond.	The Reclamation Liability Cost Estimate spreadsheets Tab 4- Monitoring oultines the categories and level of effort for environmental monitors (technical, independent 3rd party, and First Nations) to fulfill environmental monitoring activities, including wildlife monitoring, during post-closure. All staff on site during post-closure will be trained on wildlife observations and records maintenance. The Reclamation Liability Cost Estimate "Summary" sheet includes an amount of 15% of post-closure costs for Contingency as required by EMLI which can be applied to physical works/actions required to be undertaken should wildlife monitoring results post-closure indicate that wildlife deterrence measures become necessary.		EMLI (Liz Murphy)	ERM		Greg/Rolf	RT	Ready for Submission	RT; Aug. 14	Ready for Publishing
201	Joint MA/EMA Permits Application Chapter 4	Reclamation	EMLI (Liz Murphy)		Jun 01, 2022	1	New	Information Requirement	No	The shapefiles provided with the Application were used to draft a Permitted Mine Area and EMLI notes that linear features (pipeline, access road and airstrip) and the mine disturbance area were included for a total of 3321.9 ha. Updated shapefiles for the area proposed to be considered under the Mines Act Application specifically are required. That is, shapefiles including only the areas for which this Application is seeking approval under the Mines Act.	A total of 4286.1 ha is the proposed Permitted Mine Area to be considered for approval under the Mines Act Application. BW Gold will provide the EMLI reviewers and other reviewers the following shapefile attachment: "R1_EMLI_Reclamation_PMA Shapefiles_Comment ID 201" which proposed Permitted Mine Area for which this Application is seeking approval. As noted by the reviewer, the previous mine disturbance area provided to EMLI (3321.9 ha) considered only		EMLI (Liz Murphy)	ERM		Jesse/Tonia	RT	Ready for Submission	RT; June 22	Ready for Publishing
202	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Comment/ Information Requirement	No	EMLI released the Interim Major Mines Reclamation Security Policy on April 5, 2022. EMLI acknowledges that Artemis developed the RLCE for the Application before the policy was released, but may choose to consider the policy at this time. If Artemis chooses to apply the policy guidance, an updated reclamation liability cost estimate and supporting documentation must be submitted for review. Artemis should clearly document the updates as a result of implementation of the policy guidance in the response.	BW Gold acknowledges that the Blackwater Reclamation and Closure Liability Cost Estimate was prepared and submitted prior to EMLI releasing the Interim Major Mines Reclamation Security Policy on April 5, 2022. BW Gold is reviewing the interim policy and will determine how the company proposes to incorporate elements of the policy, and if so, reflect these changes in the updated Reclamation and Closure Liability Cost Estimate.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	At, June 19	Ready for Publishing
203	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Comment	No	The review comments below generally apply to both the Year +3 and the LoM cost estimates. Please consider each review comment and provide a response for, and update, each cost estimate, as required. If the review comment only applies to one of the cost estimates, and this is not specified in the review comment, please include that information in the response	BW Gold acknowledges the comment and each response specifies whether the response pertains to the Y+3 or LoM cost estimates.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
204	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	EMLI's review of reclamation liability cost estimates is over a 100-year time period, not a 100-year post closure time period. For example, for the Year +3 scenario, costs for post closure monitoring and maintenance requirements are only required for 95 years, while for the LoM scenario costs for post closure monitoring and maintenance requirements are required for a subsequent 75 years. Please update the cost estimate for the 100-year period (Year +98).	This response pertains to the Y+3 and LoM cost estimates. The Y+3 and LoM cost estimates have been updated in conformance with the EMLI direction on time periods to incorporate for the cost estimates.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
205	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	EMLI understands that revegetation costs are currently based on 1500 stems/ha and future estimates will be based on results revegetation trails with native seed and plugs. Please include a summary and cost estimate breakdown for native seed collection, propagation, and nursery construction as outlined in Chapter 4 of the Application.	This response pertains to the Y+3 and LoM. The nursery construction capital cost will be realized by Y+2 and therefore does not need to be included in the cost estimate, in the same manner that other mine construction capital costs are not included in the RCLE. The cost estimate for native seed collection, propagation and nursery operation and maintenance costs will be included in the final updated RLCE.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
205	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Information Requirement	No	EMLI notes the nursery decommissioning costs have been added to Y+27 LoM. The costs applied for Y+3 are 0 and the memo states that "The nursery will be closed early in the Y+3 early closure scenario, timing depending in part, on success of early seed collection and propagation programs." EMLI believes the nursery woud be required, to support revegetation trials in C&M and/or if closure occurred following the C&M phase, to complete reclamation as per the current plan. Please include these costs or clarify where they are applied and/or the rationale for not including them. [Information Requirement]	BW Gold notes this discrepancy and has updated Section 5.2.2 of the RLCE Memo and notes it is the same cost as LoM: $100,000 which are now added to Y+3 T-2 Infrastructure for the cost of closing the nursery.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
206	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	Yes	EMLI understands that the project does not include onsite treatment of hydrocarbon contaminated soils. Off-site disposal costs of all contaminated soil is estimated to be 250 m3 in Year +3. Please provide a rationale for this estimate.	This response pertains to Y+3 and LoM. - The rationale for the estimate of 250 m3 of contaminated soil to be treated in Y+3 and LoM is based on the following assumptions. - The following locations are potentially the most likely locations where hydrocarbon contaminated soils may result from the activities typical for the site and may have residual contamination (contamination generated during construction and operations /closure is addressed at the time of contamination):		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
207	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	a. The rate for contaminated soil is based on the 2018 EMLI Regional Reclamation Bond Calculator soil remediation rate which was designed with smaller scale operations in mind. Please adjust the rate and provide a breakdown and rationale including location of soil treatment facility and current transportation costs.	This response pertains to Y+3 and LoM. - The BW mine site presently does not identify a soil treatment facility. A decision on whether to identify, permit and operate a future soil treatment facility has not been made. - If, or until, such time as an on-site soil treatment facility is established, BW Gold will collect and transport contaminated soil for offsite treatment. Detailed breakdown of costs are included in the RLCE update. See also the responses to ID#206 and ID#210.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing

207	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Clarification	No	EMLI notes the cost applied to off site treatment of contaminated soils for Y+ 3 is $423,279. Please clarify how this cost is applied to the period between Y+3 and closure (additional costs for this period do not appear to be included in the LoM spreadsheet). [Clarification]	The RLCE Memo has been updated in Section 6 to provide details for Y+3 and LoM Contaminated Soils management. The details for these costs have been included in App 12 for LoM. Costs for the assessment and handling of contaminated soils is based on a Phase 1 and Phase 2 assessments and soils rehandling.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
208	Appendix 5-B Unit Cost 2021	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Clarification	No	The tab App 5-B Unit Cost 2021 includes inflation calculations. EMLI notes that these rates may not have been used for all cost calculation (e.g., contaminated soil T-2 Infrastructure tab). Please clarify if inflation rates were applied to Y+3 costs.	This response pertains to Y+3 and LoM. BW Gold has reviewed rates and inflation calculations and applied inflation rates to cost inputs where applicable. Where the Blue Book 2022 input cost rates were used for equipment rates, no additional inflation rates were applied.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
209	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please update inflation calculations to current rates.	This response relates to Y+3 and LoM. - BW Gold has reviewed and updated inflation calculations to current rates, and noted the source and metric applied for the inflation adjustment(s).		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
210	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please provided costs for a contaminated sites assessment.	This response relates to Y+3 and LoM. - A detailed cost breakdown and assumptions for undertaking Phase 1 and Phase 2 contaminated sites assessment is included in the updated RCLE, and additional overview discussion is provided in the updated accompanying submission Memo.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
210	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Clarification	No	Please indicate where specifically (tab, cell, section) the detailed breakdown is located. For example the memo mentions cost quotes for treatment off site. Please indicate where those are applied. Please also clarify how costs for operational contaminated soil off site treatment are seperate from treatment estimates as a result of Phase 1 and Phase 2 contaminated site assessments. [Clarification]	The RLCE Memo has been updated in Section 6 to provide details for Y+3 and LoM Contaminated Soils management. The details for these costs have been included in App 13 for Y+3 and App 10 for LoM. Costs for the assessment and handling of contaminated soils is based on a Phase 1 and Phase 2 assessments and soils		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
211	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please provide a summary and estimated cost breakdown of the additional scientific and engineering work required to complete a site characterization assessment and development of a final closure plan for the existing open pit.	The response pertains to LoM. The scope, assumptions and cost breakdown of undertaking the work to develop the final closure plan for the open pit, consistent with the closure strategies described in Section 4.7.7 of the MA-EMA application, are included in the updated RLCE.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM	KP	Rolf, Greg	RT	Ready for Submission	AT, June 19	Ready for Publishing
211	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Information Requirement	No	This information could not be located. The section of the RLCE memo referenced in the table of concordance appended to the memo (4.2) does not exist. Please provide the requested costs or indicate specifically where they can be located in the updated submission. [Information Requirement]	The Open Pit closure plan will be an integral part of the following plans developed during the final 5 years of the LoM: Final 5 Year Detailed Mine Plan; Final End Land Use Plan; and Mine Closure and Reclamation Plan. Reference to End Land Use Plan requirement (with open pit closure as an example component) is referenced in Section 5.3, and the cost breakdown listed on Tab T-4 Monitoring		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
212	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please clarify where costs for monitoring and maintenance of erosion and sediment control infrastructure is applied.	The response pertains to both Y+3 and LoM. Site Maintenance and Equipment costs are listed in Tab T-5 "Maintenance and Security". Further description and rationale for the estimated costs will be provided in the updated RLCE.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
212	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Information Requirement	No	Appendix A of the memo indicates that Tab-5 includes costs for monitoring and maintenance of erosion and sediment control infrastructure. A line item for these costs was not found in the Y+3 or the LoM spreadsheets. Please provide the costs or indicate specifically where and how these costs are applied. [Information Requirement]	Maintenance staff and equipment on site, roads and ditches, control by design, maintenance schedule are noted in Section 8 and 9 of Memo. Indicated in Tab T-5; there are four full-time personnel on-site 5 days a week. There primary tasks include but are not limited to:, monitoring and maintenance of geotechnical instrumentation and reclamation, camp		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
213	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please include costs for dust control.	The response pertains to both Y+3 and LoM. The costs for dust control have been calculated and included in the updated cost spreadsheet and assumptions documented in the cover memo.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
213	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Information Requirement	No	Tab-5 includes costs for dust on roadways. Provisions for dust control on TSF beaches and the LGO stockpile were not found. Please provide costs for dust control on LGO and TSF beaches expected at Y+3 (Application review indicated a sprayer may be used on the LGO if required). [Information Requirement]	The LGO dust control costs are included in App 14A LGO Rehandle. Costs for dust control on the LGO stockpile are estimated to be $1M whilst the stockpile is rehandled. This figure is approximately 25% of the total cost presented for the rehandle of the stockpile in Yr16 The TSF beach dust control costs for RLCE Y+3 are included in App 11 TSF Dust Mgmt., and incorporated in T-2		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
214	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please clarify how potential costs for adaptive management activities which may result from monitoring are applied.	This response pertains to both Y+3 and LoM. The rationale for costs resulting from adaptive management activities are summarized in the RLCE submission memo, reflecting the Adaptive Management framework described in Section 4.10.10. The indicative costs are represented in Tab T-4 of the updated RLCE		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
215	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please include costs to complete the End Land Use Plan.	This response pertains to both Y+3 and LoM. Chapter 4 - Appendix 4-A presents a detailed End Land Use Plan. This End Land Use Plan will be revisited with each 5 Year Mine Plan and Reclamation Closure Plan update		EMLI (K. 216	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Reclamation activities such as soil application will require on site QPs, please clarify where these costs are applied.	The response pertains to Y+3 and LoM. The Mine will employ onsite QPs with responsibility for placement of soil as per reclamation prescriptions. The QPs are company personnel and their cost is not identified, just as the cost of all other company employees are not reflected in the RLCE.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
216	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Information Requirement	No	The cost estimates provided are to be inclusive of all personnel required in the event of closure without the company's support. Please provide the costs for all QPs required to oversee the reclamation. EMLI notes some personnel are included in T-6 and some QPs included in T-4. [Information Requirement]	The cost of a QP has been added to the T-5 Mine Maintenance (note T-designation change). Depending on requirements there will be different QP's on site to support different activities.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
217	Document 3 Lump Sum Unit Rates	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please provide a more detailed explanation and breakdown of how the removal costs were determined for the various buildings and infrastructure that have been calculated 'based on mine sites with similar cost estimates', as listed in the 'Lump Sum Unit Rates' in Document 3.	The response pertains to Y+3 and LoM. BW Gold re-examined Tab T-2 "Infrastructure"and has recalculated cost breakdown of the primary mine infrastructure components. A total of 13 large items, are related to WTP will have cost breakdowns presented. The remaining 25 of 38 components listed (65% of total) represent a total lump sum liability estimated to be $1,319 (7.5% of the current total infrastructure liability estimate of $17.44M) and individual cost breakdowns of these items (20 below $50K, and 5 ranging from 60K to $250K) will remain as lump sum estimates with some exceptions; for example: substantion removal, groundwater wells, and pipelines. BW Gold intends to provide as many of the large infrastructure cost breakdowns as possible during R1 with a focus on those large cost items that would be incurred early in the closure phase . Updated WTP Capital and		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM	BWG	Rolf/Alastair	RT	Ready for Submission	AT, June 22	Ready for Publishing
217	Document 3 Lump Sum Unit Rates	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Information Requirement	No	Lump sums are problematic as they can not be assessed. Cost breakdowns (such as those provided for the Plant site) are required. Please provide a rationale for not providing the breakdown or provide the cost breakdowns used to derive the costs. For example sums in T-2 column I. [Information Requirement]	BWG has revisited the LS items and included additional new estimates, and in some instances inflation adjusted estimates derived from past Feasibility Study documentation as noted. Excluding KP's LS estimate for TSF spillway ($3.5M), LS items based on professional judgement account for 0.60% for Y+3 and 0.017% for LoM ($93,731) and will not be further estimated at this time to inform Y+3 and LoM totals.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
218	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Mobilization and demobilization costs (may be estimated at 5% of the value of the physical work) must be included for all reclamation and monitoring activities. Please revise the cost estimate accordingly.	The response pertains to Y+3 and LoM. Mobilization and demobilization costs, estimated at 5% of physical work, have been assigned to all reclamation activities in the updated cost estimate. (Reference cost spreadsheet tab if appropriate).		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
219	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Do the lump sum values, outlined in Comment #3, include personnel, equipment, fuel, and transportation costs associated with the removal activities? If not, please adjust the cost estimate accordingly.	The response pertains to Y+3 and LoM. The Lump Sum values outlined in Comment #3 are all-in costs and include personnel, all-in equipment rates, fuel, transportation, administration and other affiliated costs.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	At, June 22	Ready for Publishing
220	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please update the Year +3 and Year +15 cost estimate to include implementation of the LGO Stockpile contingency plan with the following information: a. Reduction in post-closure water treatment costs, if any (Year +3 cost estimate only); b. Third-party contractor rates for equipment and operators; c. Mobilization and demobilization costs (may be estimated at 5% of the value of the physical work); d. Further information on the assumptions included in the general and administrative costs; e. Engineering costs;	This response pertains to the Y+3 LGO stockpile contingency plan. The information requested is provided in the Y+3 LGO stockpile contingency plan cost estimate and now represented separately in the RLCE submission memo and the cost spreadsheets. The Y+15 LGO stockpile contingency plan cost estimate is not included in the RLCE, as it is a separate cost scenario from the Y+3 (1st 5 year Detailed Mine Plan), and LoM (end of mine life) requirement for the Cost		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM	BWG	Rolf/Mateus /Alastair	RT	Ready for Submission	AT, June 19	Ready for Publishing
220	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Information Requirement & Clarification	No	a) The LGO rehandle costs include an assumed $400k per year for water treatment (lime dosing). Please provide a breakdown of the costs included in this estimate and indicate how this annual cost would be impacted by the size of the LGO stockpile, if at all. [Information Requirement] b) The memo states that the estimated cost to rehandle 10Mt of LGO would be $22.1 million. This	The RLCE Memo Section 6.3 Low Grade Ore Stockpile Rehandle includes discussion of the response. a) Spreadsheet will be adjusted to reflect this b) $2.21 was the average cost to rehandle the LGO back to the open pit based on a total volume of 116 Mt. The spreadsheet will be adjusted to reflect this. c) The cost estimate for rehandle of the LGO material to the TSF is now not considered as an option and		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
221	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please provide additional rationale for the assumptions in the surface water and groundwater quantity and quality monitoring costs related to the number of sample locations and the frequency of sample collection. The cost estimate for surface water and groundwater quantity and quality monitoring costs must be reflective of the Blackwater Mine Environmental Management Act (EMA) permit and Metal and Diamond Mine Effluent Regulation sampling requirements.	This response pertains to Y+3 and LoM The RLCE reflects the current surface water and groundwater quantity and quality monitoring costs as described in the MA-EMA application and includes the proposed EMA and MDMER requirements. T-4 "Monitoring" A more detailed linkage and referencing of the RLCE content and MA-EMA application content will be		EMLI (K. 223	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Clarification	No	A line item for post closure monitoring and maintainance of the till/overburden tailings beaches was not found in the Y+3 workbook or the LoM workbook. Please clarify where the costs are applied. [Clarification]	Once it is covered and vegetated no maintenance is anticipated. RLCE Memo Sections 6.5 and 6.6 discuss post-closure monitoring and maintenance, including reference to TSF beaches. Formal monitoring and reporting of revegetation is costed for the first 20 years in T-4 Monitoring in 5 year		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM	KP	Rolf, Greg				

224	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please provide a breakdown of the post closure costs over the 100-year period associated with monitoring and maintenance of the geosynthetic and HDPE liners in the TSF(s) and the WMP that are relied upon for seepage mitigation.	This response pertains to Y+3 and LoM Costs associated with monitoring geosynthetic and HDPE liners in the TSF(s) and the WMP are incorporated into the annual Geotechnical inspections for the mine site. Properly installed, maintenance of geosynthetic liners and HDPE is expected to be very minimal. HDPE is considered the longest life span of all synthetic liners. Predictions for the life span (half-life predictions) of HDPE liners have been estimated to be over 400 years in covered applications, based on operating temperatures. The primary cause of degradation of lining systems is oxidation of the geomembrane, which eventually weakens the membrane and allow stress cracks to form. Oxidation is inhibited by limiting exposure to UV radiation and open air environments, and maintaining lower ambient temperatures around the lining system. HDPE is chemically resistant to most substances, especially at lower temperatures (20C or less as typical for		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM	KP	Rolf, Greg	AT	Ready for Submission	AT, June 25	Ready for Publishing
225	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please provide a breakdown of the post closure costs over the 100-year period associated with pumping of water for the purposes of seepage collection and freshwater supply. Please itemize each source of pumped water and include details on the assumptions associated with the cost estimate, including pumping duration, frequency, and rate.	This response pertains to Y+3 and LoM The information on pumping background will be presented in the updated RLCE Submittal Letter, and the costs included in the RLCE costing spreadsheets.		EMLI (K. 226	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (S.Morse, A.McPherson)		Nov 03, 2022	2	Follow Up		No	See memo titled "M-246 Blackwater Major Works Application - Reclamation Security Cost Estimate - EMLI Geotechnical Review of Response to ITT ID #226".	Due to the length of the memo provided, the comments have been added to this ITT as Comment ID 2300-2308. Please see responses to Comment IDs 2300-2308. Complete. BW Gold acknowledges the comment and no further response is required.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM	KP	Rolf, Greg				
227	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	How was the value of $93/day for indirect costs estimated? Please include supporting information and a breakdown of included costs.	This response pertains to Y+3 and LoM. The $93/day value of indirect costs includes: accommodations, food, and facilities support costs, as described in Section 9 of the RLCE submission memo, and were provided by Artemis Gold. The value of the indirect cost will be revisited for the RLCE update		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
227	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Clarification	No	The day rate in Tab 6 is now $82.50 for all personnel listed. Please clarify why the rate was reduced and provide a breakdown of how it was derived. [Clarification]	BW Gold re-evaluated the rate and the current is considered to be more accurate. Where 3rd party estimates may have varied, and the cost seems reasonable, this has been incorporated.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
228	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	How was the hourly utilization of site maintenance equipment and operators, site labour, and site security determined? Please provide additional rationale supporting the assumptions.	This response pertains to Y+3 and LoM Section 8 of the RLCE submission **memo** provides a basic description of the assumptions for requested information accounted for in Tab - 5 "Maintenance and Security and will be reviewed to provide additional detail as applicable in the update for the reviewers		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
229	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Does the hourly utilization include time for maintenance of water management (contact and non-contact water) and erosion and sedimentation control infrastructure? Please provide additional detail on the assumptions used to estimate these costs. Please provide these costs if not already included.	This response pertains to Y+3 and LoM The hourly utilization includes time for the reviewer's list of activities. A more detailed description and assumptions used to develop these costs listed in Tab T-5 "Maintenance and Security" is provided in the RLCE update		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
230	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please demonstrate how costs for monitoring and maintenance of pit lake levels are included in the cost estimate. Please provide additional detail on the assumptions used to estimate these costs. Please provide these costs if not already included.	This response pertains to Y+3 and LoM. The projected cost for monitoring and maintenance of flooded pit lake levels have now been presented as separate line entries in the Tab "Annual Liability" and T-4 "Monitoring".		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
230	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Information Requirement	No	These costs were not located in the tabs referenced in the response. Please clarify if the "Water level" line item in the App 8 tab corresponds to the monitoring of pit lake levels. If so, please provide a breakdown of the assumptions included in this line item and how it has been incorporated into the costing, as there do not appear to be any costs associated with this item. If this cost does not refer to pit lake levels, please provide the requested costs or indicate specifically where they may be located in the updated submission. [Information Requirement]	RLCE Memo Section 6.5 references the requirement to maintain and monitor Pit Lake water levels. Monitoring of the flooded Pit Lake is done by the on-site personnel T-5 Mine Maintenance. Levels are reported in the Annual Geotechnical reporting T-4.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
231	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please provide additional detail on post-closure site maintenance costs including power requirements, permit fees, and insurance.	This response pertains to Y+3 and LoM. Post-closure power costs for pumping and WTP operations are included in Tab 3. WTP costs as presented in the referenced input technical documents. Any additional power uses are now more clearly identified, and costs are included in the updated RLCE. Permit fees and Insurance costs are now included in the updated RLCE.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing

231	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Information Requirement	No	Neither permit fees nor insurance costs were located in the updated cost estimate. Please provide these costs or indicate where they can be located. [Information Requirement]	The updated cost estimate incorporates insurance fees in Tab T-6 Indirect Costs.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
232	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Clarification	No	Please clarify if post closure site management costs include retaining a Mine Manager.	BW Gold will retain a Mine Manager until such time as a Mines Act Permit is no longer in effect for the site. The cost of retaining a Mine Manager during the Post-closure site management, including supporting costs, are reflected in the updated cost estimate.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
232	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Clarification	No	Please clarify where the cost of retaining a Mine Manager has been considered in the updated cost estimate, other than the allowance for accommodation in App T-6. [Clarification]	The costs for the Mine Manager is included T-5 Mine Maintenance. The manager is included as one of the full-time personnel on the site. Also referenced in Section 6.7 of the Memo.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
233	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Information Requirement	No	Please indicate where redundancies for pump systems (back up) are included in the cost estimate.	Response pertains to Y+3 and LoM. The detailed cost estimate will document assumptions related to pump system redundancies as notes to Tab 2 "Infrastructure Costs".		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM	KP	Rolf	RT	Ready for Submission	At, June 22	Ready for Publishing
233	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Information Requirement	No	Tab T-2 does not contain notes regarding pump system redundancies. The notes in Appendix 7 (Pumping Costs) consist of screenshots of emails and figures and it is unclear where, if anywhere, these assumptions are detailed. Please indicate where redundancies for pump systems have been included in the cost estimate, or update the estimate accordingly. [Information Requirement]	Redundancy is within the design storage capacity of both the Open pit and the TSF. If a pump goes down then that capacity would be utilized until BW Gold could bring in additional pumping capacity from Prince George. Therefore, no additional cost estimate is provided for capital expenditures of standby pumps. Costs for operations and maintenance of the primary pumps is included.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
234	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. 236	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Nov 03, 2022	2	Follow Up	Comment	No	Closed. Please note that both the discounted and the undiscounted totals should be provided for each scenario. In the summary table provided, the undiscounted values of of the following costs were not provided, requiring manual calculation by reviewers: "Overall Costs", Mob/Demob, Project Management, Contingency, and the "Disturbed Area and Infrastructure Total". [Comment]	Comment acknowledged		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf				
237	Joint MA/EMA Permits Application Chapter 4	Reclamation Security Estimate	EMLI (K. Norlund, T.Antill, L.Murphy)		Jun 01, 2022	1	New	Comment	No	The Reclamation Liability Cost Estimate must be co-signed by the Mine Manager. Please ensure any updates to the RLCE are reviewed and signed off by the Mine Manager.	BW Gold will submit the updated Reclamation Liability Cost Estimate co-signed by the Mine Manager.		EMLI (K. Norlund, T.Antill, L.Murphy)	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
238	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Comment	No	The proponents and their consultants have indicated that various mine facilities/facility stages within the application are provided at a “Feasibility Study/For Information Only” level of design whereas the Joint Application Information Requirements for Mines Act and Environmental Management Act Permits1 JAIR requires detailed designs for mine facilities. The Chief Permitting Officer has provided direction regarding the level of design for new mines accepted for various mine facilities/facility stages. The level of design for the various mine facilities/facility stages in the Application is acceptable.	BW Gold acknowledges the comment and no further response is required.		EMLI (S. Morse, A.McPherson)	ERM		NA	RT	Ready for Submission		Ready for Publishing

239	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Comment	Yes	The number of inconsistencies and discrepancies identified within the Application are resulting in confusion, questions and uncertainly regarding the accuracy of the application and the analyses completed, resulting in longer than anticipated review time, and are anticipated to increase the difficulty of compliance activities with the permitted mine plan (i.e.. what is permitted?). The Application will be the basis of the Mines Act permit and any conflict or confusion within the Application documents will be carried forward to the drafting of numerous project-specific permit conditions and ongoing regulatory compliance assessments throughout the mine life (if permitted).	BW Gold acknowledges the comment and no response is required.		EMLI (S. Morse, A.McPherson)	ERM		NA	RT	Ready for Submission		Ready for Publishing
240	Section 1.1	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	The Executive Summary and Section 1.1 of the Application indicate that the "proposed Mines Act permit boundary" is shown on Figure 2 and Figure 1.1-2, respectively. The proposed Mines Act permit boundary (i.e.. proposed Permitted Mine Area (PMA)) cannot be located on either figure; provide the proposed PMA on Figures 2 and 1.1.-2 and confirm that the proposed PMA is included on all other figures as referenced within the Application.	Please see attachment "R1_EMLI_Geotech_Comment Responses 240, 342,370.pdf"		EMLI (S. Morse, A.McPherson)	ERM		Tonia/Rolf	RT	Ready for Submission		Ready for Publishing
241	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	The Application includes several unlined water dam structures proposed to be constructed with 'Zone C' material. How has the potential for internal erosion been assessed for the unlined water ponds?	Please see attachment "R1_EMLI Geotech Comment IDs 241.pdf".		EMLI (S. Morse, A.McPherson)	KP		Michael/Dan	AT/KP	Ready for Submission	AT, June 14	Ready for Publishing
241	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	QP Response Required	No	The design engineer has indicated the dam design as possibly being incomplete and in the process of being substantially revised. EMLI requires that the designs of mining dams are correct and complete within the Mines Act Permit Application and supplementary documentation. Submit the revised designs for the unlined water dam structures.	Please see attachment "R2_EMLI Geotech Comment ID 241.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, Aug 11	Ready for Publishing
241	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Aug 25, 2022	3	Follow Up	QP Response Required	No	The response provided states, "The design basis and dimensions of the structures are complete in the Application, and the design intent and overall designs for the structures are not being substantially revised. Refinements to the design details for IFC design drawings are part of normal engineering processes to clarify the construction specifications." The response also states that, "The toe drain will be included if the seepage gradient at the downstream toe of the berm exceeds about 0.2 to 0.3… The estimated exit gradients for the ponds included in the application are typically around 0.35 or less without a toe drain at their maximum operating level." The addition of drains and changing of material specifications is not typically considered "refinement of design details." Based on the information provided in the response, it is unclear whether the designs as presented in the Application adequately mitigate internal erosion. Comment Repeated – It is expected that the designs of dams within the Mines Act Permit Application and supplementary documentation are complete. Submit the revised design reports and drawings for	Please see attachment "R3_EMLI Geotech Comment IDs 241 2160.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	KP, Sep 20	Ready for Publishing
242	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Reviewers note that additional geotechnical investigations and assessments are required throughout the mine life. Provide a summary of required geotechnical investigations and assessments to be completed in the first five years of operations, including time frames.	Please see attachment "R1_EMLI Geotech Comment ID 242.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph/Dan	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
242	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	Potential Permit Condition and Comment	Yes	The following is a potential permit condition that would be applicable to: • TSF C above 1283 masl; • All stages of TSF D; and • Any substantial changes to the detailed designs received as part of this application. The permittee shall submit detailed designs, including supporting documentation, reports, studies, and assurance statements, prior to construction. Per 10.1.18 of the Code, substantial changes to the permitted designs require written authorization	BW Gold acknowledges the potential permit condition.		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, Aug 04	Ready for Publishing

243	Appendix 3-B and 3-C	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement; Format as specified within comment	No	Several of the comments below identify mislabeling, inconsistencies and discrepancies within Section 3.5.1 of the Application (text and tables), Appendix 3-B (text and tables), and Appendix 3-C (text and tables). An example can be found on Table 3.5.1-5 which indicates a 70 m bench width and 10.7 degree inter-ramp angle in Slope Zone 1. Appendix 3-B and 3-C are understood to present the source for information for Section 3.5.1 of the Application. Based on the review and the resulting comments included below, Section 3.5.1 of the Application should be updated in time for start of Round 2 of Application review. It is EMLI's expectation that the Application is appropriately reviewed, and that the proponent's document quality control measures are implemented prior to submitting the Application to EMLI.	BW Gold acknowledges the comment. Responses have been provided for each for the mislabeling, inconsistencies, and discrepancies comments.		EMLI (S. Morse, A.McPherson)	ERM	BWG	with MMTS/KP input	RT	Ready for Submission	RT; June 20	Ready for Publishing
243	Appendix 3-B and 3-C	Geotechnical	EMLI (S. Morse, A.McPherson)			2	Follow Up	Information Requirement	No	Update Section 3.5.1 of the application with this and other clarifications/corrections and re-submit Section 3.5.1.	BW Gold will provide an updated Section 3.5.1 in a follow-up response on the date provided to the MMO in the most recent version of the Round 2 BW workplan.		EMLI (S. Morse, A.McPherson)	KP	ERM	Greg	AT/KP	Ready for Submission	KP, Aug 15	Ready for Publishing
244	Section 3.5.1.1	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Section 3.5.1.1 of the Application states, "these sedimentary rocks are the basement geological unit and are only found at the bottom of the pit with limited exposure in the pit walls." This unit is not identified in Figure 3.5-2, Projected Wall Geology and Fault Map, Ultimate Pit. Indicate where this unit is anticipated to be found and define what is considered "limited exposure in the pit walls"?	The sedimentary rock has no exposure on the currently proposed pit wall. See Figures 4.7 and 4.8 geological cross sections (Appendix 3-B).		EMLI (S. Morse, A.McPherson)	KP		Daniel Yang	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
245	Appendix 3-B	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	The fault information presented in Table 3.5.1-1 of the Application is mislabeled and inconsistent with the information presented in Table 4.2 of Appendix 3-B (both tables provide the summary of Open Pit Major Faults). Provide updated tables, as required. Please confirm the dip direction of faults EW-A and EW-N	Tables 4.2 of Appendix 3-B is correct. Table 3.5.1-1 is incorrect. Dip direction for faults EW-A and EW-N is NE. BW Gold will provide an updated Section 3.5.1 in a follow-up response on the date provided to the MMO in the most recent version of the Round 2 BW workplan.		EMLI (S. 245	Appendix 3-B	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	Information Requirement	No	Update Section 3.5.1 of the application with this and other clarifications/corrections and re-submit Section 3.5.1.	BW Gold will provide an updated Section 3.5.1 in a follow-up response on the date provided to the MMO in the most recent version of the Round 2 BW workplan.		EMLI (S. Morse, A.McPherson)	KP	ERM	Greg	AT/KP	Ready for Submission	KP, Aug 15	Ready for Publishing
246	Section 3.5.1.4	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 3.5.1.4 of the Application states, "The spatial distribution of the collected discontinuity data indicate that three structural domains exist within the region of the Open Pit, i.e.. Main, Northwest and Southeast domains (Figure 3.5-2)." a)Figure 3.5-2 presents the Ultimate Pit Wall Geology and Fault Map and identifies the 'West Structural Domain' and 'East Structural Domain'. Figure 3.5-2 does not delineate the structural domains as indicated (Main, Northwest and Southeast). Confirm the structural domains included on the figure indicated (Figure 3.5-2).	It should be two structural domains (East and West). The Section 3.5.1.4 text is incorrect. BW Gold will provide an updated Section 3.5.1 in a follow-up response on the date provided to the MMO in the most recent version of the Round 2 BW workplan.		EMLI (S. Morse, A.McPherson)	KP		Daniel Yang	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing

246	Section 3.5.1.4	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	Information Requirement	No	Update Section 3.5.1 of the application with this and other clarifications/corrections and re-submit Section 3.5.1.	BW Gold will provide an updated Section 3.5.1 in a follow-up response on the date provided to the MMO in the most recent version of the Round 2 BW workplan.		EMLI (S. Morse, A.McPherson)	KP	ERM	Greg	AT/KP	Ready for Submission	KP, Aug 15	Ready for Publishing
247	Section 4.2.2 (Appendix 3-B)	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Comment	No	b)Section 4.3.3 of Appendix 3-B states, "A review of the spatial distribution of the collected discontinuity data suggested that two structural domains exist within the region of the proposed open pit…the structural domains are referred as the West and East domains divided by the N Fault (see Figures 4.5 and 4.6)." Figure 4.6 is the same as referenced above Figure 3.5-2.	It should be two structural domains. Figures 4.5 and 4.6 of Appendix 3-B are correct.		EMLI (S. Morse, A.McPherson)	KP		Daniel Yang	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
248	Section 3.5.1.4	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Section 3.5.1.4 of the Application states, "Areas of intensely fractured rock (RQD<40%, mean = 38) were identified within all geological units and are classified as Broken Zones." and Table 3.5.1-2 presents the 'Broken Zone' 'RQD Average' as 9%. Clarify the discrepancy between the reported values.	Please see attachment "R1_EMLI Geotech Comment ID 248-249 251-259 261-265 270-275.pdf".		EMLI (S. Morse, A.McPherson)	KP		Daniel Yang	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
249	Table 3.5.1-3 of the Application, Pit Slope Factor of Safety Acceptance Criteria	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Table 3.5.1-3 of the Application, Pit Slope Factor of Safety Acceptance Criteria, indicated that the selected 'Consequences of Failure' as 'Medium" for inter-ramp and overall slopes. Provide justification for the selection of 'Medium' 'Consequences of Failure'	Please see attachment "R1_EMLI Geotech Comment ID 248-249 251-259 261-265 270-275.pdf".		EMLI (S. 250	Appendix 3-C	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	The information presented in Table 3.5.1-5 of the Application, Open Pit Design Slope Sectors for Development, is inconsistent with the information presented in Table 3.5.1-4, Recommended Pit Slope Configurations for Final Pit, and Table 2-2 of Appendix 3-C which is the source for the information presented in Table 3.5.1-5. Clarify the discrepancy between the reported values.	The information presented in Table 3.5.1-4 of the Application are the geotechnical domains and recommendations for the pit slope configurations for the final pit, which come from Table 7.1 of the Open Pit Slope Design Report in Appendix 3-B. The pit designer, Moose Mountain Technical Services (MMTS), created 3D slope sector zone solids to support the phased development of the open pit that were based on the geotechnical domains described in Appendix 3-B and summarized in Table 3.5.1-4. The generalized pit geometry based on these slope sectors is presented in Table 3.5.1-5 of the Application and Table 2.2 of Appendix 3-C.		EMLI (S. Morse, A.McPherson)	KP	MMTS	Daniel Yang, Marc	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
250	Appendix 3-C	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	Information Requirement	No	Update Section 3.5.1 of the application with this and other clarifications/corrections and re-submit Section 3.5.1. It is noted that Table 3.5.1-5 of the Application presents inter-ramp angles (IRA) of 10.7° to 14.2°, which is inconsistent with the design presented in other areas of the Application. Please clarify which pit slope design is proposed. This should be addressed, along with the other clarifications and corrections, with an updated Section 3.5.1 of the Application.	Please see response to follow-up comment 251. BW Gold will provide an updated Section 3.5.1 in a follow-up response on the date provided to the MMO in the most recent version of the Round 2 BW workplan.		EMLI (S. Morse, A.McPherson)	KP	ERM	Daniel	AT/KP	Ready for Submission	KP, Aug 15	Ready for Publishing
251	.1.5, Appendix	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 3.5.1.5 of the Application, Appendix 3-B and Appendix 3-C present two different Open Pit slope configurations/designs. As per the Joint Application Information Requirements for Mines Act and Environmental Management Act Permits2 (JAIR), the application must include detailed designs, meaning that the submitted design is supported by all necessary analyses and assessments and represents what will be constructed (except for field-fitting and other non-substantial changes). Confirm which design is proposed for construction in the Application and ensure that all supporting investigations, analyses, and designs are provided and properly signed and stamped for the option propose in the Application.	Please see attachment "R1_EMLI Geotech Comment ID 248-249 251-259 261-265 270-275.pdf". BW Gold will provide an updated Section 3.5.1 in a follow-up response on the date provided to the MMO in the most recent version of the Round 2 BW workplan.		EMLI (S. Morse, A.McPherson)	KP	MMTS	Daniel Yang, Marc	AT/KP	Ready for Submission	KP, June 23	Ready for Publishing
251	.1.5, Appendix	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up		No	Comment not addressed. Section 3.5.1 of the Application has not been updated and resubmitted for Round 2 of Application review. Confirmation of which design and supporting report is proposed is not included in the response. The comment provided is in reference to observed discrepancies in the pit slope configurations/designs presented in Tables 3.5.1-4 and 3.5.1-5, Figures 3.5-7 and 3.5-8 of the Application, and Appendix 3-B and Appendix 3-C. For example, Figures 3.5-7 and 3.5-8 identify different IRAs for the same sector (Upper Slopes of the North Sector (40° on Figure 3.5-7); Slope Zone 2 (35° on Figure 3.5-8).	The pit slope designs presented in Appendix 3-B included the most recently collected site investigation data and geotechnical analysis for the proposed pit. This document will be used by BW Gold moving forward as the basis for future pit designs upon the commencement of construction at the site. As indicated in Section 8 (Appendix 3-B), additional geotechnical work will be required prior to pit development, including further site investigations, point load testing, detailed laboratory testing, and refinement of the pit hydrogeological model and pit dewatering plan. With this additional data, further refinements of the pit slope designs may result. The pit designs presented in Section 3.5.1 and Appendix 3-C of the Application rely on the earlier pit slope		EMLI (S. Morse, A.McPherson)	KP	MMTS, ERM	Daniel	AT/KP	Ready for Submission	KP, Aug 15	Ready for Publishing

252	Section 3.5.1.7, Section 7.2.2 (Appendix 3-B)	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 3.5.1.7 of the Application states, “Surface water diversions are not proposed upslope of the pit excavation due to the limits contribution catchment area and therefor there are no applicable surface water diversion design criteria for this project component to include in the Joint Application.” Section 7.2.2 of Appendix 3-B states, “The slope depressurization measures include on-pit and perimeter vertical pumping wells, as well as diversion ditches along the pit crest of the slopes.’ and ‘The following mitigation measures should be considered as part of pit operations, to reduce and/or eliminate the consequences of the potential in-pit geohazards: constructing perimeter diversion ditches wherever appropriate to prevent and/or reduce surface runoff from entering the pit.” These two sections of the Application seem to contradict each other. Provide documentation from the pit Design Engineer whether diversion ditches are recommended above the open pit. If so, provide a design for the diversion ditches.	Please see attachment "R1_EMLI Geotech Comment ID 248-249 251-259 261-265 270-275.pdf".		EMLI (S. Morse, A.McPherson)	KP		Daniel Yang	AT/KP	Ready for Submission	KP, June 23	Ready for Publishing
252	Section 3.5.1.7, Section 7.2.2 (Appendix 3-B)	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	Potential Permit Condition	Yes	The following permit condition, if permitted, is anticipated to be included in the M-246 Mines Act permit: The Permittee must ensure that surface water is diverted away from the pit slopes in accordance with the recommendations of a Professional Engineer.	BW Gold acknowledges the potential permit condition, and suggests that the final wording should indicate that surface water is managed in accordance with the recommendations of a Professional Engineer.		EMLI (S. Morse, A.McPherson)	KP		Daniel	AT/KP	Ready for Submission	AT, Aug 04	Ready for Publishing
253	Table 3.5.1-8, Table 6.2 (Appendix 3-B)	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Table 3.5.1-8 of the Application and Table 6.2 of Appendix 3-B provides pit slope depressurization requirements for the East, Southeast, Southwest, North, and Northeast Wall Sectors with the amount of “horizontal slope depressurization required (m)” provided for various years as ‘120’, ‘50 below 1,300 masl’, ‘120 above 1,440 masl’, and others. Clarify what the ‘horizontal slope depressurization required (m)’ values mean, including reference points (i.e.. is the phreatic surface required to be 120 m behind the pit slope at all locations above 1,440 masl?).	Please see attachment "R1_EMLI Geotech Comment ID 248-249 251-259 261-265 270-275.pdf".		EMLI (S. Morse, A.McPherson)	KP		Daniel Yang	AT/KP	Ready for Submission	KP, June 23	Ready for Publishing
254	Section 3.5.1.7	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 3.5.1.7 of the Application states, “Additional mitigation measures will be provided that include horizontal or vertical drainage measures if the required slope depressurization requirement are not sufficiently met by the in-pit wells by the target date in mid to late Operations phase.” Provide triggers to identify when the ‘additional mitigation measures’ will be implemented and the anticipated times/pit phases/elevations for implementation of ‘additional mitigation measures’? 266	Section 6.3.1 of Appendix 3-B	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Section 6.3.1 of Appendix 3-B states, "Surface water dewatering systems for the Project were designed by MMTS…and are not discussed in this report." What 'surface water dewatering systems' are being referenced?	The surface water dewatering systems being referenced included the in-pit pumping systems and any potential perimeter diversion ditches, if applicable. It is understood that MMTS determined that ditches were not required due to the small catchment areas upstream of the south pit rim.		EMLI (S. Morse, A.McPherson)	KP		Daniel Yang	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
267	6.4 of Append	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Table 6.4 of Appendix 3-B provides pumping well locations, and timing for installation and decommissioning. Provide the locations, and timing for installation and decommissioning of observation wells including, but not necessarily limited to, OW-1 through OW-18.	The location of observation wells OW1 through OW18 are shown on Figure 6.1 of Appendix 3-B, and the timing of installation of these observation wells is described in Section 6.3.2. Thirteen observation wells (OW1 through OW13) are planned to be installed around the open pit perimeter between Years +1 and +3, and five additional observation wells (OW14 to OW18) on the northern edge of the ultimate extent of the open pit are planned for Year +4. Decommissioning of the observation wells will be completed following Closure, at a time when water level data collected at the observation sites are deemed to no longer be of interest.		EMLI (S. Morse, A.McPherson)	KP		Cindy	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
268	Section 6.4 of Appendix 3-B	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 6.4 of Appendix 3-B presents the overburden dewatering requirements. How long is the overburden anticipated to take to dewater and how was this considered in pit development?	The southeast corner of the ultimate open pit includes overburden that is about 100 m thick and inferred to extend out a distance from the pit of about one kilometer. The overburden in this area is mapped as lodgement till. Much of the overburden in the southeast corner of the open pit will be excavated over a period of about five years. Open pit dewatering is planned to begin at existing dewatering wells in Year -1, and installation of additional perimeter dewatering wells in bedrock is planned in Year 4 to meet mine dewatering requirements. These existing and proposed wells will provide some underdrainage of the till slopes. Horizontally flowing groundwater will provide additional natural drainage along the slopes as the slopes are excavated. Without additional actions, adequate drainage of the overburden is expected in a time frame of less than five		EMLI (S. Morse, A.McPherson)	KP		Cindy	AT/KP	Ready for Submission	AT, June 23	Ready for Publishing
269	Appendix 3-B	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	How will erosion of the open pit overburden slopes be mitigated during operations and closure?	A wider bench located immediately below the overburden/bedrock contact was incorporated into the pit design to manage surface runoff and to contain any eroded materials from upper overburden slopes.		EMLI (S. Morse, A.McPherson)	KP		Daniel Yang	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing

270	Table 7.1 of Appendix 3-B	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Clarify how the overburden slope design presented in Table 7.1 of Appendix 3-B meets the pit slope FOS acceptance criteria presented in Table 5.2 of Appendix 3-B (FOS (min) (Static) of 1.1; POF (max P[FOS≤1] of 25% - 50%). 289	Section 9.12 of the JAIR	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	Yes	Section 9.12 of the JAIR requires, "In accordance with Section 10.4.2.1.e of the Code, integrate the TSF emergency preparedness and response plan into the MERP." Demonstrate how these requirements are satisfied within the Application.	A TSF Emergency Preparedness and Response Plan has not yet been developed for the Blackwater Project. As such, there is no integration of it into the MERP. While Section 9.12 clearly lists this integration as a requirement of the Application, BW Gold suggests that this requirement of the JAIR should rather become a permit condition, with a date that it be available some time prior to the commencement of the Operations phase, as opposed to a requirement of the Application itself. The rational for this suggestion is that much of the information required to develop a TSF Emergency Preparedness and Response Plan is not yet available for this greenfield site. The listed section of the Code (10.4.2) relates to Tailings Governance, including		EMLI (S. Morse, A.McPherson)	BWG			RT	Ready for Submission	RT; June 29	Ready for Publishing
289	Section 9.12 of the JAIR	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	Potential Permit Condition	Yes	The following permit condition, if permitted, is anticipated to be included in the M-246 Mines Act permit: Page 11 of 16 The Permittee must submit Emergency Preparedness and Response Plans to the Chief Permitting Officer for TSFs and dams prior to commencement of construction of TSFs and dams. The TSF and dam	Thank for you for insight about a potential permit condition. As suggested in the R1 response to this comment, BW Gold suggests that it is more approriate to provide the Emergency Preparedness and Response Plans (EPRPs) for the Tailings Storage Facility (TSF), suitably integrated into the Mine Emergency Response Plan (MERP), to the Chief Permitting Officer prior to the		EMLI (S. 294	Appendix 3-J	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 4.4.2 of Appendix 3-J states, "The target heights of these initial fill areas and associated standby pumping capacity shall be selected by BW Gold and the Constructer based on risk tolerances and liability assignment." Table 4.3 provides a table of return periods, inflows and, "Minimum Required Height" for "Initial Fill Placement" for the Mine Area Creek and Davidson Creek Diversions. Is it anticipated that water would accumulate behind the initial fill areas under normal operating conditions	Yes, that is the design intent. Minor accumulated flows will be managed by the construction contractor with temporary pump systems and flow will be conveyed to the pond upstream of the diversion berm and subsequently diverted by the Davidson Creek Diversion System. Once PAG waste rock placement commences between the Diversion Berm and Davidson Creek Initial Fill Placement Area, water will be allow to accumulate and saturate the voids of the PAG waste rock		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
295	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Provide a drawing which clearly presents the location of the "Initial Fill Areas" specifying, which is the Mine Area Creek and Davidson Creek Diversion, or advise where this is located within the Application.	The locations and designs are shown on Drawings C1100 (both), C1120 (Davidson Creek Initial Fill Placement Area), and C1121 (Mine Area Creek Initial Fill Placement Area) in Appendix D of Appendix 3-J.		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
295	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	Information Requirement	No	Drawing C1100 does not identify which "Initial Fill Area" is the Mine Area Creek or Davidson Creek Diversion, and Drawings C1120 and C1121 do not provide reference points to clearly identify the location of each structure. Provide a drawing which clearly presents the location of the "Initial Fill Areas" specifying, which is the Mine Area Creek and Davidson Creek Diversion.	Please see attachment "R2_EMLI Geotech Comment ID 295.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, Aug 08	Ready for Publishing
296	Appendix 3-J	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 4.4.2 of Appendix 3-J, states, "Both areas of initial fill placement are shown with a design height of 8.4 metres..." Based on the section provided on Drawing C1121, the minimum height shown for the Mine Area Creek initial fill appears to be approximately 6 metres. Please clarify how the minimum embankment height is measured, and what event the Mine Area Creek initial fill embankment constructed to 1242 m elevation would accommodate with adequate freeboard.	Please see attachment "R1_EMLI Geotech Comment IDs 291 292 296 307 315 317.pdf"		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	KP, June 16	Ready for Publishing

297	Appendix 3-J	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 5.7.2 of Appendix 3-J states, “The Stage 1 and 2 spillways are not anticipated to be operational due to the TSF capacity at 1273 masl and the anticipated waste/water storage volumes. Erosion protection has therefore not been designated for the remainder of the spillway outlet channels. In the event of a mine premature closure, the emergency spillways may become operational in nature. If this occurs, the installation of erosion protection materials will be required for the full outlet channel lengths.” Provide clarification regarding how the determination was made that the Stage 1 and 2 spillways are not anticipated to be operational and justification for the absence of erosion protection materials for the full channel length.	Please see attachment "R1_EMLI Geotech Comment ID 297.pdf".		EMLI (S. Morse, A.McPherson)	KP		Jeremy/Dan	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
298	Appendix 3-J	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Appendix C1.2 of Appendix 3-J states, “There are no drillholes or test pits completed directly within the Diversion Berm footprint due to the incised nature of Davison Creek and confirmatory drilling should be performed during construction to verify the conditions assumed for design.” How has this uncertainty been accounted for in the analyses carried out to date and the design?	Please see attachment "R1_EMLI Geotech Comment IDs 298-301.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan/Joseph	AT/KP	Ready for Submission	AT, June 14	Ready for Publishing
299		Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	What contingencies have been considered in case the ground conditions within the Diversion Berm footprint are not consistent with the conditions assumed for design?	Please see attachment "R1_EMLI Geotech Comment IDs 298-301.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan/Joseph	AT/KP	Ready for Submission	AT, June 14	Ready for Publishing
300	Appendix 3-J	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Appendix C5.2 of Appendix 3-J states, “Ground conditions should be verified during construction as there are no drillholes or test pits that were completed directly within the SCP footprint.” How has this uncertainty been accounted for in the analyses carried out to date and the design?	Please see attachment "R1_EMLI Geotech Comment IDs 298-301.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan/Joseph	AT/KP	Ready for Submission	AT, June 14	Ready for Publishing
301		Geotechnical	EMLI (S. Please see attachment "R1_EMLI Geotech Comment IDs 298-301.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan/Joseph	AT/KP	Ready for Submission	AT, June 14	Ready for Publishing
302	Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Section 3.5.3.11 of the Application states, "The tailings distribution infrastructure will be expanded in Year +5 with the addition of a secondary line to the southwest end of TSF C (approximately 4,700 m in length), as well as two pipelines to convey tailings along the crest of Main Dam C to discharge into the northeast side of the TSF (approximately 7,300 m long each) in Year +6." While Appendix 3-K, Section 5.2.3 states, "The tailings distribution system will be extended along the crest of Main Dam C during	Tailings discharge from the crest of Main Dam C will begin in approximately late Year +6 or Year +7 when waste rock placement in TSF C has ceased.		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
303	Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 5.3.2 of Appendix 3-K provides the design features of Main Dam C, including "Water- retaining earthfill seal zone (Zone S) for Stages 1 to 6" and "HDPE geomembrane facing for Stages 7 to 11." Provide details for the transition between the earthfill seal zone and the HDPE geomembrane facing?	Please see attachment "R1_EMLI Geotech Comment IDs 303 304 314 318.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, June 21	Ready for Publishing
304	Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Sections 5.4.2 and 5.5.2 of Appendix 3-K provide design features for the Saddle Dam and West Dam respectively, including "HDPE geomembrane facing" and "Upstream HDPE basin liner." Provide details regarding the tie in between the HDPE geomembrane facings and upstream basin liners into the embankment abutments and TSF basin?	Please see attachment "R1_EMLI Geotech Comment IDs 303 304 314 318.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, June 21	Ready for Publishing
305	Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Section 5.2.1 of Appendix 3-K states, "TSF C was sized to contain approximately 232 Mm^3 of tailings, 32 Mm3 of waste rock, and a supernatant pond volume ranging from 1 to 10 Mm^3." Table 5.1 lists the total capacity of TSF C as 305 Mm^3. Clarify the discrepancy in the total volume from Section 5.2.1 compared to the capacity from Table 5.1.	The total available storage capacity in the TSF C is approximately 305 Mm^3, which is the sum of 232 Mm^3 of tailings, 32 Mm^3 of waste rock, a supernatant pond volume ranging up to 10 Mm^3, the 3 Mm^3 seasonal inflow allowance, 22 Mm^3 of IDF storage, and 6 Mm^3 air space within the minimum dry freeboard.		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
306	Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 9.3.1 of Appendix 3-K states, “Facilities that do not include defined threshold conditions and response plans below were deemed not to require these at this time…” Provide a list of the structures that were not deemed to require QPOs and TARPs with the justification for this decision for each structure.	Please see attachment "R1_EMLI Geotech Comment ID 306.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing
307	Section 7.0 of Appendix D1 in Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 7.0 of Appendix D1 in Appendix 3-K states, "The total available storage for the tailings waste rock and supernatant water in the TSF for the ultimate arrangement for the 2016 dam breach assessment was comparable to the approximately 480 Mm^3 currently contemplated." Table 5.1 lists the total capacity of TSF C as 305 Mm^3, and Table 6.1 lists the total capacity of TSF D as 225 Mm^3. Together these total 530 Mm^3. Appendix 3-W, Section 3 states, “The total available storage for the tailings, waste rock and supernatant water in the TSF for the Site D ultimate arrangement will be 465	Please see attachment "R1_EMLI Geotech Comment IDs 291 292 296 307 315 317.pdf"		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	KP, June 16	Ready for Publishing
308	Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 3.1 of Appendix E2 in Appendix 3-K states, “Tailings will initially be discharged into TSF C from one or more points on the west side of the facility with the PAG/NAG3 waste rock disposed of directly upstream of Main Dam C during the first six years of operations.” Provide a placement methodology for the PAG/NAG3 waste rock within TSF C.	Please see attachment "R1_EMLI Geotech-Geoscience Comment IDs 308 316 389.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	KP, June 23	Ready for Publishing
309	Appendix 3-G Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Section 3.1 of Appendix 3-G in Appendix 3-K states, "Water generated from pit dewatering activities and contact water collected at the waste stockpiles will be directed to a pond at the plant site." Which pond is this?	The Metals Water Treatment Plant influent pond.		EMLI (S. Morse, A.McPherson)	KP		Cindy	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
310	Appendix 3-G Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Section 3.2.4 of Appendix 3-G in Appendix 3-K states "The nominal volume in Post-Closure will be determined by the elevation of the outlet to the closure spillway." Is there a design for the closure spillway?	A design for the closure spillway was not developed as part of the Application. Design effort was focused on emergency spillways that are required as part of the initial construction activities, or for features required in the first five years of operations. Those include: - Davidson Creek Diversion System (Appendix 3-J) - TSF Stage 1 SCP (Appendix 3-J) - The IECD (Appendix 3-J) - Stages 1 & 2 of Main Dam C (Appendix 3-J) - The WMP (Appendix 3-J) - The ECD (Appendix 3-K) - Northern Water Transfer Pond (Appendix 3-K) - The FWR (Appendix 3-O)		EMLI (S. Morse, A.McPherson)	KP		Greg/Dan	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing

311	Appendix 3-G Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Table 3.3 of Appendix 3-G in Appendix 3-K include the entry for Year 24 onwards has a superscript 1 and 2, generally indicating clarifying notes for a table. There are no notes under the table. Provide any applicable notes to accompany the table.	The notes should have been the same as the notes provided for Table 4.6 of Appendix 5-B. The notes are: (1) The nominal TSF C Pond volume is maintained near 2 Mm^3 during Closure by pumping water to the pit lake. (2) The nominal TSF C Pond volume in Post-Closure will be determined by the elevation of the outlet to the TSF C closure spillway.		EMLI (S. Morse, A.McPherson)	KP		Cindy/Dan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
312		Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Figure 3.2 of Appendix 3-G in Appendix 3-K includes note 1 which states, "The TSF Closure Spillway is constructed in Year 12 and activated after the pit lake reaches its design elevation." Clarify how construction of the TSF Closure Spillway in Year 12 is achieved in conjunction with the proposed schedule for raising of the embankment for TSF C?	The water balance and water quality models conceptually incorporate a closure spillway channel being implemented in approximately Year 12 as a water quality mitigation consistent with the concept presented and approved during the Environmental Assessment. The spillway outlet from the TSF will not be constructed until closure of the facility due to ongoing raising of the embankment for TSF C.		EMLI (S. Morse, A.McPherson)	KP		Cindy/Dan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
313	Appendix 3-J	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 5.6.2 of Appendix 3-J states, "The tailings distribution system corridor will initially follow the existing exploration access road until the low point near the current crossing of Davidson Creek…The supernatant pond will form near the interface of the two disposal areas to allow for efficient saturation of the waste rock interstitial space within 1 year of placement to meet geochemical objectives." The Davidson Creek Berm appears to be located between the pond and waste rock areas. How does the	Initially, PAG waste rock placement will begin between the Diversion Berm and Main Dam C during pre-production. Water will be allowed to accumulate between the Diversion Berm and Main Dam C once PAG placement begins to saturate the voids in a manner consistent with the geochemical objectives for this waste material. Initially, the water stored upstream of the Diversion Berm and the water within the PAG waste rock voids will be separated by the Diversion Berm and will not interact. PAG waste rock placement will continue		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
314	Appendix 3-J	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	What is the impact of degradation of the TSF C upstream geomembrane post-closure?	Please see attachment "R1_EMLI Geotech Comment IDs 303 304 314 318.pdf".		EMLI (S. Morse, A.McPherson)	KP		Jim/Dan	AT/KP	Ready for Submission	AT, June 21	Ready for Publishing
315	Appendix 3-K	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 5.3.3 of Appendix 3-K states, "The uncertainty related to the behavior of the completely weathered bedrock and glaciolacustrine units present in the foundation can be effectively mitigated by progressively placing addition waste rock (e.g. buttresses) downstream of Main Dam C. This mitigation measure is incorporated into the TSF design with PAG/NAG-ML waste rock placement within TSF D beginning in approximately Year 6. Buttress development may also be advanced earlier (e.g. during Stages 3 and 6), if required, in critical areas within the downstream step-outs required for later stages of Main Dam C using NAG waste rock." How will the requirement for implementation of a buttress be identified?	Please see attachment "R1_EMLI Geotech Comment IDs 291 292 296 307 315 317.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan/Joseph	AT/KP	Ready for Submission	KP, June 16	Ready for Publishing
316	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Provide a TSF D waste rock deposition plan that details how waste rock will be placed in the TSF to saturate within one year, including mitigation measures for possible upset conditions, summary of Safe Operating Procedures (SOPs) for access, etc...	Please see attachment "R1_EMLI Geotech-Geoscience Comment IDs 308 316 389.pdf".		EMLI (S. Morse, A.McPherson)	KP		Jim/Dan	AT/KP	Ready for Submission	KP, June 23	Ready for Publishing
316	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Aug 10, 2022	2	Follow Up	QP Response Required	No	The proponent response states, "The technical specifications associated with Zone C material placement will apply to the material placed within the Main Dam C footprint." EMLI reviewers cannot locate where the 'Main Dam C footprint' is identified within TSF D PAG Waste Rock and where associated technical specifications are identified (i.e., to Drawings G0040, G0105, G0106, and G0107 in Appendix 3-K do not indicate the location and specifications). Provide drawings which indicate the location of the referenced Main Dam C footprint and associated technical specifications associated. Revisions of Drawings G0040, G0105, G0106, G0107 and others may be suitable.	BW Gold will provide a response to the comment on the date provided to the MMO in the most recent version of the Round 2 BW workplan.		EMLI (S. 322	Appendix 3-X3	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	Yes	Appendix 3-X3 provides descriptions of anticipated runout zones for multiple stockpiles, with extents shown on Figure 1. Provide the supporting design basis, input parameters (including justification) and analyses used to identify the potential runout zones. Note that the assessment is expected to include both runout and rock fall (where applicable).	Please see attachment "R1_EMLI Geotech Comment IDs 322 336.pdf".		EMLI (S. Morse, A.McPherson)	KP		Jordan P/Joseph/Dan	AT/KP	Ready for Submission	KP, June 24	Ready for Publishing
322	Appendix 3-X3	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	QP Response Required	Yes	The response provided indicates that, "The basis of the stockpile run-out assessment presented in Appendix 3-X3 of the Application is described therein." The reviewer is unable to locate the basis of the runout assessments. Provide the requested information or identify specifically where the requested information can be found within the referenced report for each structure.	Please see attachment "R2_EMLI Geotech Comment IDs 322 336.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, Aug 16	Ready for Publishing
322	Appendix 3-X3	Geotechnical	EMLI (S. Morse, A.McPherson)		Aug 25, 2022	3	Follow Up	Potential Permit Condition	Yes	The response provided includes recommendations for additional runout assessments to be carried out. If permitted, a requirement for these assessments to be carried out and submitted to the Chief Permitting Officer is anticipated be included as a Permit Condition. [Potential Permit Condition]	BW Gold acknowledges the potential permit condition.		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	KP, Sep 9	Ready for Publishing
323	Section 3.5.3.10	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 3.5.3.10 of the Application states, "The LGO Stockpile will be built by bottom-up construction with six 20 m lifts." Appendix 3-C, Section 6.1 provides a design input of "5 x 20 m lift heights." Appendix 3-N, Section 3.1 states "The LGO stockpile was designed with up to five 20 m high lifts…" Please clarify the number of lifts proposed for the LGO stockpile.	The maximum height of the LGO Stockpile is approximately 100 m and comprises 5 x 20 m lifts as shown on Figures 6.1 to 6.4 in Appendix 3-C. The sub-grade elevation at the downstream toe of the pile varies along the length of the stockpile and therefore the dump crest elevation also varies to maintain the maximum stockpile height of approximately 100 m.		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
324	Section 3.5.5.9	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 3.5.5.9 of the Application states, "The design capacity is 111.1 Mt with a 51.4 million loose cubic metres." Appendix 3-C, Table 6-2, and Appendix 3-N, Section 3.1 provide a design capacity of 113.1 Mt for the LGO Stockpile. What is the design capacity for the LGO Stockpile?	The design capacity of the LGO Stockpile is 113.1 Mt. Section 3.5.5.9 of the Application should state "The design capacity is 113.1 Mt or 51.4 million loose cubic metres."		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
325	Section 3.3.2	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 3.3.2 of Appendix 3-N states, "A historical sub-glacial meltwater corridor was identified at the northern end of the footprint where it is inferred that a northeast-east trending channelized glaciofluvial unit comprising undifferentiated sands and gravels may be present." Is there any potential for this glaciofluvial unit to interact with the LGO Stockpile below-liner seepage collection system?	Please see attachment "R1_EMLI Geotech Comment IDs 325-331.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph/Dan	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
326	Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Figure C1.2 in Appendix C1 of Appendix 3-N shows Artesian Exploration Drillholes encountered immediately to the east of the LGO Stockpile. How have these conditions been considered in the design and analysis of the LGO Stockpile?	Please see attachment "R1_EMLI Geotech Comment IDs 325-331.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph/Cindy	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
327	-	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Is there any potential for artesian conditions encountered immediately to the east of the LGO Stockpile to impact the LGO Stockpile or the below-liner seepage collection system?	Please see attachment "R1_EMLI Geotech Comment IDs 325-331.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph/Cindy	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
328	Table 4.3 of Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Table 4.3 of Appendix 3-N, Estimated Material Parameters, does not include parameters for the LGO stockpile low permeability liner. Demonstrate how the liner was incorporated into the stability analysis.	Please see attachment "R1_EMLI Geotech Comment IDs 325-331.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
329	Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 4.2.2 of Appendix 3-N states, "Sensitivity analyses were conducted for the LGO Stockpile (Section 1 and 2)…Results of the sensitivity analyses are discussed in Section 4.3." The reviewer was not able to find the discussion of the sensitivity analyses carried out for the LGO Stockpile in Section 4.3. Provide a description and results of the sensitivity analyses carried out for the LGO Stockpile.	Please see attachment "R1_EMLI Geotech Comment IDs 325-331.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
330	Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Appendix C1 of Appendix 3-N provides Geotechnical Conditions Plan and Sections for the LGO Stockpile (Figures C1.1 through C1.2). Appendix C2 provides stability analysis figures including ultimate configurations (Figure C2.3 through C2.8). The ultimate LGO Stockpile heights in the geotechnical conditions sections do not match the ultimate LGO Stockpile heights in the stability analysis sections. Provide clarification on the locations of the stability analysis sections for the LGO Stockpile.	Please see attachment "R1_EMLI Geotech Comment IDs 325-331.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
331	Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 3.1 of Appendix 3-N states, "The proposed ultimate stockpile crest is at an elevation of 1,540 masl, and the maximum height of the stockpile along the critical cross section is approximately 140 m." The reviewer was unable to find stability analysis figures representing an analysis of a section for the LGO Stockpile 140 m in height, or with the crest at an elevation of 1540 masl in the Application. Advise how the ultimate configurations for analysis were determined. Provide rationale if a section of the LGO	Please see attachment "R1_EMLI Geotech Comment IDs 325-331.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
332	Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Section 5.6.2 of Appendix 3-N states, "The LGO Collection Pond was designed to contain continuous seepage and runoff from events up to the 1 in 200-year, 24-hour storm assuming it is maintained dewatered to the maximum practicable extent." What is the maximum water level within the LGO Collection Pond that will allow it to contain the 1 in 200-year, 24-hour storm event?	The maximum water level for providing enough storage for the design event is 1405.5 masl (0.5 m above the base to account for dead storage). The peak elevation after the design event occurs is approximately 1410 masl.		EMLI (S. Morse, A.McPherson)	KP		Michael	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
333	Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Section 3.0 in Appendix A of Appendix 3-N, under Seepage Management System states, "Objective: Limit seepage to groundwater to the extent reasonably practicable using above liner and below liner seepage collection drains and a low-permeability liner system." The reviewer was unable to find further details regarding the above-liner seepage collection drains. Provide design details for the above-liner seepage collection drains.	The statement in Section 3.0 of Appendix A of Appendix 3-N that stockpile drainage will be "collected with above liner collection drains and conveyed to the Low Grade Ore Stockpile Collection Pond" is incorrect and should read "collected above the liner and conveyed to the Low Grade Ore Stockpile Collection Pond" for consistency with the design details provided in Section 5 and shown on the associated design drawings in Appendix 3-N. The LGO material is expected to be coarse-grained and will convey flow above the liner to the collection channels.		EMLI (S. Morse, A.McPherson)	KP		Michael/Dan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
334	Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section C3.4.6 in Appendix C3 of Appendix 3-N states, "Sensitivity analyses were also carried out while considering a range in the effective strength of the foundation materials of ±5", and the results are included on the associated figures in the attachments." The reviewer was unable to find the referenced sensitivity analysis results on the associated figures. Clarify how/where the sensitivity analysis results are presented in the Appendix C3 figures.	Please see attachment "R1_EMLI Geotech Comment IDs 334 337-339 347 354 356 360 369.pdf".		EMLI (S. Morse, A.McPherson)	KP		Jordan P/Joseph	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
335	Section 3.3.4 in Appendix D of Appendix 3-Y	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 3.3.4 in Appendix D of Appendix 3-Y states, "Seepage from the stockpile footprint contributes to the collection pond (via springs in the stockpile footprint), the LGO water collection system (via springs in the LGO footprint)…" How have the springs referenced been incorporated into the analysis and design of the LGO Stockpile?	The potential for groundwater springs was considered and accommodated in the design. Groundwater (springs) discharging to the foundation drains will be collected and conveyed to the LGO Collection Pond, as discussed in Section 5.1 of Appendix 3-N.		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
336	Section 3.11 of Appendix 3-X3	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	Yes	Section 3.11 of Appendix 3-X3 provides a description of the anticipated runout zone for the LGO Stockpile, with extents shown on Figure 1. What would be the runout extent if there was a slope failure of the LGO Stockpile towards the Open Pit?	Please see attachment "R1_EMLI Geotech Comment IDs 322 336.pdf".		EMLI (S. Morse, A.McPherson)	KP		Jordan P/Joseph/Dan	AT/KP	Ready for Submission	KP, June 24	Ready for Publishing

336	Section 3.11 of Appendix 3-X3	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	Information Requirement	Yes	The proponent response provided states, “Sometime during Year 8, the elevation of a portion of the LGO Stockpile is scheduled to rise above the lowest pit elevation (northwest wall). It is possible that the run-out hazard zone at that time would include the start of the ex-pit haul road from the pit rim and the haul ramp to the LGO Stockpile.” Part 6.10.1(7) of the Code states "The mine manager shall require a qualified person to…prepare a procedure for controlling access to areas within the potential run-out zone of all dumps; this procedure will prohibit extended activities below active dumps…" Provide the runout and rockfall zone for the LGO stockpile at the maximum stockpile elevation and demonstrate how the Code requirement will be satisfied.	Please see attachment "R2_EMLI Geotech Comment IDs 322 336.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan/Greg	AT/KP	Ready for Submission	AT, Aug 16	Ready for Publishing
336	Section 3.11 of Appendix 3-X3	Geotechnical	EMLI (S. Morse, A.McPherson)		Aug 25, 2022	3	Follow Up	Potential Permit Condition	Yes	The response provided includes recommendations for additional runout assessments to be carried out. If permitted, a requirement for these assessments to be carried out and submitted to the Chief Permitting Officer is anticipated be included as a Permit Condition. [Potential Permit Condition]	BW Gold acknowledges the potential permit condition.		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	KP, Sep 9	Ready for Publishing
337	Table 3.5.4-4	Geotechnical	EMLI (S. Morse, A.McPherson)		Aug 10, 2022	2	Follow Up	Potential Permit Condition	Yes	a) If permitted, a Safe Work Procedure (SWP) or Safe Operating Procedure (SOP) for construction including trafficability is anticipated to be included as permit conditions.	BW Gold acknowledges the potential permit condition.		EMLI (S. Morse, A.McPherson)	KP		Joseph/Dan	AT/KP	Ready for Submission	AT, Aug 15	Ready for Publishing

344	Section 8.5 of Appendix 3-Z	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 8.5 of Appendix 3-Z presents the phreatic surface for several sediment control ponds under post-construction (static, short-term) and long-term condition; phreatic surface values are presented in either masl or mbgs. Provide all values in masl and mbgs/mags.	The requested information is provided below in 'masl' and 'mbgs' for the post-construction case, along with clarification related to how the phreatic surface was drawn. The maximum pond operating levels for the long-term analyses are provided in the report in 'masl' only. Operating water levels for the ponds are not provided in meters above or below ground surface because these values would be confusing due to the cut to fill nature of the pond designs. For the post-construction (static, short term) analyses, a simplified representation of the groundwater phreatic surface was drawn in consideration of the groundwater level measured from nearby hydrogeological installations. The phreatic surface was drawn as a subdued reflection of surface topography with depth below ground surface and approximate groundwater elevation at the pond centreline as follows: • 20.1 mbgs (1,379 masl) for the LWS collection pond • 1.6 mbgs (1,473 masl) for the UWS collection pond • 3.6 mbgs (1,433 masl) for the TS-2 sediment control pond • 19.2 mbgs (1,365 masl) for the TS-3 sediment control pond • 5 mbgs (1,242.5 masl) for the TS-4A sediment control pond • 23 mbgs (1,192 masl) for the TS-4B sediment control pond • 16 mbgs (1,204 masl) for the TS-5 sediment control pond		EMLI (S. Morse, A.McPherson)	KP		Jordan P/Joseph	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
345	Table 3.5.4-7	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Table 3.5.4-7 in the Application, under the heading Structure, Lower Waste Stockpile Collection Pond, there is a superscript 4 indicating a reference note. The reviewer was unable to find the reference note. Provide the text associated with reference note 4	The reference to Note 4 should have been to Note 3 referring to a minimum of 500 mm of freeboard.		EMLI (S. 348	Table 6.1 of Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Table 6.1 of Appendix 3-N states that the design flow for the LWS South Collection Channel is 3.56 m^3/s. Appendix 3-N, Appendix D, Drawing C3716, includes a detail of a road crossing culvert for the LWS South Collection Channel. What is the capacity of the road crossing culvert?	The culvert was designed to pass the 1-in-10-year 24-hour storm event flow of 1.73 m3/s.		EMLI (S. Morse, A.McPherson)	KP		Michael	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
348	Table 6.1 of Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	Information Requirement	No	The HSRC Guidance Document states “Applications should provide…hydraulic capacity and confirmation that all ditches/channels can safely convey the design flood in accordance with CDA guidelines (minimum 1:200 years) without overtopping, side slope failure or significant erosion.” What impact would a 1 in 200-year flood event have on the road crossing culvert? Would there be a loss of containment of the LWS South Collection Channel? If so what are the impacts?	The 1 in 200-year flood event would be expected to backwater the culvert designed for the 1 in 10-year flood event and could result in a loss of containment of the LWS South Collection Channel. Any lost flow would be captured downstream in the Water Management Pond. The LWS South Collection Channel culvert design criteria will be reviewed for the Issued for Construction (IFC)		EMLI (S. Morse, A.McPherson)	KP		Michael	AT/KP	Ready for Submission	AT, Aug 04	Ready for Publishing
348	Table 6.1 of Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Aug 25, 2022	3	Follow Up	Information Requirement	No	When will the design criteria be reviewed? When will IFCs be produced? What is the impact to the Water Management Pond when the there is overflow from the LWS? {Information Requirement]	The Issued for Construction (IFC) design drawings for the Lower Waste Stockpile (LWS) water management structures will be developed and submitted to the EMLI Chief Inspector prior to construction of these structures as required by Part 10.5.1 of the Health, Safety and Reclamation Code for Mines in British Columbia. A hard target date for IFC drawing submission cannot be provided at this time due to the dynamic nature of the permitting, IFC design, and project development schedule. The design criteria have been		EMLI (S. Morse, A.McPherson)	KP		Michael	AT/KP	Ready for Submission	KP, Sep 7	Ready for Publishing
349	Section 6.5.1 of Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 6.5.1 of Appendix 3-N states, “The collection pond has the ability to contain and convey the 1 in 10-year, 24-hr flood through the primary outlet to the Metals WTP Pond.” What is the maximum allowable pond level for the LWS Collection Pond to be capable of containing and conveying the 1 in 10-year 24 hr. flood?	The maximum pond level for providing enough storage for the design event is 1400.25 masl (0.5 m above the base to account for dead storage). The peak elevation after a 1:10 year 24-hour storm is 1405.5 masl.		EMLI (S. Morse, A.McPherson)	KP		Michael	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
350		Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Provide a plan showing the location of the Metals WTP Pond and a design for the Metals WTP Pond.	Please see memo "R1_EMLI_Geotechnical_Comment ID 350.pdf"		EMLI (S. Morse, A.McPherson)	BWG		Georges	TD	Ready for Submission	GM; June 24	Ready for Publishing

350		Geotechnical	EMLI (S. Morse, A.McPherson)		Jul 22, 2022	2	Follow Up	Information Requirement	No	The drawings provided do not show any details for the WTP Pond. Provide design details for the pond including, but not limited to, a cross-section through the pond, the pond capacity, if any dams are required to contain the pond.	The Metals WTP Pond will be constructed in two stages to support the water treatment system ramp up with an initial storage volume of approximately 4,600 m3 provided at the start of operations. The pond capacity will be expanded up to approximately 9,000 m3 in Year 4 by constructing an adjacent, connected pond of similar size. Both ponds will be rectangular in shape with approximate base dimensions of 40 m by 22 m, approximately 4 m deep with 3H:1V side slopes within the pond. The ponds will be lined with high-density polyethelene (HDPE) or an equivalent containment liner approved by the engineer. The ponds will be excavated and contained entirely below ground surface with no dams required to contain the ponds. A small perimeter berm at the top of the cut-slope will prevent surface runoff from contributing to the ponds. BW Gold will provide a letter with additional design details, including the technical design basis, design drawings with a plan view and cross sections, and relevant analyses in a follow-up response on the date provided to the MMO in the most recent version of the Round 2 BW workplan. [On Hold]	Please see memo "R2_EMLI_Geotechnical_Comment ID 350.pdf"		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, Aug 31	Ready for Publishing
351		Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Provide a list of all water sources that will be reporting to the Metals WTP Pond during the 1 in 10-year 24-hour flood?	Water will be conveyed to the Metals WTP from the following sources: 1) Lower Waste Stockpile Collection Pond 2) Open Pit dewatering system, including the pit sump and groundwater dewatering wells 3) Upper Waste Stockpile Collection Pond (beginning in approximately Year +11)		EMLI (S. Morse, A.McPherson)	KP		Cindy	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
351		Geotechnical	EMLI (S. Morse, A.McPherson)		10-Aug-22	2	Follow Up	Information Requirement	No	Demonstrate that the Metals WTP Pond has the capacity required to accommodate the anticipated flows during flood events.	The Metals WTP Pond will function as an influent equalization pond with a storage volume of approximately 4,600 m3 until Year 4 and up to approximately 9,000 m3 thereafter. This pond is designed to accommodate steady inflows from the various pumping systems from the Lower Waste Stockpile Collection Pond, Open Pit dewatering system, including the pit sump and groundwater dewatering wells, and the Upper Waste Stockpile Collection Pond (beginning in approximately Year +11). The Lower Waste Stockpile Collection Pond (LWS CP), Upper Waste Stockpile Collection Pond (UWS CP), and pit sump will provide temporary storage water generated by flood events until the flows can be transferred to the Metals WTP Pond and treated at the Metals WTP. The flood storage capacity of the LWS CP is approximately 50,000 m3 as described in Sections 6.5 of Appendix 3-N of the Application and the capacity of the UWC CP is approximately 100,000 m3 as described in Section 6.4 of Appendix 3-Y of the Application. The temporary storage capacity in the pit sump will be dependent on the mining phase, but is expected to be substantial and is not considered to be a design constraint that would affect the design basis capacity of the Metals WTP Pond.		EMLI (S. Morse, A.McPherson)	KP		Cindy	AT/KP	Ready for Submission	AT, Aug 15	Ready for Publishing
352	Section 6.5.2 of Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 6.5.2 of Appendix 3-N states, “The spillway outlet was designed to convey spillway flow beyond the toe of the pond. An option to excavate and line the full 100 m length to Mine Area Creek will be determined in the field…” What are the anticipated impacts of not excavating and lining a channel from the spillway outlet to the Mine Area Creek? Provide a rationale of why this activity may not be required.	Please see attachment "R1_EMLI Geotech Comment IDs 352 353 357.pdf".		EMLI (S. Morse, A.McPherson)	KP		Dan	AT/KP	Ready for Submission	AT, June 16	Ready for Publishing
353	Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Appendix 3-N indicates that in case of the 1 in 200-year, 24-hour flood, both the LGO Collection Pond and the Lower Waste Stockpile Collection Pond spillways would direct flows to the Mine Area Creek. What will the impact of these additional flows be on the stability of creek materials?	Please see attachment "R1_EMLI Geotech Comment IDs 352 353 357.pdf".		EMLI (S. Morse, A.McPherson)	KP		Michael/Carlos	AT/KP	Ready for Submission	AT, June 16	Ready for Publishing
354	Appendix 3-Z	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Appendix 3-Z states, "For the long-term static and seismic analyses a simplified representation of the phreatic surface is drawn to follow the natural ground surface." Figures E1.1 and E1.4, stability analysis results for the LWS Collection Pond long-term conditions, do not appear to include a phreatic surface outside of the pond area. Provide details regarding the modeled phreatic surface for long-term static and seismic analyses for the LWS Collection Pond	Please see attachment "R1_EMLI Geotech Comment IDs 334 337-339 347 354 356 360 369.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
355	Section 2.6 of Appendix 3-Y	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Section 2.6 of Appendix 3-Y states, “Terrain Stability Assessments (TSAs) should be undertaken in mapped areas of ‘potentially unstable’ and ‘unstable’ terrain during construction as recommended in the geohazard assessment (KP, 2022c). TSAs should adopt a risk-based approach to determine the extent of any necessary temporary mitigation measures…” What types of “temporary mitigation measures” are anticipated?	The types of temporary mitigation measures could include additional control of surface and subsurface water, adjustment to construction methods and activity sequencing, adjustment to cut and fill design slope angles, and temporary support/stabilization (e.g. buttressing, soil nailing, rock bolting, etc...).		EMLI (S. Morse, A.McPherson)	KP		Dan/James	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
356	Section 4.2 of Appendix 3-Y	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 4.2 of Appendix 3-Y indicates that the sensitivity analyses were completed by varying the effective strength of the lodgement till foundation by +/-5 degrees. What is the basis for the selection of +/-5 degrees being used?	Please see attachment "R1_EMLI Geotech Comment IDs 334 337-339 347 354 356 360 369.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
357	n 6.0 of Appen	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 6.0 of Appendix 3-Y states that the UWS South Diversion Channel discharges to ‘natural ground downstream of the collection pond where is will flow following exiting drainages to the WMP.’ and that “The emergency spillway from the collection pond would release flows to a drainage that ultimately flows to the WMP as well.” Reviewers note that the UWS South Diversion Channel is predicted to discharge flows of 5.0 m3/s or 2.5 m/s to natural ground during the 1 in 10 year 24 hour storm event	Please see attachment "R1_EMLI Geotech Comment IDs 352 353 357.pdf".		EMLI (S. Morse, A.McPherson)	KP		Carlos	AT/KP	Ready for Submission	AT, June 16	Ready for Publishing

358	Section 6.4 of Appendix 3-Y	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Section 6.4 of Appendix 3-Y states, “the pond is assumed to have a starting water level of 0.5 m when the 1 in 10-year and 1 in 200-year, 24-hour precipitation event occurs.” and “The spillway from the collection pond can also provide controlled discharge of flows into a natural drainage that flows to the WMP if water quality is suitable for direct release.” Describe how the spillway will provide controlled discharge of flows suitable for direct release, while maintaining a water elevation of 0.5 m to accommodate the design storm event for storage (1 in 10-year, 24-hour precipitation).	A starting water level in the UWS Collection Pond of 0.5 m was selected to account for some dead storage prior to the occurrence of any design storm event. The spillway will provide controlled discharge for a 1 in 200-year, 24-hour design storm event, maintaining a maximum flow level 0.5 m below the pond crest (freeboard). The UWS Collection Pond will utilize a pumping system to convey the recovered flows to the Metal WTP influent pond. The pond will be maintained in a dewatered condition to the maximum practical extent to limit the potential for discharge of untreated water to the WMP during severe storms. No change in the stability of the creek material is expected as all the water discharging from the proposed channels and ponds will be controlled by erosion control outlets.		EMLI (S. Morse, A.McPherson)	KP		Carlos	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
359	Tables 8.2 and 8.3	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Tables 8.2 and 8.3 present the ‘key design parameters’ for the North Collection Channel and South Diversion Channel, respectively, based on the 1 in 10-year, 24-hour design storm event. Provide the ‘key design parameters’ for the 1 in 200-year, 24-hour design storm event.	Please see attachment "R1_EMLI Geotech Comment IDs 343 359 367".		EMLI (S. Morse, A.McPherson)	KP		Carlos	AT/KP	Ready for Submission	AT, June 07	Ready for Publishing
360	Figure C.4 in Appendix C of Appendix 3-Y	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Figure C.4 in Appendix C of Appendix 3-Y does not meet the minimum FOS requirement of 1.4 as indicated in Table 4.4. EMLI expects the design meet the target minimum FOS or provide justification if meeting the target FOS is not required.	Please see attachment "R1_EMLI Geotech Comment IDs 334 337-339 347 354 356 360 369.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
361	Appendix 3-D of Appendix 3-Y	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	Appendix 3-D of Appendix 3-Y indicates that springs are located in the UWS footprint. Identify the location of the springs, and how the springs were considered in the stability analyses.	The water balance info in Section 3.3.4 of Appendix D notes that seepage from the stockpile footprint contributes to the collection pond (via springs in the stockpile footprint). This is considered in the stability modelling by the groundwater surface at the natural ground surface in the base of the stockpile. The "springs" are based on the results of the numerical groundwater modelling presented in Appendix 5-F of the Application and refer to groundwater that is simulated to discharge along the drainages beneath the proposed stockpile footprints. Individual springs have not been identified in the field; groundwater discharge to surface is expected to be along the natural drainages.		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
362	Figures E2.2 and E2.3 of Appendix E in Appendix 3-Z	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	The UWS Control Pond stability analyses shown on Figures E2.2 and E2.3 of Appendix E in Appendix 3-Z do not appear to include loading from the UWS. Provide justification for not including the loading from the UWS.	The analyses were for the post construction condition prior to placement of waste material into the stockpile as noted on the referenced figures. Additional analyses were provided in the report that include loading from the stockpile (see results for the Long Term case). The analyses were also updated in response to EMLI comment IDs 363 and 364. See attachment "R1_EMLI Geotech Comment IDs 363 364" for additional stability analyses.		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
363	Appendix E of Appendix 3-Z	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	The UWS Control Pond stability analyses provide in Appendix E of Appendix 3-Z includes phreatic surface assumption which are inconsistent with those used for the UWS stability analyses (Appendix 3-Y) and the field results which indicate that phreatic surface is 1.6 mbgs. Provide justification for the phreatic surface applied in the UWS Control Pond stability analyses including discussion of the likelihood and impact of seepage from the excavated UWS Control Pond face behind the liner. 368	Table 7.2 of Appendix 3-N	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Clarification	No	Table 7.2 of Appendix 3-N includes a note that the ‘Total Depth’ “Includes erosion protection thickness.” Do the depths noted in Tables 7.3 through 7.15 include erosion protection thickness?	Yes, all the depths noted in Tables 7.3 through 7.15 include erosion protection thickness.		EMLI (S. Morse, A.McPherson)	KP		Michael	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
369	Appendix 3-Z	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	QP Response Required	No	Section 8.5 of Appendix 3-Z states, "For the long-term static and seismic analyses a simplified representation of the phreatic surface is drawn to follow the natural ground surface" and "A manual phreatic surface is modelled for the long-term analyses for the maximum pond operating water level for each stockpile of…" Provide details regarding how the phreatic surface transition from the maximum pond operating level to the natural ground surface was established for the Topsoil Stockpile Sediment Control Ponds for stability analyses.	Please see attachment "R1_EMLI Geotech Comment IDs 334 337-339 347 354 356 360 369.pdf".		EMLI (S. Morse, A.McPherson)	KP		Joseph	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
370	Appendix 3-Z	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	The Application references a number of borrow areas including, but not necessarily limited to, the mine access borrow area, construction borrow pit, downstream aggregate borrow area, the borrow, aggregate screening and concrete batch plant area, and the borrow, aggregate screening and construction laydown area. Provide a plan with all the borrow areas within the proposed PMA, including the three identified at the Open Pit, and a summary table of each borrow (material, excavation method, depth, volume, etc…).	Please see attachment "R1_EMLI_Geotech_Comment Responses 240, 342,370.pdf"		EMLI (S. Morse, A.McPherson)	ERM	BWG/KP	Tonia	RT	Ready for Submission		Ready for Publishing
370	Appendix 3-Z	Geotechnical	EMLI (S. Morse, A.McPherson)		Aug 10, 2022	2	Follow Up	Information Requirement	No	Response incomplete. EMLI reviewers cannot locate a plan with all borrow areas within the proposed PMA and the summary table does not include information for all borrow areas proposed. One of the areas of confusion is the apparent multiple naming conventions for the same borrow areas. Comment repeated: “Provide a plan with all the borrow areas within the proposed PMA, including the three identified at the Open Pit, and a summary table of each borrow (material, excavation method, depth, volume, etc..).”	Please see attachment "R2_EMLI Geotech Comment ID 370.pdf".		EMLI (S. Morse, A.McPherson)	ERM	BWG/KP	Tonia		Ready for Submission		Ready for Publishing
371	Appendix 3-Z	Geotechnical	EMLI (S. Morse, A.McPherson)		Jun 01, 2022	1	New	Information Requirement	No	The Application includes reference to the Downstream Aggregate Borrow Area Sediment Control Pond, the location and design for which cannot be found within the Application. Provide the location and design for the Downstream Aggregate Borrow Area Sediment Control Pond, and confirm that all other ponds and dams are included in the Application including, but not necessarily limited to, ponds and dams associated with the borrow areas identified in the comment above	Please see attachment "R1_EMLI Geotech Comment ID 371.pdf".		EMLI (S. Morse, A.McPherson)	KP		Michael, Dan, Cindy	AT/KP	Ready for Submission	KP, June 24	Ready for Publishing

372	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	The geochemical characterization information provided in the Application relies on several supporting documents, including the report entitled "Blackwater Gold Project: 2013 Geochemical Characterization Report", prepared by AMEC Environment and Infrastructure, and two technical memoranda prepared by Emily Sportsman, Amec Foster Wheeler, dated May 2016. As these documents were prepared by a consultant not listed in Table 1.3-5, and are not signed or sealed, please indicate the responsible and accountable QP, where these documents have been relied on for the Application	These documents were submitted as part of the EA and provide the baseline geochemical characterization for the Project. This information has been summarized in Section 2.4.1 of the Application (Geochemical Characterization) and has been relied upon in good faith. Information in these reports has also been relied on to support the development of the ML/ARD Management Plan (Appendix 9-D) and the Geochemistry Source Term Report (Appendix A.6 to Appendix 5-D). These two documents (Appendix 9-D and Appendix A.6 of Appendix 5-D) were prepared and sealed by Lorax Environmental Services.		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
373	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	Terms for NP appear to be used inconsistently throughout Section 2.4 of the Application. NP is noted to have been determined by four methods including “Carbonate NP as determined by total inorganic carbon content (CNP)”, and “Carbonate NP as determined by the solid phase calcium concentration after aqua regia digestion (Ca NP)”. Subsequently, instead of using these defined acronyms, the term “Carbonate NP” is used without specifying between CNP and CaNP. Please clarify the following: a.Which form of Carbonate NP is plotted in Figure 2.4-6?	Figure 2.4-6 shows the CNP (Carbonate NP, as determined by total inorganic carbon content).		EMLI (G.Wolff)	Lorax		Timo	GM	Ready for Submission	GM; June 21	Ready for Publishing
374	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	b.Which form of NP was used to calculate the NPR presented in Figure 2.4-7	Figure 2.4-7 presents NPR values calculated using the modified sobek NP.		EMLI (G.Wolff)	Lorax		Timo	GM	Ready for Submission	GM; June 20	Ready for Publishing
375	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Information Requirement	No	Provide a figure comparing ICP CaNP and modified Sobek NP results for all waste rock units and overburden, or indicate where this figure can be located in the Application.	Please see attachment "R1_EMLI Geoscience Comment ID 375".		EMLI (G.Wolff)	Lorax		Timo	GM	Ready for Submission	GM; June 22	Ready for Publishing
375	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	Follow Up	Clarification	No	The correlation used to derive NP from assayed ICP-Ca was developed in 2016, as described in the AMEC 2016 memorandum. Was this correlation re-evaluated to incorporate ABA data collected subsequent to 2016	No, the relationship has not been re-evaluated. Limited ABA data on drill core has been collected since the original geochemical characterization program.		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 10	Ready for Publishing
376	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Approximately 83 Mt of overburden are anticipated to be excavated and stockpiled at site, a comparable quantity to the NAG4 and NAG5 waste rock tonnages. In particular, the Lower Waste Stockpile will consist almost entirely of overburden. However, minimal detailed characterization of overburden has been conducted and management details are lacking compared to other waste rock units. Table 3.5.4-1 in the Application appears to indicate that overburden will be operationally classified as NAG5. Meanwhile, the ML/ARD Management Plan (Appendix 9-D) states that overburden is expected to be NAG with low ML potential, and will be managed as waste rock, with only a minor volume of overburden requiring active management. The geochemical characterization of overburden presented in the Application indicates that overburden chemistry varies substantially. In particular, overburden samples were encountered in the Open Pit area and at depth with zinc concentrations in excess of 1,000 ppm, and PAG overburden samples were also encountered. 2021 SFE analyses of overburden samples, using high efficiency filters, also indicated concentrations greater than short-term water quality guidelines of parameters including arsenic, cadmium, copper, and zinc. Please provide the following details regarding overburden characterization and management: a.What are the relative tonnages or volumes of the different overburden material types (e.g., glacial till vs. weathered bedrock) expected to be excavated during construction and operations? b.How have different overburden types been considered in waste management planning? c.What contingencies have been developed to manage PAG or ML overburden that may be encountered?	Please see attachment "R1_EMLI Geoscience Comment ID 376.pdf"		EMLI (G.Wolff)	MMTS		(c) or MMTS	Marc S	GM	Ready for Submission	GM; June 21	Ready for Publishing
376	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	Follow Up	Clarification	No	The memo from MMTS indicates that all overburden excavated and stockpiled at site was considered to be glacial till, and that weathered bedrock was incorporated into the bedrock material balance for ore and waste. Meanwhile, geochemical characterization of overburden provided in Chapter 2 of the	Yes, confirmed that some geochemical data presented for overburden, specifically the "weathered bedrock", is planned to be managed as waste rock		EMLI (G.Wolff)	MMTS		Marc S		Ready for Submission	TD; Aug 16	Ready for Publishing
377	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	LGO will be stockpiled subaerially for several years, with the bulk of this material being processed during the final years of mining. Over this period of time, oxidation and weathering of the LGO material will be occurring. How has the impact of long-term oxidation of the material on mill processes been considered in mine planning? In the event of an extended Care and Maintenance period, please demonstrate if there is a temporal limit to the economic value of the LGO due to ongoing oxidation of	Please see response provided in attachment "R1_EMLI_Geoscience Comment ID 377.pdf".		EMLI (G.Wolff)	BWG	BWG	Alastair	TD	Ready for Submission	RT; June 22	Ready for Publishing

378	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Plans for the prevention, mitigation, and management of ML/ARD are required to be prepared in consideration of the Guidelines for Metal Leaching and Acid Rock Drainage at Minesites in British Columbia, as per Section 10.1.16 of the Health, Safety and Reclamation Code for Mines in British Columbia (the Code). Please demonstrate how the design and proposed size and duration of the LGO stockpile considers the principles and hierarchy for ML/ARD mitigation, as described in the Guidelines and the Policy for Metal Leaching and Acid Rock Drainage at Minesites in British Columbia.	Please see attachment "R1_EMLI Geoscience Comment IDs 376c, 378, 383, 385, and 386.pdf".		EMLI (G.Wolff)	Lorax	KP	Timo, Greg	GM	Ready for Submission	GM; June 21	Ready for Publishing
379	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Information Requirement	No	The LGO stockpile liner includes an HDPE geomembrane and compacted glacial till. Where will the till for this liner be sourced from?	Glacial till meeting the Zone S fill material specification for the LGO Stockpile liner will be sourced from the Open Pit or other appropriate local borrow area, similar to Zone S material for other site water management structures.		EMLI (G.Wolff)	KP		Joseph/Dan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
380	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Information Requirement	No	Following processing of the LGO stockpile, the till liner will likely contain elevated metals from leaching of the LGO. How will this material be handled and stored upon reclamation of the stockpile liner?	Upon mine closure, the LGO liner will be tested. Should results indicate elevated metal levels above background, the liner will be removed and stored within the open pit.		EMLI (G.Wolff)	BWG		Klaus	TD	Ready for Submission	RT; June 13	Ready for Publishing
381	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Information Requirement	No	Table 5.1-1 in the Application indicates that "covering waste rock with tailings to reduce hydraulic connection between waste rock and supernatant pond" is a management strategy for waste rock deposited in the TSFs. Given the relative deposition volumes and timing for waste rock and tailings in the TSFs, it is unclear how effective this strategy will be. What proportion of waste rock in each TSF is intended to be covered by tailings? Once placed, how long will this waste rock be uncovered before it is covered by tailings?	Waste rock deposited into each TSF will be covered with tailings once waste rock placement has ceased (in approximately Year +6 for TSF C and Year +18 for TSF D). It was estimated that the waste rock could be covered by tailings within approximately one year, once tailings deposition over the waste rock storage area begins. Waste rock in TSF D will be temporarily covered by water to limit potential for oxidation beginning in Year 18 prior to deposition of tailings into TSF D beginning in approximately Year 21.		EMLI (G.Wolff)	KP		Dan	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
382	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	Section 9.5 of the Application lists "quarry and borrow material" among the materials to be discussed in the ML/ARD Management Plan (Appendix 9-D); however, ML/ARD operational characterization, handling, and monitoring of quarry and/or borrow areas are not mentioned in Appendix 9-D. Please indicate where this information can be located or justify its exclusion.	Borrow material will be characterized at the same frequency as overburden. This will be specified in an updated version of the ML/ARD Management and Monitoring Plan.		EMLI (G.Wolff)	Lorax		Timo	GM	Ready for Submission	GM; June 23	Ready for Publishing
383	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Appendix 9-D, Section 4.1.1 references a relationship between ICP-Ca content and NP, and states that "in the absence of direct NP measurements, this formulation of NP will be used to define the acid generating potential of geologic materials". This statement appears to imply that direct NP measurements (i.e.., modified Sobek) are preferred; however, these measurements will only be conducted on a subset of samples submitted to an external laboratory. In the event that confirmatory NP measurements are inconsistent with on-site NP calculations derived from ICP-Ca, and would result in a reclassification of material. what steps will be taken?	Please see attachment "R1_EMLI Geoscience Comment IDs 376c, 378, 383, 385, and 386.pdf".		EMLI (G.Wolff)	Lorax		Timo	GM	Ready for Submission	GM; June 21	Ready for Publishing
383	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	Follow Up	Potential Permit Condition	Yes	a) A contingency measure for misclassification of PAG material as NAG4 or NAG5 is adjusting water management and/or treatment capacities. Should this contingency measure be understood to describe a scenario where misclassified PAG material is left in the waste stockpiles and/or other NAG4/5 waste rock deposition locations? If so, what water management adjustments or changes to treatment capacities would be considered, and what changes to stockpile closure and reclamation plans would be required? [Information Requirement] b) Please clarify if the NP formulation of [NP = 9.89 * (ICP-Ca wt%) + 4.19] is the intended operational method for determination of NP. [Clarification] c) EMLI is considering a potential permit condition requiring ongoing assessment of the correlation between ICP-Ca and NP and the use of ICP-Ca and ICP-S as proxies for NP and AP. [Potential Permit Condition]	a) Yes, this is how this contingency measure should be understood. It is important to keep in mind that the referenced contingency measure is considered a "last resort", reactive management strategy and is not expected to be required since misplaced PAG and NAG3 waste rock would be delineated and relocated to prevent the localized deterioration of contact water quality. Should the latter not be feasible due to operational constraints, operational water quality monitoring along with updated source term models would inform the need for adjustments of water management or treatment. b) It was found that inconsistent NP proxy relationships were presented in the ML/ARD Management Plan and the Source Term Report. The most up-to-date relationship used in the ARD block model is presented in the Source Term Report and should be: NP = 0.396 x (wt.% Ca x 24.9) + 3.23 The ML/ARD Management Plan will be revised with this relationship for the next document update. c) This comment is acknowledged and this potential permit condition is consistent with the planned ongoing re-evaluation of the NP proxy based on operational monitoring data as outlined in the ML/ARD Management Plan.		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 10	Ready for Publishing
384	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	Which NP method (e.g., ICP-Ca, modified Sobek) was used to derive the waste rock tonnages by type presented in the waste rock production schedule in Table 5.1-1 of Appendix 9-D?	The tonnages are based on the ARD block model, which incorporates both ICP-Ca and ABA results. It is important to note that although both measurement types are included in the block model, the model largely relies on the ICP-Ca measurements as they are far more abundant (approx. 285,000 samples) compared to ABA samples (n=945).		EMLI (G.Wolff)	Lorax	BWG	Timo	GM	Ready for Submission	GM; June 20	Ready for Publishing
385	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Appendix 9-D, Section 7.1.5 discusses a verification monitoring program that will be implemented for selected mine components, including sampling waste rock deposited in the stockpiles at a frequency of one sample per 200,000 t. The verification monitoring SOP in Appendix F of this document states that this monitoring program is only applicable to waste rock (bedrock) material and not overburden materials. The Lower Waste Stockpile will contain predominantly overburden, and at a rate of one sample per 200,000 t, only two samples of NAG waste rock would be collected from this stockpile over the operations period. a.Please provide a rationale for the sampling frequency of one sample per 200,000 t.	Please see attachment "R1_EMLI Geoscience Comment IDs 376c, 378, 383, 385, and 386.pdf".		EMLI (G.Wolff)	Lorax		Timo	GM	Ready for Submission	GM; June 21	Ready for Publishing
385	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	Follow Up		No	The likely effectiveness of the proposed verification monitoring program is limited at the indicated sample frequency, particularly for the Lower Waste Stockpile. However, EMLI understands that the monitoring program includes pre-blasting sampling at a greater frequency, and that the monitoring frequency will be regularly reviewed. [Comment]	Thank you for the comment.		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 10	Ready for Publishing
386	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	b.Please explain why overburden was excluded from the verification program	Please see attachment "R1_EMLI Geoscience Comment IDs 376c, 378, 383, 385, and 386.pdf".		EMLI (G.Wolff)	Lorax		Timo	GM	Ready for Submission	GM; June 21	Ready for Publishing

387	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Information Requirement	No	Operational sampling will include analysis of S, Ca, and Zn as proxies for AP, NP, and ML potential. One duplicate per 10 samples will be submitted to an external laboratory for QA/QC and more comprehensive analyses. a.How will the replicability of the onsite laboratory compared to the external laboratory be assessed at the start of sampling?	The replicability of onsite and external test results will be assessed through statistical analysis (i.e.., relative percent difference) of all results produced for QA/QC purposes by a QP. In addition, suitable QA/QC protocols will be incorporated by the contracted onsite laboratory internally to ensure that the required instrumentation is adequately calibrated. Such QA/QC measures would include use of standard reference materials, the analysis of internal duplicates, and additional external comparisons. An increased frequency of external QA/QC samples may be requested if warranted.		EMLI (G.Wolff)	Lorax		Timo	GM	Ready for Submission	GM; June 23	Ready for Publishing
388	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	b.The confirmatory testing includes Modified NP. Will there be any quantification of siderite or other mineral content as part of the operational testing program?	The ML/ARD monitoring program does not currently include mineralogic analysis of waste rock. Routine XRD analysis to improve quantification of carbonate mineralogy in waste rock will be included in an updated version of the ML/ARD Management Plan.		EMLI (G.Wolff)	Lorax		Timo	GM	Ready for Submission	GM; June 23	Ready for Publishing
388	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	Potential Permit Condition	Yes	As noted in Comment 410, EMLI expects that mineralogical analyses will be included in the ML/ARD monitoring program, due to the reliance on calcium as a proxy for NP and the associated assumptions regarding carbonate mineralogy. [Potential Permit Condition]	Thank you for the comment. The next update of the ML/ARD Management Plan will include routine mineralogical analysis for the purpose of ongoing NP proxy refinement.		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 10	Ready for Publishing
389	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Table 7.2-1 in Appendix 9-D lists contingency measures for failing to submerge PAG and NAG3 rock within the prescribed timeframe in the TSF, including adjusting water management to accelerate flooding in the TSF. Where would water to accelerate flooding be sourced from, and what are the implications of this contingency for wider water management at the mine site? [	Please see attachment "R1_EMLI Geotech-Geoscience Comment IDs 308 316 389.pdf".		EMLI (G.Wolff)	KP		Dan/Cindy	AT/KP	Ready for Submission	KP, June 23	Ready for Publishing
389	Appendix 9-D ML/ARD	Geoscience	EMLI (G.Wolff)		Aug 05, 2022	2	Follow Up	Potential Permit Condition	Yes	Placement of PAG waste rock in the TSF and submergence within a relatively short timeframe appears to be the primary mitigation for ML/ARD generated by waste rock. Consequently, EMLI is considering a permit condition requiring the saturation of PAG waste rock within specific timeframes. Given the complexity of water management required to maintain waste rock saturation while meeting both the needs of the mill and downstream flow requirements, detailed contingencies for maintenance of the water cover during scenarios including a water deficit are expected to be further developed.	BW Gold acknowledges this comment.		EMLI (G.Wolff)	KP		Dan	AT/KP	Ready for Submission	KP, Aug 15	Ready for Publishing
390	Section 3.2.1.1 of the Geochemistry Source Term Report	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Section 3.2.1.1 of the Geochemistry Source Term Report (Appendix A.6 to Appendix 5-D) indicates that NAG3, NAG4, and NAG5 waste rock loading rates were derived from all NAG HCTs, and that PAG1 and PAG2 neutral loading rates were derived from all neutral pH PAG HCTs. a.Please explain why one loading value was used for all NAG waste rock, apart from the parameters with pH correlations, despite the difference in ML classification between NAG3 waste rock and the remaining NAG units.	Please see attachment "R1_EMLI Geoscience Comment IDs 390, 392-394, 396, 398, 399, 403, 404 and 407".		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 22	Ready for Publishing
391	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	b.Were the individual HCTs weighted in any way in the loading rate calculations? If so, how were they weighted?	The HCTs were given equal weighting in the loading rate calculations.		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
392	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	17.NAG5 HCT HC-17-01 was used as a source term for overburden loading rates. This HCT was constructed from felsic tuff material with 0.01 wt% sulphur. As the median sulphur concentration in overburden is 0.01 wt%, this appears to be a reasonable source term for Base Case calculations. However, it is noted that overburden sampling represents a wide range of overburden material, including till and weathered bedrock, and overburden samples at depth in the Open Pit and TSF areas and from the bedrock interface contained substantially greater sulphur and metal concentrations, including zinc concentrations in excess of the 600 ppm cut-off for NAG5 classification. a.Please provide further justification for the selection of HC-17-01 as representative of Base Case overburden loadings	Please see attachment "R1_EMLI Geoscience Comment IDs 390, 392-394, 396, 398, 399, 403, 404 and 407".		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 22	Ready for Publishing
392	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	Follow Up		No	Further comments regarding overburden source terms are provided under Comment ID 376. [Closed]	BW Gold acknowledges that the comment is closed.		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 4	Ready for Publishing
393	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	b.As HC-17-01 represents median sulphur concentrations for overburden material, 90th percentile loadings from this HCT may not be a reasonably conservative Upper Case source term. Please evaluate the sensitivity of this source term to the selection of an alternate HCT that is more representative of Upper Case overburden chemistry	Please see attachment "R1_EMLI Geoscience Comment IDs 390, 392-394, 396, 398, 399, 403, 404 and 407". 395	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Information Requirement	No	Please replicate Figure 3-2 for all parameters with loading rates derived from pH correlations.	Please see attachment "R1_EMLI Geoscience Comment ID 395".		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 22	Ready for Publishing
395	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	QP Response Required	No	"a) The correlations between HCT loading rates normalized to solid phase concentrations and pH are considerably weaker for arsenic, antimony, and lead than for other parameters presented. How has the potential influence of iron sorption been considered in the development of these regressions? Please provide additional rationale for using these regressions in the development of source terms for arsenic, antimony and lead, demonstrating that this is a conservative approach. [QP Response Required]	Please see attachment "R2_EMLI Geoscience Comment ID 395, 396, 397, 399".		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 10	Ready for Publishing
395	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Aug 25, 2022	3	New	Information Requirement	No	a) Closed b) The response indicates that "waste rock management is based on ARD potential and does not distinguish between different types of NAG rock based on carbonate mineralogy". The comment referenced NAG waste rock segregation, which is based on solid phase zinc content--specifically, NAG3 material is managed as metal leaching and deposited in the TSF based on zinc concentrations. A wide	metal content. While the influence of pH should not be understated, the solid phase metal content remains a relevant characteristic for determining metal leaching potential. Solid phase metal content has the advantage of being readily determined through ICP assays, and has been measured in sufficient quantity and spatial resolution for trace metal content and NPR to be populated into the ARD block model. Generating data on carbonate abundance and mineralogy with sufficient resolution to		EMLI (G.Wolff)	Lorax		Georges		Ready for Submission	GM; Sept 15	Ready for Publishing

395	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Oct 11, 2022	4	Follow Up	QP Response Required	No	The correlation between pH and solid phase metal content developed in the Application indicates there is uncertainty in the use of just solid phase metal content for operational segregation of NAG3/4/5 waste rock, as higher loading rates may be observed from waste rock with lower metal content and vice versa. Considering this uncertainty, please demonstrate that the operational cut-offs, particularly for NAG3, are conservative. [QP Response Required]	Please see attachment "R4_EMLI Comment IDs 395".		EMLI (G.Wolff)	Lorax				Oct. 18	GM; Oct 19	Ready for Publishing
395	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Nov 02, 2022	5	Follow Up	Potential Permit Condition	Yes	Based on the data provided in the Application and subsequent responses, the uncertainty in the use of solid phase zinc content for operational segregation of NAG waste rock remains. In addition to previously noted expected permit conditions requiring ongoing evaluation of geochemical source terms and carbonate mineralogy, EMLI is considering a permit condition requiring reassessment of the operational waste rock classification and segregation criteria on an ongoing basis.	This comment is acknowledged.		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Nov 10	Ready for Publishing
396	Section 3.4 of the Source Term Report	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Section 3.4 of the Source Term Report provides a scaling factor for "% of year frozen" of 0.33 (Table 3-7), with the accompanying text indicating that this represents 33% of the year. Scaling factors are stated to be incorporated into the source terms by simple multiplication. Please clarify if this specific scaling factor was incorporated by multiplication or by setting relevant loads to zero during those months. Additionally, explain how this correction was added to the temperature correction of 0.66 applied to all other source terms.	Please see attachment "R1_EMLI Geoscience Comment IDs 390, 392-394, 396, 398, 399, 403, 404 and 407".		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 22	Ready for Publishing
396	Section 3.4 of the Source Term Report	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	QP Response Required	No	The response appears to indicate that both the "% of year frozen" and temperature correction scaling factors were applied to pit wall loadings. Please justify the use of a temperature scaling factor that accounts for annual field temperatures on loadings that are already set to zero during winter months, rather than deriving an alternate temperature scaling factor that excludes those months, or clarify further. [QP Response Required]	Please see attachment "R2_EMLI Geoscience Comment ID 395, 396, 397, 399".		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 10	Ready for Publishing
397	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Mineral solubility limits have been applied to the WQM source terms at various locations including TSF waste rock, stockpiles, and the TSF ponds. An arsenic sorption model was also developed. Due to the greenfield nature of this Project, EMLI acknowledges that site-specific field-scale studies of geochemical attenuation mechanisms are not possible, and that modelling represents the best available information. In order to bracket uncertainty in the source terms, water quality predictions, proposed water quality mitigation requirements, and ultimately the reclamation liability, please produce an additional WQM sensitivity that does not include secondary mineral solubility limits for mine facilities, arsenic sorption, TSF pond solubility controls, or overburden solubility limits. Compare the results of this model sensitivity to the Base Case WQM results and identify which water quality mitigations proposed are sufficient under this scenario, and where additional mitigation may be required under this scenario.	The solubility constraints were developed in a conservative manner consistent with industry standard practice. The specifics of this rational are presented in the attachment "R1_EMLI Comment ID 397"		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	TD, 15-Jun	Ready for Publishing
397	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2		QP Response Required	No	"a) Tables 2-2 to 2-4 include barium (Ba) twice in the Parameter column. The second Ba is assumed to be beryllium (Be); however, it is noted that in several columns, the concentrations are repeated between the two rows (e.g., post-PHREEQC concentrations in Table 2-2). Please confirm if there is a simple typo in the Parameter column or if the data have also been repeated. [Clarification] b) Please confirm if the PHREEQC concentrations presented are inclusive of the arsenic sorption model. [Clarification] c) The memo states that solubility for the Lower Waste Stockpile was based on a combination of PHREEQC and solubility caps derived from SFE concentrations. Appendix 5-D to the Application states that 2021 SFE concentrations were used to cap the Lower Waste Stockpile source term. How was PHREEQC used in this source term? [QP Response Required] c) Were solubility limits in the TSF ponds only applied during the operations phase, as shown in Figures 2-1 to 2-8? If solubility caps were also applied in closure and post-closure, please provide similar plots for those phases. [QP Response Required] d) Dissolved aluminum concentrations in the TSF ponds appear to be controlled by the solubility cap (0.0026 mg/L) throughout operations. This limit is substantially lower than dissolved aluminum concentrations measured frequently in the receiving environment, including in background water quality used as inputs to the TSF ponds. Please provide further justification for the selection of this solubility cap. [QP Response Required]"	Please see attachment "R2_EMLI Geoscience Comment ID 395, 396, 397, 399".		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 10	Ready for Publishing
397	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Aug 25, 2022	3		Potential Permit Condition	Yes	The application of concentration caps derived from SFE in addition to equilibrium modelling for LWS drainage is noted to result in substantial reductions in concentrations for several parameters including cadmium, copper, and zinc. SFE testing may not be a conservative measure of leachate concentrations due to the short time frame and high liquid to solid ratios employed. However, it is also understood that overburden data are influenced by weathered bedrock material that would not be expected to be placed in the LWS, that LWS contact flows will be captured and treated prior to discharge, and that additional contingencies are available for management of overburden material with elevated metal leaching. Ongoing monitoring of waste stockpile contact flows and consequent source term updates are expected to be a permit condition. [Potential Permit Condition]	BW Gold will be required to submit updates to the water quality model and reclamation program every five years. BWG suggests that potential source term updates based ongoing monitoring and research programs be a component of the Five Year Plan water quality model updates. 400	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	Source terms for tailings consolidation water were set as "equal to contemporary pond water predicted in GoldSim" for nitrogen species and major ions. Should this be understood as “contemporary” pond water upon deposition of tailings, or upon release of tailings void water?	The source term is set to contemporary pond water upon release of void water.		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
400	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	Information Requirement	No	Please provide further rationale for the assumption that nitrogen species and major ions in tailings void water released through consolidation can be represented by contemporary pond water, demonstrating how tailings voids would not be expected to impact concentrations of these parameters in the TSF ponds. [Information Requirement]	A majority of tailings consolidation takes place in the first months after tailings slurries are discharged into the TSF. Therefore, contemporary pond chemistry which forms the initial tailings pore water is considered a reasonable estimate of major ions in consolidation water. Similarly, there will be limited time for redox processes to influence nitrogen speciation; therefore, the evolution of nitrogen speciation is not incorporated into this source term.		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 10	Ready for Publishing

401	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	TSF D seepage chemistry is derived from a flow weighted average of the TSF pond over time, based on the assumption that loading from waste rock will be dominated by flushing of oxidation products. Does this mean that, following the final flush of loadings upon submergence, it is assumed that waste rock deposited in the TSF does not contribute any additional load to seepage passing through it?	Metal release associated with saturation of waste rock is modelled as a function of exposure time. The release of this geochemical load is conservatively assumed to be instantaneous upon submergence, rather than gradual over time. These peak concentrations are applied to water passing through waste rock throughout the operations and post-closure period, with no consideration of rinsing out of peak concentrations. The TSF D seepage source term presented in Table 4-8 of the Geochemistry Source Term Report (Appendix A.6 of Appendix 5-D) is applied into the Post-Closure period.		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
402	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Assumptions for saturated waste rock are predominantly dependent on the results of two saturated column tests from 2014. The Application notes that additional waste rock saturated column tests were initiated in March 2021, but no leachate results are reported. Please provide a comparison of the 2021 and 2014 waste rock saturated column test results and comment on any implications for the assumptions presented in the Application regarding saturated waste rock.	This comment is acknowledged. The column test report will be provided once it is available.		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
402	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	QP Response Required	No	The requirement remains outstanding. Please provide the comparison as requested. [QP Response Required]	Based on a call held between EMLI, BW Gold and Lorax on Aug. 22, 2022, Lorax will continue to operate the column tests currently underway for two or three additional months until column pH achieves circumneutral water chemistry. The results of these tests will be provided in a report once all results are received, anticipated to be provided in early Q1 2023. In the Aug. 22 meeting, Lorax conveyed that the rock samples used in the ongoing columns tests were not intended to be used as 'base case' source terms, as the rock samples had an in-situ acidic pH which is not typical of mine rock from the deposit. Rather, the results of the		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 15	Ready for Publishing
403	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Please explain how the Open Pit geotechnical domains described in Chapter 3 of the Application (surficial materials, broken zone, competent rock) have been considered in the assumptions of pit wall loadings.	Please see attachment "R1_EMLI Geoscience Comment IDs 390, 392-394, 396, 398, 399, 403, 404 and 407".		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 22	Ready for Publishing
403	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	Clarification	No	Comment partially addressed. Please clarify if the blast damaged and blast fractured zones as mentioned in the response also accounted for the geotechnical domains described in Chapter 3 of the Application. [Clarification]	The geotechnical structural domains described in Chapter 3 of the Application were not incorporated into pit wall source term development.		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 10	Ready for Publishing
404	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	What is the rationale for using overburden SFE results to cap Sb concentrations specifically for the mine facilities source term?	Please see attachment "R1_EMLI Geoscience Comment IDs 390, 392-394, 396, 398, 399, 403, 404 and 407".		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 22	Ready for Publishing
405	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	The Downstream Aggregate Borrow Area source term incorporates loading from overburden fill and from undisturbed ground. Please indicate if any loadings from the exposed borrow material were considered, or if these are intended to be represented by the overburden fill loadings.	The Downstream Aggregate Borrow Area source term is based on 50% of the area being covered with overburden fill and 50% remaining undisturbed. At the time of source term development, design details for this area were limited. As such, the source term was based on 2 m of overburden material placed over 50% of the area. The remaining 50% of the area was assigned the source term for reclaimed ground (i.e.., median water quality for WQ10). These two values were combined to provide an overall source term for the Downstream Aggregate Borrow Area. No additional loadings were applied.		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
406	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	The source term for "reclaimed surfaces" (surface runoff from mine components covered with overburden during reclamation activities, including dams, stockpiles, tailings beaches, and mine facilities) is derived from median background water quality results for station WQ10 in upper Davidson Creek; that is, the model assumes that loadings from these surfaces will be equivalent to completely undisturbed background catchment runoff. Additionally, no upper case source term was developed for these surfaces. These assumptions do not appear to be supported by the proposed reclamation plan, particularly for the tailings beaches. Please develop an additional source term that accounts for influences from remobilized overburden used in reclamation of these facilities, and discuss any changes to WQM predictions and long-term water quality mitigation and management requirements as a result of using this updated source term.	Model sensitivity will be provided with Round 2 comment responses, as discussed with EMLI and BW Gold Ltd. on 22-June-2022. A memo was submitted on August 16 " R1_EMLI Geoscience Comment ID 406		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	TD, 15-Jun	Ready for Publishing

406	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Sep 02, 2022	2		Information Requirement	No	The memo from Lorax states that "The model results associated with the revised Reclaimed Area source term indicate material consistent with overburden may not be suitable for mass application as a reclamation material due to estimated Cd concentrations unless runoff from reclaimed areas is managed in a manner that mitigates predicted BC WQG exceedances. These results will be used to guide reclamation material management and selection, which will be subject to ongoing refinement throughout the Project Construction and Operation phase." In this scenario, how would the reclamation material volume estimates for overburden as presented in the Application be affected? Would there be a potential reclamation material deficit? If so, what is the contingency to source reclamation material to meet end land use objectives for the TSF? [Information Requirement]	An updated reclaimed surface source term was developed in response to R1 EMLI comment 406. The new source term approach discussed with EMLI and BW Gold Ltd. on 22-June-2022 , incorporated an upscaling approach using scaled waste rock HCT loading rates. This approach resulted in a 15x increase in Cd concentrations (0.0000072 mg/L to 0.00011 mg/L) from the original source term used in the Base Case model (V13e). Applying an upscaling approach to overburden is considered highly conservative, as weathered overburden generally lacks reactive sulphide minerals and geochemical loadings would be limited to rinsing of residual oxide minerals. For additional context, the D-Cd guideline exceedances presented in attachment "R1_EMLI Geoscience Comment ID 406.pdf" are considered to present a relatively low risk to aquatic receptors during the Post-Closure phase. The magnitude of D-Cd guideline exceedances presented in that memo are low (1.3x the BC long-term water quality guideline (WQG) or less) and spatially limited to upper Davidson Creek. It is noted that all predicted D-Cd concentrations at WQ28 in the updated reclaimed source term model sensitivity fall below the BC long-term WQG when the guideline is calculated using the corresponding predicted hardness (in "R1_EMLI Geoscience Comment ID 406.pdf", predicted concentrations are conservatively screened against guidelines calculated using baseline monthly hardness). For the above reasons, we suggest that revaluation of the reclamation materials balance is not warranted at this time. Evaluation of mine water management during the Post-Closure phase is ongoing within the context of meeting long-term environmental targets (e.g., in response to Round 3 comment 411(c)).		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Sept 15	Ready for Publishing
406	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Oct 11, 2022	3		Potential Permit Condition	Yes	EMLI expects that standard permit conditions requiring research of reclamation materials and development of contingency plans to address potentially unsuitable reclamation material will apply. EMLI is also considering specific permit condition(s) relating to further geochemical characterization of overburden material intended for reclamation and contingency plans for material placement on tailings beaches that address volume requirements and geochemistry considerations. [Potential Permit Condition]	This comment is acknowledged.		EMLI (G.Wolff)	Lorax				Oct. 18	GM; Oct 19	Ready for Publishing
407	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Table 4-20 in the Source Term Report provides percent removals for the Membrane WTP. Please indicate if these removal percentages were applied at all times, or if there is a minimum parameter concentration below which reduced removal efficiency would be expected.	Membrane rejection rates are not expected to vary significantly with influent concentrations in the range of design feedwater. Rejection rates can decline at very low feed concentrations in some instances, but these are much lower than the expected influent water quality at Blackwater. However, rejection percentage is impacted by influent temperature, with higher temperatures resulting in higher salt passage (lower rejection) than lower temperatures. The cited reference sites and pilot results from which the rejections in Table 4-20 are taken have similar climatic conditions and water temperatures as what can be expected at Blackwater, so it is reasonable to use these rejections for calculation purposes in the Blackwater design. The removal percentages were applied at all times when water was being treated in the water quality model.		EMLI (G.Wolff)	Lorax	BQE	John	GM	Ready for Submission	GM; June 22	Ready for Publishing
408	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	Table 4-21 in the Source Term Report provides Membrane WTP brine concentrations. Are these concentrations calculated/modelled based on removal rates and influent chemistry, or do they represent brine chemistry provided by in the WTP Design Report?	These brine concentrations presented in Table 4-21 were calculated using the removal rates and predicted influent chemistry (95th percentile influent water concentrations from the average climate scenario).		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 23	Ready for Publishing
409	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	Source terms for sludge by-products have not been developed. Synthetic precipitation leaching procedure analyses of sludge reported by McCue in Appendix 5-G were not considered in the WQM as they were representative of mildly acidic conditions. EMLI expects that detailed characterization of these materials under conditions that are more representative of the TSF ponds, and derivation of source terms, will be completed as indicated in the water quality model report and ML/ARD Management Plan.	BW Gold acknowledges the comment and will perform a detailed characterization of the sludge by-product once it becomes available.		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 15	Ready for Publishing
410	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Potential Permit Condition	Yes	The Source Term Report notes that uncertainty in the associations between carbonate mineralogy and lithology may be improved by conducting mineralogical analysis to quantify relative proportions of carbonate minerals. Mineralogical testing is not included as part of the operational testing program proposed in the ML/ARD Management Plan. EMLI expects that further quantification of carbonate mineralogy in waste rock will be completed during operations.	BW Gold acknowledges the comment and can perform such studies when waste rock becomes available.		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 15	Ready for Publishing

411	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	The Pit Lake is expected to develop into a density stratified system, but was modelled as one fully-mixed reservoir. Due to the deposition of brine at depth in the Pit Lake, and the influences of pit seepage on zinc concentrations in the TSF C Pond and the TSF spillway in post-closure, pit stratification has the potential to significantly influence post-closure water quality, long term mitigation requirements, and the assessment of the reclamation liability. Please complete a WQM sensitivity incorporating Pit Lake stratification in post-closure. Please include an assessment of any proposed changes to post-closure water quality mitigation and/or management actions under this scenario. Please provide updated cost estimates for the Year +3 and LoM cost estimate as a result of this assessment. Please provide a determination on any recommended updates to the Base Case water quality model following that assessment.	A simplified two-cell pit lake model has been developed and results of that model can be provided to the MRC the week of July 10th. This model will be validated through a more robust quantitative pit lake dynamic model under development by Lorax. The results of this model will be integrated with the Application water quality model to evaluate the effects of predicted pit lake stratification on predicted mine and receiving environment water quality. The results of this model exercise will be presented in a memorandum provided to MRC on or before August 15, 2022. BW Gold will update the closure cost estimate for the Year +3 and LoM cost estimate if needed as part of its round 2 responses. This update would build upon the update being completed for round 1 responses and any other comments received during round 2.		EMLI (G.Wolff)	Lorax		Alan	GM	Ready for Submission	TD, 15-Jun	Ready for Publishing
411	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	QP Response Required	No	Partial response received July 18th. Comments will be provided at a later date.	BW Gold acknowledges this comment and looks forward to discussing further in future Review rounds.		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 5	Ready for Publishing
411	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Sep 02, 2022	3	Follow Up	QP Response Required	No	a) The pit lake surface receives acidic pit wall inputs and elevated loadings of several parameters, including zinc. Mineral solubility controls were applied to pit wall loading source terms but no additional geochemical modelling has been conducted for the pit lake. Please provide an estimate of water quality in the pit lake surface layer in post-closure that incorporates solubility controls as well as an estimation of pH levels. [QP Response Required] b) Zinc and cadium concentrations were predicted to increase above the "one cell" predictions in the surface layer in the Round 1 two-cell pit lake predictions, whereas concentrations of these parameters were predicted to be below the "one cell" predictions in the updated PitMod model. The dominant loading source of these parameters was stated in the Round 1 memo to be pit wall runoff. Please indicate the dominant source of zinc and cadmium loadings to the pit lake in the PitMod model and explain the cause of the observed reduction in predicted concentrations. [QP Response Required] c) The response notes that the pit is predicted to provide approximately 70-80 years of brine storage, and states that "given the time scales of brine storage, there is considerable time to modify water management strategies and re-evaluate the need for long-term treatment and alternative strategies for brine treatment and or disposal". Please provide a detailed plan for development of alternate long-term mitigation strategies for pit lake water quality. The plan must include specific research areas that will be addressed during the development of these mitigations and/or contingencies, timelines associated with each task within the plan, and must include a detailed cost estimate for the execution of the plan. [QP Response Required]	Please see Reponse ID 487 and 490. Please see attachment "R3_EMLI Comment ID 411_Part_a_and_b.pdf" Please see attachment "R3_EMLI Comment ID 411c..pdf"		EMLI (G.Wolff)	Lorax		Georges		21-Sep-22	GM; Sept 20 GM; Sept 27	Ready for Publishing
411	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Oct 11, 2022	4	Follow Up	QP Response Required	No	a) Closed b) Closed c) Response Pending	"R3_EMLI Comment ID 411c..pdf" was submitted on October 10, 2022		EMLI (G.Wolff)	Lorax						Ready for Publishing
411c	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Nov 01, 2022	5	Follow Up		Yes	a.EMLI acknowledges the suggested permit conditions, which will be considered during the reclamation liability cost estimate review. [Comment] b.The post-closure Membrane WTP is referred to as a nanofiltration (NF) system throughout the document. BW Gold had previously indicated that post-closure water treatment would use a reverse osmosis (RO) system, as part of the v13e water balance and water quality modelling updates discussed in the memorandum from Lorax dated June 29, 2022. Please clarify the system that BW Gold is applying to permit. [Clarification] c.EMLI requires the Near-term evaluations #1-3 listed in Appendix A to be provided during the Application Review stage. EMLI understands that the deliverables associated with these tasks are scheduled to be provided on November 15th, and will review the information when received. [Information Requirement] d.For each listed deliverable in the "Key Deliverables and Outcome" column of Appendix A, please indicate if the deliverable is intended to be internal or external (i.e., submitted to ENV/EMLI). Tasks #5 and 6 include delivery of interim modelling updates--please note that EMLI does not typically review interim or draft reporting. [Clarification] e.For Long-term task #2, please clarify if the cost estimate is intended to represent the pilot testing of the treatment system(s) in addition to the development of the report; if not, please indicate where these costs have been included. [Clarification] f.Long-term tasks #3 and 4 include deliverables that are listed as proposals. Is the cost assigned to these tasks the estimated cost to complete the proposals, or also to complete the testing and literature reviews? [Clarification]	a) BWG acknowledges the comment b) BWG would use a reverse osmosis (RO) system at post-closure c) The deliverable associated with these tasks are scheduled for Nov 22. Please see "R5_EMLI Comment 411c_Near Term Evaluations_Final.pdf" and "R5_EMLI Comment 411c_Near Term Evaluations_Responses.pdf" d) The deliverable would be external. e) Cost estimate is intended to represent the development of the report only because it should not incur additional capital or operating expenses to run the already deployed full-scale membrane system f) This cost relates to the completion of the proposal and excludes the toxicity tests.		EMLI (G.Wolff)	Lorax	BQE	Georges			GM; Nov 1	Ready for Publishing
411c	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Dec 14, 2022	6	Follow Up		No	EMLI Geoscience has reviewed the updated submission from BQE Water regarding long-term water treatment at the Blackwater Project in response to EMLI Geoscience Comment 411(c), titled "Post-Closure Water Treatment at Blackwater: Responses to ENV Information Requests", dated November 22, 2022. This report is intended to include near-term evaluations 1-3 from the work plan submitted by Lorax Environmental on October 10, 2022, as follows: 1.Identify if there is a preferred alternative treatment option for post-closure (excluding reverse osmosis or nanofiltration). 2.Report on alternative treatment option (if one is identified through the risk assessment). 3.Evaluate Parameters of Concern in post-closure. EMLI Geoscience has the following comment on the submission: The assumptions regarding the use of dilution to treat sulphate in pit lake discharge once the membrane system has been discontinued rely on potential maximum dilution factors and do not appear to have been modelled. The report includes a recommendation to investigate the feasibility of this option. EMLI expects that this investigation will be explicitly included in the near-term evaluation #5 from the long-term water treatment work plan submitted October 10, 2022, and will include the following: a.Updated water balance and water quality modelling, incorporating updated geochemical source terms and consideration of alternate sources of sulphate and metals (e.g., ARD from pit walls); and b.Management of solid by-products generated by ongoing treatment of metals and oxyanions following discontinuation of membrane treatment and brine production.	BW Gold acknowledges the reviewer's comments. Near-term evaluation #5 from the long-term water treatment work plan submitted October 10, 2022, will include the following: a.Updated water balance and water quality modelling, incorporating updated geochemical source terms and consideration of alternate sources of sulphate and metals (e.g., ARD from pit walls); and b.Management of solid by-products generated by ongoing treatment of metals and oxyanions following discontinuation of membrane treatment and brine production.		EMLI (G.Wolff)	BWG				TD, Dec 19	Ready for Publishing

411c	Source Terms and Water Quality Prediction		BC ENV		Dec 14, 2022	6	Follow Up		Yes	Below are ENV's comments based on our review of the response memos for R5_EMLI Comment ID 411c. To note, ENV is not expecting specific comment responses at this time, but rather is providing the below comments for consideration by BWG: 1.ENV is considering a condition in the Environmental Management Act (EMA) effluent permit that would require the development and submission of an updated water balance/water quality model to demonstrate the feasibility of the post-closure discharge scenario that involves mixing the pit supernatant with other lower sulphate water collected on the mine site, as well as treatment of metals to make the effluent suitable for discharge to Davidson Creek. The proposal of this requirement aligns with the R3 Comment 411c workplan tasks 5 and 6, which proposes an interim modelling update by June 1, 2023. Requirements of this condition could include: oA comprehensive model report, which would include all the model assumptions and results. oThe authorization of tailings discharge to the tailing storage facility may be contingent on submission of the model report, which is subject to approval by the director. oThe required timeline for submission of the updated model report is proposed to be June 2023 to allow for sufficient review and discussion by ENV and First Nations prior to referral to the director for decision, and assumes commencement of tailing deposition August 1, 2024. 2.This comment is not specific to the information provided in the above-mentioned memos, however important for consideration in post-closure water treatment and discharge planning. ENV notes that the water quality predictions for post-closure from the TSF spillway (WB/WQM v13e), which is assumed to be the end-of-pipe, are shown to be above the proposed permit limits in the current Major Works application (i.e., BC WQGs and proposed SBEBs) - reference Lorax memo "Water Balance/Water Quality Model Update" dated June 29, 2022. Whereas, the water quality predictions in Davidson Creek, immediately downstream of the discharge at WQ28 are shown to meet BC WQGs. Hence: oIt is assumed that a certain amount of dilution is being relied upon to achieve BC WQGs in the receiving environment downstream of the project during the post-closure phase. oProposal of an initial dilution zone (IDZ) is not considered to be part of the current application. oIn the event that BWG proposes this discharge scenario for authorization in future permit amendments for the closure/post-closure water management, then proposal and acceptance of an IDZ will be required. Refer to the ENV IDZ guidance document. oThe proposed permit limits in the current application are at or below BC WQGs or proposed SBEBs to	BW Gold acknowledges the reviewer's comments. BW Gold looks forward to reviewing the draft EMA permit and to discussing the proposed condition with ENV. BW Gold would like ENV to consider the proposed permit condition consider the final water balance/water quality model scenario (Task #7), which has a deliverable date of May 2024 - that culminates with a model report that summarizes key outcomes, recommendations, and updated Post Closure water management plan (if applicable) as opposed to Task #5, which would be an interim modelling update. BW Gold acknowledges the reviewers comments on water quality predictions for post-closure from the TSF spillway (WB/WQM v13e) and understands the inherent risk taken on by BWG when opting to take a phased approach to EMA effluent permitting.		EMLI (G.Wolff)	BWG					TD, Dec 19	Ready for Publishing
412	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	Groundwater seepage flow paths were included in the WQM if predicted travel times were less than 125 years; otherwise seepage pathways were excluded from modelling. For seepage pathways included in the model, were travel times considered or was seepage assumed to report to the receptor instantaneously?	Seepage pathways included in the model were assumed to report instantaneously to the downstream discharge location.		EMLI (G.Wolff)	KP		Cindy	AT/KP	Ready for Submission	GM; Aug 6	Ready for Publishing
413	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Base case predicted zinc concentrations appear to increase over the post-closure period at several mine site facilities, including TSF C Pond and the Pit Lake, as well as in Davidson Creek. The primary source of zinc loadings to the Pit Lake during this period, as indicated by Figure B.4-4-4 in Appendix 5-D, is the exposed pit wall. Please explain the cause of this progressive increase in zinc concentrations in post-closure, and identify if similar increases are predicted to occur for other parameters.	Please refer to attachment "R1_EMLI Comment ID 413.pdf".		EMLI (G.Wolff)	Lorax		Colin	GM	Ready for Submission	GM; Aug 7	Ready for Publishing
413	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	Clarification	No	The memo response refers to the v12b water quality model results, and has therefore been superseded. However, in the v13e water quality predictions, several parameters are observed to increase in concentrations in the Pit Lake throughout Post-closure (e.g., sulphate, ammonia, zinc, cadmium), with a greater rate of increase than in the v12b results. Please indicate if the drivers for increased concentrations in the Pit Lake are the same in the updated model predictions as described in the Round 1 response (lack of pre-treatment, lower removal efficiencies, and/or elevated in pit wall runoff), or if there are additional contributing factors. [Clarification]	In the v13e model compared to the v12b model, the exposed pit wall area is greater due to the pit lake being managed to a lower elevation. This contact area represents a key loading source to the pit lake and results in the pit wall runoff term contributing a greater relative load of metals to the pit lake in the v13e model compared to v12b for parameters like Cd and Zn. Predicted pit lake concentrations for major ions like sulphate and ammonia increase in the v13e model over time compared to the v12b model due to Membrane WTP brine injection to the lower layer of the pit lake and updated brine source term assumptions applied in the latter model. One additional contributor to increasing pit lake concentrations in the v13e model compared to v12b relates to a modelling artifact in which the pit lake elevation decreases slightly over Post-Closure in the Variable Climate Case (refer to memo "**R1_EMLI Geoscience 411, CSFN 844, LDNUFN 1280, 1281, 1309, 1344-1346, 1348, 1624_Two-cell pit lake WQM.pdf**" for further detail). This artefact decreases the volume of available water to which source term loads are applied, resulting in an apparent concentration increase over time. In actuality, the pit lake will be managed at a constant elevation and this decrease in elevation would not occur.		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 15	Ready for Publishing
414	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Information Requirement	No	The WQM report states that "it is anticipated that the designs resulting from the reclamation programs will help further reduce the likelihood of WQG exceedances during the Closure and Post- Closure periods". Please indicate the specific reclamation programs that are anticipated to reduce water quality concentrations in closure and post-closure, considering that WQG exceedances during this period appear to be driven by Pit Lake and TSF water quality.	Model sensitivity will be provided with Round 2 comment responses as discussed with EMLI and BW Gold Ltd. on 22-June-2022.		EMLI (G.Wolff)	Lorax	KP/BWG	Meghan, Cindy	GM	Ready for Submission	TD, 23-Jun	Ready for Publishing
414	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	Information Requirement	No	Response pending, EMLI will provide further comment once the outstanding information is received.	Version 12b water quality model results (as presented in the Application) were computed on October 26, 2021. Since that time, BW Gold Ltd. and their consultants have revised the site-wide water balance model and the site-wide water quality model with a focus on mitigating Project changes for the Closure and Post-Closure phases. Updated water quality predictions that reflect optimized water management and quality were presented to EMLI, ENV and First Nations on June 15, 2022, and are summarized in Lorax (2022), as part of BW Gold Ltd. (2022). Those documents demonstrate Project-influenced parameters that were previously predicted to exceed their BC WQGs in Closure and Post-Closure (Application version 12b) in the receiving environment are no longer predicted to exceed BC WQGs. Please refer to the document cited below for further information, including optimized water management proposed for the Closure and Post Closure phases to mitigate previously-predicted BC WQG exceedances in the receiving environment. As such, specific reclamation programs designed to decrease receiving environment concentrations below BC WQGs are not proposed at this time. Document: "R1_ENV_EMLI_CSFN_LDN-UFN Comment IDs 102 126 415 490 586 607 610 612 1263 1289 1320 1615 1853.pdf" In addition to the above work, an updated source term was developed for reclaimed areas and evaluated in a model sensitivity. The results of this work are documented in " R1_EMLI Geoscience Comment ID 406".		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 5	Ready for Publishing
414	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Sep 02, 2022	3	Follow Up	Comment	No	EMLI understands that BW Gold is not proposing to conduct the reclamation programs reference in the Round 1 comment, and that consequently the statement from the WQM report is not considered to be current. [Comment]	The reviewer is correct in that BW Gold will not conduct the reclamation programs described in Round 1 that would have focussed on mitigating the predicted water quality guideline exceedances presented for the v12b water quality model results presented in the Application. However, BW Gold will continue to evaluate and develop reclamation programs through the Project Construction and Operation phases as presented in Chapter 4 of the Application to minimize potential effects to the Project environment upon the Closure and Post-Closure phases.		EMLI (G.Wolff)	Lorax		Georges		Ready for Submission	GM; Sept 16	Ready for Publishing

415	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Water quality modelling indicates that in post-closure, regular exceedances of several water quality guidelines are predicted for the TSF spillway and Davidson Creek, including acute water quality guideline exceedances in Davidson Creek associated with the TSF spillway overflow and pit seepage to the spillway. These predictions are observed under Base Case modelling. Although EMLI understands that BW Gold is not currently applying for a discharge permit corresponding to the TSF spillway in post-closure, these predictions represent water quality that would not be suitable for direct discharge, and indicate that existing ML/ARD and water quality mitigations incorporated into the mine design and WQM are inadequate to ensure water quality discharge in post-closure is protective of the receiving environment. Several contingencies are noted in the Application in the event that TSF spillway water quality is not suitable for discharge to Davidson Creek, such as pumping to the Membrane WTP, routing discharge to the Pit Lake or TSF for temporary containment, and increasing WTP capacity. However, given the frequency and regularity of exceedances in post-closure, detailed mitigation planning is required to ensure these options are feasible and effective. Please provide a detailed mitigation plan for post-closure water quality exceedances associated with TSF spillway overflow. The mitigation plan must include the level of detail described for mitigation methods in Section 5.6 of the JAIR, and must also include a detailed cost estimate for the proposed mitigation(s).	Version 12b water quality model results (as presented in the Application) were computed on October 26, 2021. Since that time, BW Gold Ltd. and their consultants have revised the site-wide water balance model and the site-wide water quality model with a focus on mitigating Project changes for the Closure and Post-Closure phases. Updated water quality predictions that reflect optimized water management and quality were presented to EMLI, ENV and First Nations on June 15, 2022, and are summarized in Lorax (2022), as part of BW Gold Ltd. (2022). Those documents demonstrate Project-influenced parameters that were previously predicted to exceed their BC WQGs in Closure and Post-Closure (Application version 12b) in the receiving environment are no longer predicted to exceed BC WQGs. Please refer to BW Gold Ltd. (2022) for further information, including optimized water management proposed for the Closure and Post Closure phases to mitigate previously predicted BC WQG exceedances in the receiving environment. References: BW Gold Ltd. 2022. Revised Base Case Closure and Post-Closure WQ Predictions. Prepared for ENV and EMLI. June 30, 2022. 415	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	QP Response Required	No	a) The updated brine source term is stated to be "calculated within GoldSim on a monthly basis from the WTP influent water quality". What are the inputs to this calculation? [QP Response Required] b) Pit lake water quality predictions for post-closure include elevated concentrations of several parameters, including zinc concentrations in excess of 3 mg/L. What pH values are predicted to be observed in the pit lake in post-closure? Has geochemical equilibrium modelling of the pit lake post-closure water quality been conducted? [QP Response Required]	Please see attachment "R2_EMLI_Geoscience Comment ID 415.pdf"		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 12	Ready for Publishing
415	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Aug 25, 2022	3	New	Comment	No	Further comment on the predicted pit lake post-closure water quality will be provided as part of Comment 411, once the full response to that comment has been received. [Comment]	This comment is acknowledged.		EMLI (G.Wolff)	Lorax		Georges		Ready for Submission	GM; Sept 16	Ready for Publishing
416	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Comment	No	The seepage rate sensitivity demonstrates that seepage contributions from the LGO stockpile have the potential to significantly impact water quality in the WMP and in Davidson Creek. LGO stockpile seepage management and monitoring are therefore a vital component of ML/ARD and water quality management during operations.	This comment is acknowledged.		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	RT; June 15	Ready for Publishing
417	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	The modelled results from the seepage rate sensitivity appear to be significantly influenced by the LGO stockpile contributions, and consequently it is challenging to identify the impacts of increased seepage rates on downstream water quality. Additionally, the impacts of increased pit seepage in post-closure are not considered. Substantial uncertainty in the TSF seepage rates was identified in the review of the numerical groundwater modelling. Please develop an additional seepage WQM sensitivity that excludes the LGO stockpile contributions and accounts for increased seepage rates from the Pit Lake as well as the TSF.	BW Gold acknowledges the noted uncertainty in seepage and potential changes to predicted receiving environment water quality and quantity. A sensitivity will be conducted to address Comments 130, 142, and 417. The predicted water quality results of model output will be presented in a memorandum provided to MRC on or before July 20, 2022.		EMLI (G.Wolff)	Lorax		Travis	GM	Ready for Submission	TD, Jun 27	Ready for Publishing
417	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Aug 05, 2022	2	Follow Up		No	a) The TSF increased seepage sensitivity scenario includes water management changes to maintain saturation of PAG waste rock in TSF D, including pumping ECD water to injection wells in TSF D waste rock during Closure and pumping Membrane WTP effluent to the TSF D Pond in Post-Closure. In this scenario, are any changes to water management required during Operations? [Clarification] b) During Closure, ECD water is injected into waste rock in TSF D. Is this flow modelled as contributing directly to the TSF seepage pathway or does it contribute to the TSF D Pond water quality? [Clarification] c) Are the injection wells in TSF D waste rock in Closure intended to be established in the Base Case scenario or do they constitute new water management infrastructure for the increased seepage scenario? If the latter, what operational triggers will determine the need to install these wells? [Information Requirement] d) How would the redirection of ECD water to TSF D waste rock in Closure impact the time required to fill the Open Pit? [Clarification] e) The responses to increased seepage are noted to consist of an increase in treatment rate and additional pumping of water to TSF D. What other mitigations or contingencies have been considered to address increased seepage losses from the TSF? [Information Requirement] f) Higher concentrations are noted in the TSF seepage scenario in the Membrane WTP effluent due to increased brine disposal in the pit lake associated with higher treatment rates. At the increased treatment rate, how would the time to effectively fill the pit lake with brine (as discussed in Comment #433) change? [Clarification] g) As the increase in treatment capacity impacts the effectiveness of the treatment system, is there an upper limit to the treatment capacity beyond which point the volume of brine generated makes treatment unfeasible? If so, what TSF seepage rates would lead to this scenario? [QP Response Required]	Please see attachment "R2_EMLI_Geoscience_Comment ID 417.pdf"		EMLI (G.Wolff)	KP	Lorax			Ready for Submission	TD, Aug 16	Ready for Publishing
417	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Sep 02, 2022	3	Follow Up		No	a-f) [Closed] d-f) [Closed] g) Response Pending h) [Closed] i) [Closed]	Please see attachment "R3_EMLI Comment ID 417g.pdf"		EMLI (G.Wolff)	KP	Lorax/ERM/ BWG	Cindy, Meghan, Rolfe, Alastair	AT/KP	Ready for Submission	KP, Sep 30	Ready for Publishing
417j	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Sep 02, 2022	3	Follow Up		No	j) Response outstanding, pending submission of closure cost estimate.	Please see attachments "R3_EMLI Comment ID 417j.pdf" and "R3_EMLI Comment ID 417j.xls"		EMLI (G.Wolff)	ERM				Oct.7	AT: October 10	Ready for Publishing
417	Source Terms and Water Quality	Geoscience	EMLI (G.Wolff)		Oct 11, 2022	4	Follow Up		No	j) Response outstanding, pending submission of closure cost estimate.	Please see attachments "R3_EMLI Comment ID 417j.pdf" and "R3_EMLI Comment ID 417j.xls"		EMLI (G.Wolff)	ERM						

417	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Oct 11, 2022	4	Follow Up		No	1.Section 2 of the memo indicates that there should be two Excel spreadsheets provided ("J.6 Y+3 BW Closure Estimate.xlsx" and "J.6 LOM BW Closure Estimate.xlsx"); however, only one spreadsheet was attached, which appears to be the Y+3 estimate. Please provide both spreadsheets. 2.Please provide a clear summary of both discounted and undiscounted costs for both the Y+3 and LoM scenarios, or indicate where this summary can be located. Table 4 in the memo has some of this information but is missing the undiscounted costs for discounted items (that is the, the cost if discounts are not applied to any line items). 3.Mob/demob costs are noted to have been assigned a value of 2%. As per the interim Major Mines Reclamation Security Policy, mob/demob costs may be estimated as 5% of the value of the physical work to be conducted. Please update the cost estimate accordingly or provide further rationale for the value selected.	Please see updated attachments"R3_EMLI Comment ID 417j.pdf" "J.6 LoM BW Closure Estimate" and "J.6 Y + 3 BW Closure Estimate" and "RLCE update Cover Letter.pdf" 1) Both current versions of the spreadsheets have now been provided to EMLI, and as were used as the basis for discussion on 31/10/2022 between EMLI, Artemis, CSFN, ERM and other First Nations. 2) The summary is provided in the update J.1 versions of the spreadsheets for both Y+3 and LoM scenarios. 3) Mob/demob cost allowance of 5% is now applied in the spreadsheets and depicted in the Summary tab.		EMLI (G.Wolff)	ERM					TD, Nov 21	Ready for Publishing
417	Source Terms and Water Quality Prediction	Geoscience	EMLI (G.Wolff)		Nov 03, 2022	5	Follow Up	Information Requirement	Yes	The request was to provide any updates to the Y+3 and LoM cost estimates as a result of the water management changes in Closure and Post-Closure associated with the increased seepage sensitivity scenario. This information could not be located as part of the updated cost estimate submission. Please provide the requested information or indicate where it can be located. [Information Requirement]	The RLCE Y+3 and LoM cost estimate for seepage recovery is based on the current water quality model and pumping estimates are costed accordingly. During Post-closure, should seepage occur which exceeds the predicted values, then the cost of additional pumping would be covered in the contingency amount ($30M) of the liability estimate. The seepage estimates will of course be revisited during mine operations and regular water management updates through LoM to inform Closure requirements.		EMLI (G.Wolff)	ERM		Rolf				
418	Water Management - Appendix 9-E	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Information Requirement	No	Appendix 9-E provides a list of mine site and discharge water quality monitoring locations, including WTP influent and effluent streams, TSF ponds, the Pit Lake, and various collection ponds on the mine site. Monitoring of the WTP brine stream directed to either the pit lake or the TSF was not identified in this Plan. Please indicate if water quality monitoring of WTP brine is planned; if not, please indicate how the influences of this input to pit lake and/or TSF water quality are intended to be captured and how water quality modelling assumptions will be validated.	Brine water quality will be continuously monitored via calculation. Brine WQ can be calculated by performing a mass balance of constituents with the feed and permeate water quality results. Brine conductivity will be continuously monitored by inline instruments and serves as a proxy indicator of overall water quality. Sampling and assay by third-party labs will periodically be conducted to validate the calculations.		EMLI (G.Wolff)	Lorax	KP/BQE	Meghan, Stephanie, Cindy, V.Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing
418	Water Management - Appendix 9-E	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	QP Response Required	No	Please clarify the statement that brine water quality will be calculated continuously based on feed and permeate water quality results, if most water quality monitoring for the WTP influent and effluent occurs weekly or monthly according to Table 9-1 in Appendix 9-E. Provide an update to Table 9-1 that includes brine water quality monitoring. [QP Response Required]	Please see attachment "R2_EMLI_Geoscience_Comment Response 418.pdf"		EMLI (G.Wolff)	BQE				Ready for Submission	GM; Aug 16	Ready for Publishing
419	Water Management - Appendix 9-E	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	Appendix 9-E, Table 9-1 indicates that seepage surveys "will be carried out regularly to identify seep locations; per ML/ARD Management Plan". The referenced plan does not appear to discuss seep surveys. Seep surveys are discussed in Section 7.3.4.4 of the Mine Water and Discharge Management Plan. Please clarify if there is additional information that should be included in the ML/ARD MP	This was an editorial error. The correct reference is for Section 7.3.4.4 of the Mine Water and Discharge Monitoring Plan.		EMLI (G.Wolff)	Lorax	KP	Meghan, Jordan, Cindy	GM	Ready for Submission	GM; June 23	Ready for Publishing
420	Water Management - Appendix 9-E, Appendix 4-J	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Information Requirement	No	Appendix 4-J indicates that in a temporary closure scenario, water management activities would proceed as during operations, including pit dewatering and operation of WTPs. Several of these activities would only be effective mitigation strategies in the short term, due to the effects of ongoing oxidation of the LGO stockpile and exposed tailings beaches, and the accumulation of treatment by-products in the TSF. What is the maximum period of time that operational water management can be maintained under temporary closure conditions before partial or full closure of these facilities (i.e.., relocation of LGO stockpile, flooding of Open Pit, reclamation of tailings beaches) would be required?	A number of Care and Maintenance (i.e.., temporary closure) water balance/water quality scenarios are being developed and will be provided near the end of July 2022. This imperial data can be used to follow-up with a response to this comment. Please see response to Comment 441 for more information on the C&M modelling scenarios.		EMLI (G.Wolff)	Lorax	KP	Meghan/Cindy/Dan	GM	Ready for Submission	GM; June 29	Ready for Publishing
421	Water Management - Appendix 9-E	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	The maximum flow rate of 205 L/s influent to the Metals WTP is estimated for Year -1 to 17. This influent flow rate is based on monthly average flows corresponding to average annual climate inputs. Please provide the rationale for basing the design of the WTP and the metals treatment pond(s) on average flows.	R1_EMLI_Geoscience_Comment ID 421, 422, 424, 425		EMLI (G.Wolff)	McCue		Lynda Smithard	GM	Ready for Submission	GM; June 17	Ready for Publishing
422	Water Management - Appendix 9-E	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	What triggers are proposed to identify the requirement for expedited construction of Metals WTP trains C & D?	R1_EMLI_Geoscience_Comment ID 421, 422, 424, 425		EMLI (G.Wolff)	McCue		Lynda	GM	Ready for Submission	GM; June 17	Ready for Publishing

423	Water Management - Appendix 9-E	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	Does the WQM during variable climate scenarios incorporate untreated bypass water from the metals treatment pond(s) to the TSF?	No water is modelled to bypass the Metals WTP untreated. In wet conditions, should water exceed the upstream WTP ponds capacity (9,000 m3), the pit sump is assumed to manage additional volumes of water until treatment capacity resumes. Results of the predicted Metals WTP influent rates and simulated storage requirements under variable climate conditions are discussed in Section 6.3.4.1 of the Life of Mine Water Balance Report in Appendix 5-B.		EMLI (G.Wolff)	KP		Cindy	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
423	Water Management - Appendix 9-E	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	Clarification	No	This response appears to partially contradict the response to Comment 423, which states that WTP pond overflow would be discharged to the TSF if the capacity is exceeded. Please confirm if WTP bypass to the TSF is considered in the event that WTP pond capacity is exceeded. [Clarification]	The simplifying assumption included in the water balance model is that any water in excess of the Metals WTP is modelled as held in the open pit sump. The response to Comment #421 authored by McCue (2022) suggests the overflow could go to the TSF, which is another option for managing overflow from the Metals WTP; however, this option was not assessed with the water balance model. The predicted volume of water that could be in excess of treatment capacity at the Metals WTP during wetter than average conditions is discussed in Section 6.3.4.1 of the water balance model report presented in Appendix 5-B. Notwithstanding the response to Comment #421 by McCue (2022), the base case simplifying water management assumption for modelling purposes was to hold water in excess of the Metals WTP influent rate in the open pit sump. Please also see the response to Round 2 Comment 351 about how inflows to the Metals WTP Pond are planned to be managed at the waste stockpile collection ponds.		EMLI (G.Wolff)	KP		Cindy	AT/KP	Ready for Submission	AT, Aug 15	Ready for Publishing
424	Water Treatment Appendix 5-G	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	The Metals WTP design report (Appendix 5-G) notes that if the final concentrations for the combined sources vary from the estimates show in Table 2.2-1 of the design report, then the estimate of effluent quality may not be valid. Please provide the range of influent quality for which the effluent quality estimate is valid. Is the effluent quality estimate affected by influent water quality that is more dilute than estimated? Please provide an assessment of the likelihood of realizing influent quality at the end members of that range	Please see attachmment "R1_EMLI_Geoscience_Comment ID 421, 422, 424, 425.pdf"		EMLI (G.Wolff)	McCue		Lynda Smithard	GM	Ready for Submission	GM; June 17	Ready for Publishing
425	Water Treatment Appendix 5-G	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	The Metals WTP design report (Appendix 5-G) acknowledges that additional information is required to confirm assumptions regarding suspended sediment loading to the WTP: a.What is the proposed plan including timeline for developing this required information, including both TSS and total metals concentrations estimates, as well as determining if additional settling capacity or secondary/advanced water treatment processes are required? b.Please provide a cost estimate associated with these additional studies. c.What additional source control practices could be implemented to reduce solids loading into the pit sump and OBS runoff? What is the rationale for not including the source control practices at this time?	Please see attachmment "R1_EMLI_Geoscience_Comment ID 421, 422, 424, 425.pdf"		EMLI (G.Wolff)	McCue	BWG	Lynda Smithard	GM	Ready for Submission	GM; June 17	Ready for Publishing
425	Water Treatment Appendix 5-G	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	New	QP Response Required	No	a. Please provide a timeline for when the TSS and total metal concentrations estimates, prepared by others, will be provided to McCue. [Information Requirement] b. [Closed] c. [Closed]	a. Please see attached memo "R2_EMLI_Geoscience_Comment ID 425.pdf"		EMLI (G.Wolff)	McCue		Kareena Gill		Ready for Submission	GM; Aug 12	Ready for Publishing
426	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	The Membrane WTP design report (Appendix 5-H) recommends bringing the full-scale RO system online in Year 1 to demonstrate performance. Is the intent to operate a pilot or field study at site in advance of full-scale WTP operation?	The site water balance does not require operation of the membrane WTP during the early stages of the mine life. The intent is to operate the membrane WTP during this phase in order to inform final design of the post-closure WTP and also to serve as a contingency in case there is an unforeseen need to treat TSF water during operation. This could be considered a "full scale field study". It affords opportunity for process and operability optimization prior to the requirement to discharge. It also allows for design learnings to be incorporated into the post-closure plant design/operations.		EMLI (G.Wolff)	BQE		V. Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing
426	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	Follow Up	Information Requirement	No	Please state the mine year when the membrane WTP is intended to be constructed. [Information Requirement]	D.1_Blackwater_MAEMA_Ch3 Mine Plan (page 3-58) states that Membrane WTP will be constructed in year -1.		EMLI (G.Wolff)	BQE		V. Sundar	GM	Ready for Submission	GM; July 29	Ready for Publishing
427	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Information Requirement	No	The Membrane WTP is noted as being able to ramp-up to maximum plant capacity quickly when needed. What is the length of time required to ramp-up from not operating to fully operational?	With adherence to good routine maintenance and preservation practices, the plant could achieve full capacity operation in less than one week from full shutdown. If the plant is operating in recycle/low flow, it could be ramped up in less than 12 hours.		EMLI (G.Wolff)	BQE		V. Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing
428	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	The by-product stream chemistry (retentate water quality) presented in Appendix 5-H notes that other by-product streams blended with the retentate, including MMF backwash, spent CIP solution, and spent permeate, are not considered due to making a negligible contribution to the overall stream. Please further demonstrate that the contribution of these streams, particularly the MMF backwash, is negligible.	Please see attachment "R1_EMLI_Geoscience_Comment IDs 428, 429, 432.pdf"		EMLI (G.Wolff)	BQE		V. Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing
429	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Removal rates provided for the NF and RO Membrane WTPs are based on predicted influent water quality and presented as a percentage removal for each parameter. Across what range of variability in influent chemistry are the assumed removal rates considered valid?	Please see attachment "R1_EMLI_Geoscience_Comment IDs 428, 429, 432.pdf"		EMLI (G.Wolff)	BQE		V. Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing

429	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	Follow Up	Clarification	No	Please confirm if the response should be understood to mean that the same percentage removal would be expected if influent concentrations are lower than predicted. [Clarification	Percentage removals are valid in the range of 500-4700 mg/L total dissolved solids (TDS). Average and 95th percentile predicted TDS are ~3800 mg/L and ~4700 mg/L, respectively.		EMLI (G.Wolff)	BQE		V. Sundar	GM	Ready for Submission	GM; July 29	Ready for Publishing
430	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Does the WQM incorporate water quality influences to the TSF and Pit Lake from the solid residues generated by the Membrane WTPs? If not, are these solids intended to be characterized with the sludge from the lime neutralization system and Metals WTP?	Please see attachment "R1_EMLI_Geoscience_Comment ID 430.pdf"		EMLI (G.Wolff)	Lorax		John	GM	Ready for Submission	GM; June 23	Ready for Publishing
430	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	Follow Up	Potential Permit Condition	Yes	As noted in Comment 409, EMLI expects that characterization of WTP solid by-products will be conducted and results incorporated into site-wide water quality modelling. [Potential Permit Condition]	Thank you for this response. It is noted that detailed characterization of sludge solids is not proposed at this time. This relates to: 1) data for the Equity Mine present a reasonable analogue for the Project; 2) there is a very low likelihood that sludge materials will have an influence of TSF seepage chemistry; and 3) the impracticality of generating the mass of sludge required to conducted kinetic testwork. Each of these points is discussed in turn below. As shown in Martin et al. (2013), influent chemistry is a strong predictor of the metal hosting phase(s) in sludge materials as generated through water treatment. For example, ratios of Mg-Al-Fe for the Blackwater influent show a strong similarity to that of the Equity Mine, which produces an Al-Mg-(Fe) hydroxysulfate metal hosting phase. This phase has been shown to be chemically stable under conditions of saturation in their place of deposition (pit lake). In this manner, the information available for the Equity Mine is considered to represent a reasonable analogue for the Blackwater Project. The combined mass of the sludge materials from both the Lime Neutralization and Metals Removal systems will represent <0.05 % of the total mass of tailings and waste rock. Given the relatively small volumes of lime treatment sludges as compared to tailings and waste rock, and the inferred degree of chemical stability (as per the Equity Mine analogue), sludge materials are not predicted to significantly influence TSF seepage chemistry. Lastly, the generation of the required sludge mass for kinetic testwork would require the treatment of 100's of litres of synthetic influent. This is impractical, and may not yield representative materials. To confirm the assumptions above relating to sludge chemical stability, treatment sludges from the WTPs are proposed to undergo detailed characterization within the first two years of operation. Such testwork will include detailed solid-phase characterization (grain size, elemental abundance, sequential extractions, high resolution microscopy) and kinetic testwork (saturated columns).		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 12	Ready for Publishing
430	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Aug 25, 2022	3	Follow Up	Potential Permit Condition	Yes	EMLI acknowledges the response and understands that detailed characterization of treatment sludges would occur during early operation of the WTPs, when representative materials are available in the required volumes. [Potential Permit Condition]	This comment is acknowledged.		EMLI (G.Wolff)	Lorax		Georges		Ready for Submission	GM; Sept 16	Ready for Publishing
431	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	Clarification	No	Appendix 5-H lists a recommended assay analysis schedule for identifying concentrations at key locations in the treatment train. Will these assays be conducted at the onsite laboratory or shipped offsite?	The intention is to conduct on-site assays in order to guide day-to-day operational decisions. Field measured analysis will be validated with a third-party off-site accredited laboratory. Third-party laboratory results will be used for proof of treated water regulatory compliance.		EMLI (G.Wolff)	BQE		V. Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing
432	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	No	Appendix 5-H notes that demineralization of the effluent as part of the treatment process has the potential to cause effluent toxicity, and that this risk can be mitigated by implementing sodium bicarbonate addition to the treated water as required. How will the potential need for bicarbonate addition be identified during WTP operations?	Please see attachment "R1_EMLI_Geoscience_Comment IDs 428, 429, 432.pdf"		EMLI (G.Wolff)	BQE		V. Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing

433	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jun 01, 2022	1	New	QP Response Required	Yes	No end-date for water treatment in post-closure has been proposed in the Application. As brine from the Membrane WTP is deposited in the Pit Lake, how long will it take for the Pit Lake chemistry to be dominated by the brine chemistry?	Please see attachment "R1_EMLI_Geoscience_Comment ID 433.pdf"		EMLI (G.Wolff)	Lorax		Alan	GM	Ready for Submission	GM; June 29	Ready for Publishing
433	Water Treatment Appendix 5-H	Geoscience	EMLI (G.Wolff)		Jul 22, 2022	2	Follow Up	QP Response Required	Yes	Does this response account for the reduced pit volume as a result of the updated modelling (v13e)? If not, please update the response accordingly. [QP Response Required]	Please see attachment "R2_EMLI_Geoscience Comment ID 433.pdf"		EMLI (G.Wolff)	Lorax				Ready for Submission	GM; Aug 11	Ready for Publishing
434	Chapter 2: Baseline Information	Geochemistry and ML/ARD: Weathering of Material	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The Application must incorporate the age of material on surface into the development of source terms for material stockpiled on surface. Material stockpiled on surface will oxidize over time, which will increase rates of metal release. A possible permit condition can be developed for reporting and reconciliation. (Source Comment ID#1)	The age of material stockpiled at surface is incorporated into source term derivation in multiple ways. Source terms include the lag time until acid rock drainage incorporates for PAG 1 and PAG 2 rock units, which allows the model to reflect gradual acidification of material over variable exposure times. The age of waste rock is also incorporated into the submergence calculations, where it is used to calculate the oxide load that may be released to pore water upon saturation. The LGO stockpile is assumed to be immediately acid generating as a conservative approximation, without considerations of lag time. Please refer to Section 3.5 of Geochemical Source Term report for discussion of lag time to ARD. In terms of monitoring, the Operational mine site water quality will be compared to predicted concentrations. If the concentrations exceed predictions, potential actions include follow up investigations and potential additional sampling or increased monitoring frequency. Further details on potential adaptive management measures for specific facilities are included in Table 11-1 of Appendix 9-E Mine Site Water and Discharge Monitoring and Management Plan.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
434	Chapter 2: Baseline Information	Geochemistry and ML/ARD: Weathering of Material	CSFN - K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Aug 23, 2022	2	Follow Up	Information Requirement	No	It is understood that the source terms appropriately and conservatively incorporate the age of rock. It is requested that an inventory of rock ages be maintained through operations so that source terms can be refined and help manage waste. (Source Comment ID#1)	This comment is acknowledged. Requirements to maintain an inventory of waste rock age will be incorporated into the next iteration of the ML/ARD management and monitoring plan		CSFN	Lorax				Ready for Submission	GM; Sept 1	Ready for Publishing
434	Chapter 2: Baseline Information	Geochemistry and ML/ARD: Weathering of Material	CSFN - K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Thank you. The ML/ARD management and monitoring plan or MA permit Annual Report should include an inventory of waste rock volumes, tailings volumes, and LGO volumes, mined during that year, as well as the cumulative volumes and corresponding ages of each waste type. This is in addition to the ABA and NPR of the material. The location of the inventory of waste on site, and the geochemical characteristics, should be referenced in the permit. (Source Comment ID#1)	The comment is acknowledged and these material types will be identified as requiring inventory and age tracking in the ML/ARD Management Plan. The inventory itself would be presented in the Annual Report, not the Management Plan.		CSFN	Lorax				Ready for Submission	TD, Oct 19	Ready for Publishing
435	Chapter 2: Baseline Information	Milling Oxidized LGO	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The Application must include distinct source term development for the LGO including the impact of weathering of material. The Application must assess the impact of the proposed large ore stockpiles as they tend to be problematic when milled, causing increased concentrations of oxidation products (sulphate, metals) in the tailing's facility. (Source Comment ID#2)	A distinct source term was developed for tailings and supernatant produced from processing LGO ore. Refer to section 4.1.5 and section 4.1.4 in the Source Term Report for details.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
436	Chapter 2: Baseline Information	Geochemistry and ML/ARD: Source Term Revision	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The Application must present and describe differences between new and old source terms where source terms have been updated since EA. (Source Comment ID#3)	A summary of the changes to source terms between the EA and the current application was provided in Table 1-2 of the Geochemistry Source Term Report (Appendix A.6 of Appendix 5-D).		CSFN	Lorax		John	GM	Ready for Submission	GM; June 16	Ready for Publishing
437	Chapter 2: Baseline Information	Geochemistry and ML/ARD: Source Term Analogue Sites	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Application must compare source terms for the Blackwater project to those of analogue sites. In previous modeling, the pit wall source term appeared to underestimate sulphate loading. (Source Comment ID#4)	Analogue mine data from similar mine sites was incorporated into the source term predictions to calibrate degradation rates of cyanate and ammonia in the tailings pond at the Project, to develop a relationship between metallurgical supernatant and full-scale mill process water chemistry, to constrain the source term for concentrations from acidic LGO stockpile runoff, and to define source terms for lime neutralization treatment effluent. An overview is included in Section 2.9 of the source term report (Appendix A.6 of Appendix 5-D) and details are provided in Sections 3.7, 4.1.5, 4.3, and 4.7.3.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
437	Chapter 2: Baseline Information	Geochemistry and ML/ARD: Source Term Analogue Sites	CSFN - K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Aug 23, 2022	2	Follow Up	Recommendation	No	Please compare the sulphate predictions to analogue mine sites with similar amounts of exposed PAG surface areas to confirm that sulphate is expected to be well below gypsum saturation (assuming calcite buffering - acknowledging sodium will significantly increase this concentration). (Source Comment ID#4)	Please see attachment "R2_CSFN_Comment IDs 437 and 558.pdf"		CSFN	Lorax				Ready for Submission	GM; Sept 2	Ready for Publishing
437	Chapter 2: Baseline Information	Geochemistry and ML/ARD: Source Term Analogue Sites	CSFN - K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: A permit condition regarding model validation is outlined in the Round 3 comment under ITT ID 572. In additional to model validation, the following permit condition is recommended. In the second year of operations, the source terms, water balance, and water quality model must be updated based on observed information (flow and water quality) during the first year and a half of mining. The water balance and water quality model update should include the following items: •A list of assumptions and a description of how they differ from initial assumptions. •A list of all inputs and all associated uncertainties. •The PAG source term must discuss the potential range in potential pH, and a discussion of metal leaching rates at multiple pH values for all parameters sensitive to pH. •The source terms must consider seasonality based on observed data. •The variability of concentrations in the receiving environment must be considered to a minimum of the 75th percentile of the observed concentration at each model node / water quality monitoring station. •The model must continue until steady state conditions are attained in all model reservoirs for flow and water quality. •A 1:100 year wet and dry event must be incorporated into the VCC case for all stochastic scenarios, and if treatment capacity is exceeded or water covers are not predicted to be maintained during any year of mining, a table describing the available storage volumes and or water needs must be clearly presented in the report. •A comparison to initial predictions should be provided. •The source terms, water balance, and water quality model assumptions, inputs, results, and discussion should be documented in a report and submitted to CSFN for review prior to Dec 31st of the second year of operations. Note: Given the high risk and reliance of this site on treatment, waiting five years for a model update is not acceptable or protective of the environment, particularly if treatment targets cannot be achieved consistently. (Source Comment ID#4)	A workplan presenting the details of the water balance and water quality modelling will be compiled for review prior to the modelling exercise. The workplan will be provided within the first year of operations for review and discussion. The workplan will consider the items listed by the reviewer		CSFN	BWG	KP Lorax		GM	Ready for Submission	GM; Oct 26	Ready for Publishing

438	Chapter 2: Baseline Information	Additional Baseline Water Quality data for breach consequence analysis	CSFN	Rolf Schmitt, P.Geo.; ERM Consultants Canada Ltd	Jun 02, 2022	1	New	Information Requirement	No	The Application must include additional baseline water quality data to allow evaluation of the impacts of a tailings breach (or unforeseen release of mine water) should that unfortunate scenario occur. This includes additional baseline data required for the Nechako Reservoir. (Source Comment ID#5)	Baseline data has been collected at the baseline water quality station WQ30 (now CC-40 in the Aquatic Effects Monitoring Program). The station was intended to represent a suitable proxy for water quality in Nechako Reservoir (based on the minimal dilution of creek inflows) and evaluation of potential mine related effects. To confirm this inference, BW Gold has proposed to collect baseline data in 2022 at two locations within the Nechako Reservoir (Main Basin and Embayment Constriction). BW Gold has also accessed a lengthy record of water quality data from other areas of the reservoir.		CSFN	ERM		Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
438	Chapter 2: Baseline Information	Additional Baseline Water Quality data for breach consequence analysis	CSFN	Rolf Schmitt, P.Geo.; ERM Consultants Canada Ltd	Aug 11, 2022	2	Follow Up	Recommendation	Yes	Thank you for providing an update on the additional data being collected in 2022 and the availability of additional data on the Nechako Reservoir. Will these data be provided in an addendum to the baseline water quality report? Alternatively, a baseline water quality memorandum for the Nechako Reservoir could be developed as a permit condition. (Source Comment ID#5)	The Nechako Reservoir 2022 monitoring results will be provided in a memorandum in early 2023. BW Gold would be pleased to provide monitoring results periodically to the CSFNs following QA/QC of the data.		CSFN	ERM		Tonia	RT	Ready for Submission	RT; Aug. 14	Ready for Publishing
439	Chapter 2: Baseline Information	Effects on Water Quality	CSFN	Rolf Schmitt, P.Geo.; ERM Consultants Canada Ltd	Jun 02, 2022	1	New	Recommendation	No	In Section 2.7.1 (Surface Water Quality), the authors state "the baseline surface water quality program assessed watercourses that could potentially be affected by the Project: Davidson Creek, Chedakuz Creek, Tatelkuz Lake, Creek 661, and Creek 705". Further in this chapter, (i.e.., Section 2.7.1.1 on Baseline Data Sources), the authors describe monitoring "a location downstream where no further effects on water quality from the Project are predicted." Based on information provided in the Application, it is presumed that the station referred to in 2.7.1.1 is WQ30 on Chedakuz Creek; however, the water quality model results show an influence of the Project at this location, defined as a change from baseline condition. How are "effects on water quality" defined? Recommendation: Please describe in the Application how effects on water quality are to be interpreted in the context of this Application. If it is not defined by a change from baseline condition, please describe the expected spatial scope of influence (i.e.., change from baseline) of the Project and include how the Project may influence waterbodies classified under the Yinka Dene 'Uza'hné Surface Water Management Policy. (Source Comment ID#6)	In the Application, Project-related parameters of potential concern (POPC) and parameters of concern (POC) were identified based on screening against BC or CCME water quality guidelines (WQGs). In general, Project-related changes relative to background conditions were not specifically evaluated, except for parameters that had predicted concentrations that were higher than WQGs (see Section 5.4.8.1 [Screening Approach] in Chapter 5; Section 4.1 of Appendix 5-D [Water Quality Model Report]; and Section 2.5 of Appendix 5-I [Conceptual Site Model]). In addition to screening to identify POCs or POPCs based on WQGs, water quality predictions against Class 2 YDWL standards were also provided for Chedakuz Creek at node WQ13 (see Section 4.3.4.2 of Appendix 5-D [Surface Water Quality Model Technical Report] or Section 5 of Appendix 2-K [2011 to 2020 Surface Water Quality Baseline Report]). The Yinka Dene 'Uza'hné Surface Water Guide to Surface Water Quality Standards (Nadleh Whut'en and Stellat'en 2016a) provides methods for the derivation of water quality standards for each of the classified water categories. Baseline water quality sampling has been completed at a number of potential attainment sites on Davidson Creek and Chedakuz Creek in recent years (including 2019 to 2021) to meet the Yinka Dene Water Law sampling frequency (see Appendix 2-K, 2011 to 2020 Baseline Water Quality Report). The implementation of the YDWL is under discussion with the CSFNs.		CSFN	ERM		Tonia	RT	Ready for Submission		Ready for Publishing
440	Chapter 2: Baseline Information	Monitoring Location Figures	CSFN	Rolf Schmitt, P.Geo.; ERM Consultants Canada Ltd	Jun 02, 2022	1	New	Recommendation	No	Table 2.7.1 provides the list of surface water quality monitoring locations and rationale for inclusion. The associated figure (i.e.., Figure 2.7.1), however, does not include all of the monitoring locations (e.g., WQ29 and WQ30). Recommendation: Please include an updated figure or additional map (e.g., large scale inset) to show Chedakuz Creek and the associated monitoring locations. (Source Comment ID#7)	Figure 2.7.1 in Chapter 2 is missing the inset that shows several of the water quality monitoring locations that are further away from the mine site. Chapter 2 will not be updated or reissued, therefore refer to Figure 3.1-1 in Appendix 2-K [2011 to 2020 Baseline Water Quality Report] that shows the same figure with the inset (showing sites WQ29, WQ230, WQ17, WQ18) provided. 441	Chapter 3: Mine Plan	Care and Maintenance Mitigations and Modelling	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Recommendation	No	The Application must include a detailed description of how the risks associated with a potential period of Care and Maintenance (C&M) following re-start of mine operations would be effectively mitigated including ongoing water management ARD onset, water levels in the TSF, beach maintenance and TSF safety. The Application must conform to the requirements of the EA Condition on Care and Maintenance (Condition 11) and Condition 33 as well. Details of Blackwater Gold's C&M modelling scenario were provided to CSFN on February 21, 2022 and discussed with CSFN. CSFN provided a memo to Artemis on March 17, 2022 containing key comments on the proposed modelling scenario. On April 11, 2022, the Major Mines Office (MMO) provided C&M Information Requirements from Lowell Constable (Major Mines Permitting Office Executive Director & Deputy Chief Inspector). In the memo, MMO detailed additional Information Requirements (IRs) for inclusion in the Major Works Application. These Information Requirements are in addition to those already outlined in Section 4.9 of the JAIR. MMO shared CSFN's expectation that the requirements of EAC Condition 33 be incorporated into all aspects of the Application. Recommendation: Please refer to the letter from MMO, dated April 11, 2022, containing additional C&M Information Requirements and ensure all IRs are fully addressed in the Application. (Source Comment ID#8)	A C&M Plan has been developed by BW Gold, as required by Condition 11 of EAC M19-01, to meet the conditions of the EAC. By way of letter dated February 18, 2022, EAO communicated to BW Gold that the Condition 11 plan is to be revised in consultation with required parties, including the CSFNs, and resubmitted 60 days following the start of construction. BW Gold is planning to submit the outcomes of C&M modelling in the form of an updated Cond. 11 C&M Plan, supported by technical memos from Lorax and KP and a completed ITT, no later than July 31, 2022. It is noted that BW Gold has committed to voluntary C&M Water Balance and Water Quality modelling (above and beyond the EAC requirements) at CSFN's request during a technical meeting between BW Gold and CSFN (Jan 19th, 2022). The voluntary water modelling was subsequently co-presented by CSFN and BW Gold at the Jan 20, 2022 EMC meeting. BW Gold also communicated this modeling initiative to EMLI. EMLI followed up with a letter to BW Gold on April 11th, 2022, outlining the overlap between the EAC Cond. 11 requirements and what EMLI would be requiring for the major works application. EMLI stipulated that MMO will require that the C&M Plan, which addresses all the information requirements, to be provided the later of either the end of Round 2 review or June 30, 2022. BW Gold is in the process of balancing completing the modelling exercise and updating the plan alongside responding to Round 1 MRC comments, with a view to developing an updated plan that reflects the outcomes of Round 1 discussions. BW Gold has already achieved re-submission of the C&M plan to all required parties by the EAC on May 21st ahead of a date in the DSP (v4) of June 30th. BW Gold will also incorporate any required edits into EAC Plan 33 in accordance with the most recent approved version of the DSP. However, Plan 33 is not part of the MW's application, therefore the application is not required to address EAC Condition 33.		CSFN	BWG	BWG	Travis	TD	Ready for Submission	TD, 13-Jun-22	Ready for Publishing
441	Chapter 3: Mine Plan	Care and Maintenance Mitigations and Modelling	CSFN - P. Littlejohn, F. Mohamm	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	Acknowledged, I look forward to seeing the outcomes of the updated C&M modeling work and discussing changes to the C&M plan. Comment remains open until an updated C&M plan has been provided by Artemis' team. (Source Comment ID#8)	The outcomes of the Care and Maintenance modelling scenarios were presented to the CSFN's in a technical meeting on August 11, 2022. The outcomes were also presented to the entire EMC on August 18th. The updated Care and Maintenance plan incorporating the ourtcomes of the C&M modelling was distributed to the EAO, EMLI and Indigenous nations on August 21. 2022.		CSFN	BWG	BWG	Travis	TD	Ready for Submission	TD: Aug 23	Ready for Publishing
442	Chapter 3: Mine Plan	Inadequate C&M Planning	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Recommendation	No	[Please see comment #9 in the source doc for additional context] Recommendation: Please ensure the plan for C&M fully addresses the requirements set out by EAC Conditions 11 and 33. (Source Comment ID#9)	Refer to response to comment #441.		CSFN	BWG		TD	TD	Ready for Submission	TD, 13-Jun-22	Ready for Publishing
442	Chapter 3: Mine Plan	Inadequate C&M Planning	CSFN - P. Littlejohn, F. Mohamm	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	See Round 2 response to comment #8 (ITT ID 441). (Source Comment ID#9)	The outcomes of the Care and Maintenance modelling scenarios were presented to the CSFN's in a technical meeting on August 11, 2022. The outcomes were also presented to the entire EMC on August 18th. The updated Care and Maintenance plan incorporating the ourtcomes of the C&M modelling was distributed to the EAO, EMLI and Indigenous nations on August 21. 2022.		CSFN	BWG		TD	TD	Ready for Submission	TD, 23-Aug-23	Ready for Publishing

443	Chapter 3: Mine Plan	ARD Prevention Requirement in Condition 33	CSFN	Knight Piésold Ltd. and Lorax Environmental Service Ltd.	Jun 02, 2022	1	New	Recommendation	No	Tailings for the project are expected to be potentially acid generating (PAG). A key mitigation for the prevention of Acid Rock Drainage (ARD) is covering old tailings with fresh tailings before the onset of ARD. During periods of C&M, fresh tailings will not be generated so covering old tailings with fresh tailings will not be possible. This is problematic for ARD prevention as the old tailings will remain uncovered and Acid Rock Drainage (ARD) is expected to be generated. No plan has been proposed to prevent ARD generation during C&M periods. ARD generation is prohibited by EAC Condition 33. The plan for C&M in the Application must provide mitigation strategies for ARD prevention before the onset of ARD for the tailings beaches. Possible options for ARD prevention include : a)Deposition of overburden material on the tailings beach (inert material) and flooding of PAG tailings to prevent ARD (see Ascot permit requirements in Nov 2021 MA permit) b)Flooding of PAG tailings beaches and geotechnical stability assessment showing adequate safety factors are met c)Design of tailings beaches during operations that are NAG material (current understanding is that for this site this is not feasible due to limitations with desulfurization effectiveness (pers com Lorax, John Dockery) d)Ongoing "wetting" of tailings beaches with sprinklers (seems unlikely to be practical and feasible) Recommendation: Further work is required to determine the plan for the prevention of ARD during periods of C&M. This is an essential component of the Application that is lacking. (Source Comment ID#10)	Refer to response to comment #441.		CSFN	KP	Lorax	Greg/John	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
443	Chapter 3: Mine Plan	ARD Prevention Requirement in Condition 33	CSFN - P. Littlejohn	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	See Round 2 response to comment #8 (ITT ID 441). (Source Comment ID#10)	The outcomes of the Care and Maintenance modelling scenarios were presented to the CSFN's in a technical meeting on August 11, 2022. The outcomes were also presented to the entire EMC on August 18th. The updated Care and Maintenance plan incorporating the ourtcomes of the C&M modelling was distributed to the EAO, EMLI and Indigenous nations on August 21. 2022.		CSFN	BWG		Travis	TD	Ready for Submission	TD: Aug 23	Ready for Publishing
443	Chapter 3: Mine Plan	ARD Prevention Requirement in Condition 33	CSFN - F.Mohamm, P. Littlejohn	BW Gold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Considering the results of the additional modelling work, CSFN support limiting the quantity of water stored in the TSF to reduce geotechnical risks and facilitate speedy return to operations. This, however, increases geochemical risks that can potentially lead to negative environmental effects due to the inherent uncertainty of modelling. This risk is further exacerbated by the assumptions made for derivation of the acidic tailings source term in the current C&M modelling work. The tailings source term is estimated based on the PAG rock properties and neglects the significant difference in particle size between tailings and PAG rock. This results in a gross underestimation of the contaminants loading and must be addressed as soon as possible and no later than in the next iteration of the model. Moreover, the quantity of soil available for site reclamation is finite. As such, it is recommended that BW Gold plan for and use alternative sources of inert materials to cover the exposed tailings if required. This could be inert NAG or overburden material. Tables 6.4-2 and 6.5-1 of the C&M Plan refer to draining the tailings distribution system but maintaining operational capacity in the case that a NAG slurry cover is determined to form part of the C&M cover described for scenario 2. However, the use of	Chapter 4 - section 4.2.2 Landform design and control of the application states that *'The closure strategy for the PAG tailings includes processing NAG waste rock and OVB to create a slurry made of NAG waste rock and OVB to cover the PAG tailings. The NAG waste rock and OVB slurried cover will minimize ARD/ML from the underlying PAG tailings in the long-term.'* Depending on the timing of a potential C&M period within the timing of the overall LoM and the volumes of soil available for use at the time the site entered a C&M period, a risk assessment could be carried out prior to placing a cover to determine the best path forward, whether it be soil placement or a NAG slurry. It is important to keep in mind that the water quality results from a 'no cover' scenario vs. a soil cover scenario in a C&M period were very similar based on the outcomes of the C&M water quality modelling and as such there is no potential risk from a timing perspective to carry out an informed risk assessment before making a decision on placement of a cover. The C&M plan will be updated at its next annual interval to include information related to the potential use of NAG slurry as a cover alternative to soil including discussion on any potential impacts from a NAG slurry cover to any other remediation and reclamation plans and activities. In regards to the recommended permit condition - BW Gold has already		CSFN	BWG		Travis			TD, Oct 17	Ready for Publishing
444	Chapter 3: Mine Plan	Tailings Beach QPO	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The Application must describe how the TSF water management plan will ensure that the assumptions for the TSF design allow for tailings beach presence for all project phases including operations, C&M and closure. QPOs for tailings beaches must be developed that are practical to implement and monitor. (Source Comment ID#11)	Monitoring and operational requirements related to the TSF are summarized in Section 9 of Appendix 3-K of the Application. Preliminary QPOs related to the initial construction and operations of TSF C with the goal of managing freeboard, facility capacity, and embankment stability were developed. Final QPOs will be established after construction and summarized in the Operations, Maintenance and Surveillance (OMS) Manual. QPOs are selected to enable a high-level comparative assessment with the performance objectives for the TSF and must be reviewed annually and revised as required to remain current during on-going construction of the TSF.		CSFN	KP		Dan	AT/KP	Ready for Submission	KP, June 25	Ready for Publishing
444	Chapter 3: Mine Plan	Tailings Beach QPO	CSFN- L. Boxill	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	At a minimum, beach above water width of 30 m should be established as a QPO when tailings are deposited in both TSF-C and TSF-D facilities. This aligns with the requirements of EAC Condition 33. (Source Comment ID#11)	As noted in the R1 response, monitoring and operational requirements related to the TSF are summarized in Section 9 of Appendix 3-K of the Application. QPOs are selected to enable a high-level comparative assessment with the performance objectives for the TSF and must be reviewed annually and revised as required to remain current during on-going construction of the TSF. QPOs will be summarized in the Operations, Maintenance and Surveillance (OMS) Manual, per the Code. At this time, it is premature to presume such a prescriptive minimum QPO is appropriate for the proposed TSF. The stated goal of EAC Condition 33 (Mine Waste and Water Management Plan) is to 'manage mine waste and water in a manner that is protective of the receiving environment'. BWG is unclear how this proposed QPO for the TSF 'aligns' with EAC Condtion 33.		CSFN	KP				Ready for Submission	AT, Aug 31	Ready for Publishing

444	Chapter 3: Mine Plan	Tailings Beach QPO	CSFN- L. Boxill	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Oct 11, 2022	3	Follow Up	Recommendation	Yes	While it is well understood that an OMS will be developed and periodically updated to govern operation of site TSFs, clear articulation of how above water beaches will be maintained, and all other measures taken to maintain embankment dam safety, are consistent with tailings management best practice. Absence of above water tailings beaches deviates from best tailings management best practice and introduces the potential for prolonged elevated dam safety risk, especially if its maintenance is not understood to be an operational requirement. Recommendation: While it is understood and known that portions of the above water beach may become periodically inundated depending on which tailings deposition spigots are active at any given period of time, the OMS must clearly specify how the supernatant pond will be managed to reduce the potential for dam failure and avoid triggering various modes of dam failure. As such, recommendations for this inclusion in the OMS Manual is initially targeted at operational commitments to monitor and maintain dam safety, recognizing that failure to manage water in a TSF can result in elevated risks of certain modes of dam failure. Secondarily, location of the supernatant pond immediately adjacent to the upstream embankment shortens the seepage pathway and elevates the driving head for seepage that will report downstream of the TSF. (Source Comment ID#11)	As stated in the response to this comment in Round 1, monitoring and operational requirements related to the TSF are summarized in Section 9 of Appendix 3-K of the Application. Preliminary QPOs Trigger-Action Response Plans (TARPs) related to the initial construction and operations of TSF C with the goal of managing freeboard, facility capacity, and embankment stability were developed and presented in Section 9.3 and Appendix H1 of the report. Additionally, Section 9.4 of the report contains maintenance and surveillance requirements for the TSF to monitor and maintain dam safety. It is important to note that initial tailings discharge into TSF C in early operations will be from the ground on the west side of the facility (i.e. not from the embankment crest) as described in Section 5.2.3 of Appendix 3-K. The presence of an above water tailings beach during the early operations period until about Year 7 is basically inconsequential due to the TSF filling plan. The PAG/NAG3 waste rock dump located immediately upstream of Main Dam C between Years 1 and 6 provides initial separation of the supernatant pond from the embankment. The importance of the relative elevation and extents of this dump surface compared to the TSF supernatant pond is clearly articulated in the report, and incorporated into the Preliminary QPOs with associated TARPs presented in the report. A tailings beach length QPO may be incorporated in the OMS Manual at an appropriate time in the future, such as when tailings discharge from the Main Dam C embankment crest commences in approximately Year 7.		CSFN	KP		Dan	AT/KP	Ready for Submission	AT, Oct26	Ready for Publishing
445	Chapter 3: Mine Plan	General Comments Related to Latest Versions of Major Works Application	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	Yes	Improvement of the overall completeness of Chapter 3 and Chapter 4 of the Application (compared to earlier versions reviewed in October 2021) is noted. The format supports more comprehensive review of details related to the design, operation, and closure of tailings storage facilities (TSFs), mine waste dumps, the low-grade ore stockpile, topsoil stockpiles, and water management structures. Table 3.3-10 (Infrastructure Overview) and Table 3.3-11 (Summary of Impoundments) provide good compilations of key design configurations and construction schedule for mine waste and water management infrastructure. Unfortunately, tables summarizing material properties, design criteria and results of seepage, stability, liquefaction, and settlement analyses completed for TSFs and water management structures were not included in the body of the report as was done for the sections describing waste rock stockpiles.	Thank you for the recommendation. We will consider these comments and stated preferences in the future; however, no changes are being made to the way the information has been presented.		CSFN	KP		Dan	AT/KP	Ready for Submission	KP, June 25	Ready for Publishing
446	Chapter 3: Mine Plan	Quantitative Evaluation of Static and Seismic Liquefaction Potential	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	[Please see comment #13 in the source doc for additional context] Recommendation: It would be more accurate to acknowledge that only a screening level qualitative assessment of liquefaction potential of samples from the various geologic units encountered during site 2019 and 2020 site investigation programs was completed. (Source Comment ID#13)	Thank you for the recommendation. We believe the methodology is adequately described in the report.		CSFN	KP		Dan	AT/KP	Ready for Submission	KP, June 25	Ready for Publishing
446	Chapter 3: Mine Plan	Quantitative Evaluation of Static and Seismic Liquefaction Potential	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Aug 08, 2022	2	Follow Up	Recommendation	No	Clearly indicate what specific additional liquefaction analyses will be completed for site materials that will be collected during the site investigation program outlined in "R1_EMLI Geotech Comment ID 242.pdf. Regarding liquefaction, "R1_EMLI Geotech Comment IDs 319 - 321" notes "uncertainty has been identified that must be addressed through supplemental investigation, testing, and analysis." It further states, "where data exists, the liquefaction assessment indicates that the GLUs are not likely to be susceptible to liquefaction. The understanding of the nature and extent of the GLU along the MDD alignment is limited by the available drilling information and in-situ testing data. Additional work, similar to the investigations completed between 2019 and 2021 at Main Dam C is required prior to preparing the Issued-for-Construction (IFC) design of MDD and the start of construction in approximately Year 5." Recommendation: Please provide a clear explanation of what specific engineering analyses will be completed and what data is to be collected to provide greater insight into the liquefaction potential of the various GLU materials encountered at the site. (Source Comment ID#13)	The reviewer is encouraged to consider the information presented in Appendix C3 (Section C3.6) of Appendix 3-J (TSF Stage 1 Detailed Design Report) of the Application for additional information on the liquefaction assessment completed for Stages 1 and 2 of Main Dam C. In addition to the SCPT based assessments of the glaciolacustrine and completely weathered bedrock materials presented in Appendix 3-Z and described in the reviewers comments, liquefaction susceptibility analyses were carried out using several methods based on soil index testing results, downhole seismic testing shear wave velocity data, and standard penetration testing data collected at the site. A similar approach was taken for the other structures; however, analogue data based on material type was sometimes used if site specific in-situ testing was not available at the structure of interest. The site investigations recommendations include consideration for additional in-situ testing, particularly where analogue data was more heavily relied upon (e.g. Main Dam D). The referenced response, "R1_EMLI Geotech Comment ID 242.pdf", describes the targeted sampling and supplemental specialized soil laboratory testing plans for the upcoming site investigation program that will be used to further enhance understanding of material behavior of the foundation materials in the TSF and stockpiles areas. The laboratory testing program will incorporate additional index testing, odometer testing to further investigate reconsolidation pressures and over consolidation ratio, drained/undrained triaxial and direct simple shear testing to further evaluate material strength properties using remolded and low-disturbance samples collected during the program. Material strength characterization, steady-state seepage and stability modelling, and assessments of the potential for liquefaction will be updated progressively as new information becomes available. These engineering analyses will inform preparation of the issued for the construction designs of the various stages of the TSF. 446	Chapter 3: Mine Plan	Quantitative Evaluation of Static and Seismic Liquefaction Potential	CSFN (Lois Boxill)	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: We recommend a comprehensive assessment of foundation conditions, and clear description of site investigation, laboratory testing, and analyses that will be completed to address all "uncertainties" associated with foundation conditions, and GLUs in particular, as a permit condition that must be satisfied prior to granting regulatory approval of construction of all impoundment embankments associated with the Project. We further recommend independent 3rd party review of all design reports and their supporting appendices be included as a permit condition that must be satisfied prior to granting regulatory approval for the construction of any impoundment embankments at the Project site. (Source Comment ID#13)	BW Gold acknowledges the comment and disagrees with the suggested permit condition related to assessment of the foundation conditions as these details were already provided in the Application and supporting documentation. A comprehensive assessment of the foundation conditions is presented in the Dam Site Characterization Report in Appendix 3-L of the Application. A description of the upcoming field programs to further enhance the characterization of the site was provided in response to the Round 2 comment above. Detailed planning and objectives for later stages of investigation will be further developed based on the findings and success of the upcoming investigations, as is standard practice. EMLI has indicated in comment IDs 288 and 2079 that there is a potential permit condition related to independent review and BW Gold has acknowledged that potential permit condition.		CSFN	KP		Dan	AT/KP	Ready for Submission	AT, Oct26	Ready for Publishing
446	Chapter 3: Mine Plan	Quantitative Evaluation of Static and Seismic Liquefaction Potential	CSFN (Lois Boxill)	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Dec 15, 2022	4	Follow Up	Recommended Permit Condition	No	The key elements of the permit condition recommended for comment ID 446 are consistent with those that would also need to be addressed under the Permit Conditions anticipated by EMLI in comment IDs 288 and 2079 which BW Gold has acknowledged. Independent review and any subsequent reporting triggered by the permit conditions anticipated by EMLI in comment IDs 288 and 2079 will be tracked and reviewed to confirm the extent to which the concerns prompting our recommended permit condition for comment ID 446 have been addressed. Consequently, the potential permit condition recommended for comment ID 446 is considered subsumed by the Potential Permit Conditions anticipated by EMLI in comment IDs 288 and 2079 which BW Gold has acknowledged. Recommended Permit Condition: to be addressed under Permit Condition anticipated in Comment IDs 288 and 2079	Acknowledged. BW Gold looks forward to discussing the proposed language during the permit drafting stage.		CSFN	KP						
447	Chapter 3: Mine Plan	Quantitative Evaluation of Static and Seismic Liquefaction Potential	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	[Please see comment #13 in the source doc for additional context] Recommendation: Samples of material that were identified as contractive should be obtained either from past or future geotechnical site investigation programs at the site, especially where they occur within the foundation limits of dam embankments. These materials (primarily completely weathered bedrock (CWB) and glaciolacustrine (GLU) deposits, should be submitted for additional laboratory geotechnical testing to further characterize and evaluate their engineering properties when cyclic triaxial and cyclic simple direct shear forces are applied. (Source Comment ID#14)	Agreed. Additional laboratory testing is incorporated in the on-going site investigation plans for the project. See response to Comment ID #449 for additional details.		CSFN	KP		Dan	AT/KP	Ready for Submission	KP, June 25	Ready for Publishing

447	Chapter 3: Mine Plan	Quantitative Evaluation of Static and Seismic Liquefaction Potential	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Aug 08, 2022	2	Follow Up	Recommendation	No	The detail provided in "R1_EMLI Geotech Comment ID 242.pdf" regarding the proposed scope and schedule for completing additional site characterization and laboratory testing of collected samples is appreciated. However, neither this document nor "R1_EMLI Geotech Comment IDs 319-321.pdf" mention specific analyses that will be completed using engineering characterization data from materials samples to be collected prior to finalizing embankment design sections for construction, especially for areas where samples have not been collected. Please ensure this information is provided. (Source Comment ID#14)	The engineering analyses supporting the issued for construction designs of the various stages of the TSF will generally include updated characterization of the foundation conditions (if required), steady-state seepage analyses to estimate the phreatic surface elevation and evaluate flow paths through the dam and foundations, limit equilibrium stability analyses to verify target factors of safety are being met, liquefaction susceptibility assessments, and embankment deformation assessments and crest settlement estimates using simplified methods at a minimum. Dynamic deformation modelling may be performed, if required to demonstrate seismic performance objectives are being met.		CSFN	KP		Dan	AT/KP	Ready for Submission	KP, Aug 15	Ready for Publishing

448	Chapter 3: Mine Plan	TSF and Water Control Dam Stability Analyses	CSFN	Joseph Cristobal, P.Eng.; Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Aug 08, 2022	2	Follow Up	Recommendation	No	The additional discussion about stability analyses for Main Dam D provided in "R1_EMLI Geotech Comment IDs 319-321.pdf" has been reviewed and is appreciated. Recommendation: Please indicate which drill holes were used to develop the design cross sections (including foundation materials beneath Main Dam C and Main Dam D) that were analyzed and presented in the Application to evaluate embankment stability under the range of operations conditions evaluated. Explain the rationale that was applied to determine cross-section stratigraphy in areas where test hole data does not exist. Additionally, while actual site conditions encountered will always require site investigation programs to be adjusted, it would be extremely helpful to provide a plan drawing showing, at a minimum, the locations where drill holes will be targeted to improve the material characterization (Source Comment ID#16)	Overall summaries of the foundation conditions at each dam site are provided in Appendix 3-L (Dam Site Characterization Report) of the Application. A summary of the information, including drillholes, test pits, and other data, used to the develop the design cross sections for Main Dam C is provided in Appendix C3 (Figure C3.1 and Table C3.1) of Appendix 3-J (TSF Stage 1 Detailed Design Report) of the Application. The drillholes used to develop the design cross section for Main Dam D are shown on Figure 6.1 of Appendix 3-Z; the drillholes used to develop the section included several geotechnical drillholes along the alignment (GT13-40, GT12-02, GT12-16), geotechnical drillholes within the TSF basin (GT12-15, GT12-31, GT12-41, GT20-03, GT20-04, GT21-03 (D), GT21-03B (S), GT21-05), several nearby condemnation drillholes (RCH008, RCH009, RCH010, and RCH031), various test pits completed in the area, and the findings of the surficial geology and landform mapping presented in Appendix C1 of Appendix 3-L of the Application. The rationale applied to develop the cross-section stratigraphy (including where test hole data was unavailable) was generally as follows: 1. The deglaciation model map along with the reference maps and terrain and landform maps provided in Appendix A1 and Appendix C1, respectively, of Appendix 3-L fill in the site geology data gaps where drillhole data does not exist. The maps were developed through glacial landform mapping, extrapolation of site investigation data, and reconnaissance terrain mapping, respectively, and provide a high level representation of the site geology that can reasonably be used in the absence of specific data. 2. Data from drillholes completed in the vicinity of the analysis cross section were used to refine the high level representation provided by deglaciation model and terrain and landform maps. The refinement was generally completed as follows: (a) The bedrock surface along the cross section was modelled as a subdued reflection of surface topography based on the depth of bedrock contacts. Where drillholes intercept bedrock across the cross section, the surface elevation modelled was a spatial average of the contacts. (b) Highly and completely weathered bedrock contacts were modelled at spatially averaged thickness above the bedrock surface along the cross section. (c) The glaciolacustrine units along the cross section were modelled at the top elevation and thickness at which they were intercepted in the drillholes along the cross section. Where drillholes intercepted glaciolacustrine units near the cross section, the glaciolacustrine unit top of elevation and thickness was modelled as a spatial average of the contacts and extended to the limits indicated by Figure A1.9 and described in the structure specific sub-sections in Section 7 of Appendix 3-L or to the intersection of the		CSFN	KP		Dan	AT/KP	Ready for Submission	AT, Aug 15	Ready for Publishing

448	Chapter 3: Mine Plan	TSF and Water Control Dam Stability Analyses	CSFN (Lois Boxill)	Joseph Cristobal, P.Eng.; Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Embankment conditions and design sections analyzed for stability (static, dynamic, peak and residual) and seepage analyses of TSFs shall be explicitly tied to site investigation data stemming from test holes that are clearly located within currently anticipated embankment and impoundment footprint limits. Permit Condition Recommendation to EMLI: We recommend independent 3rd party review of all design reports and their supporting appendices be included as a permit condition that must be satisfied prior to granting regulatory approval for the construction of any impoundment embankments at the project site. (Source Comment ID#16)	The previous Round 2 response provides the rationale for how embankment conditions and design sections were tied to the site investigation data. We note that the reviewer has not commented on any specific aspect of the summary/rationale that was provided in response to the previous iteration of this comment, and the reviewer has not stated any inferred concerns with the rationale supporting their recommendation of independent review. However, we further note that EMLI has indicated in comment IDs 288 and 2079 that there is a potential permit condition related to independent review of the TSF, and BW Gold has acknowledged that potential permit condition. 452	Chapter 3: Mine Plan	Seismic Deformation Estimates	CSFN	Joseph Cristobal, P.Eng.; Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	Section 5 of Appendix 3-Z provides descriptions of the seismic deformation estimates that were determined for the various dams analyzed using the methods provided in Bray (2007) and Swaisgood (2003). Reading the various paragraphs where settlement data are provided, it appears that in most cases, embankment dam crests settled less than 15 cm. This level of settlement is considered reasonable for embankment dams of the size of the structures proposed. Recommendation: Include a summary of the settlement analysis completed (i.e.., method used) and the results in the main body of the Application to enhance and expedite thorough assessment of	Thank you for the recommendation. We will consider these comments and stated preferences in the future; however, no changes are being made to the way the information has been presented.		CSFN	KP		Dan/Joseph	AT/KP	Ready for Submission	KP, June 25	Ready for Publishing
453	Chapter 3: Mine Plan	TSF Operations, Management, and Surveillance	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	Section 3.5.3.9 confirmed that placement of tailings in TSF-D does not commence until Year 21. As such, TSF-D will serve as a PAG storage location for its first 20 years of operation, with these materials only becoming flooded/inundated by tailings between Year 21 and Year 23. Conversely, it is noted that PAG/NAG waste rock will be placed upstream of Main Dam C during its first six years of operations along. Additionally, this facility has been designed to provide tailings storage for the first 21 years of mine operation as well as "provide a continuous source of process water to the mill operations." Figure 3.3-11 which provides the General Arrangement of Blackwater Mine during Year 8 of operations, shows a significant tailings beach upstream of Main Dam C with the TSF C pond located further	Monitoring and operational requirements related to the TSF are summarized in Section 9 of Appendix 3-K of the Application. These preliminary operations and monitoring requirements will be incorporated into Operations, Maintenance and Surveillance (OMS) Manual following construction of TSF C along with other pertinent content. The OMS Manual will be reviewed annually and updated as required during progressive development of the TSF. It will incorporate requirements for TSF D once it is constructed.		CSFN	KP		Dan	AT/KP	Ready for Submission	KP, June 25	Ready for Publishing
453	Chapter 3: Mine Plan	TSF Operations, Management, and Surveillance	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Aug 08, 2022	2	Follow Up	Recommendation	No	When prepared, the OMS for both impoundments will need to explicitly state how PAG is placed upstream of each embankment will be continuously submerged to avoid onset of acidification of stored PAG. (Source Comment ID#21)	BW Gold acknowledges this comment.		CSFN	KP		Dan	AT/KP	Ready for Submission	KP, Aug 15	Ready for Publishing
453	Chapter 3: Mine Plan	TSF Operations, Management, and Surveillance	CSFN (Lois Boxill)	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: We recommend independent 3rd party review of the OMS for all impoundment embankments be included as a permit condition that must be satisfied prior to granting regulatory approval for the use of any impoundment embankments at the project site. Specifically, OMSs should be reviewed in conjunction with their associated detailed design report to ensure consistency between the mass balance, incremental stage storage curves and proposed operations for each facility. Specifically, any filling associated with PAG rock inundation or water withdrawals, as described in sections of the EA associated with water that will be treated for sulphate prior to discharge to the environment from TSF-C, should be clearly described in the design reports for TSF-C and TSF-D which should also indicate what measures are included in the design and operation of each TSF to avoid developing potentially adverse operating conditions at either impoundment. The operating conditions that must be maintained and the means by which these conditions will be monitored and adjusted as needed throughout mine life should be clearly noted in the OMS for all site impoundments. (Source Comment ID#21)	BW Gold acknowledges the comment and disagrees that independent review of an OMS Manual is a necessary permit condition because this review requirement is already incorporated in the Code. The OMS Manual will be developed, reviewed, and approved in a manner consistent with requirements of the Health, Safety and Reclamation Code for Mines in British Columbia (the Code) and submitted to the chief inspector prior to operation of the TSF. The OMS Manual will be reviewed regularly by the operator and revised as required during operations. Annual dam safety inspections and periodic dam safety reviews, as required by the Code, already include requirements for regular reviews of the OMS Manual by the Engineer of Record and independent reviewers, respectively.		CSFN	KP		Dan	AT/KP	Ready for Submission	AT, Oct26	Ready for Publishing

453	Chapter 3: Mine Plan	TSF Operations, Management, and Surveillance	CSFN (Lois Boxill)	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Dec 15, 2022	4	Follow Up	Recommended Permit Condition	Yes	While independent technical reviews of detailed design reports and OMS manuals for TSFs are required under the Code as acknowledged by the Respondent, the proposed recommendation is flagging a need for independent reviewers to examine and assess potential implications and necessary considerations related to placement of PAG upstream of both Main Dam D and Main Dam C (as noted in comment ID 453), and of the potential for any adverse or otherwise undesirable conditions stemming from free water in the pore spaces of placed PAG creating a wetting front equal in depth to the height of placed waste rock (as noted in comment id 444). Additionally, comment ID 453 intends to draw explicit attention to the geotechnical professionals who are typically responsible for preparing and reviewing OMS manuals of the likelihood that the OMS manuals prepared for this project will likely also need to address how TSF operations accommodate removal of water for treatment of sulphate prior to discharge to the environment. Consequently, the recommendations made under comment ID 444 are carried forward here and modified as follows: Recommendation 1a: Independent Technical Review of the detailed design of Main Dam C and Main Dam D that is anticipated to be included as a Permit Condition by EMLI in comment IDs 288 and 2079 should include an assessment of why and how a practice of prolonged/extended storage of water adjacent to the upstream slope of an embankment dam is desirable and/or acceptable, and how any combination of factors that may result in a breach of either embankment will be mitigated or managed during operations. Recommendation 1b: That Independent Technical Review of the detailed design of Main Dam C and Main Dam D include explicit review of proposed operations practices of both TSFs including placement of PAG materials, deposition of tailings, controlling the location and depth of ponded supernatant water, and how operation of TSFs accounts for withdrawals of water for chemical treatment prior to planned release to the environment. Recommendation 2: That the issue of and plan for managing free water (including that stored in large open voids of PAG stored in TSFs) be flagged for additional review and evaluation as part of the Mine Permit and should be completed prior to the start of operating either TSF. Recommended permit condition 1a and 1b to be addressed under Permit Condition anticipated in Comment IDs 288 and 2079 Recommended Permit Condition: Recommended permit conditions 1b and 2 should be clearly specified as related to discussions/topics to be addressed in the OMSs prepared for TSFs for which Main Dam C	Acknowledged. BW Gold looks forward to discussing the proposed language during the permit drafting stage.		CSFN	KP						
454	Chapter 3: Mine Plan	TSF Operations, Management, and Surveillance	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	[Please see comment #21 in the source doc for additional context] Recommendation: Different line types should be used to differentiate tailings profiles and placement, from waste rock placement, and co-mingled waste rock and tailings for both TSFs in Figure 3.5-32 and Figure 3.5-33. At a minimum, the stage storage curve shown for each TSF should articulate how each of these facilities will be utilized. (Source Comment ID#22)	Figures showing a longitudinal cross-section through the TSF and additional detailed information in the general vicinity of Main Dam C and Main Dam D were developed that shows the relative placement of waste rock and tailings in TSF C and TSF D. Please see attachment "R1_EMLI Geotech Comment ID 290.pdf" for details.		CSFN	KP		Dan	AT/KP	Ready for Submission	KP, June 25	Ready for Publishing
455	Chapter 3: Mine Plan	Topsoil Stockpiles and Its Use in TSF Closure and Remediation	CSFN	Rolf Schmitt, P.Geo.; ERM Consultants Canada Ltd	Jun 02, 2022	1	New	Recommendation	No	Section 3.5.7 provides a description of topsoil stockpiles and directs readers to Table 3.5.7-1 which summarizes the storage capacity of each of the seven topsoil stockpiles that will exist at the site during Life of Mine operations. While Figure 3.3-5 through Figure 3.3-15 provide good overviews of the site's general arrangement from year Y-2 (mine construction) through year Y46+ (post closure), it is notable that the only units not labelled on these drawings are topsoil stockpiles. While this may seem trivial, inclusion of the names with the locations of each topsoil stockpile on each of the indicated General Arrangement figures demonstrates the Proponent's awareness that salvaging, stockpiling, and preserving topsoil and reclamation media is a requirement from the outset and throughout all phases of mine life. In addition, while Figure 3.3-15 is entitled "General Arrangement of Blackwater Mine at Post-closure Year 46+, it is notable that the tailings beaches are shown as un-reclaimed and existing in the form of above water tailings. While Section 3.5.7 indicates that placement of topsoil on tailings surfaces may cause fouling of anticipated water treatment, the closure plan description included in Chapter 4 of the Application makes clear that as a bare minimum, 30 cm of Overburden and NAG sand will be placed over the tailings beach. As such, Figure 3.3-15 should indicate that some sort of cover material is placed on the surface on the exposed tailings beaches above water and that tailings beaches will not be present in the post closure phase as a driver for annual dusting challenges. This modification would make the tailing beach surfaces consistent with the information shown in Figure 4.2-1 of Chapter 4 of the Application. Recommendation: Clearly label Topsoil Stockpiles on General Arrangement Figures provided in Chapter 3. (Source Comment ID#23)	The topsoil stockpiles are represented by a pink colour on the figures and indicated in the legend as 'Topsoil Stockpile' on general arrangement figures (beginning with Figure 3.3-5 in Chapter 3). Each of the numbered topsoil stockpile locations are labelled and provided in Figure 3.5-61 of Chapter 3 and in Figure 10.1-1 of the Soil Management Plan (Appendix 9-B). Thank-you for your comment regarding the 'unreclaimed' tailings beaches in Figure 3.3-15. We will consider these comments and stated preferences in the future; however, no updates to Figure 3.3-15 is provided. The Reclamation and Closure Plan will be provided as a future stand-alone plan with Figure 4.2-1 (Reclamation-material Depths for Mine Closure) provided to show the proposed cover material and depth of the Tailing Storage Facility (TSF) beach. 456	Chapter 3: Mine Plan	Integration of Reclamation Security Cost in Net Smelter Return (NSR)	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Any LGO stockpile that requires movement of the stockpiled material from the stockpile location to a final reclamation location will have to be considered in the reclamation security cost. BW Gold states that costs associated with the LGO stockpile bonding have been incorporated into the financial cash flow forecasts for the project but are not explicitly included in the calculation of the Net Smelter Return (NSR) value. CSFN are concerned about this omission from an environmental impact perspective. Exclusion of these costs from the NSR value decreases the economic cut-off grade for LGO material on an incomplete basis, disincentivizes the use of alternative LGO stockpile designs, and incentives a larger LGO stockpile than what is truly economically processable. Analysis of LGO stockpile size and options must incorporate the cost of bonding into NSR. Information Request: Please provide updated project economics using NSR values that reflect the cost of bonding. (Source Comment ID#24)	Please see attachment "R1_CSFN_Comment IDs 456, 457, 458, 459, 460.pdf"		CSFN	BWG		Alastair	TD	Ready for Submission	AT; June 28	Ready for Publishing

456	Chapter 3: Mine Plan	Integration of Reclamation Security Cost in Net	CSFN - F. Mohamm	BW Gold Ltd.	Oct 11, 2022	3	Follow Up	Information Requirement	Yes	The proposed LGO stockpile for the Blackwater project remains a top concern for CSFNs, primarily because of its massive size, immediate onset of acid rock drainage, the requirement to be moved if not processed, and its relatively low grade of gold. Together, these characteristics give the proposed LGO a level of environmental risk that is unprecedented in Canadian mining projects. CSFNs raised concerns with the LGO stockpile during the Environmental Assessment when it was	The comment is acknowledged. BW Gold submitted to EMLI for distribution to the MRC an update to its proposed RLCE on October 13th. The update included the following proposed permit condition as part of its updated RLCE: *Prior to the commencement of stockpiling Low Grade Ore, and prior to each subsequential increment of 10 Mt, the Permittee will cause to be deposited with the* *Minister of Finance, a security in the amount of $22.1 million for rehandling of the*		CSFN	BWG		Travis			TD, Oct 17	Ready for Publishing

457	Chapter 3: Mine Plan	LGO Alternative Designs	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Source has suggested several alternative options for LGO siting. BW Gold has so far responded by how alternatives to the option proposed by Artemis are less cost-effective. CSFN are concerned that the evaluation of alternatives is incomplete when the cost of bonding is not incorporated into the overall cost-benefit analysis. This means that a portion of the LGO will appear to be economical to process based on incomplete NSR evaluation but, will not be economical when the cost of bonding a large LGO is incorporated. BW Gold argues that the impact of this omission on the project economics is minimal and compares it to a large increase of 25% in the price of gold ($500/oz). This is a flawed comparison – the project application was prepared based on $1400/oz and that is the basis for its assessment. CSFN's concern is that by omitting the difference in bonding cost from different alternative designs that the evaluation of alternatives is incomplete. BW Gold has not yet resolved these concerns. The assessment of the impact of the alternative storage option for LGO within the boundaries of TSF D as provided by Artemis does not consider major savings that will result from the elimination of the bond. CSFN had requested that economic analysis of including upfront mitigation for the LGO be compared with the proposed scenario of posting an adequate closure bond to move the material to the pit. As such, the assignment of -$233M Net Present Cost (NPC) to the project economics due to moving LGO to TSF D is not accurate. Assessment of the economic impact of any alternative option for management of LGO must be inclusive of all major costs and savings to produce satisfactory and reliable results. Information Request: Please clarify how the financial cash flow relates to the actual value of the part of the LGO that is not economical to process when all-inclusive costs of mining are considered. (Source Comment ID#25)	Please see attachment "R1_CSFN_Comment IDs 456, 457, 458, 459, 460.pdf"		CSFN	BWG		Alastair	TD	Ready for Submission	AT; June 28	Ready for Publishing
457	Chapter 3: Mine Plan	LGO Alternative Designs	CSFN - F. Mohamm	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Information Requirement	No	Source continues to be concerned about this issue and will seek to reduce the risk via setting an appropriate bond and bond review process with EMLI. CSFNs will continue discussion of the LGO bonding cost through trilateral meetings with BW Gold and EMLI, to establish a cost basis, including rehandling costs for the maximum LGO pile volume in the reclamation and closure cost estimate. 462	Chapter 4: Reclamation and Closure Plan	Care and Maintenance – Pit Dewatering	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Recommendation	No	Often during periods of C&M, water builds up in mine pits and needs to be addressed prior to re-start. The "ramp up" period needs to consider the potential for dewatering of the pit lake. Currently the plan appears to assume no water will build up in the open pit, however without more work to determine where water goes, this assumption is not considered reasonable. Given the limitations placed on dumping water in the TSF (EAC Condition 33), evidence is required that the treatment systems are adequate, and the water balance can avoid surplus buildup without storing water in the pit. A quantitative evaluation is required to support the approach to excess water management in C&M. Recommendation: Please provide a quantitative assessment to support the statements that the pit will indeed be dewatered for years 1-17. (Source Comment ID#30)	Refer to response to comment #441.		CSFN	BWG		TD	TD	Ready for Submission	TD, 13-Jun-22	Ready for Publishing
462	Chapter 4: Reclamation and Closure Plan	Care and Maintenance – Pit Dewatering	CSFN - P. Littlejohn, F. Mohamm	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	See Round 2 response to comment #8 (ITT ID 441). (Source Comment ID#30)	The outcomes of the Care and Maintenance modelling scenarios were presented to the CSFN's in a technical meeting on August 11, 2022. The outcomes were also presented to the entire EMC on August 18th. The updated Care and Maintenance plan incorporating the ourtcomes of the C&M modelling was distributed to the EAO, EMLI and Indigenous nations on August 21. 2022. The modelling assumed that the open pit remains in a dry, dewatered state.		CSFN	BWG		TD	TD	Ready for Submission	TD, 23-Aug-22	Ready for Publishing
463	Chapter 4: Reclamation and Closure Plan	Care and Maintenance – Water Treatment Capacity Requireme	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Recommendation	No	During operations "pore lockout", the water in tailings pores, is a significant water sink, ranging from approximately 2 to 8 Mm3/year depending on project phase and mill throughput. During a C&M period, the mill will cease operation and pore lockup will no longer be a significant sink for water. This change significantly increases the volume of surplus water requiring management at the site. During operations, the capacity of the sulphate WTP is approximately 2 Mm3/year. Source is concerned that the operations phase water treatment capacity is not sufficient to maintain a stable water balance	Refer to response to comment #441.		CSFN	BWG		TD	TD	Ready for Submission	TD, 13-Jun-22	Ready for Publishing
463	Chapter 4: Reclamation and Closure Plan	Care and Maintenance – Water Treatment Capacity Requireme	CSFN - P. Littlejohn, F. Mohamm	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	See Round 2 response to comment #8 (ITT ID 441). (Source Comment ID#31)	The outcomes of the Care and Maintenance modelling scenarios were presented to the CSFN's in a technical meeting on August 11, 2022. The outcomes were also presented to the entire EMC on August 18th. The updated Care and Maintenance plan incorporating the ourtcomes of the C&M modelling was distributed to the EAO, EMLI and Indigenous nations on August 21. 2022. The modelling outputs revealed that an increase in treatment capacity of the membrane treatment plant is required to manage the VCC climate outputs over the 20 year period of 72 L/s to 110 L/s..		CSFN	BWG		TD	TD	Ready for Submission	TD, 23-Aug-22	Ready for Publishing
463	Chapter 4: Reclamation and Closure Plan	Care and Maintenance – Water Treatment Capacity Requirements	CSFN - P. Littlejohn, F. Mohamm	BW Gold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	As indicated from the results of the WB/WQ modelling work, regardless of the scenario modelled, upon entering a C&M period, the project needs additional water treatment capacity. This is a critical component for the satisfactory management of site WB/WQ in periods of C&M to ensure the project meets the requirements set out in EAC Condition 33. The underestimation of the contaminants loading by the source terms used for C&M modelling, the limited availability of coverage material for the exposed tailings beaches, and the significantly higher volume of water that must be managed/treated during a C&M period, increase the risk of water quality exceedances and negative environmental impacts during a C&M period for the project. Due to the extremely low capacity of the downstream environment for additional loads of contaminants, it is crucial that the necessary water treatment capacity is available as soon as possible so it can be used when needed. Therefore, it is recommended that BW Gold increase water treatment capacity of the project as soon as possible after entering a period of C&M. Recommended Permit Condition: If a period of C&M occurs, BW Gold must add the estimated additional water treatment capacity (110 L/s vs. 72 L/s during operations) within one year of entering the C&M period. Recommendation to the Province: Quantitative Assessment for Periods of C&M CSFNs appreciate BW Gold's collaborative approach to the development of the C&M Plan. Most of the issues that had been raised previously by the CSFNs are resolved in the updated C&M Plan. CSFN would like to highlight the positive outcomes of the quantitative assessment and the analysis of various potential scenarios for the period of C&M that were completed by BW Gold. These include a better understanding of the site conditions and requirements with implications for mine planning and design to ensure the necessary mitigation measures can be put in place, in a timely and effective manner, should the project enter a C&M period. BW Gold, CSFN, and the Province appreciate the value and the benefits of the C&M exercise that was completed for the Project. As such, we would strongly recommend to the province to include a quantitative assessment of site water balance and quality (WB/WQ) and the necessary mitigation measures for periods of C&M as a requirement for all projects seeking regulatory approvals. (Source Comment ID#31)	Based on the outcomes of the C&M modelling completed to inform an update to the EAC condition 11 C&M plan, Section 6.8 - Monitoring and Managing Build-up of Water Surplus in the Tailings Storage Facility of EAC Condition 11 plan was updated with the following: *The Operational water treatment rate is 72 L/s (up to 2.3 Mm3/yr; Appendix D) and the treatment rate required during C&M is 110 L/s (up to 3.5 Mm3/yr) under the variable climate scenario modelled for the C&M period (Appendix D).* Furthermore, Section 6.9 Mine Site Water Management and Water Treatment Plants was updated with the following: *During C&M, the Membrane WTP will continue to treat surplus supernatant pond water from TSF C, however as indicated in Section 6.8 a higher maximum treatment rate is required (increasing from 72 L/s in Operations to 110 L/s for all C&M scenarios under the variable climate case). The costs (capital and operating) as well time to construct the additional treatment facility is provided in Appendix F.* Consequently, BW Gold agrees with the permit condition of adding the estimated additional water treatment capacity, however, market conditions outside of BW Gold's direct control (e.g. availability of parts, equipment and contract labor) will likely play a factor in the timing to get the plant capacity increased. BW Gold would propose to revise the permit condition proposed by CSFN as follows: *If a period of C&M occurs, BW Gold must initiate the process of tendering contract to add the estimated additional water treatment capacity (110 L/s vs. 72 L/s during operations) within 90 days of entering the C&M period.* BW Gold also appreciated CSFN's engagement and collaboration of the development of the C&M plan and the positive outcomes of the agreed upon water balance and water quality modelling to inform possible changes to water treatment capacities and managing water quality in periods of C&M. 464	Chapter 4: Reclamation and Closure Plan	Preparations for a C&M Period	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	The point of the C&M condition is to consider the need for project design, so the project is prepared for C&M. By deferring these considerations to mine operations, the risks to the First Nations communities are greater as it will be too late to make project design changes. The point of permitting is to design the project, with the ability to modify designs to make improvements – but avoiding an initial design until after permitting is not appropriate. Permitting is a detailed design as stated many times in the EA process. The suggestion to defer these topics even further, after permitting, is not appropriate and conflicts with the statements of the Holder and the permitting agencies during the EA process. As an example, is more capacity required in the water management pond (WMP) or the TSF for C&M or are other design modifications required such as increased treatment plant capacity? Recommendation: CSFN is pleased that operational plans are robust and would like to see some thought go into robust C&M Planning. Please ensure the Application adequately addresses periods of C&M. EAC conditions 11 and 33 combined explicitly mandate the provision of C&M. 466	Chapter 4: Reclamation and Closure Plan	Care and Maintenance – Ramp Up Period	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Recommendation	No	There is no indication in the Application of the factors that would allow for a re-start including dewatering of the pit, should that occur. Source recommends further work be completed with scenarios including: •a significant buildup of water in the pit, •a relatively minor buildup of water in the pit, •brine management in the pit, or •no water builds up. If the pit requires dewatering, there is a strong possibility that a re-start of the mine will not be allowed, depending on the permit conditions. Further planning for these scenarios is required. Simply moving water to the TSF can increase risks and may not be acceptable given previous problems with this water management approach in BC mines. If water does accumulate in the pit, the size of the treatment system should be evaluated to see if the pit level can be drawn down in a reasonable time to allow the return to operation. Further, where does water treatment brine get deposited in a C&M scenario specifically? Recommendation: Please ensure a quantitative water balance model for C&M followed by a return to operations is completed, to evaluate the potential for water to build up in the pit. (Source Comment	Refer to response to comment #441.		CSFN	BWG		TD	TD	Ready for Submission	TD, 13-Jun-22	Ready for Publishing
466	Chapter 4: Reclamation and Closure Plan	Care and Maintenance – Ramp Up Period	CSFN - P. Littlejohn, F. Mohamm	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	See Round 2 response to comment #8 (ITT ID 441). (Source Comment ID#34)	The outcomes of the Care and Maintenance modelling scenarios were presented to the CSFN's in a technical meeting on August 11, 2022. The outcomes were also presented to the entire EMC on August 18th. The updated Care and Maintenance plan incorporating the ourtcomes of the C&M modelling was distributed to the EAO, EMLI and Indigenous nations on August 21. 2022. The modelling outputs revealed thast Scenarios 1 and 2 have a ramp up period of approx 1.5 years, whereas scenario 3 has a rampup period of 6-8 years. 467	Chapter 4: Reclamation and Closure Plan	Discount Rate Chosen	CSFN	Rolf Schmitt, P.Geo.; ERM Consultants Canada Ltd	Jun 02, 2022	1	New	Information Requirement	No	Discount rates for reclamation cost estimation must have some relation between the current rate of inflation and the current “safe” return on investment. In other words, it is not acceptable or reasonable to use net present value discount rates that reflect years gone by when federal interest rates (i.e.., rate of “safe” return) were higher and the rate of cost escalation/inflation was lower. For example, the use of discount rates of 3-4% does not reflect current economic conditions. The actual trend of cost escalation can be seen in Statistics Canada data for the Industrial Product Price Index (IPPI)1. The metric for Fabricated metal products and construction materials [P63] shows an annual rate of cost escalation of 5.2% over the past 10 years, 8.8% over the past 5 years, and 17.5% over the past 2 years2. During the same span, the Bank of Canada’s overnight interest rate has ranged from 0.25% to 1%. The implication of the vast difference between the current rate of cost escalation and the current rate of “safe” return is that use of any positive discount rate will vastly underestimate the cost of long-term maintenance. https://www150.statcan.gc.ca/t1/tbl1/en/tv.action?pid=1810026501 2 Values calculated from February 2012, 2017, and 2020 to February 2022, respectively Information Request: Please discuss how the discount rate for reclamation security cost estimation was chosen for Blackwater and its basis in the context of broader macroeconomic conditions. (Source Comment ID#35)	BW Gold acknowledges that the selection of the Discount Rate to apply to the NPV calculations for the LoM Reclamation Liability Cost estimate is an important subject. BW Gold intends to follow the policy direction of EMLI in the April 2022 Interim Major Mines Reclamation Security Policy. BW Gold notes that throughout the LoM, the status of reclamation liabilities is regularly reviewed, and the reclamation cost is updated using current inflation rates.		CSFN	ERM		Rolf	RT	Ready for Submission	AT, June 19	Ready for Publishing
467	Chapter 4: Reclamation and Closure Plan	Discount Rate Chosen	CSFN - P. Littlejohn	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Information requirement	No	EMLI's policy notwithstanding, if Artemis appreciates the importance of updating the reclamation cost using current inflation rates, why not start on the right foot by using discount rates that reflect current inflation rates for the initial reclamation cost update? (Source Comment ID#35)	BW Gold intends to follow the policy direction of EMLI in the April 2022 Interim Major Mines Reclamation Security Policy.		CSFN	BWG				Ready for Submission	AT, Aug31	Ready for Publishing
467	Chapter 4: Reclamation and Closure Plan	Discount Rate Chosen	CSFN - P. Littlejohn	BW Gold Ltd.	Oct 11, 2022	3	Follow Up	Information requirement	Yes	Acknowledged. CSFN has concerns about this policy but will raise them with EMLI. (Source Comment ID#35)	BW Gold acknowledges that CSFN has concerns about the April 2022 Interim Major Mines Reclamation Security Policy that they plan to raise directly with EMLI. BW Gold looks forward to continuing to discuss with CSFN and EMLI its RLCE through upcoming trilateral meetings (the next tentatively scheduled for Oct 31).		CSFN	BWG	Travis				TD, Oct 17	Ready for Publishing
468	Chapter 4: Reclamation and Closure Plan	Covering Reclamation Security via Promissory Note	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Recommendation	No	In previous comments, Artemis has implied that they will cover the reclamation bond via a promissory note rather than by posting cash with EMLI. Promissory notes typically do not escalate in value, and as no cash would be posted, it would not be possible for EMLI to manage these funds such that return on investment is generated. Use of discounting in estimating the reclamation security cost assumes that some return on investment is earned before the bond is required. Recommendation: If a promissory note is proposed to be used by Artemis to cover the reclamation	On a point of clarification, Artemis expects to be required to provide financial security in the form of a financial guarantee bond (not a promissory note), which is to be endorsed by a duly authorized surety provider. Under the Health, Safety and Reclamation Code for Mines in British Columbia, Parts 10.4.1, 10.4.4, and 10.4.5 Artemis is required to provide annual updates of the reclamation and closure plan. As such, Artemis anticipates that the financial security will be updated, if required, in line with these plans to reflect the (then) latest disturbances and present value cost of reclamation.		CSFN	BWG		Alastair	TD	Ready for Submission	AT, June 29	Ready for Publishing
468	Chapter 4: Reclamation and Closure Plan	Covering Reclamation Security via Promissory Note	CSFN - P. Littlejohn	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	Artemis has stated that they will cover the reclamation bond via a financial guarantee bond rather than by posting cash with EMLI. Financial guarantee bonds typically do not escalate in value, and as no cash would be posted, it would not be possible for EMLI to manage these funds such that return on investment is generated. Use of discounting in estimating the reclamation security cost assumes that some return on investment is earned before the bond is required. **Recommendation to EMLI:** If a financial guarantee bond is proposed to be used by Artemis to cover the reclamation security cost for the Blackwater project, then the value of the financial guarantee bond should be required to be updated (increased) on an annual basis in line with the rate of discounting used. (Source Comment ID#36)	The comment is acknoweledged as a recommendation to EMLI, and BW Gold looks forward to discussing at the appropriate time.		CSFN	BWG		Ryan	RT	Ready for Submission	RT; aug 24	Ready for Publishing
468	Chapter 4: Reclamation and Closure Plan	Covering Reclamation Security via Promissory Note	CSFN - P. Littlejohn	BW Gold Ltd.	Oct 11, 2022	3	Follow Up	Recommendation	No	The comment remains open and is being carried forward. (Source Comment ID#36)	BW Gold looks forward to continuing to discuss with CSFN and EMLI its RLCE through upcoming trilateral meetings (the next tentatively scheduled for Oct 31).		CSFN	BWG		Travis			TD, Oct 17	Ready for Publishing
469	Chapter 4: Reclamation and Closure Plan	Post-Closure Water Treatment	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Recommendation	No	Water treatment is proposed during operations and during post-closure using the membrane water treatment plant. During closure, the membrane water treatment plant will be offline for ~20 years. This is a long period for a complex system to be offline. Is the intent to build an entirely new WTP for post-closure or to expand/refurbish the WTP prior to the post-closure phase? Recommendation: Please describe what infrastructure is expected to be maintained during closure versus what is expected to be built during the closure phase. What level of work/cost is expected to be required to refurbish the WTP so it can be operational during Post-Closure? Has the cost of this activity been incorporated into the reclamation security cost estimate? (Source Comment ID#37)	The reclamation cost estimate assumes that the membrane water treatment plant used during operations will not be available for use during post closure, and consequently includes the cost of building new plant for Post-closure. However, BW Gold will assess the condition of the existing membrane water treatment plant used during operations and salvage components that are still fit for operations and properly discard of components past their useful life. This can be clarified in a future version of the RCP. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups		CSFN	BWG	BW	Ryan/Alastair to finish	RT	Ready for Submission	RT; June 29	Ready for Publishing
469	Chapter 4: Reclamation and Closure Plan	Post-Closure Water Treatment	CSFN - P. Littlejohn	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Question	No	Thank you. Has the cost of constructing a new WTP for post closure been incorporated into the reclamation security cost estimate? (Source Comment ID#37)	The updated RLCE will capture the closure cost liability for the mine, including the water treament capital costs and operating costs, in accordance with EMLI guidance. The strategy for water treatment which forms the basis for the estimate will be summarized as part of the update.		CSFN	BWG		Rolf		Ready for Submission		Ready for Publishing
469	Chapter 4: Reclamation and Closure Plan	Post-Closure Water Treatment	CSFN - P. Littlejohn	BW Gold Ltd.	Oct 11, 2022	3	Follow Up	Question	No	Comment will remain open until the updated closure cost estimate has been reviewed. (Source Comment ID#37)	BW Gold submitted to EMLI for distribution to the MRC an update to its proposed RLCE on October 13th. BW Gold looks forward to continuing to discuss with CSFN and EMLI its RLCE through upcoming trilateral meetings (the next tentatively scheduled for Oct 31) to explain our rationale and cost basis for the RLCE and respond to any comments provided.		CSFN	BWG		Travis			TD, Oct 17	Ready for Publishing
470	Chapter 4: Reclamation and Closure Plan	Nature of Closure/Post-Closure Water Treatment	CSFN	Veneil Sundar, Manager, Process Engineer; BQE Water	Jun 02, 2022	1	New	Information Requirement	No	Was a Best Available Technology assessment carried out for water treatment in the Closure/Post-Closure phases? If not, such a study should be conducted in order to address water quality exceedances in Closure/Post-Closure. (Source Comment ID#38)	The assessment of best achievable technology for sulphate control (membrane WTP) was documented in a report titled "Sulphate Removal from Blackwater Tailings Storage Facility Supernatant and Seepage during Closure and Post-Closure" (BQE Water, 2017).		CSFN	BQE		V. Sundar	GM	Ready for Submission	GM; June 16	Ready for Publishing

471	Chapter 4: Reclamation and Closure Plan	Pre-Mine Land and Aquatic Ecosystem Capability	CSFN	Justin Straker, M.Sc, P.Ag Integral Ecology Group and Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Clarification	No	Pre-mine land capability was determined through Terrestrial Ecosystem Mapping prior to 2013. Clarification: Are 2013 Terrestrial Ecosystem Mapping observations of soil moisture and nutrient regimes representative of current conditions? (Source Comment ID#39)	Yes, 2013 TEM is representative of current conditions. The primary influences on soil moisture and nutrient regimes are (1) climate, (2) topography, and (3) soil properties (soil particle-size distribution, organic-matter and nutrient content). While climate continues to shift due to climate change, the baseline soil properties are expected to be relatively static. The temporal resolution of the climate models used to project ecosystem shifts with climate change in the ecohydrological modeling is not sufficient to quantitively compare 2013 with current conditions, but we expect climate change to have had limited effects on this ecosystem type (i.e.., BEC subzone variants and sites series) over this period.		CSFN	IEG		Justin Straker (IEG)	TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
472	Chapter 4: Reclamation and Closure Plan	Post-Mine Land Capability	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Clarification	No	The stated closure and end land use goals for the Project on lands and waters that are disturbed by mine activities are to reclaim ecosystems to achieve an average land and water capability in these areas not less than that existing prior to Project development. However, it is also stated that "Despite differences between pre-development and post-closure conditions, it is anticipated that ecosystems established on the post-mining landscape will provide value for intended land uses." An ecohydrological model was used to determine the reclaimed ecosystems that the post-mine landscape is most likely to support. Ecohydrology modeling relies on soil available water-storage capacity, organic-matter content, and bulk density in the upper metre of the soil profile. Results of the ecohydrological model indicate that the post-mine ecosystems and land capability will shift towards drier ecosystems compared to pre-mine conditions. Clarification: Will the post-mining landscape provide ecosystems to achieve an average land and water capability that is not less than that existing prior to Project development? (Source Comment ID#40)	BW Gold has acknowledged that there will be challenges for reclaiming target ecosystems (see Section 4.1.4 of Chapter 4, Reclamation and Closure Plan). This includes unfavourable post-mining soil characteristics affecting reclamation success and successional trajectories, including soil depth, texture, bulk density, moisture availability, nutrient contents and cycling capabilities, and erosion losses. Thus while the ultimate goal of the all reclamation will be to achieve a positive or equal ecosystem quality when compared to pre-mine capability (allowing for natural variation) there will be limitations and challenges. Therefore BW Gold has stated that the closure and end land use goals on lands and waters that have been disturbed by mine activities will be to"..reclaim ecosystems to achieve an average land and water capability in these areas not less than that existing prior to Project development." With this target it is expected that some ecosystems may be left better or worse as long as the average is not less than pre-development conditions. See also response to comment #853		CSFN	ERM		Rolf	RT	Ready for Submission		Ready for Publishing
473	Chapter 4: Reclamation and Closure Plan	Reclamation-Material Suitability and Salvage – Soil Sampling	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Clarification	No	Element concentration thresholds should be evaluated relative to ranges of natural variation in soils within the Project area as soil salvage samples are collected. In cases where baseline conditions exceed CCME parkland thresholds for soil and Contaminated Sites Regulation (BC CSR) soil standards (Schedule 3.1 of B.C. Reg. 375/96) for reverted wildlands, thresholds may need adjustment. Clarification: EMA has Technical Guidance for soil sampling Site Characterization and Confirmation Testing and protocols for Establishing Local Background Concentrations in Soil. Will these documents be used to characterize soil to ensure that it is suitable for reclamation and establishing background soil quality? (Source Comment ID#41)	As noted in Section 4.4 "Although some components or infrastructure associated with the mine site may not be subject to the BC CSR, the policies and technical guidance developed by BC ENV to support the CSR can still be used to guide site investigations and closure plans for the mine site." The EMA Technical Guidance Documents can be used for guidance but adjustments may be made (under the direction of a CSAP or other qualified professional) based on known baseline conditions. As discussed in Section 4.2.1.5: "Because baseline condition disturbance levels are low in the Project area, any elevated concentrations should be interpreted as reflecting natural mineralization of surface soils rather than contamination, and will not affect suitability ratings for reclamation."		CSFN	ERM		Rolf	RT	Ready for Submission	RT; June 27	Ready for Publishing
473	Chapter 4: Reclamation and Closure Plan	Reclamation-Material Suitability and Salvage – Soil Sampling	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Aug 11, 2022	2	Follow Up	Information Request	No	The Environmental Management Act includes protocol for establishing natural background concentration of elements in soil. Please provide additional rationale on why the Ministry of Environment and Climate Change Strategy protocols are not applicable to the proposed development. Please provide the scientific bases of the assumption that "any elevated concentration should be interpreted as reflecting natural mineralization." Furthermore, provide rationale on why potentially naturally localized mineralized soil that may be excavated from depths of greater than one metre would be suitable for wide-spread surface reclamation, regardless of the natural concentration of heavy metals. (Source Comment ID#41)	Section 4.4 describes the rationale for when the BC CSR is not applicable based on the absence of prior anthropogenic activities which could give rise to un-natural (not found in original background) sources of contamination. The BC CSR applies to soil where anthropogenic contamination is introduced. Section 4.4 notes that there is no record of spill or contamination from prior exploration activities, hence there is no need for sampling for potential contaminants of concern during baseline surveys. Sections 2.3.5.3, 2.3.5.4, and 2.3.5.5, describes the baseline soil surveys undertaken and the methods followed to determine soil suitability for reclamation, soil nutrient and soil metal analysis (Table 2.3-6) consistent with MCCS requirements, including BC CSR and CCME standards. Baseline elevated concentrations of metals in soils are assumed to reflect geological conditions, which may be influenced by underlying natural mineralization as the Blackwater Project area is underlain by geology which contains metallic mineral deposits. Interpreting the source of elevated metal concentrations in soils can be complex, requiring a full understanding of underlying geology, glacial history and surficial deposit transport, hydromorphic processes and post-glacial biogeochemical processes. BW Gold wishes to clarify the reviewers understanding that the Project intends to use salvaged overburden (OVB)(mineralized soil) for "wide-spread surface reclamation regardless of the natural concentration of heavy metals". As stated on page 2-35 of the Application, Preliminary suitability criteria for selection of OVB that is appropriate for use as a reclamation material include: "element concentrations that are below CCME thresholds for parkland soils (or alternate Project-specific criteria if elevated concentrations of surfaces soils are detected at baseline). All use of soil for reclamation is under the direction of a qualified professional and will conform to the approved Reclamation and Closure plan.		CSFN	ERM		Rolf		Ready for Submission	AT, Aug 11	Ready for Publishing
474	Chapter 4: Reclamation and Closure Plan	Reclamation-Material Suitability and Salvage – Particle Size Distribution	CSFN	Justin Straker, M.Sc, P.Ag Integral Ecology Group and Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Ecohydrology modeling relies on available water-storage capacity based on particle-size distribution, organic-matter content, and bulk density in the upper metre (m) of soil. Laboratory baseline testing of particle-size distribution, organic-matter content, and bulk density could not be located in the submission. Information Request: How many soil samples were analyzed for particle-size distribution (PSD), organic-matter content, and bulk density was completed during the baseline assessment? (Source Comment ID#42)	Overburden: 16 samples were analyzed for PSD. Surface soil: 46 samples were analyzed for OM. PSD was based on field estimates of coarse fragment content and hand texturing. Supplemental nutrient data from the BC Soil Survey were used. No laboratory data for bulk density were available from the baseline assessment Data inputs for ecohydrological modeling are described in Section 3.1 of Appendix E-E (Detailed Post-closure Mapping Methodology).		CSFN	IEG		Justin	AT	Ready for Submission	TD, Jun 27	Ready for Publishing
474	Chapter 4: Reclamation and Closure Plan	Reclamation-Material Suitability and Salvage – Particle Size Distribution	CSFN	Justin Straker, M.Sc, P.Ag Integral Ecology Group and Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Aug 11, 2022	2	Follow Up	Clarification	No	The primary inputs to a quantitative ecohydrological analysis model are PSD, OM content, soil depth, and topographical data, as well as layering arrangements within the soil profile. It is unfortunate that no grain sized distribution analysis (i.e., sieve grain size and hydrometer laboratory analysis) for the surface soil was completed for one of the primary input parameters to the quantitative ecohydrological analysis model. Please clarify why this was not completed. (Source Comment ID#42)	BW Gold acknowledges that the lack of laboratory analysis for PSD is a shortcoming. The need for detailed PSD data beyond soil texture and coarse-fragment content was not known at the time of the baseline surveys. BW Gold plans to collect this information during the sampling programs for soil salvage and stockpiling (Section 4.2.6.1, Reclamation Material Monitoring during Salvage and Stockpiling) and following construction of reclamation covers (Section 4.2.6.2, Permanent Sample Plots). These data will be used in updates to the QEA model to refine post-closure ecosystem projections.		CSFN	IEG		Justin		Ready for Submission	TD; Aug 15	Ready for Publishing

475	Chapter 4: Reclamation and Closure Plan	Reclamation-Material Suitability and Salvage – Baseline Testing	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Clarification	No	It appears that relative soil moisture and nutrient regimes were based on field data descriptions from 2013 and professional experience. Laboratory baseline testing of soil moisture and nutrient content could not be located in the submission documents. Clarification: Were any soil samples submitted for laboratory analyses of moisture or nutrient content during the baseline assessment? (Source Comment ID#43)	Thank you for noting this contradiction. The text will be updated to clarify that soil moisture and nutrient regimes were in fact based on field data descriptions (based on the Field Manual for Describing Terrestrial Ecosystems (BC MOF and BC MOE, 1998)). BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		CSFN	ERM		sent to Valerie	RT	Ready for Submission	RT; June 27	Ready for Publishing
476	Chapter 4: Reclamation and Closure Plan	Contaminated Sites and Human Health and Ecological Risk Assessment – Certificate of Compliance	CSFN	Lesley Shelley, Ph.D., R.P.Bio, Entia Environmental Consultants	Jun 02, 2022	1	New	Clarification	No	By the end of the Closure and Reclamation phase, it is stated that "any areas of environmental concern are expected to be addressed through remediation and/or risk assessment to ensure that biological receptors are protected from the potential for adverse effects in the long term and that end land use objectives can be met." Clarification: Will a Certificate of Compliance under the Environmental Management Act be obtained once all areas of environmental concern are remediated? (Source Comment ID#44)	BW Gold is committed to ensuring that any areas of environmental concern are reclaimed or remediated to ensure that biological receptors are protected from the potential for adverse effects and end land use objectives are met, whether or not a Certificate of Compliance is sought (e.g., to address legal liability or site redevelopment). Based on the current mine plan, the Closure phase is many years away and it is likely that the process and legal framework for completing reclamation or remediation under either the Environmental Management Act or Mines Act will evolve and a Certificate of Compliance may or may not be required in the future. Given the potential for change in process or regulatory frameworks, BW Gold has not determined at this time whether a Certificate of Compliance would be sought once closure and reclamation is complete. BW Gold is committed to following the legal frameworks, standards, and processes that are current at the time of Closure phase.		CSFN	Entia		Lesley	RT	Ready for Submission	RT; June 19	Ready for Publishing
477	Chapter 4: Reclamation and Closure Plan	Contaminated Sites and Human Health and Ecological Risk Assessment – Site Investigati	CSFN	Lesley Shelley, Ph.D., R.P.Bio, Entia Environmental Consultants	Jun 02, 2022	1	New	Clarification	No	During the closure phase, a site investigation (Stage 1 preliminary site investigation and if necessary, Stage 2 detailed site investigation; BC ENV 2016a, 2016b) will be completed to identify any areas of environmental concern where concentrations of parameters are greater than the standards prescribed under the BC CSR (BC ENV 2009). The BC Contaminated Sites Regulation was last amended July 7, 2021, by B.C. Reg. 179/2021. Clarification: Please confirm whether a site investigation will be completed to identify any areas of environmental concern where concentrations of parameters are greater than the current CSR standards. (Source Comment ID#45)	BW Gold confirms that a site investigation will be completed to identify any areas of environmental concern where concentrations of parameters are greater than BC CSR standards. The BC CSR standards (B.C. Reg. 375/96, as amended from time to time) that are current at the time of the site investigation would be used as the numerical standards against which parameter concentrations would be compared.		CSFN	Entia		Lesley	RT	Ready for Submission	RT; June 19	Ready for Publishing
478	Chapter 4: Reclamation and Closure Plan	Contaminated Materials – Sample Collection	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Clarification	No	It is stated that "soil samples will be collected and tested by a qualified professional at locations where fuel and chemicals were handled extensively during construction and operation." Clarification: Will groundwater and soil vapour samples also be collected and analyzed from locations where fuel and chemicals were handled extensively during construction and operation? (Source Comment ID#46)	Groundwater (where present) samples will also be co-collected along with soil and soil vapour samples from locations where fuel and chemicals were handled extensively and results compared to the BC CS Regulations for management level decision making and potential excavation and treatment/removal.		CSFN	ERM		Rolf	RT	Ready for Submission	TD, Jun 23	Ready for Publishing
479	Chapter 4: Reclamation and Closure Plan	Contaminated Materials – Core and Non-Core Mine Components	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Clarification	No	Contaminated site remediation requirements for mining projects in British Columbia focus on "non-core" mine components (Part 5. Remediation of Mineral Exploration Sites and Mines, Chapter 53, Environmental Management Act [2003]). Non-core Project components include, but may not be limited to, the Maintenance/Truck Shop, storage facilities (including the Bulk Fuel and Ready Line), camps, and the Processing Plant. A remediation order under section 48 (remediation orders) of EMA in relation to the remediation of a core area of a producing or past producing mine may be issued if requested to do so by the Chief Inspector of Mines under the Mines Act. Clarification: Will both Core and Non-core area of the property be remediated in accordance with Environmental Management Act (2003)? (Source Comment ID#47)	Please refer to section 4.4 for a discussion of site-wide remediation requirements: "Once mining operations end and before the Project can be considered closed, any areas of known or suspected contamination need to be identified and remediated, removed, or otherwise resolved (e.g., through human health and ecological risk assessment). Although some components or infrastructure associated with the mine site may not be subject to the BC CSR, the policies and technical guidance developed by BC ENV to support the CSR can still be used to guide site investigations and closure plans for the mine site. The overall objective is to ensure that end land use objectives are met and there are no areas of environmental concern or parameters of concern (POC) that could pose a risk to human or ecological receptors in the long term"		CSFN	ERM		Rolf	RT	Ready for Submission	RT; June 27	Ready for Publishing

480	Chapter 4: Reclamation and Closure Plan	Topsoil Stockpiles and Its Use in TSF Closure and Remediation	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Recommendation	No	Table 4.2-4 provides a reclamation materials balance showing quantities of glaciofluvial surface soil, mixed-mineral surface soil, and organic surface soil. While it is noted in several places in Chapter 3 and Chapter 4 that the salvage of reclamation media at the site would follow a focused salvage plan, the portion of the tailings beach that could be covered with materials stored in Topsoil Stockpiles should be indicated. Also, for clarity and consistency, it would be helpful to indicate clearly in Table 4.2-2 which stockpiles will be used to source glaciofluvial parent material and mixed parent materials (both material types listed as surface soil). Recommendation: Update Table 4.2-2 to indicate which stockpiles will source "surface soil" reclamation materials indicated. While it is understood that exact quantities of each material type will be confirmed by later site investigations, a high-level quantitative assessment showing how currently estimated quantities of different types of salvage material stored in the various topsoil stockpiles will be used should be provided to support the reclamation and closure plans provided in Section 4. (Source Comment ID#48)	A future iteration of the Reclamation and Closure Plan will be updated to illustrate which stockpiles are anticipated to store surficial soil, with allowance for variation based on future site investigations. 481	Chapter 4: Reclamation and Closure Plan	Topsoil Stockpiles and Its Use in TSF Closure and Remediation	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Recommendation	No	Table 4.2-4 provides a reclamation materials balance showing quantities of glaciofluvial surface soil, mixed-mineral surface soil, and organic surface soil. While it is noted in several places in Chapter 3 and Chapter 4 that the salvage of reclamation media at the site would follow a focused salvage plan, the portion of the tailings beach that could be covered with materials stored in Topsoil Stockpiles should be indicated. Also, for clarity and consistency, it would be helpful to indicate clearly in Table 4.2-2 which stockpiles will be used to source glaciofluvial parent material and mixed parent materials (both material types listed as surface soil). Recommendation: Provide calculation to confirm that there will be adequate volumes of surface soil	A future iteration of the Reclamation and Closure Plan will show materials stored in each stockpile. The data and approach that confirm adequate volumes of surface soil materials are presented in Section 4.2.1.4 and Table 4.2-4. These are based on volume calculations (area x depth) for each polygon in which soil is salvaged (supply) and placed (demand), and thus cannot be easily summarized in a calculation. However, additional detail is presented in Table 4.2-3 and the Soil Management Plan, Appendix 9-B.		CSFN	ERM	KP	Rolf	RT	Ready for Submission	RT; June 27	Ready for Publishing
482	Chapter 4: Reclamation and Closure Plan	Topsoil Stockpiles and Its Use in TSF Closure and Remediation	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Recommendation	No	[Please see comment #48 in the source doc for additional context] Recommendation: Provide calculation to confirm that there will be adequate volumes of surface soil materials to place the full cover described in Chapter 4. Note also that an analysis should be completed to see if the tailings beach cover could truly be designed in a way that could potentially reduce the need for site water treatment post closure. (Source Comment ID#49)	A future iteration of the Reclamation and Closure Plan will show materials stored in each stockpile. The data and approach that confirm adequate volumes of surface soil materials are presented in Section 4.2.1.4 and Table 4.2-4. These are based on volume calculations (area x depth) for each polygon in which soil is salvaged (supply) and placed (demand), and thus cannot be easily summarized in a calculation. However, additional detail is presented in Table 4.2-3 and the Soil Management Plan, Appendix 9-B.		CSFN	ERM		Rolf	RT	Ready for Submission	RT; June 27	Ready for Publishing
483	Chapter 4: Reclamation and Closure Plan	Salvage and Preservation of Overburden Materials	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Recommendation	No	In this project, overburden (OVB) is described in Chapter 4 as "unconsolidated soil and non-soil surficial materials that underly surface soils and occur at depths greater than 0.5m below the interface between organic and mineral soil horizons." Overburden materials that are proposed to be used as cover for above water tailings beaches will be sourced from the Lower Waste Stockpile. The Application also notes that most OVB will be stripped during development of the Open Pit and placed in its storage location as specified in a soil salvage plan that will be developed. While it is understood that there are intentions to carefully sort and place reclamation media in their respective stockpiles so that those materials can be used for their intended purpose, the potential for OVB to become buried by waste rock seems significant since most of these materials will be salvaged early in the mine's development. Recommendation: The salvage plan should indicate measures that will be taken to ensure that reclamation media stockpiles are preserved and that materials that are being relied on for site reclamation do not become buried or otherwise sterilized or stranded. (Source Comment ID#50)	The Soil Management Plan (Appendix 9-B) details overburden salvage and reclamation material stockpiling. Stockpiling best management practices (see Section 10.4 of Appendix 9-B) are listed and state 'Clearly mark stockpile locations and reclamation material types and ensure that personnel are aware of their presence to prevent inadvertent contamination, burial, or removal.'		CSFN	ERM		Rolf - Peter	RT	Ready for Submission	RT: June 26	Ready for Publishing
484	Chapter 4: Reclamation and Closure Plan	Reclamation and Closure of Above Water Beaches in TSFs – Cover Materials	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Recommendation	No	Section 4.7.4 of Chapter 4 of the Application describes the closure prescription that will be applied to above water tailings beaches as being comprised of: 1) subaerial slurry deposition of approximately 30 cm of a combination of NAG waste rock and OVB; 2) placement of a growth medium cover of OVB that is approximately 70 cm thick; and 3) placement of 30 cm of mixed-plant-material that will be "placed by truck and dozer, dumped, and spread" over the surface. Given the broad range of materials that may be classified as OVB, the fact that not all OVB materials readily lend themselves to being blended with NAG and deposited via slurry, or for use as growth media, the general assessment that a "surplus" of OVB materials will exist, and further that these materials will be placed in the Lower Waste Stockpile, a clear path showing how required quantities of the various material types required to implement this reclamation prescription has not been demonstrated. Section 4.7.4 goes on to indicate that this cover would only be placed if the TSF beach is trafficable by heavy equipment, or that the application of soil on tailings beach surfaces could potentially foul a membrane WTP. While it is true that both of these conditions could theoretically exist and that further testing (reclamation, geochemical, and cover design) are required, this reviewer notes that their existence would suggest in one instance that proper tailings deposition practices were not followed (in the instance of a non-trafficable above water beach), and failure to adequately design and install a cover system that would actually enhance overall management of water quality associated with the TSFs (in the case of potentially fouling a membrane WTP). Consequently, it is recommended that the OMS manuals that will be developed for TSF C and TSF D ensure that proper tailings deposition practices are followed that would enable reclamation of above water beaches as indicated in Figure 4.2-1. In other words, contrary	The OMS manual that will be developed for the TSF will discuss recommended tailings deposition practices to achieve the operating objectives for the facility. The OMS manual will speak to the need to regularly review and adjust tailings deposition practices, as the facility shifts towards the end of its operating life, and the Closure phase approaches. The intent of making this connection in the OMS manual is to highlight that planning is needed in order to achieve the closure objectives for the TSF, in particular to have above-water tailings beaches that are developed so that they can have a cover applied and reclaimed per the closure design (Figure 4.2-1). Figure 4.2-2 provides the locations of the surficial soil salvage areas and Table 4.2-4 provides the reclamation-materials volumes (by reclamation material). The locations and volumes of the reclamation materials required to implement the proposed cover of above water tailings beaches will be clearly specified in future updates of the RCP. The RCP is required to be updated each 5 years under the MA permit, so volumes and types of these materials will be updated as well to reflect the actual stockpiles materials, and any revisions to the closure concept, and thus potential changes to the needs of said stockpiled materials. Any salvage plan related to the storage and preservation of reclamation media will demonstrate how required quantities of each material type will be preserved and remain accessible for verification of quantity and quality throughout the mine life. Further information can be found in the Appendix 9-B Soil Management Plan.		CSFN	ERM		Rolf	RT	Ready for Submission	RT: June 28	Ready for Publishing
485	Chapter 4: Reclamation and Closure Plan	Reclamation and Closure of Above Water Beaches in TSFs – OMS	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The OMS documents that will be developed for each TSF should specify not only how above water tailings beaches will be sustained but also how their progressive development into the desired closure configuration will be monitored and assessed over the mine's life. (Source Comment ID#52)	Monitoring and operational requirements related to the TSF are summarized in Section 9 of Appendix 3-K of the Application. Preliminary QPOs related to the initial construction and operations of TSF C with the goal of managing freeboard, facility capacity, and embankment stability were developed. Final QPOs will be established after construction and summarized in the Operations, Maintenance and Surveillance (OMS) Manual. QPOs are selected to enable a high-level comparative assessment with the performance objectives for the TSF and must be reviewed annually and revised as required along with the OMS Manual to remain current during on-going construction of the TSF. The OMS Manual will incorporate requirements for TSF D once it is constructed.		CSFN	KP		Dan	AT/KP	Ready for Submission	KP, June 25	Ready for Publishing

486	Chapter 4: Reclamation and Closure Plan	Reclamation and Closure of Above Water Beaches in TSFs – Cover Design Assessment	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Planning for post closure water quality should include assessment of the impact and potential considerations associated with a designed cover comprised of the materials proposed in Section 4.7.4. This assessment should demonstrate effective collaboration and interfacing between a B.C. registered P.Eng specializing in tailings cover design and a B.C. registered P. Geo, specializing in the assessment of long-term water quality of mine wastes with and without an engineered cover. Specifications about how exposed above water tailings could be reclaimed while not undermining function of a membrane WTP should also be developed. (Source Comment ID#53)	The WTP has a circuit for metals and TSS removal upstream of the membrane unit for protection against fouling. Furthermore, BW Gold will be dosing antiscalant to mitigate fouling on the membrane. Some fouling is expected over time, and for that BW Gold will be performing regular CIP cleans to maintain performance. 487	Chapter 4: Reclamation and Closure Plan	Maintaining and Re-establishing Pit Stratification	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	The Application must detail the management plans to allow for reliance on pit stratification being achieved. Should pit filling occur before or following full mine buildout, discharges into the pit must be engineered at depth or in such a way that promotes stratification to occur. Closure commitments must be defined that require BW Gold to maintain stratification to the extent possible and re-establish stratification if it is lost. A mitigation plan and effects assessment are required in case water quality impacts are significant to Davidson Creek from pit discharge in the case of early or premature closure. Recommendation: Please include in the Application an assessment of the case of early closure and the stratification assumption, as the depth of the pit may not allow for stratification to develop. A mitigation plan and effects assessment are required in case water quality impacts are significant to Davidson Creek from pit discharge in the case of early or premature closure (Source Comment ID#54)	Please refer to Comment response #411.		CSFN	Lorax	ERM/KP		GM	Ready for Submission	TD, Jun 28	Ready for Publishing
487	Chapter 4: Reclamation and Closure Plan	Maintaining and Re-establishing Pit Stratification	CSFN - F. Mohamm	Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Information Request	No	The two-cell pit lake water balance/water quality model update memo dated July 14, 2022 describes how permanent water column stratification (meromixis) is anticipated to occur within the pit lake during the Project post closure phase. However, as depicted in Figures 1 and 2 of the update memo, the pit lake will only contain brine after recycling it from the membrane water treatment plant after ~100 years of post closure. Yet, water treatment from all the contributing sources must continue, except the brine reporting back to the WTP from the pit lake will be of significantly worse quality. It is unclear what the plan is afterwards and whether managing the water in the proposed fashion for almost a century will leave options for management and treatment required in perpetuity. Beyond stating that 100 years is a long time and plans can be made, no other plans are provided for water management. This makes it impossible to define the appropriate and necessary Closure and Post Closure commitments. Information Request: Please describe what, if any, plans exist that ensure negative environmental impacts of the storing water in the pit are mitigated and monitored effectively throughout the entire LOM. After 100 years, the pit lake will be full of brine with no room for storage. It is not clear what plans BW Gold is referring to that can be developed in 100 years, but not now, such that the management of water is clear and there are minimum uncertainties for how the contaminated water will be managed in perpetuity to minimize environmental impact. See comment #57 (ITT ID 490) for more commentary on this topic.	In response to Round 3 Comment 411(c), a work plan is under development that will support alternate long-term mitigation strategies for pit lake water quality. This plan will be provided to reviewers once available and is anticipated to address the information request by the reviewer in this comment. In the interim, the membrane WTP vendor has conducted additional work to evaluate treatment capacity for sulfate in the Post-Closure phase after the entire pit volume is composed of brine. The preliminary results of this work suggest the treatment plant could continue to treat sulfate in the "brine lake" for an additional 300 years until the treatment efficiency is no longer feasible. Sulfate was selected for this analysis as a key limiting parameter This analysis will be considered within the plan submitted in response to Round 3 Comment 411(c) amongst other mitigation strategies identified by BW Gold. For the information Request, BWG acknowledges the Request and will provide a memo addressing the Request. 487	Chapter 4: Reclamation and Closure Plan	Maintaining and Re-establishing Pit Stratification	CSFN - F. Mohamm	Lorax Environmental Services Ltd.	Dec 12, 2022	4	Follow Up	Recommendation	No	To be addressed through ITT ID 490	Please refer to the forthcoming response that will be provided for Round 4 Comment 490.		CSFN	Lorax						
487	Chapter 4: Reclamation and Closure Plan	Maintaining and Re-establishing Pit Stratification	CSFN - F. Mohamm	Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommendation	No	While the work completed by BQE Water demonstrates that the deteriorating water quality in the pit 300 years into the Post Closure phase will not result in exceedances against MDMER/BCWQG, as assumed for the exercise, the water quality in the pit lake keeps getting worse over time and so the treated water quality and the WQG are expected to be exceeded at some point in the future although not clear exactly when. CSFNs communicated previously in comment ITT ID 490 that this approach is unacceptable. MMO Reclamation Security Policy describes the overarching objective of mine reclamation is to return disturbed land to a state that achieves the desired end land use goals and a state of physical and geochemical stability, a self-sustaining state. Moreover, BW Gold committed to equilibrium modelling and stratified pit lake with a freshwater lens during the EA. The expectations are always that a mine design, planning, and reclamation ensure that dependence on active water management and treatment is reduced over time. The proposed water management strategy for the Post Closure phase (V13e) results in progressive deterioration of the pit water quality with ever increasing demand and risk of water treatment in perpetuity. CSFN strongly recommends WB/WQ models are updated to achieve the state of equilibrium and water management strategies are revised to focus on mitigation measures rather than treatment in perpetuity to address the lack of stratification in the pit lake and management of brine to avoid deteriorating pit lake water quality. This is regardless of the timeframe proposed for duration of Post Closure. Although WTP effluent is shown to meet MDMER/BCWQG in the receiving environment, the treatment objectives for the water treatment plant must be set based on the maximum capacity of the downstream receiving environment. Specifically for sulphate, the most stringent treatment targets appear to be required to meet the Class 1 standards in the Nechako Reservoir. As such, it is recommended that these limits are identified and if different from MDMER/BCWQG, considered in WQ models and water treatment requirements. From a fundamental perspective, the accumulation of sulphate in the pit lake is due to the presence of sodium ions because sulphate is balanced by calcium caps at gypsum solubility in the brine and as such can be removed from the overall system as solid gypsum during brine treatment. Considering that the predominant source of sodium at the site is from chemical reagents used during mining and processing, continuing contributions of sodium loading to the water quality are expected to decline over time. It is counterintuitive that the V13e modelling results show continually increasing sulphate and sodium concentrations in the pit lake	The reviewer's comment and recommendations are acknowledged. In response to Round 3 Comment 411(c), a Work Plan has been submitted by BW Gold to reviewers to derive alternate long-term mitigation strategies for pit lake water quality with the overarching goal of ultimately reducing the Project's reliance on long-term active treatment. It is anticipated that analyses proposed as part of the Work Plan will address several of the reviewer's concerns noted in this comment. The request to extend the model timeline to equilibrium (steady-state) conditions is noted and will be incorporated as applicable in Work Plan modelling exercises. The primary source of ammonia release in post closure originates from TSF seepage. This ammonia is sourced primarily from reagent usage, and concentrations will decline in the long term as this load is rinsed out of the TSF. However, significant reductions of ammonia in seepage concentrations due to flushing will require an extended period of time, owing to the modest seepage rates (2 Mm3/year) and large volume (180 Mm3) of pore water contained within the interior of the TSF. Within the saturated pore space of the TSF, ammonia is expected to remain relatively stable. The sub-oxic conditions will promote ammonia stability and biological uptake would be limited to anaerobic bacteria consuming residual organic carbon present in the interior of the TSF. Ammonia released as TSF seepage will be concentrated as brine and discharged to the bottom waters of a meromictic pit lake. Within the pit lake a portion of the ammonia may be oxidized or consumed by biological uptake. The degree of ammonia oxidation and biological uptake within the pit lake bottom waters would depend on the turbidity and depth of the surface water layer which will vary over time, as well as nutrient (i.e., phosphorous) availability. For these reasons, ammonia is assumed to remain stable as a model conservatism. Work Plan reference: Lorax Environmental Services Ltd. (Lorax). 2022. 488	Chapter 4: Reclamation and Closure Plan	Contingency Plans for Water Treatment in Closure/Post-closure	CSFN	Veneil Sundar, Manager, Process Engineer; BQE Water	Jun 02, 2022	1	New	Recommendation	No	Water treatment is a crucial aspect of Closure and Post-closure reclamation and requires contingency planning to ensure success. The Application must include contingency planning for these periods to lower the risk of treatment failure/shutdown and non-compliance. These plans and measures can include duplicate installation of critical systems as well as maintaining an inventory of spare parts. Similarly, increasing the plant capacity to treat more water creates an offset for when no water can be treated if the plant is shut down. Recommendation: Please include in the Application detailed contingency plans for water treatment in Closure/Post-closure. (Source Comment ID#55)	Detailed contingency planning for water treatment failure/shutdown and non-compliance for the Closure and Post-closure phases is beyond the scope of the joint application. Despite this, the following contingencies could be implemented if the WTP is shut down/fails: •Leave a nominal volume of water in the ECD. The ECD pond will be managed with a minimum volume of water in the pond. Water can accumulate in storage for short periods if required. The available storage in the ECD pond is 194,000 m3. •Direct water to the pit lake. More than 50 Mm3 storage capacity exists in the open pit above the Post-Closure target pit lake elevation as a result of maintaining the pit lake as a groundwater sink in Post-Closure. BW Gold will also evaluate the possibility of warehousing critical spare equipment parts locally as the mine moved from Operations into Closure and Post-closure. These same contingencies could be implemented in the event that off-spec water is produced by the WTP (i.e..., non-compliances).		CSFN	BQE		V. Sundar	GM	Ready for Submission	RT; June 29	Ready for Publishing
488	Chapter 4: Reclamation and Closure Plan	Contingency Plans for Water Treatment in Closure/Post-closure	CSFN - F. Mohamm	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	Thank you for the response. To resolve this comment, please include a discussion of these contingencies and the focus on local resources for Closure/Post Closure in the Application. (Source Comment ID#55)	Detailed contingency planning for water treatment failure/shutdown and non-compliance for the Closure and Post-closure phases is beyond the scope of the joint application. Despite this, the following contingencies could be implemented if the WTP is shut down/fails: • Leave a nominal volume of water in the ECD. The ECD pond will be managed with a minimum volume of water in the pond. Water can accumulate in storage for short periods if required. The available storage in the ECD pond is 194,000 m3. • Direct water to the pit lake. More than 50 Mm3 storage capacity exists in the open pit above the Post-Closure target pit lake elevation as a result of maintaining the pit lake as a groundwater sink in Post-Closure. BW Gold will also evaluate the possibility of warehousing critical spare equipment parts locally as the mine moved from Operations into Closure and Post-closure. These same contingencies could be implemented in the event that off-spec water is produced by the WTP (i.e..., non-compliances). 490	Chapter 4: Reclamation and Closure Plan	Water Quality Exceedances in Closure and Post-closure	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	According to the Reclamation and Closure Cost Estimate (RCCE) the project components that are active in the Closure phase for the Year +23 LoM do not include water treatment. However, water quality in the receiving environment during the closure phase exceeds BCWQG frequently. Moreover, and despite the operation of the membrane WTP in Post-closure, water quality exceedances occur frequently during this phase as well. These exceedances must be addressed, which would necessitate the implementation and operation of additional mitigation and treatment measures. None of this information is available now and as such the RCCE provided inherently provides a gross underestimation. Recommendation: Please describe how these exceedances will be addressed including additional mitigation and treatment measures that might be necessary to implement. These costs must be accounted for in the RCCE. (Source Comment ID#57)	Version 12b water quality model results (as presented in the Application) were computed on October 26, 2021. Since that time, BW Gold Ltd. and their consultants have revised the site-wide water balance model and the site-wide water quality model with a focus on mitigating Project changes for the Closure and Post-Closure phases. Updated water quality predictions that reflected optimized water management and quality were presented to EMLI, ENV and First Nations on June 15, 2022, and are summarized in Lorax (2022), as part of BW Gold Ltd. (2022). Those documents demonstrate Project-influenced parameters that were previously predicted to exceed their BC WQGs in Closure and Post-Closure (Application version 12b) are no longer predicted to exceed BC WQGs. Please refer to BW Gold Ltd. (2022) for further information, including optimized water management proposed for the Closure and Post Closure phases to mitigate previously-predicted BC WQG exceedances in the receiving environment. References: BW Gold Ltd. 2022. Revised Base Case Closure and Post-Closure WQ Predictions. Prepared for ENV and EMLI. June 30, 2022. 490	Chapter 4: Reclamation and Closure Plan	Water Quality Exceedances in Closure and Post-closure	CSFN - F. Mohamm	Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Recommendation/Information Request	No	See 220822 Source Round 2 Detailed Comments on the Revised Blackwater Major Works Application (Batch 2C) Recommendation: BW Gold should revisit the WQ/WBM and extend the modeling timeframe to the point when equilibrium conditions are reached in the pit lake. If the duration to equilibrium is many decades, it is recommended that additional mitigations or alternative methods of treating/handling brine are integrated into the project so that water treatment demands do not continually escalate over time. Information Request: The updated WQ/WB model indicates that levels of ammonia in the pit are expected to increase significantly over time, reaching >10 mg/L N after 100 years. This seems counterintuitive, as ammonia addition to the water balance should cease when blasting/cyanide is no longer used at site and ammonia degrades over time from sunlight and biological activity. Was ammonia degradation in the pit modeled similar to how it was modeled in the TSF? (Source Comment ID#57)	The comment presents one Recommendation and one Information Request. A response to each is presented below. For the Recommendation: In response to Round 3 Comment 411(c), a work plan is under development that will support alternate long-term mitigation strategies for pit lake water quality. This plan will be provided to reviewers once available and is anticipated to address the recommendation provided in this comment. It is anticipated this plan will identify additional WB/WQM scenarios that will be extended until pit equilibrium conditions are reached, as appropropriate. For the Information Request: Ammonia and other nitrogen species were treated conservatively in the model outside of the TSF C and TSF D ponds. The primary source of NH3 in Post Closure originates from TSF seepage, which is then concentrated into the brine being discharged into the mine pit. Ammonia within the interior of the TSF is expected to be relatively stable, with minimal decay over time. This reservoir will gradually be rinsed out of the facility, which is not considered in the tailings seepage source term predictions which use constant ammonia concentrations over time. Ammonia disposed in the pit lake will degrade through oxidation and biological uptake. These reactions were not incorporated into the WQM as a model conservatism		CSFN	Lorax				Ready for Submission	GM; Sept 15	Ready for Publishing
490	Chapter 4: Reclamation and Closure Plan	Water Quality Exceedances in Closure and Post-closure	CSFN - F. Mohamm	Lorax Environmental Services Ltd.	Oct 10, 2022	3	Follow Up	Information Request	No	BW's response to our recommendation for alternate long-term mitigation strategies for management of pit lake water quality is acknowledged. CSFNs look forward to reviewing BW Gold's workplan and expect that the alternate strategies will result in significantly reduced environmental concerns and liabilities and more importantly not in perpetuity. This comment remains open until receiving and reviewing the outcomes of BW Gold's workplan. With respect to modelling assumptions for ammonia sources and sinks and thus concentration in the pit, is there evidence to support ammonia from TSF will last longer than the duration of the modelling work? This same concern must be crucially addressed for sodium and consequently the rising sulphate concentrations in the pit lake. It is understood that conservatism is a necessity for all models, but the assumption of unlimited sources for ammonia and sodium is simply a false assumption rather than a degree of conservatism. Such an assumption may not necessarily result in false predictions in other cases, but could in the case of the Blackwater project where the limited capacity of the receiving environment and the nature of the water treatment process together result in a significant proportion of the contaminants remaining within the battery limits of the mine. Therefore, if contaminants are assumed to be introduced into the balance in perpetuity, the concentrations are naturally expected to rise. It is crucial to CSFNs' rights and interests to understand and evaluate actual concerns rather than artifacts of modeling work. Information request: Please share with CSFNs, for review and comment, the workplan referred to in this response as being in development for alternate long-term mitigation strategies for the management of pit lake water quality. Information Request: All assumptions built into the WQ modelling work must be carefully reviewed and if possible, verified through analogue site information before updating the WQ models, evaluating additional scenarios, and especially devising alternative management strategies. This specifically includes sources and sinks for sodium and nitrogen species. (Source Comment ID#57)	Regarding the first Information Request, BW Gold Ltd. provided the Review Comment 411c Work Plan to MMO on October 10, 2022, for distribution to the Mine Review Committee. For reference, the full Work Plan reference is included at the end of this response. Assumptions built into the model will be routinely updated and evaluated as model updates occur. In general, it is not possible to evaluate all assumptions against an analogue. All source terms, water inputs, and general model assumptions are based on site-specific empirical data where possible, for which analogues may not be available or appropriate. Analogue mine data from a number of mines is incorporated into the geochemical source terms and water quality predictions (Section 2.9 of Geochemical Source Term Report). This data was used to support degradation of nitrogen species in the TSF pond (Section 3.7 of the Geochemical Source Term Report), which included T-CN and WAD-CN losses, cyanate conversion to ammonia, and subsequent ammonia decay. Outside of the TSF pond ammonia was assumed to behave conservatively, the rational for which is described in the R3 Comment 487 response. As noted in the R3 Comment 487 response, the Work Plan submitted in response to Review Comment 411c (Lorax 2022) will evaluate alternative management strategies, particularly in the Post-Closure phase. Lorax Environmental Services Ltd. (Lorax). 2022. Technical Memorandum: Response to Round 3 Comment 411(c). Prepared for BW Gold Ltd. October 10, 2022. File ID: R3_EMLI Comment ID 411c.pdf		CSFN	Lorax				28-Oct-22	GM; Nov 1	Ready for Publishing
490	Chapter 4: Reclamation and Closure Plan	Water Quality Exceedances in Closure and Post-closure	CSFN - F. Mohamm, P.Littlejohn	Lorax Environmental Services Ltd.	Dec 12, 2022	4	Follow Up	Information Request	No	The overarching assumption made in the existing Workplan is that it is ok to advance without a reasonable solution at sight. The ever-increasing concentration of contaminants and TDS in the pit is a significant concern to the environment and the Nations and must be resolved through a technically feasible solution, irrespective of costs and implementation/operation challenges before a permit can be issued and a Workplan commenced. Specifically, the first near term activity currently listed in the Workplan must be completed as a pre-requisite to the Workplan, which is to "identify if there is a preferred alternative treatment option for post-closure (excluding reverse osmosis or nano-filtration)". The main concern here is that if the answer to this question is "No" and a technical solution cannot be devised, it is not clear how the long-term risks to the environment and the Nations can be mitigated/managed. Permit conditions and other activities stated in the Workplan can be implemented based on Project requirements and priorities to ensure the best solution can be implemented in a cost-effective manner but a solution to this issue must be identified as early as possible. Considering the water quality predictions, one potentially feasible solution to the long-term concentration of contaminants and TDS in the pit could be to increase water treatment capacity as required and pair with existing metals/gypsum removal to maintain a steady concentration of contaminants in the pit that must be back calculated based on the capacity of the receiving environment. This option along with any other potentially feasible solutions that BW Gold can envisage	BWG has been informed that the comment is being re-written		CSFN	Lorax				TBD		

490	Chapter 4: Reclamation and Closure Plan	Water Quality Exceedances in Closure and Post-closure	CSFN - F. Mohamm, P.Littlejohn	Lorax Environmental Services Ltd.	Jan 12, 2022	5	Follow Up	Recommended Permit Condition	Yes	Thank you for the additional work and information provided in BQE's memo of Nov 22, 2022 in response to ENV information request and our meeting on December 19, 2022. BQE estimates that if SO4 and N are assumed to have finite quantities, TSF seepage quality will improve, to a degree that membrane treatment for sulphate will no longer be required, at around 176 years in post closure (it is understood, the exact timing of this occurrence is difficult to estimate). The reduced sulphate loads combined with the dilution from the plunge pool are expected to achieve compliance for sulphate. Therefore, it is acknowledged that effluent quality will eventually meet treatment targets, without membrane treatment after an estimated 176-year period. It is also understood that treatment for metals removal will likely continue in perpetuity due to the ongoing pit wall source term., Additionally, pit discharge quality is expected to rely heavily on precipitation regardless of the relative sizes of the catchment areas. This will need to be carefully evaluated by updating the WQM to include best estimate assumptions for sources/sinks a key step in de-risking the project. However, CSFNs remain concerned that the water quality liability has not been adequately addressed. The proposed effluent quality management approach in post-closure still relies on storage of the contaminant salts in the pit for many decades, if not centuries, and requires long term operation of the membrane water treatment plant. Operating the membrane treatment plant for a period of 200 years is a costly and potentially, increasingly complex process. As such, removal of the contaminant salts must be prioritized and evaluated in the near term, for potential implementation early in the project life. Salt precipitation methods that may be perceived unfeasible or costly could become the preferred choice of treatment if applied early in the project life to avoid decades of costly membrane treatment during post-closure. This is in addition to brine volume management activities that although important, are of lower priority in comparison. Early removal of salts may prove to be less costly for BW Gold in the long run and serve to reduce environmental risk for CSFN's rights and interests. Recommended Permit Condition: Additional consultation will be required to the feasibility study of seepage quality												
491	Chapter 4: Reclamation and Closure Plan	Costing for the LGO Liability in the Closure Bond	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	[Please see comment #58 in the source doc for additional context] Information Request: Please update the cost estimate for moving LGO back into the pit using the information provided and requested in this comment. Based on Source's calculations and after fixing the presumed erroneous assumptions, the bond requirement for LGO using the fleet proposed by Artemis would be on the order of ~$250M as opposed to ~$130M as calculated by Artemis. (Source Comment ID#58)	The inclusion of stockpile rehandling costs into the RLCE was discussed with EMLI and Indigenous groups on Thursday, June 17th, 2022. The Year 3 RLCE will be updated to include an estimate for rehandling the stockpiled material contained within the stockpile at the end of year 3 of operations.		CSFN	BWG		Alastair	TD	Ready for Submission	AT, June 20	Ready for Publishing
491	Chapter 4: Reclamation and Closure Plan	Costing for the LGO Liability in the Closure Bond	CSFN - F. Mohamm	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Information Requirement	No	As discussed during the meeting of June 17, 2022, the updated RLCE must include a clear strategy for rehandling the stockpile and the LGO rehandling cost calculations must include the rationale for the assumptions made. Information Request: The updated RLCE should capture the LOM liability for the LGO pile. Please state the strategy for rehandling the LGO clearly and respond to the initial comment to provide the details requested and the rationale for the assumptions made for the movement of LGO. Please include details on distance, haul times, loading and dumping locations and any specific requirements or constraints. (Source Comment ID#58)	The updated RLCE will capture the closure cost liability for the mine, including the LGO pile, in accordance with EMLI guidance. The strategy for closing the LGO stockpile will be clear. If the plan is for the LGO to be rehandled, details on distance, haul times, loading and dumping locations and any other specific requirements or constraints will be provided.		CSFN	BWG				Ready for Submission	AT, Aug31	Ready for Publishing
491	Chapter 4: Reclamation and Closure Plan	Costing for the LGO Liability in the Closure	CSFN - F. Mohamm	BW Gold Ltd.	Oct 11, 2022	3	Follow Up		No	Comment remains open until the updated RLCE and LGO rehandling strategy have been reviewed. (Source Comment ID#58)	The comment is acknowledged. BW Gold submitted to EMLI for distribution to the MRC an update to its proposed RLCE on October 13th. BW Gold looks forward to continuing to discuss with CSFN and EMLI its LGO bonding strategy through upcoming trilateral meetings (the next tentatively scheduled for Oct 31) to explain our rationale and cost basis, including rehandling costs for the maximum LGO pile volume in the reclamation and closure cost estimate.		CSFN	BWG		Travis			TD, Oct 17	Ready for Publishing
492	Chapter 4: Reclamation and Closure Plan	Reference Costs for Membrane Treatment of Mine Impacted Water	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd and Veneil Sundar, Manager, Process Engineer; BQE Water	Jun 02, 2022	1	New	Information Requirement	Yes	The references provided in the Application for membrane application for mine impacted water treatment are limited to pilot scale. Membrane operation in such conditions is associated with a high degree of fouling that although may be reduced by various means of descaling, require frequent maintenance and replacement. This not only increases the operating costs directly but also more importantly decreases the plant availability and treatment capacity. Information Request: Please use operations and maintenance costs as well as plant availability references from comparable full-scale membrane treatment systems and conditions to verify the assumptions. (Source Comment ID#59)	Large scale membrane applications are relatively new in the mining industry and there are many site-specific factors that influence availability and operating and maintenance costs. Development of cleaning and membrane replacement frequencies used in plant sizing and operating cost estimates for Blackwater was developed from test work on similar mine waters and represents a very conservative estimate, with both of these aspects being more frequent than membrane vendor recommendations.		CSFN	ERM	BQE	Rolf	RT	Ready for Submission	GM; June 14	Ready for Publishing
492	Chapter 4: Reclamation and Closure Plan	Reference Costs for Membrane Treatment of Mine Impacted Water	CSFN - F. Mohamm	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Recommended Permit Condition	Yes	Water treatment is an important aspect of all stages of mine life for the Blackwater Project. Considering that the project is to use an innovative membrane approach to water treatment, there is uncertainty on how the system will perform long term. Two permit conditions are recommended below to address this uncertainty. Recommended Permit Condition: It is recommended that annual reporting include discussion of water treatment performance in terms of effluent quality, throughput, and operability and that this topic be the subject of an annual review meeting. This annual review should generate information needed to inform an updated operating cost and performance estimate for the Membrane WTP. Recommended Permit Condition: Twelve months prior to the 5-year closure update, conduct an analysis of actual costs of the membrane water treatment plant and for use in the first reclamation closure cost estimate update. Recommendation: As discussed in the response, application of membranes for water treatment is relatively new in the mining industry. As such, vendor recommendations and standards for cleaning and replacement frequencies may not represent the best frame of reference. Source requests that BW Gold review lessons learned from reference sites in the development of the Membrane WTP OMS, including the Emalahleni facility (Hutton et al. 2009), https://www.imwa.info/docs/imwa_2009/IMWA2009_Hutton.pdf). (Source Comment ID#59)	Response to Recommended Permit condition 1: The comment is acknoweledged as a recommendation to EMLI, and BW Gold looks forward to discussing at the appropriate time (ie., during condition development). Response to Recommended Permit condition 2: The comment is acknoweledged as a recommendation to EMLI, and BW Gold looks forward to discussing at the appropriate time (ie., during condition development). Response to Recommendation: Based on the expected Blackwater Project timing, BQE Water expects to have designed/commissioned three or more full scale membrane-based water treatment plants at mine sites. BQE Water has reviewed the Emalahleni facility lessons learned report and will incorporate outcomes from this document, as well as lessons learned from other membrane plants we are responsible for, into the design, planning and OMS for the Blackwater membrane treatment plants.		CSFN	BWG				Ready for Submission	RT; aug 30	Ready for Publishing
492	Chapter 4: Reclamation and Closure Plan	Reference Costs for Membrane Treatment of Mine Impacted	CSFN - F. Mohamm	BW Gold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	CSFNs appreciate BW Gold's response and direction to BQE to review and incorporate lessons learned from relevant membrane operations. This comment will remain unresolved until the discussion of permit conditions. (Source Comment ID#59)	This comment is acknowledged.		CSFN	BWG		Travis			TD, Oct 17	Ready for Publishing

493	Chapter 4: Reclamation and Closure Plan	Reclamation Closure Cost Update Program	CSFN	Rolf Schmitt, P Geo. ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Recommendation	No	The Blackwater project will increase in level of disturbance and environmental liability over time, increasing future reclamation and closure needs. It is important that a robust process for updating the mine plan, reclamation and closure plan and the associated reclamation security cost estimate be incorporated into any future project permit. BC's policy is that closure plans and associated cost estimates be updated every 5 years. Based on Source's experience on other projects, this policy is not always followed. Recommendation: The process of updating these plans should involve at minimum the following: •Review the design basis and appropriateness of planned mitigation measures (i.e.. placement of covers, water management/treatment, revegetation) to ensure that they have been designed to a sufficient level of detail to allow evaluation of their suitability, whether or not they are achievable, and to develop a reasonable cost estimate •Updates to water balance/water quality models that incorporate actual site monitoring data including updates to MLARD/geochemical characterization, site water quality, treatment performance, reagent/explosive usage, disturbed volumes of material, material availability for covers, and climate •Unit costs for material movement (i.e.. cover placement) should be reviewed and revised using the BC Blue Book. This review should account for the location of material currently stored, its destination and equipment required to move it •Major consumable costs for long term water treatment should be updated based on vendor quotes •Future capital costs should be revised to account for inflation via use of the Industrial Products Price Index Given the level of interconnectedness between these plans and the level of effort required to develop, review and integrate them, it is recommended that discussion of reclamation closure planning and associated reclamation security cost estimation start a year in advance of the 5-year update timeline. A hard deadline is required for the end of each 5-year cycle. (Source Comment ID#60)	With regards to the first two recommendation: Section 4.10.10 (Adaptive Management Framework) indicates how the effectiveness of management measures will be reviewed at least on a minimum 5-year interval. Updates to the water balance/water quality models to include operations data will be completed at minimum every 5 years as part of adaptive management to inform updates and improvements to the Reclamation and Closure Plan. With regards to the costing recommendations: As stated in Section 4.13 'At the time of plan updates, the closure cost estimate is re-examined and adjusted to reflect the existing and planned disturbance, activities, and liabilities on the site'. BW Gold acknowledges the recommendation to provide the next iteration of the Reclamation and Closure Plan on a hard deadline at the end of the 5-year cycle and will work to achieving this. 494	Chapter 5: Modelling, Mitigation and Discharges	Simulated POC Concentrations	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Simulated POC concentrations in the Application must include diagrams or tables that present the contribution of each source at model nodes. This data should also integrate seasonally-derived loading distributions. Sensitivity scenarios should include both mitigated and unmitigated conditions. (Source Comment ID#61)	Included as standard output for base case water quality model runs and sensitivities are the following: 1) high level screenings of the results for receiving stream nodes against guidelines/SPOS, with results summarized as both number/factor of exceedance per station and Project phase; 2) summary tables tallying monthly mean and P95 predictions per mine site/receiving stream node, by Project phase; 3) time-series plots showing predicted concentrations for mine site and receiving stream nodes screened against applicable guidelines; and 4) plots show time-varying predicted load signatures for key model nodes and parameters of concern.		CSFN	Lorax		John, Colin	GM	Ready for Submission	GM; June 21	Ready for Publishing
495	Chapter 5: Modelling, Mitigation and	Seepage to Creek 705	CSFN	Cindy Starzyk, Ph.D., P.Eng.;	Jun 02, 2022	1	New	Information Requirement	Yes	The Application must include measures to prevent seepage to Creek 705. Measures include a seepage recovery sump associated with the west side of the TSF within the Davidson Creek watershed designed to redirecting seepage to the TSF, as well as a freshwater pond constructed upstream of the TSF to create a hydraulic barrier for the Site C West Dam seepage. The Application must provide details on	The seepage control measures for the West Dam to prevent seepage to Creek 705 are described in Section 5.5 of Appendix 3-K of the Application. Details related to the Phase 2 Central Water Transfer Pond are described in Section 7.3.9 of Appendix 3-K. The design report and site characterization reports (Appendix 3-L) indicate that additional site investigations are required in the first several years of mine operations to inform		CSFN	KP		Cindy	AT/KP	Ready for Submission	AT, June 26	Ready for Publishing
496	Chapter 5: Modelling, Mitigation and Discharges	Storage of Residues	CSFN	Dan Fontaine, P.Eng.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	Yes	During operations, water treatment residue from the metals removal WTP and the LGO lime neutralization WTP is to be commingled and deposited with tailings. During C&M, tailings will not be generated, so alternative disposal management methods are required. The residue generated by these processes is unstable in acidic conditions, which could develop without proper upfront planning. Clarification: Please clarify how treatment residue will be managed during C&M. Will the same tailings conveyance infrastructure that is suitable for moving tailings and WTP residue to the TSF during operations be suitable for moving only residue during C&M? Moving solid slurry in a very oversized line risks sanding out the line. (Source Comment ID#63)	The management of treatment residue for the various Care & Maintenance scenarios, as outlined in response to comment #441, will be included in the updated C & M Plan being developed. See response to comment #441 for more information.		CSFN	KP	BWG	Cindy/Dan	AT/KP	Ready for Submission	KP, June 30	Ready for Publishing
496	Chapter 5: Modelling, Mitigation and Discharges	Storage of Residues	CSFN - P. Littlejohn	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	See Round 2 response to comment #8 (ITT ID 441). (Source Comment ID#63)	Refer to response to comment #441.		CSFN	BWG		Travis	TD	Ready for Submission	TD, Aug 30	Ready for Publishing
497	Chapter 5: Modelling, Mitigation and Discharges	IFN in Chedakuz Creek at 15-CC	CSFN	Palmer	Jun 02, 2022	1	New	Recommendation	No	The proposed plan to pump from Tatelkuz Lake to augment Davidson Creek streamflow to meet Instream Flow Needs (IFN) will reduce streamflow along the reach of Chedakuz Creek downstream from the lake outlet and upstream from the Davidson Creek confluence. The Water Balance Model Report (Appendix 5-B) included a model node along this reach, named 15-CC. According to Table E3.4 in the Water Balance Model Report, on average, annual flow rate at 15-CC will be reduced by 8% compared to baseline. In an average year, February will experience the largest percent change (27% decrease from baseline), and May will see the lowest change (2% decrease from baseline). It is unclear whether there is potential for adverse effects on aquatic habitat in Chedakuz Creek (at 15-CC) during drier than average years when the Fresh Water Supply System (FWSS) pumps from Tatelkuz Lake to Davidson Creek. Recommendation: Develop monthly IFN values for Chedakuz Creek at 15-CC. (Source Comment ID#64)	Instream flow needs (IFN) were developed for Davidson Creek to maintain adequate streamflow to provide fish habitat. The IFN was developed for Davidson Creek due to the magnitude of anticipated flow changes that will result from mine operations. The anticipated magnitude of relative flow changes in Chedakuz Creek (at model node 15-CC) are less than in Davidson Creek due to the limited disturbance planned within the Chedakuz Creek catchment and the difference in watershed size. The Freshwater Supply System (FWSS) will provide a means of augmenting and managing streamflow in Davidson Creek to meet the IFN for that stream. There is no comparable water management infrastructure planned for Chedakuz Creek, so an IFN was not developed and its streamflow will continue to exhibit natural variability. The modelled 27% decrease in February flows (0.51 m^3 to 0.37 m^3) during late Operations (Year 22) presented in Table E3.4 is due to currently planned additional pumping from Tatelkuz Lake (Years 18 to 23), as the FWR will provide the freshwater requirements for the mill during this timeframe. Utilizing the FWR as the source of freshwater for the mill in later operations allows for an accelerated filling of the open pit to submerge exposed pit walls to prepare for site closure. BW Gold will use actual measured data on water management system performance during the Operations phase to establish a water allocation framework guiding site water management decisions to minimize water loss in Chedakuz Creek, while maintaining habitat in Davidson Creek and balancing the needs of geochemical mitigation at the mine site. This framework will involve continually updating its life of mine water balance with measured data, and may include reducing water withdrawals from Tatelkuz Lake during low flow periods such as the month of February and potentially increasing withdrawals during higher flow months to balance actively flooding the open pit against the potential for flow impacts downstream. Furthermore, IFN requirements during periods of reducing water withdrawals from Tatelkuz Lake could be met through treatment and release of water from the stockpiles and/or TSF as opposed to directing these water sources to the pit on a continuous basis starting in Year 18. This reduction during low flow months in water use will help limit any adverse effects on aquatic habitat in Chedakuz Creek during winter low flows.		CSFN	Palmer	ERM KP requested transfer to Palmer	Stefan Gronsdahl	AT/KP	Ready for Submission	TD, Jun 27	Ready for Publishing

497	Chapter 5: Modelling, Mitigation and Discharges	IFN in Chedakuz Creek at 15-CC	CSFN	Palmer	Aug 08, 2022	2	Follow Up	Recommendation	Yes	Thank you for the model results from the Variable Climate Case (VCC). Table 1 from the Round 1 response memo demonstrates that under baseline conditions (i.e., the natural creek regime), Davidson Creek streamflow is lower than the proposed IFN in drier than average years. Therefore, it is reasonable to expect that IFN may not be met in drier than average years. During dry years, operators may need to be careful not to draw too much from Tatelkuz Lake to make up the IFN in Davidson Creek because the resulting flow reduction in Chedakuz Creek could cause stress to aquatic life. Recommendation: To fulfill this information request, one of the two following items must be completed: 1)Demonstrate that the Davidson Creek IFN can be met for all phases of mining for the range of hydrologic conditions in the VCC model by pumping from Tatelkuz Lake without causing stress to aquatic life in Chedakuz Creek. To do this, it is expected that BW develop a minimum allowable flow rate in Chedakuz Creek to maintain suitable conditions for aquatic life (similar to the IFN that was developed for Davison Creek) and show with model results that the Chedakuz Creek flow rate will stay above its minimum required flow rate while maintaining IFN in Davidson Creek. 2)If it is not possible to maintain IFN in Davidson Creek during dry years without causing stress in Chedakuz Creek, then pumping to Davidson Creek could be scaled down. A potential operational regime to follow would be to balance the pumping rate from Tatelkuz Lake so the flows in Davidson and Chedakuz Creeks correspond to about the same return period. Table 2 is a hypothetical lookup table an operator could use to balance flows between the two monitoring stations. For example, if total available streamflow (i.e., the sum of flows in Davidson and Chedakuz Creeks) was 0.3 m3/s, then 0.05 m3/s would go to Davidson Creek, leaving 0.25 m3/s in Chedakuz. In both creeks, the flow corresponds to a baseline 25-year low flow. Table 2 represents a single month. A complete table would be expanded to include 12 months. Flow values are hypothetical. Table 2.Example lookup table for concurrent flows in Davidson and Chedakuz Creeks during dry years. [see Source Doc} The reviewer is not looking for a commitment to ongoing modelling during operations. Instead, they would like to see an easy-to-understand protocol that the operators can follow to optimize the	During dry years to mitigate adverse effects to fish. Withdrawals will be balanced between meeting the Davidson Creek IFN to maintain habitat and meeting the needs for geochemical mitigation at the mine site. A decision making framework will be established for partitioning water between Davidson Creek and Chedakuz Creek during low flow periods such as the month of February. The framework will include thresholds for determining whether withdrawals from Tatelkuz Lake should be reduced or ceased, based on established guidance that is consistent with the BC Environmental Flow Needs (EFN) Policy. The BC Tennant Approach will be used to define mean annual discharge (MAD)-based flow thresholds that support the species and life stages that use Chedakuz Creek at relevant times of year. If flows were to drop below established thresholds, then withdrawals from Tatelkuz Lake would be reduced/cease, depending on the severity of low flows, to maintain EFN in Chedakuz Creek. During periods of reducing water withdrawals from Tatelkuz Lake, IFN requirements in Davidson Creek could be met through treatment and release of water from the stockpiles and/or TSF as opposed to directing these water sources to the pit on a continuous basis starting in Year 18. BW Gold's environmental compliance certificate - EAC-M19-01 has a condition 10 document submission plan which requires the development and provision of a Tatelkuz Lake Protection Plan 90 days prior to pumping water from Tatelkuz lake. BW proposes that this Tatelkuz lake Protection Plan will include describing the framework for managing water withdrawal from Tatelkuz Lake to balance flows in Davidson and Chedakuz creeks. The Plan will describe the MAD-based thresholds for Chedakuz Creek and the corresponding adaptive management process, including limiting or halting withdrawal from Tatelkuz Lake and other mine-site water management changes.BW Gold proposes that if required, EMLI can include that the plan also be submitted as a permit condition of the MA's permit to align and harmonize the EAC/MA permit req's on the same timeline.		CSFN	Palmer			TD	Ready for Submission	TD, Aug 16	Ready for Publishing
497	Chapter 5: Modelling, Mitigation and Discharges	IFN in Chedakuz Creek at 15-CC	CSFN (Rob Griffith)	Palmer	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Thank you for the proposed commitment to include a framework to manage flow needs in Chedakuz Creek in the Tatelkuz Lake Protection Plan (TLPP). Recommended Permit Condition: The reviewer recommends EMLI include a permit condition which requires the development and provision of a TLPP prior to pumping water from Tatelkuz Lake. Minimum requirements of the plan are summarized under condition 31 of the EAC-M19-01. In addition to the EAC-M19-01 requirements, the TLPP shall include the following components: •Establish Environmental Flow Needs (EFN) for Chedakuz Creek. •A framework for partitioning water between Davidson Creek and Chedakuz Creek with the goal of meeting EFN in Chedakuz Creek and Instream Flow Needs (IFN) in Davidson Creek. The framework will include the scenario for dry years when EFN (Chedakuz Creek) and IFN (Davidson Creek) cannot be concurrently met. •Use a water balance model to demonstrate how the framework will be implemented. The model simulation should use Blackwater's climate variability scenario to evaluate system performance over the range of expected environmental conditions (i.e., wet/dry years). •Describe the monitoring system (e.g., stream gauging, lake level measurements) that operators will use to set pumping rates, and to monitor the performance of the system. (Source Comment ID#64)	BW Gold supports inclusion of a framework to manage flow needs in Chedakuz Creek in the Tatelkuz Lake Protection Plan (TLPP) prior to pumping water from Tatelkuz Lake, including: • Following the minimum requirements as summarized under condition 31 of the EAC-M19-01. • Establishing Environmental Flow Needs (EFN) for Chedakuz Creek. • Developing a framework for partitioning water between Davidson Creek and Chedakuz Creek with the goal of meeting EFN in Chedakuz Creek and Instream Flow Needs (IFN) in Davidson Creek. The partioning framework will include the scenario for dry years when EFN (Chedakuz Creek) and IFN (Davidson Creek) cannot be concurrently met. • Use of a water balance model to demonstrate how the framework will be implemented. • Description of the monitoring system (e.g., stream gauging, lake level measurements) that operators will use to set pumping rates, and to monitor the performance of the system. 499	Chapter 5: Modelling, Mitigation and Discharges	IFN in Chedakuz Creek at 15-CC	CSFN	Palmer	Jun 02, 2022	1	New	Recommendation	No	[Please see comment #64 in the source doc for additional context] Recommendation: It is reasonable to expect that in extreme dry years, IFN cannot be met in Davidson Creek and/or Chedakuz Creek. Define the rules that Blackwater will follow for FWSS pumping to minimize adverse effects on aquatic habitat on both watercourses if IFN is not achievable at one or both of Davidson Creek and Chedakuz Creek (15-CC). (Source Comment ID#66)	A Goldsim daily timestep site water balance will be implemented during Operations to incorporate ongoing monitoring of water management components (e.g., reservoir volumes, process water requirements, water treatment rates, climate data) and be coupled with assessment of available data on future water availability (e.g., snowpack measurement, precipitation measurement, weather forecasting) to inform water management decisions at site. When dry conditions or low flow periods are encountered or predicted, BW Gold will ensure that changes to treatment and discharge rates are implemented based on outputs from the Goldsim model to ensure water availability on site to reduce or limit the need for freshwater from the FWSS, ensure that PAG is saturated and that adequate process water supply is available in the TSF cells. BW Gold will consider methods to meet the IFN, including adjusting process water flows (e.g., adjusting rates of water treatment, pit dewatering, or ore processing water needs), or drawing down water from retention structures (e.g., the FWR) to provide supplemental flows. BW Gold will also consider the timing of sensitive life stages of fish (e.g., spawning, egg incubating) through consultation with Fisheries QP's when evaluating changes to water management strategies		CSFN	Palmer	KP KP requested transfer to Palmer	Stefan Gronsdahl	TD	Ready for Submission	TD, Jun 27 GM; June 27	Ready for Publishing

499	Chapter 5: Modelling, Mitigation and Discharges	IFN in Chedakuz Creek at 15-CC	CSFN	Palmer	Aug 08, 2022	2	Follow Up	Recommendation	No	Please refer to the Round 2 comment under comment #64 of this memo. [The proposed plan to pump from Tatelkuz Lake to augment Davidson Creek streamflow to meet Instream Flow Needs (IFN) will reduce streamflow along the reach of Chedakuz Creek downstream from the lake outlet and upstream from the Davidson Creek confluence. The Water Balance Model Report (Appendix 5-B) included a model node along this reach, named 15-CC. According to Table E3.4 in the Water Balance Model Report, on average, annual flow rate at 15-CC will be reduced by 8% compared to baseline. In an average year, February will experience the largest percent change (27% decrease from baseline), and May will see the lowest change (2% decrease from baseline). It is unclear whether there is potential for adverse effects on aquatic habitat in Chedakuz Creek (at 15-CC) during drier than average years when the Fresh Water Supply System (FWSS) pumps from Tatelkuz Lake to Davidson Creek. (Source Comment ID#66)	The Tatelkuz Lake Protection Plan referred to in ITT Comment #497 (Source comment #64) will define the framework for FWSS pumping to minimize adverse effects on aquatic habitat in Chedakuz Creek and Davidson Creek during a variety of flow scenarios.		CSFN	Palmer			TD	Ready for Submission	TD, Aug 16	Ready for Publishing
499	Chapter 5: Modelling, Mitigation and Discharges	IFN in Chedakuz Creek at 15-CC	CSFN (Rob Griffith)	Palmer	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: Please refer to the Round 3 comment under comment #64 of this memo. (Source Comment ID#66)	BW Gold supports inclusion of a framework for FWSS pumping to minimize adverse effects on aquatic habitat in Chedakuz Creek and Davidson Creek during a variety of flow scenarios in the Tatelkuz Lake Protection Plan (TLPP).		CSFN	Palmer			TD		TD, Oct 24	Ready for Publishing
500	Chapter 5: Modelling, Mitigation and Discharges	IFN in Chedakuz Creek at 15-CC	CSFN	Knight Piésold Ltd. and Palmer	Jun 02, 2022	1	New	Recommendation	No	[Please see comment #64 in the source doc for additional context] Recommendation: Demonstrate that appropriate monitoring systems will be in place (hydrometric monitoring, pumping rate monitoring, storage volume monitoring) to implement the rules for FWSS pumping requested in comment #68. (Source Comment ID#67)	Flows are monitored in the FWR to track release of IFN releases into Davidson Creek. The FWR flow monitoring systems are described in the Water Management Structures Detailed Design Report (Appendix 3-O). The FWR outlet pipes will feed into a Temperature and Flow Control Chamber, and each pipe will be fitted with a main valve and maintenance valve with the ability to regulate flows according to water surface levels and IFN requirements. Ultrasonic flow meters will be installed on the pipes upstream of the outlet valves to accurately measure flows for compliance reporting requirements. Surface water level monitoring will be used to quantify the total volume in the reservoir and also to indicate when the spillway is being used. In addition, a hydrometric monitoring station downstream of the FWR can be used as a backup to confirm the IFN release. These flow and level monitoring instrumentation are to be used in conjunction to determine if any supplemental water is required from the FWSS to meet IFN and by how much. The FWSS Report (Appendix 3-P) describes the pumping system from Tatelkuz Lake. The objective of this system is to only provide additional flow when the IFN cannot be met by diversions and mine water management. The maximum IFN is 0.56 m3/s during the spring; the FWSS will draw water from Tatelkuz Lake through two pipes (for redundancy), which will passively convey water from the lake to a concrete wet well. The intake screen design basis assumption includes a 0.67 m3/s capacity for each screen. Three vertical turbine pumps within the pump station will provide a total maximum flowrate of 0.67 m3/s . Each of the pumps will be equipped with a variable frequency drive and motor to accommodate variable flow demand. As described in Section 3.5.6.7 of the Application, the design of the FWSS takes into consideration the requirements to provide variable and controlled flow from Tatelkuz Lake. 501	Chapter 5: Modelling, Mitigation and Discharges	Reduction in Flow in Creek 661	CSFN	Palmer	Jun 02, 2022	1	New	Recommendation	No	In Section 5.3.5.2., Creek 661 (Node H11, H1, and 1-661) model results show a reduction in streamflow during late operations, closure, and post-closure phase. Average annual streamflow at H11 is predicted to decrease by 39% and 43% from baseline flows by the end of operations and post-closure, respectively. Model results for node 1-661, approximately 8 km downstream of node H11, show a reduction in average annual streamflow by 11% in late operations and post-closure. Section 6.3.4.4 states that Creek 661 was not evaluated for effects because modelled flow changes (from baseline) are less than 5%. Recommendation: Evaluate the effects of the modelled flow changes on aquatic life in Creek 661 provided in Table E3.3 of the Water Balance Model Report (Appendix 5-B). (Source Comment ID#68)	Potential impacts to aquatic habitat that will occur due to flow changes in Creek 661 at node 1-661 were quantified through the development of the Fisheries Act Authorization Application and were included in the habitat offsetting calculations. Refer to Figure 8-5, Table 8-8, and Section 8.4.2.2 of the application document.		CSFN	KP	KP requested transfer to Palmer	Stefan Gronsdahl	AT/KP	Ready for Submission	RT; June 14	Ready for Publishing
502	Chapter 5: Modelling, Mitigation and Discharges	Reduction in Flow in Creek 661	CSFN	Palmer	Jun 02, 2022	1	New	Recommendation	No	In Section 5.3.5.2., Creek 661 (Node H11, H1, and 1-661) model results show a reduction in streamflow during late operations, closure, and post-closure phase. Average annual streamflow at H11 is predicted to decrease by 39% and 43% from baseline flows by the end of operations and post-closure, respectively. Model results for node 1-661, approximately 8 km downstream of node H11, show a reduction in average annual streamflow by 11% in late operations and post-closure. Section 6.3.4.4 states that Creek 661 was not evaluated for effects because modelled flow changes (from baseline) are less than 5%. Recommendation: Yinka Dene Water Law states: “Waters within the traditional Territories of the Carrier Sekani First Nations should remain substantially unaltered in terms of water quality and flow.” If warranted by the results of the effects assessment, develop an appropriate mitigation or offsetting plan to address the expected changes in flows to Creek 661. (Source Comment ID#69)	Potential impacts to aquatic habitat that will occur due to flow changes in Creek 661 at node 1-661 were quantified through the development of the Fisheries Act Authorization Application and were included in the habitat offsetting calculations. Refer to Figure 8-5, Table 8-8, and Section 8.4.2.2 of the application document. BW Gold understands that Creek 661 is outside of the CSFNs’ territories and as such is not subject to the requirements of the YDWL. 503	Chapter 5: Modelling, Mitigation and Discharges	FWSS years 1 to 5	CSFN	Stephanie Eagen, R.P.Bio.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	The Water Balance Model Report states that there is a low likelihood (15% to 25% likelihood) that the Fresh Water Supply System (FWSS) from Tatelkuz Lake will be needed during the first five years of mining. The Water Management Plan (Appendix 9-E) states that the FWSS will be commissioned by Year 6. It is unclear whether a contingency plan is in place in the event that IFN cannot be met in Davidson Creek prior to Year 6. Recommendation: Incorporate a contingency (e.g., early construction of the FWSS) to the Adaptive Management Plan in the Water Management Plan for the scenario where IFN cannot be maintained prior to commissioning the FWSS in Year 6. Describe the trigger that will initiate the contingency plan. Describe the timeframe for implementation of the plan and demonstrate that IFN in Davidson Creek can be met with the plan in place. (Source Comment ID#70)	Contingencies to meet IFN during drier than average conditions during the first phase of operations without having available the supply of water from Tatelkuz Lake include: advancing pit dewatering rates for treatment and release during low flow periods, decreasing the use of fresh water from the WMP for mill operations by increasing reclaim water usage from the TSF, treating and releasing TSF supernatant water via the Operations phase membrane WTP. BW Gold is applying now for the authorization to construct and operate the FWSS, so that there are no regulatory constraints to build this part of the project, thus reducing the time to have the FWSS operating. See response to comment #499 for additional discussion on contingencies to address IFN needs in Davidson and Chedakuz Creeks.		CSFN	KP		Stephanie/Cindy	AT/KP	Ready for Submission	KP, June 30	Ready for Publishing
504	Chapter 5: Modelling, Mitigation and Discharges	Tatelkuz Lake Water Level	CSFN	Palmer and Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	Yes	The FWSS will draw water from Tatelkuz Lake. It is unclear whether the pumping is expected to change the lake water surface elevation compared with baseline conditions. Recommendation: a)Using the water balance model, quantify the expected range in water levels in Tatelkuz Lake given the water balance inflows and outflows. Use the climate variability model for this evaluation. b)Compare the results from (a) with baseline conditions. c)Assess the effect of water level fluctuations on aquatic life. (Source Comment ID#71)	a) KP Water Balance Model update required for Tatelkuz Lake water balance. b) KP assessment of results vs. baseline required. c) Palmer can assess based on results of a & b. Long-term water withdrawl from Tatelkuz Lake is not predicted to have a significant effect on water surface elevation (i.e.., indistinguishable from natural variation) based on water modelling. Section 5.3.9..4.5 Reduction in Littoral Fish Habitat of Tatelkuz Lake of the EIS/Application states that "The magnitude of change is negligible to low, because some months will differ from mean baseline values, but will remain within range of natural variation. On average, water surface elevation of the lake fluctuates 0.8 m over a year, but the greatest change estimated to be caused by pumping 0.11 m from baseline conditions or 14% of the baseline range". Effects on littoral habitat in Tatelkuz Lake were not considered to have changed in the subsequent updated assessments (Blackwater Gold Project – Consolidated Fish and Fish Habitat Effects Assessment, ERM September 2017). Conclusions presented in the Application/EIS are considered to be conservative, as water withdrawal from Tatelkuz Lake to augment flows in Davidson Creek will be decreased based on project design changes. Any potential changes in aquatic habitat will be monitored as part of the follow-up program for the CEAA Decision Statement Condition 3.16 pertaining to fish habitat in Tatelkuz Lake and Chedakuz Creek. A memo on this follow-up plan was submitted to Indigenous groups for review. Additionally, the provincial EAC Condition 31 Tatelkuz Lake Protection Plan mandates the development of a plan that will evaluate changes to flows and fish habitat in Tatelkuz Lake. BW Gold will develop this plan in consultation with First Nations and regulators.	sistance from	CSFN	Palmer			0	Ready for Submission	TD, Jun 28	Ready for Publishing
505	Chapter 5: Modelling, Mitigation and Discharges	IFN in Care and Maintenance	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	If the mine undergoes early closure, active management of Davidson Creek may be required to maintain IFN. Recommendation: Use the water balance model to simulate a protracted Care and Maintenance period following early closure to demonstrate how Davidson Creek IFN will be maintained. Use the climate variability model for this assessment to show how IFN will be managed over the modelled range of hydrologic conditions. (Source Comment ID#72)	Refer to response to comment #441. 506	Chapter 5: Modelling, Mitigation and Discharges	IFN in Post-Closure	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	Table E3.1 presents average monthly WBM results for Davidson Creek. Post-closure flows generally exceed the IFN values. However, during summer, predicted flows are only moderately above IFN. Modelled flow in June is slightly below IFN. Recommendation: a)Compare the WBM output from the climate variability model with IFN at H2B. b)Describe potential contingencies that could be implemented if IFN cannot be maintained in Davidson Creek in Post-Closure. (Source Comment ID#73)	Please see attachment "R1_CSFN Comment IDs 498 506 583.pdf".		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, June 29	Ready for Publishing
506	Chapter 5: Modelling, Mitigation and Discharges	IFN in Care and Maintenance	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Aug 08, 2022	2	Follow Up	Recommendation	No	The memorandum "R1_CSFN Comment IDs 498 506 583.pdf" was reviewed. The VCC model results show H2B potentially not meeting the IFN in May, June, and July during Post-Closure. It is noted that additional monitoring will be conducted, and mitigations will be considered. However, meeting IFN is a requirement at all times and will likely be a crucial compliance point throughout all phases including Post-Closure. The federal Decision Statement condition 3.8 requires the Proponent to develop, prior to construction, measures to maintain flow needs in Davidson Creek. Please ensure preventative measures for scenarios where IFN cannot be maintained are developed. (Source Comment ID#73)	BWG acknowledges this comment. Preventative measures for scenarios where IFN cannot be maintained will be developed.		CSFN	KP		Cindy	TD	Ready for Submission	AT, Aug15	Ready for Publishing
506	Chapter 5: Modelling, Mitigation and Discharges	IFN in Care and Maintenance	CSFN (Martin Shin)	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Thank you for the proposed commitment to develop preventative measures for scenarios where IFN cannot be maintained. The reviewer looks forward to receiving documentation of the preventative measures. (Source Comment ID#73)	Preventative measures for scenarios where IFN cannot be maintained will be assessed and included as part of the process to update the water balance and water quality modelling to assess alternative Post-Closure water management and treatment strategies. 509	Chapter 5: Modelling, Mitigation and Discharges	Closure/Post-Closure Water Quality Exceedances	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	Yes	Figure 4-10 and Figure 4-14 of Appendix 5-D show water quality predictions for dissolved cadmium and total zinc in the receiving environment over the different mine phases. During closure and post closure, dissolved cadmium is expected to exceed both acute and chronic BC WQG in both the base case and 95th percentile case at WQ26-28. Total zinc is expected to exceed chronic BC WQG during the same span. The fact that Artemis is predicting this level of exceedance with the proposed project design is a major red flag – this indicates that the proposed mitigation measures are insufficient to protect the environment. It is not acceptable to permit a project that is expected to result in this level of exceedance in the receiving environment, even if exceedances are not expected until Closure/Post-Closure. Information Request: Please describe the sources/causes of contamination leading to these exceedances, delineating between the closure and post-closure phases and different sources, for example, treated water, uncaptured seepage, contact water that is deliberately released, TSF spillway, etc… Please comment on sources/causes of contamination from a modeling perspective, for example, key contaminant source terms that drive these exceedances. (Source Comment ID#76)	Version 12b water quality model results (as presented in the Application) were computed on October 26, 2021. Since that time, BW Gold and their consultants have revised the site-wide water balance model and the site-wide water quality model with a focus on mitigating Project changes for the Closure and Post-closure phases. Version 13e water quality predictions were presented to EMLI, ENV and First Nations on June 15, 2022, and are summarized in Lorax 2022. Lorax Environmental Services Ltd. (Lorax). 2022. Water Balance/Water Quality Model Update. Prepared for BW Gold Ltd. by Lorax. June 30, 2022.		CSFN	Lorax		Jen	GM	Ready for Submission	GM; June 21	Ready for Publishing
510	Chapter 5: Modelling, Mitigation and Discharges	Closure/Post-Closure Water Quality Exceedances	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	[Please see comment #76 in the source doc for additional context] Recommendation: Further mitigations should be designed and implemented in order to prevent exceedances in the receiving environment in Closure/Post-Closure. These mitigations must be designed to a level of detail sufficient to allow costing and integration into the reclamation and closure security. 511	Chapter 5: Modelling, Mitigation and Discharges	Frequency of Membrane Cleaning/Flushing	CSFN	Veneil Sundar, Manager, Process Engineer; BQE Water	Jun 02, 2022	1	New	Information Requirement	No	Please discuss the rationale for the membrane WTP design basis of one membrane cleaning per week and one permeate flush per day. Are these estimates based on long term operation or projections from shorter term pilot data? (Source Comment ID#78)	Frequencies are conservative and based on pilot rinsing/cleaning frequencies during which no scaling was experienced. Design CIP cleaning frequencies are more frequent than recommended by membrane manufacturers who recommend CIP cleaning only when a decline in performance is experienced, rather than on a timed interval. Permeate flush frequencies are also more frequent than recommended by membrane manufacturers that recommend permeate flush only on plant shutdown. In practice, the cleaning frequency will be set at these highly conservative design frequencies and then adjusted based on observed operational performance of the plant.		CSFN	BQE		V. Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing
511	Chapter 5: Modelling, Mitigation and Discharges	Frequency of Membrane Cleaning/Flushing	CSFN - P. Littlejohn	Veneil Sundar, Manager, Process Engineer; BQE Water	Aug 22, 2022	2	Follow Up	Recommended Permit Condition	Yes	Noted, thank you. The approach of CIP cleaning only when a decline in performance is experienced is suitable for certain kinds of contaminants but gypsum scaling has a tendency to get worse over time and not be resolved via cleaning. Permeate flushing is only typically part of membrane manufacturer recommendations for shutdown because most membrane manufacturers do not recommend use of membranes for waters with elevated potential for gypsum fouling. I agree with the approach of adjusting cleaning frequency based on plant performance and not on a preset timing, but nevertheless disagree with the assertion that these are highly conservative design frequencies given the uncertainty associated with the application. Recommended Permit Condition: I suggest that this uncertainty be captured in a permit condition around annual reporting requirements for the project. Cleaning frequency/actual plant throughput/membrane replacement rate should be discussed in annual reporting and the results should be used to inform updates to the closure plan & closure cost estimate. This could be incorporated into the recommended permit condition described in comment #59 (ITT ID 492). (Source Comment ID#78)	Based on the expected Blackwater Project timing, BQE Water expects to have designed/commissioned three or more full scale membrane-based water treatment plants at mine sites. BQE Water has reviewed the Emalahleni facility lessons learned report and will incorporate outcomes from this document, as well as lessons learned from other membrane plants we are responsible for, into the design, planning and OMS for the Blackwater membrane treatment plants.		CSFN	BQE		Travis	TD	Ready for Submission	TD, Aug 24	Ready for Publishing
512	Chapter 5: Modelling, Mitigation and Discharges	Frequency of Membrane Cleaning/Flushing	CSFN	Veneil Sundar, Manager, Process Engineer; BQE Water	Jun 02, 2022	1	New	Question	No	What is the significance of higher-than-expected cleaning/flushing requirements in terms of ability to manage excess water/process throughput, and cost? (Source Comment ID#79)	Higher-than-expected cleaning and flushing requirements will result in lower plant availability, because the membrane systems will be offline for cleaning for longer time periods. However, refer to comment ID #511--this scenario is highly unlikely.		CSFN	BQE		V. Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing
513	Chapter 5: Modelling, Mitigation and Discharges	Frequency of Membrane Cleaning/Flushing	CSFN	Veneil Sundar, Manager, Process Engineer; BQE Water	Jun 02, 2022	1	New	Question	No	Is it reasonable to expect the same requirements for cleaning/flushing for both operations and post-closure phases in the context of different water quality/use of different types of membrane elements? The higher sulphate level during operations and tighter membrane weave (RO) implies greater cleaning requirements during operations than post-closure. (Source Comment ID#80)	Higher feed concentrations does not imply a greater cleaning requirement. The cleaning frequencies during WTP operation will be largely dictated by the need to remove scale on the surface of the membrane. Scaling potential is a product of the influent water chemistry, membrane system recovery and the use of antiscalant, relative to the saturation concentration of the constituents in the water. So, the increase in feed concentrations does not automatically result in increased cleaning frequency. Much of the cleaning requirements are dictated by experienced operators and close monitoring of the performance of the plant, which ensures that the plant is operated below scaling conditions, reducing the requirement for cleaning.		CSFN	BQE		V. Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing
514	Chapter 5: Modelling, Mitigation and Discharges	Sensitivity Analysis on Membrane WTP Performance	CSFN	Veneil Sundar, Manager, Process Engineer; BQE Water	Jun 02, 2022	1	New	Question	No	Did Artemis conduct a sensitivity analysis on membrane WTP performance with respect to the amount of brine generated? (Source Comment ID#81)	BQE did not specifically conduct a membrane performance sensitivity with respect to the amount of brine generated. Current design basis is on 95th percentile influent concentrations. Lower influent concentrations will result in lower-than-designed brine volumes.		CSFN	BQE		V. Sundar	GM	Ready for Submission	GM; June 18	Ready for Publishing
515	Chapter 5: Modelling, Mitigation and Discharges	Sensitivity Analysis on Membrane WTP Performance	CSFN	Knight Piésold Ltd. and BQE Water	Jun 02, 2022	1	New	Question	Yes	How does the overall site water balance/ability of the membrane WTP to manage excess water change if the membrane recovery is 60% instead of 75%? (Source Comment ID#82)	The scenario in which this reduction in recovery would occur is only associated with an increase in feed water TDS values. Given that the design basis uses 95th percentile feed water quality, it is more likely that the plant will be able to operate at higher recoveries rather than lower. Notwithstanding this likelihood, a scenario with decreased membrane recovery was modelled. Results of the modelling suggest that a lower membrane recovery of 60% instead of the 75% as included in the water balance model presented in Appendix 5-B has the following implications to the water balance: 1) No implication during Operations, because the current Membrane WTP design (72/ L/s) is sufficient to maintain the TSF C Pond volume within a similar range as predicted with the base case modelling presented in Appendix 5-B. This result is achieved operating the Membrane WTP in Operations for only seven months of the year (April to October), consistent with the base case modelling predictions. Flexibility is built into the water management strategy, so that if required, the Membrane WTP could be operated for a longer period during Operations than the seven months specified in the model. 2) During Post-Closure, an increase in the Membrane WTP influent design rate of approximately 10 L/s could be required to accommodate the lower membrane recovery and additional brine volume directed to the pit lake if the Membrane WTP persistently operates at the lower membrane recovery. Fluctuations in the Membrane WTP recovery and generation of higher proportions of brine over a period of months to a year can be accommodated by the storage available in the pit lake. 516	Chapter 5: Modelling, Mitigation and Discharges	Sensitivity Analysis on Membrane WTP Performance	CSFN	Veneil Sundar, Manager, Process Engineer; BQE Water	Jun 02, 2022	1	New	Question	No	Is the same plant sufficient to manage excess water or would additional capacity be required if high recovery cannot be maintained? Recovery rate will depend to an extent on salt accumulation in the TSF and so recovery will likely decrease as the project progresses and TSF water quality evolves. (Source Comment ID#83)	During the operations phase, water treatment is only required for treating excess water, and the primary water management mechanism is through planned dam wall raises. Returned sulphate during operations will be offset by dilution from rainwater and other water accumulation. The design basis for contingency treatment during operation is 7 months per year. If additional capacity is required, then the operating season could be extended to increase the annual treatment capacity by up to ~71%.		CSFN	BQE		V. Sundar	GM	Ready for Submission	GM; June 21	Ready for Publishing
517	Chapter 5: Modelling, Mitigation and Discharges	Operations Phase Treatment of Retentate in Membrane WTP	CSFN	Veneil Sundar, Manager, Process Engineer; BQE Water	Jun 02, 2022	1	New	Question	No	Why does the operations phase Membrane WTP include treatment of retentate for metals with ferric/sulphide? Page 11 of Appendix 5-H states that "the retentate produced by the process does not require desaturation because it is recycled back to the TSF". If this is the case for sulphate, why is this not also true of heavy metals? (Source Comment ID#84)	This is an additional metals removal contingency measure (on concentrated retentate). The trace metal concentrations in the membrane feed are concentrated in the retentate. An additional metal removal step on the retentate provides another removal point for a more robust process. The removal of metals in this fashion differs from sulphate, since metal precipitates will settle out in the TSF compared with sulphate solids, which will re-dissolve.		CSFN	BQE		V. Sundar	GM	Ready for Submission	GM; June 14	Ready for Publishing
518	Chapter 5: Modelling, Mitigation and Discharges	Selenium Removal in Metals WTP	CSFN	Kareena Gill, M.Eng., P.Eng., Romick Bhatti, P.Eng.,, and Lynda Smithard, P.Eng.; McCue Engineering Contractors	Jun 02, 2022	1	New	Recommendation	No	Later in the mine life, water quality entering the Metals WTP is expected to contain elevated levels of selenium. Depending on its form, selenium can be removed from water through ferric co-precipitation. Selenite selenium is most effectively removed in this fashion. Recommendation: Consider addition of ferric iron in the first lower pH reactor of the metals removal system to aid with selenium removal. Selenite selenium is most effectively removed in this way at pH <5. (Source Comment ID#85)	Selenium removal is not considered in the Metals WTP design per discussions with BW Gold during design stages. The concentration of Selenium is believed to be based on the detection limit and assumed to have a high degree of conservatism. However, addition of ferric sulphate is included in WTP design as the first chemical injection step upstream of the first reactor chamber to aid in the precipitation of target parameters. If Selenium removal is required, the treatment process would have to be optimized/adjusted for it.		CSFN	McCue		Lynda Smithard	GM	Ready for Submission	GM; June 17	Ready for Publishing
519	Chapter 5: Modelling, Mitigation and Discharges	Sediment in Metals Removal Ponds	CSFN	Kareena Gill, M.Eng., P.Eng., Romick Bhatti, P.Eng.,, and Lynda Smithard, P.Eng.; McCue Engineering Contractors	Jun 02, 2022	1	New	Recommendation	No	The Inlet Surge Ponds described in Table 5.6-5 of Chapter 5 supply influent water to the Metals WTP. The working volumes of these ponds may be reduced over time owing to accumulation of sediment. Recommendation: Include monitoring of the working volume of these ponds over time and consider dredging (or other methods of removing accumulated solids) on a periodic basis.. (Source Comment ID#86)	The pond will be designed by a third party, such that dredging equipment can be utilized. Manual checks of sludge depth will be included as part of the Maintenance procedures and the O&M manual will be amended to include this. Moreover, the Metals Treatment Ponds are designed for flow homogenization and buffering only. If excessive sediment accumulation is observed through continuous monitoring, the implementation of sediment management upstream of the pond would be initiated.		CSFN	McCue		Lynda Smithard	GM	Ready for Submission	GM; June 17	Ready for Publishing
520	Chapter 5: Modelling, Mitigation and Discharges	Manganese Removal in Metals WTP	CSFN	Kareena Gill, M.Eng., P.Eng., Romick Bhatti, P.Eng.,, and Lynda Smithard, P.Eng.; McCue Engineering Contractors	Jun 02, 2022	1	New	Information Requirement	No	Manganese is expected to be elevated in the influent of the Metals WTP and require a significant amount of removal to achieve BC WQG at end of pipe. The 2021 bench test involved treatment of water from 1.2 mg/L to 0.36 mg/L as dissolved manganese. However, BC WQGs set limits on total manganese, not dissolved. The bench test used 20- and 1.5-micron filters to produce effluent – this is likely a higher degree of filtration than achievable in practice using multimedia filters. Information Request: Is the degree of total manganese removal required to meet BC WQG achievable by the system? Is reference site data where full-scale systems have demonstrated this level of treatment performance available? (Source Comment ID#87)	This degree of removal can be achieved by the chemical treatment and filtration steps included in the WTP design. The pH setpoints can be adjusted in the system and optimized to better target specific parameters of concern like Mn. In addition to multimedia filters, a 1-micron or 1.5-micron bag filter is also included in the process downstream of the multimedia filter as a final polishing step. During WTP detailed design, dissolved manganese (Mn) concentration was compared to the BC WQG for total Mn, because total Mn predicted concentrations for Years -1 to 17 were not available. To be consistent with the approach, dissolved Mn concentrations from bench testing were also compared to BC WQG for total Mn. In 2021 bench testing total Mn was reduced from 1.25 mg/L to 0.369 mg/L. This concentration is lower than the BC WQG (long-term) of 0.530 mg/L. We understand that significant reduction of Mn is required during the WTP operation. If total Mn is assumed to just comprise of available maximum dissolved concentration (18.69 mg/L for Phase 3), approximately 97% removal is required to meet the BC WQG. Moreover, one of our currently operating full-scale water treatment plants for a mine in BC, involving a similar treatment process, have demonstrated more than 97% removal for both total and dissolved Mn from the WTP influent. This data has been included in the data analysis and estimation results shown in the response to comment #424 (see above). 521	Chapter 5: Modelling, Mitigation and Discharges	Baseline Watershed Model – Calibration	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	To predict flow rates, variables were calibrated in the watershed model. This is a standard practice; however, the calibration of the parameters should be well-defined and with typically observed ranges supported by additional evidence. The calibrated factors are presented in Table 4.1. It is understood that the two primary variables that are calibrated in the model include the k1 and k2 variables. Overall, the calibration appears adequate; however, an additional clarification is requested. Information Request: Please describe the initial values for all calibrated variables as well as the final values. (Source Comment ID#88)	Please see attachment "R1_CSFN Comment ID 521.pdf".		CSFN	KP		Cindy	AT/KP	Ready for Submission	AT, June 21	Ready for Publishing

522	Chapter 5: Modelling, Mitigation and Discharges	Baseline Watershed Model – Calibration	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	To predict flow rates, variables were calibrated in the watershed model. This is a standard practice; however, the calibration of the parameters should be well-defined and with typically observed ranges supported by additional evidence. The calibrated factors are presented in Table 4.1. It is understood that the two primary variables that are calibrated in the model include the k1 and k2 variables. Overall, the calibration appears adequate; however, an additional clarification is requested. Discuss the non-uniqueness of the calibration and if it would be possible to reproduce the NSE and matched stream flows with a different set of calibrated variables. (Source Comment ID#89)	Taken in isolation, sets of parameter values in the watershed model can lead to non-uniqueness. However, the procedures employed to develop and calibrate the simulated flows against the observed flows reduces the non-uniqueness of the watershed model calibration. These procedures include: •Adjusting the precipitation, evaporation, and sublimation inputs and the best estimate of groundwater entering and leaving the catchment areas so that the calculated total volume of water passing the stream gauge is close to the measured volume over the calibration period (in this case up to eight years of data exist). This modelling refinement is displayed as a cumulative distribution plot. •Adjusting the groundwater recharge factors, discharge factors, and estimate of groundwater bypassing the surface water gauge factors to reproduce as closely as possible the low flow rates and streamflow distribution shape. This modelling work is displayed as the semi-log cumulative distribution plot. The lower flow portion of this plot is most representative of groundwater discharge. •Adjusting the factors controlling surface water detention and release (and likely short flow path groundwater) to better fit the middle portion of the semi-log cumulative distribution plot. •Reconsidering the appropriateness of all input parameters, initially assigned based on the understanding of site meteorology, hydrology and hydrogeology, given the results of the watershed modelling. •Reconsidering input parameters given upstream and downstream measured flows. Calibrating the model to several consecutive gauging station allows refinement toward the most likely onsite conditions. This check was possible for Davidson Creek where four gauging stations are located along the main drainage. •Examining the time history histogram of measured and calculated monthly stream flows to identify and understand anomalous results. The modeled flows for Davidson Creek are within expected bounds as are resulting input parameters. The very good hydrology data and hydrogeologic understanding based on surficial geology and drilling in the valley made this possible. The main exception is the orographic factors assigned to precipitation. Precipitation multipliers assigned to the sub-catchments in Davidson Creek increase with elevation; this increasing trend could have been overcome by increasing the orographic factor, but this would have resulted in an orographic factor outside the expected range and inconsistent with the calculated orographic factor based on data available at the Blackwater High and Blackwater Low climate stations. The other catchments that were modeled lacked the detail that was available for Davidson Creek with respect		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, June 30	Ready for Publishing
523	Chapter 5: Modelling, Mitigation and Discharges	Watershed Model: Inflow and Outflow Assessment	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	Proper assessment of flow rates and summation of these flows (inflow and outflow) and identification of balance of flow terms is an important parameter to evaluate in a watershed model. Table 5.2 lists a summary of the water balance components and includes runoff, groundwater recharge and groundwater discharge in the model. The total storage or unaccounted for discharge is not provided. Clarification: Please confirm if Table 5.2 in the watershed model represents total inflow and outflows related to each elevation band. (Source Comment ID#90)	Table 5.2 in the Baseline Watershed Model Report (Appendix A of Appendix 5-B), provides the components of the water balance in each modelled sub-catchment. Values in Table 5.2 represent average annual values. The values provided in the table that form the balance are "Net Precipitation = Surface Runoff + Groundwater Recharge". The water balance components are provided as average annual values and the change in storage is assumed to be zero for average annual conditions.		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, June 21	Ready for Publishing
524	Chapter 5: Modelling, Mitigation and Discharges	Watershed Model: Inflow and Outflow Assessment	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	Proper assessment of flow rates and summation of these flows (inflow and outflow) and identification of balance of flow terms is an important parameter to evaluate in a watershed model. Table 5.2 lists a summary of the water balance components and includes runoff, groundwater recharge and groundwater discharge in the model. The total storage or unaccounted for discharge is not provided. Clarification: The total groundwater discharged as a percentage of total recharge varies between 74% in Turtle Creek catchment and 94% in Davidson Creek. Is the difference lost to groundwater that discharges further downstream or to storage? (Source Comment ID#91)	In instances where less than 100% of the groundwater discharges within a sub-catchment, the difference is groundwater that flows to the next downstream sub-catchment. The amount of groundwater that flows to the next downstream sub-catchment is provided in Table 5.1 (in L/s) called "Groundwater Passing beneath Gauge".		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, June 21	Ready for Publishing
525	Chapter 5: Modelling, Mitigation and Discharges	Watershed Model: Groundwater Flow Assessment	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	Table 5.1 summarizes the annual average simulated and surface water groundwater flow predicted in the watershed model. Clarification: Please clarify what groundwater passing beneath the gauge indicates in the context of the model? (Source Comment ID#92)	"Groundwater Passing beneath Gauge" in Table 5.1 represents the flow of water in the subsurface (as groundwater) to the next downstream modelled sub-catchment.		CSFN	KP		Cindy	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
526	Chapter 5: Modelling, Mitigation and Discharges	Watershed Model – Reference Stream Calibration	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	It is understood that there is no impact to Turtle Creek; however, given the LOM of the mine is substantial, Turtle Creek monitoring may be useful in terms of evaluating the impact of climate or other activities such as deforestation or fires on flow. The calibration presented for Turtle creek is limited to a small period and has the lowest correlation between modeled and observed monthly flows. Clarification: Did anything change in the Turtle Creek catchment that may have resulted in cumulative underestimates of flow prior to 2014 and overpredictions in 2018? Baseline average monthly flow comparisons were not provided for Turtle Creek. Is there a reason for this data gap? (Source Comment ID#93)	As discussed in Section 3.1 of the 2022 Hydrology and Water Temperature Baseline Report (Appendix 2-I), the H6 gauging station has been difficult to maintain. The station was vandalized in May of 2014 and was damaged again during construction in 2018. No discharge hydrograph data are available in 2019 or 2020 because the creek is suspected to have been impacted by beaver activity. A field reconnaissance was conducted in 2020 to find a potential new location to establish the station, however no definitive new location has been established for this station. Available measured streamflow data from the Project indicates that 2018 freshet occurred in May, however monthly mean measured flows are not available for May 2018 at station H6. Measured flows are also not available for the 2019 or 2020 freshet and summer periods. The absence of high flow data during the latter portion of the calibration period influences the appearance of the fit between modelled and measured flows shown on Figure D.1 of the Baseline Watershed Model Report. Baseline average monthly flow comparisons for Turtle Creek were not provided in Appendix B of the Life of Mine Water Balance Report (Appendix 5-B) because the streamflows are not predicted to change in the catchment attributed to mine development. The content of the report was focused on providing information related to activity in the catchments with predicted changes.		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, June 28	Ready for Publishing
527	Chapter 5: Modelling, Mitigation and Discharges	Source Term Report – Material Reporting	CSFN	Dan Fontaine, P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	Waste rock will be used for construction of the dams along the upstream face and potentially other construction material. Clarification: Please clarify if this material will remain saturated through operations and closure for all scenarios. (Source Comment ID#94)	The TSF and water management designs presented in the Application include for progressive saturation of PAG/NAG3 waste rock deposited into each TSF during operations for all scenarios considered. The reclamation and closure plan includes consideration for maintaining PAG/NAG3 waste rock saturation following closure.		CSFN	KP		Dan	AT/KP	Ready for Submission	KP, June 25	Ready for Publishing

528	Chapter 5: Modelling, Mitigation and Discharges	Source Term Report – LGO Tailings Thickness in Cell D and Cover Requirements	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	TSF D will hold the majority of the waste rock after year 5 and will only contain tailings amounting to 3 years' worth of tailings deposition near the end of operations, primarily from LGO tailings. Clarification: Please clarify if the cover strategy for TSFs rely on oxygen depletion in the LGO tailings and the implications associated with the possibility that waste rock will remain exposed in Cell D at closure, particularly if LGO tailings are not mined. (Source Comment ID#95)	All PAG1, PAG2 and NAG3 waste rock will be stored under saturated conditions in the TSF in the long-term. PAG waste rock will be submerged within one year of placement and NAG3 waste rock will be submerged within five years. In addition to the tailings placed over the waste rock, the final configuration includes a slurried NAG waste rock and overburden cover surface across all PAG tailings. The cover will serve to reduce both net percolation and oxygen ingress into underlying PAG materials. The TSF cover design will be refined based on continued development of closure water management plans and reclamation research. Waste rock will not remain exposed in TSF D at closure.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 21	Ready for Publishing
528	Chapter 5: Modelling, Mitigation and Discharges	Source Term Report – LGO Tailings Thickness in Cell D and Cover Requirements	CSFN -K. Jones	Lorax Environmental Services; BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	Please confirm if the tailings will be PAG. It is unlikely that a waste rock and overburden cover will prevent the development of ARD unless a saturated layer in the overburden is created to restrict oxygen ingress, or the cover is engineered. Further, the ore for the LGO tailings has been exposed for a prolonged period of time. It is unclear if it is possible for the LGO to develop acidic drainage in a timeframe shorter than a year (unless demonstrated otherwise). (Source Comment ID#95)	Yes, both mill tailings and LGO tailings are expected to be PAG. Chapter 4 - Section 4.7.4.1 Design and Construction explains that the NAG waste rock and OVB cover (approximately 30 cm) will be placed, most likely slurried (like tailings placed during operations). A growth medium cover of OVB (approximately 70 cm) overlain by 30 cm of mixed-parent-material surface will be placed by truck and dozer, dumped, and spread to cover the above-water beaches. The total depth of the cover is planned to be approximately 130 cm. The current cover design assumes the TSF beach will be trafficable by heavy equipment. In addition, if a membrane WTP is required at closure, soil application on and revegetation of the TSF surface may cause fouling of the treatment membrane, thus, revegetation may not be permitted (in which case surface soil would not be applied). The TSF cover design will be refined based on continued development of closure water management plans and reclamation research (Section 4.2.5.1, Vegetation and Cover Trials).		CSFN	Lorax	BWG			Ready for Submission	TD, Aug 25	Ready for Publishing
528	Chapter 5: Modelling, Mitigation and Discharges	Source Term Report – LGO Tailings Thickness in Cell D and Cover Requirements	CSFN -K. Jones	Lorax Environmental Services; BW Gold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	The cover commitments must be strengthened. The use of the term "most likely slurried" is not acceptable. The cover must be designed to restrict oxygen ingress and potentially infiltration to the extent possible such that PAG material does not oxidize and produce leachate that is not protective of the environment, within the context of the mine site. A detailed cover design program must be submitted by Dec 31st of the first year of operations. The cover design program must prescribe the following: •Timelines for the implementation of lab scale and field scale trail cover programs. •A complete discussion of the laboratory tests that will be completed. •A discussion of the need for oxygen ingress modelling. •Milestone events for the cover design program. •A discussion of temporary closure strategies to prevent oxidation of the PAG material. •A discussion of how source terms may be impacted by the design. Consistent with the response to ITT ID 437, the source terms must be updated in accordance with the cover design assumptions. (Source Comment ID#95)	BW Gold acknowledges the response.		CSFN	Lorax				GM; Oct 14	Ready for Publishing
529	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance – % Runoff and Infiltration	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Precipitation within the footprint of the upper and lower waste rock piles can either runoff overtop of the waste rock pile, infiltrate through the waste rock pile, or contribute to the wetting up of pore spaces within the waste rock pile. Each of these processes will have unique chemistries and, depending on storage assumption, this could impact the temporal distribution of water from the waste rock pile. Information Request: Please describe the amount of water that is lost to storage in the waste rock piles over time (if any) and describe why the percentage of runoff and infiltration of net precipitation for the upper and lower waste stockpiles varies. (Source Comment ID#96)	Water is held in storage in each of the stockpiles. The modelled total volume of water retained in the stockpile increases during years when the stockpile volume grows and decreases in years that material is removed from the stockpile. Average annual water balances for each mine year for the Upper and Lower Waste Stockpiles and Low-Grade Ore (LGO) Stockpile are provided in Appendix B of Appendix 3-N. The proportions of runoff and infiltration from the Lower and Upper Waste Stockpiles differs due to the different composition of the stockpiles: the Lower Waste Stockpile will consist of approximately 98-100% overburden and limited NAG4/5; the Upper Waste Stockpile will consist of 1/3 overburden and 2/3 NAG waste rock as indicated in Section 4.6 of Appendix 5-B Life of Mine Water Balance Model Report. The LGO Stockpile will be comprised of run-of-mine low grade ore. Stockpiles with higher proportions of waste rock (or run-of-mine low grade ore, in the case of the LGO Stockpile) compared to overburden are assumed to have lower runoff and higher infiltration to a stockpile.		CSFN	KP		Cindy	AT/KP	Ready for Submission	AT, June 08	Ready for Publishing
530	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – LGO Water	CSFN	Knight Piésold Ltd. and Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	The LGO stockpile is assumed to develop acidic drainage during operations. The acidic drainage can be captured by runoff and infiltration or stored within the pore spaces of the pile. Clarification: Please describe if the water/load stored within the LGO pile is expected to contribute to the water/load in the mill and confirm that the LGO supernatant source term account for this source. (Source Comment ID#97)	The treated LGO stockpile water is directed to the TSF pond and would therefore influence predictions in the pond. This water is then pumped to the mill. The process water source term uses the ROM and LGO supernatant chemistries as end members and weights these based on the ore processing schedule to produce the process water source term. A distinct LGO process water source term is developed, and described in Section 4.1.5 of the Source Term Report.		CSFN	KP	Lorax	Cindy/John	AT/KP	Ready for Submission	KP, June 27	Ready for Publishing
530	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – LGO Water	CSFN -K. Jones	Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	The question is related to LGO stockpile acidic drainage. To rephrase, please confirm the inflows from the LGO pile to the ponds/mill (as residual pore water) will not impact the pH of the pond and that during processing, any acidic process water contributions are minor and will be neutralized which will promote metal precipitation. (Source Comment ID#97)	The potential sources of acidity from the LGO are understood to be seepage and water soluble acidity associated with the LGO solids. Seepage from the LGO will be treated prior to discharge, mitigating any potential acidity from this source. LGO solids will be neutralized within the mill prior to discharge into the TSF. A pH of approx. 10.5 will be maintained through lime addition within the mill environment to support CN stability. As a result, the mill will neutralize any water soluble acidity associated with stockpiled LGO. For these reasons, ARD generated from LGO during operations is not expected to impact pond water pH.		CSFN	Lorax				Ready for Submission	GM; Sept 1	Ready for Publishing
531	Chapter 5: Modelling, Mitigation and Discharges	Watershed Model – Adequate Evaluation of Extreme Events	CSFN	Jaime Cathcart, Ph.D., P.Eng.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The highest flow rates in the dataset were observed in May 2018. The highest precipitation rate corresponds to a 1:50 year event. Typically, a 1:100 year precipitation rate are used to evaluate the risk of project and 7Q10 events are used to evaluate the prediction under low flow conditions in the receiving environment. Information Request: Please provide the predictions assuming 1:100 year events for the Watershed Model and provide clarification for where this information is provided or adequate justification for why it is not required. (Source Comment ID#98)	Please see attachment "R1_CSFN Comment IDs 531-536 538 539 543 559.pdf".		CSFN	KP		Cindy/Jaime	AT/KP	Ready for Submission		Ready for Publishing
532	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Accounting for Extreme Wet	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The wet period in the historic record that extends from 1990 to 1997 (Figure 5.1) consists of six wetter than average years, including a 1 in 50 year wet year. The water balance results suggest that wetter than average climate conditions occurring in Years 7 through 10 of Operations could require a different water management strategy than represented in the model to maintain the TSF C Pond within the seasonal inflow allowance and below the maximum normal operating pond volume (the nominal design volume combined with the seasonal inflow allowance). One contingency strategy referenced is pre-emptively pumping water to maintain storage capacity. Information Request: Provide the results for a 1:100 year wet scenario as well as storm duration events (if completed). 534	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Accounting for Extreme Wet Events	CSFN	Knight Piésold Ltd. and Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The wet period in the historic record that extends from 1990 to 1997 (Figure 5.1) consists of six wetter than average years, including a 1 in 50 year wet year. The water balance results suggest that wetter than average climate conditions occurring in Years 7 through 10 of Operations could require a different water management strategy than represented in the model to maintain the TSF C Pond within the seasonal inflow allowance and below the maximum normal operating pond volume (the nominal design volume combined with the seasonal inflow allowance). One contingency strategy referenced is pre-emptively pumping water to maintain storage capacity. Information Request: For the provided results for a 1:100 year wet scenario and storm duration events, are the contingency measures, such as pre-emptively pumping water feasible, and have they been modelled? (Source Comment ID#101)	Please see attachment "R1_CSFN Comment IDs 531-536 538 539 543 559.pdf".		CSFN	KP	Lorax	Cindy/Colin	AT/KP	Ready for Submission		Ready for Publishing
535	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Accounting for Extreme Wet	CSFN	Knight Piésold Ltd. and Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The P95 scenario in the water balance indicates that water treatment rates will be exceeded; however, excess storage capacity does exist on site. Information Request: Please provide the location of the results for the 1:100 year wet scenario and confirmed that there is sufficient storage capacity during wet years to manage the excess water from tailings ponds or other facilities in the event the excess water is unable to be treated. Confirm that the mine can manage water during all periods of mine life without exceeding water quality standards in the receiving environment during extreme wet events. (Source Comment ID#102)	Please see attachment "R1_CSFN Comment IDs 531-536 538 539 543 559.pdf".		CSFN	KP	Lorax	Cindy/Colin	AT/KP	Ready for Submission		Ready for Publishing
535	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Accounting for Extreme Wet Events	CSFN -K. Jones	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	The response to this question indicates that the results of the VCC Model suggest that the volume of water that could require management is up to 120,000 m3 through Year 11, and up to 200,000 m3 in the later years of mining (95th percentile). Water is predicted to be held in the pit sump for one to two months before the WTP has capacity to treat the stored water. The Metals WTP influent rate is sufficient to treat the combined sources of water under average climate conditions. As it is understood, the 1:100 year event wet scenario was not applied during these years. It is unclear from this response if there is sufficient capacity to manage the water from the VCC case (maximum predictions) during this time (which may be lower than the 1:100 wet case). Clarification: Please clarify the water management strategies to manage up to 200,000 m3 of excess water. (Source Comment ID#102)	The Metals WTP Pond will function as an influent equalization pond with a storage volume of approximately 4,600 m3 until Year 4 and up to approximately 9,000 m3 thereafter. This pond is designed to accommodate steady inflows from the various pumping systems from the Lower Waste Stockpile Collection Pond, Open Pit dewatering system, including the pit sump and groundwater dewatering wells, and the Upper Waste Stockpile Collection Pond (beginning in approximately Year +11). The Lower Waste Stockpile Collection Pond (LWS CP), Upper Waste Stockpile Collection Pond (UWS CP), and pit sump will provide temporary storage water generated by flood events until the flows can be transferred to the Metals WTP Pond and treated at the Metals WTP. The flood storage capacity of the LWS CP is approximately 50,000 m3 as described in Sections 6.5 of Appendix 3-N of the Application and the capacity of the UWC CP is approximately 100,000 m3 as described in Section 6.4 of Appendix 3-Y of the Application. The temporary storage capacity in the pit sump will be dependent on the mining phase, but is expected to be substantial and is not considered to be a design constraint that would affect the design basis capacity of the Metals WTP Pond. 535	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Accounting for Extreme Wet	CSFN -K. Jones	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: A permit condition is recommended, described in comment #4 of this memo. (Source Comment ID#102)	Please see the response to Comment 437.		CSFN	KP		Cindy	AT/KP	Ready for Submission	GM; Oct 24	Ready for Publishing

536	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Accounting for Extreme Wet	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	During closure / post-closure, water treatment capacity might be exceeded during some scenarios, with excess water redirected to the open pit. Clarification: Does the potential exist for water to be discharged from the open pit to the receiving environment during this time? (Source Comment ID#103)	Please see attachment "R1_CSFN Comment IDs 531-536 538 539 543 559.pdf".		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, June 24	Ready for Publishing
537	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Seepage from Stockpiles	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	Table 3-26 in the Water Quality Model report indicates various seepage times from TSF C, TSF D and the Pit Lake to downstream locations based on Modflow results. Seepage from the LGO stockpiles is described as potentially 13% of the stockpile footprint could contribute to seepage to the WMP if it is able to flow past engineered line and underdrains according to the Modflow results. The drainage from the LGO stockpile is expected to be acidic and metal leaching and therefore a small seepage rate could contribute a large load to the receptor. It is understood that the LGO will be placed on a drained till cover; however, it is still possible that groundwater recharge beneath the stockpiles will occur during the period this material is stockpiled and develop a plume. The inflows and outflows to the water management pond are shown in Figure 3.27 of the Water Quality Modelling Report; however, the flow term associated with potential LGO seepage in Figure 3.27 was not immediately clear. Clarification: Was uncaptured seepage from the LGO considered in the water quality model and is it possible that a plume from each stockpile could discharge to the receiving environment during post-closure? (Source Comment ID#104)	During Operations, any potential uncaptured seepage would report to a surface drainage that flows to the WMP. Groundwater and surface water will be monitored (as discussed in the Mine Site Water and Discharge Monitoring and Management Plan in Appendix 9-E) during Operations to monitor for uncaptured seepage and additional mitigations will be applied as outlined in Table 10-1 (e.g. discontinuing pumping from the WMP, routing non-contact diversion water around the WMP to the FWR, initiating treatment at the Membrane WTP during winter months), if required. The LGO will be processed before the end of Operations and the LGO stockpile water management systems will be decommissioned and site reclaimed in Closure. Results of groundwater and surface water monitoring during Operations will inform closure planning and final decommissioning/reclamation requirements, therefore the likelihood of an inferred potential plume discharging from the stockpile during Post-closure is considered very unlikely.		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, June 28	Ready for Publishing
537	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Seepage from Stockpiles	CSFN -K. Jones	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	Based on the response, it is assumed that seepage from the LGO stockpile was not considered. However, the response indicated that should seepage bypass the till layer, it will discharge to a drainage ditch and can be managed. Please confirm the understanding of the response is correct. Recommendation: It is understood that the initial groundwater model assumed that seepage from the LGO will be limited by an HDPE liner and a till layer; however, the current plan is to place the LGO on a till layer. If the current model does not consider seepage from the LGO, please consider updating the model going forward with this source, or confirm the loadings will be negligible using a loading calculation (either outside of the model or within the model) to assess the impact of potential seepage on the WMP. (Source Comment ID#104)	Yes, the reviewer's understanding of the response is correct. The numerical groundwater model presented in Appendix 5-F was used to assess the potential flow paths of seepage originating from the LGO stockpile if it was to bypass the engineered liner beneath the stockpile footprint. Results of the groundwater modelling were incorporated into a seepage sensitivity (upper bound) in the water balance model as described in Section 7.1 of Appendix 5-B of the Application. The water balance model seepage sensitivity was the basis for a water quality model sensitivity (Scenario 4) as described in Section 4.4 of the water quality model in Appendix 5-D of the Application. 538	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Accounting for Extreme Dry Events	CSFN	Knight Piésold Ltd. and Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The water balance report indicates there is a risk of the ponds drying up in the 5th percentile scenarios (assuming the driest year is 50%). Maintaining a water cover over rock and potentially tailings is a key mitigation strategy to reduce the potential for acid rock drainage and metal leaching. It is understood that diversions can be discharged to the facility based on the average diversion flow rates. Information Request: Provide the results for a 1:100 year dry scenario, particularly as it relates to exposing PAG material in the facilities or describe where this assessment has been completed. (Source Comment ID#105)	Please see attachment "R1_CSFN Comment IDs 531-536 538 539 543 559.pdf".		CSFN	KP	Lorax	Cindy/Colin	AT/KP	Ready for Submission		Ready for Publishing
538	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Accounting for Extreme Dry Events	CSFN -K. Jones	Knight Piésold Ltd. and Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Information Requirement	No	The response does not provide the results from the minimum scenario. As it is understood, the minimum scenario would represent the 1:50 year dry year in the time series. Please clarify if the minimum results of the VCC scenario result in depleted pond volumes and how climate change and 1:100 dry years are expected to impact pond volumes. Note: The contingency measures discussed in the response to ITT comment ID 539 do appear adequate to manage pond volumes and therefore only a high-level confirmation of understanding and discussion is requested. (Source Comment ID#105)	The minimum (driest) condition generated with the VCC Model does not result in depleted TSF pond volumes. TSF C and D Pond volumes are maintained by allowing more water from the upgradient catchments to be directed onto the TSF than is simulated in the base case VCC Model and the sensitivity model presented in the Round 1 response to Comment ID#538 (KP, 2022). Runoff from catchments upgradient of the TSF are primarily directed around the TSF via the Northern and Southern Diversion Systems and collected in the WMP for discharge downstream. A minimum additional 2.5 Mm3 /yr water is available to contribute to the TSF in the driest modelled year of the base case VCC Model if the non-contact runoff from upgradient catchments is directed onto the TSF instead of around it. This minimum simulated annual volume of water that can be directed to the TSF based on all 40 iterations of the VCC Model is comprised of the following upgradient sources (5th percentile and average volumes also provided for reference): •0.8 Mm3/yr from the Northern Diversion System (5th percentile flow is 1 Mm3/yr and average annual flow is 1.8 Mm3/yr). •0.35 Mm3/yr from the Central Diversion System once the stockpile footprints are at maximum build out (5th percentile flow is 0.4 Mm3/yr and average annual flow is 1.1 Mm3/yr). •1.4 Mm3/yr from the natural drainage contributing to the WMP (5th percentile flow is 1.5 Mm3/yr and average annual flow is 2.9 Mm3/yr). This flow is in addition to flows contributing to the Northern and Southern Diversion Systems. A minimum nominal pond volume of at least 1 Mm3 can be maintained in TSF C and TSF D when water from these upgradient diverted areas are considered. In Closure and Post Closure, untreated water from the ECD, pit lake, and the Upper and Lower Waste Stockpiles could also be directed to injection wells screened in TSF waste rock to facilitate maintenance of a larger pond volume on the TSF surface by maintaining waste rock saturation, if required. Extreme dry conditions such as 1:100 year dry climate could necessitate that a greater volume of runoff from the upgradient catchment is diverted onto the TSF surface to maintain a minimum nominal pond volume. If extreme dry conditions occur during Closure, less water would be pumped from the TSF to the pit lake to facilitate pit filling. Future climate conditions, as discussed in Section 8.0 of Appendix 5 B, are predicted to include higher		CSFN	KP		Cindy	AT/KP	Ready for Submission	AT, Sept 06	Ready for Publishing
538	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Accounting for Extreme Dry Events	CSFN -K. Jones	Knight Piésold Ltd. and Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: A permit condition is recommended, described in comment #4 of this memo. 539	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance and Water Quality Model – Accounting for Extreme Dry Events	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The water balance report indicates there is a risk of the ponds drying up in the 5th percentile scenarios (assuming the driest year is 50%). Maintaining a water cover over rock and potentially tailings is a key mitigation strategy to reduce the potential for acid rock drainage and metal leaching. It is understood that diversions can be discharged to the facility based on the average diversion flow rates Information Request: Discuss the contingency measures in place for extreme dry events, particularly as they relate for the potential for the water within the diversions to maintain sufficient volumes of water to ensure PAG material maintains a water cover and for adequate flow to be maintained at all points within the downstream environment (including consideration for realistic pumping rates). (Source Comment ID#106)	Please see attachment "R1_CSFN Comment IDs 531-536 538 539 543 559.pdf".		CSFN	KP		Cindy	AT/KP	Ready for Submission		Ready for Publishing
540	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance – Water Cover Depth	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	A water cover is typically an adequate barrier to significant oxygen ingress due to the limited solubility of oxygen in water. Standard practice has suggested as a rule of thumb that a 2 m water cover is a suitable depth. Information Request: Please confirm the location of the water table in the TSF and the saturation depth of waste rock during operations and closure. (Source Comment ID#107)	The water management strategy for the TSF is to maintain saturation of the waste rock and a pond on the surface of the TSF during Operations through Post-Closure. To achieve this, the water table in the TSF will rise commensurate with the waste rock placement such that the waste rock is saturated within one year of deposition in the TSF. In closure and post-closure, the supernatant pond will be maintained above the elevation of the waste rock. Similar comments were raised by EMLI (308, 316 & 389). Please see Please see attachment "R1_EMLI Geotech-Geoscience Comment IDs 308 316 389.pdf" for more explanation on this topic.		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
540	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance – Water Cover Depth	CSFN -K. Jones	Dan Fontaine, P.Eng.; Knight Piésold Ltd. John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Information Requirement	No	Please confirm that the PAG material will be covered with a 1 m water cover or engineered cover that will prevent oxygen ingress to the extent possible, and that any potential oxidation is accounted for in the assessment. (Source Comment ID#107)	As stated in the R1 response, during the Operations phase, the water table in the TSF will rise commensurate with the waste rock placement such that the waste rock is saturated within one year of deposition in the TSF. Thus, during the Operations phase, there is no water cover over the PAG/NAG3 waste rock. During the Operations phase, some of the PAG tailings are covered by the supernatant pond; the depth of the pond varies within the TSF, and throughout the life of mine. A minimum depth is not listed as a design criteria. As noted in Section 4.7.4.1 of the Application, a cover is proposed over the surface of the TSF for the Closure and Post-Closure phases of the mine, as well as a supernatant pond over a portion of the TSF surface. Oxidation of exposed PAG material that is not yet saturated/covered is incorporated into the water quality model. PAG1 and PAG2 waste rock is assumed to become partially acidic when oxidizing prior to saturation/cover placement. Runoff from the unsaturated mine waste contributes loading to the tailings pond and a flushing load is also assumed to be released upon inundation of this material. 540	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance – Water Cover Depth	CSFN -K. Jones	Dan Fontaine, P.Eng.; Knight Piésold Ltd. John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: The time that PAG rock can be exposed on site should be defined in the permit, as well as the minimum water depth over subaqueous deposited material that has been exposed for a defined period of time. The permit should prescribe the exposure times, the minimum depths, and how this will be tracked and recorded. This can be decided during the writing of the permit.(Source Comment ID#107)	BW Gold acknowledges the recommended permit condition and is open to discussing language related to this condition that is measureable and achievable.		CSFN	KP		Dan	AT/KP	Ready for Submission	AT, Oct26	Ready for Publishing
541	Chapter 5: Modelling, Mitigation and Discharges	LOM Water Balance – Water Taking	CSFN	Palmer	Jun 02, 2022	1	New	Information Requirement	No	The Blackwater mine requires significant water management during operations, closure and post-closure. Diverted flows are required for 100% of the FWR in some years to maintain flow requirements. Information Request: Please clarify how water taking is predicted to impact water levels in Tatelkuz Lake (potentially requiring a bathometric survey if Lake volume is assumed to remain constant in the model) and thus flows downstream in Chedakuz Creek. (Source Comment ID#108)	Long-term water withdrawl from Tatelkuz Lake is not predicted to have a significant effect on water surface elevation (i.e.., indistinguishable from natural variation) based on water modelling. Section 5.3.9..4.5 Reduction in Littoral Fish Habitat of Tatelkuz Lake of the EIS/Application states that "The magnitude of change is negligible to low, because some months will differ from mean baseline values, but will remain within range of natural variation. On average, water surface elevation of the lake fluctuates 0.8 m over a year, but the greatest change estimated to be caused by pumping 0.11 m from baseline conditions or 14% of the baseline range". Effects on littoral habitat in Tatelkuz Lake were not considered to have changed in the subsequent updated assessments (Blackwater Gold Project – Consolidated Fish and Fish Habitat Effects Assessment, ERM September 2017). Conclusions presented in the Application/EIS are considered to be conservative, as water withdrawal from Tatelkuz Lake to augment flows in Davidson Creek will be decreased based on project design changes. Any potential changes in aquatic habitat will be monitored as part of the follow-up program for the CEAA Decision Statement Condition 3.16 pertaining to fish habitat in Tatelkuz Lake and Chedakuz Creek. A memo on this follow-up plan was submitted to Indigenous groups for review. Additionally, the provincial EAC Condition 31 Tatelkuz Lake Protection Plan mandates the development of a plan that will evaluate changes to flows and fish habitat in Tatelkuz Lake. BW Gold will develop this plan in consultation with First Nations and regulators.		CSFN	Palmer			0	Ready for Submission	TD, Jun 28	Ready for Publishing
542	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model / Source Term Development – Reduction of Oxygen Ingress	CSFN	Knight Piésold Ltd. and Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Condition 33 of the Schedule B Table of Conditions states “the means by which the Holder will implement an oxygen-preventing barrier to cover waste rock, tailings and other mine by-products to prevent adverse effects from rock that is currently or potentially acid-generating or ML. The barrier may include coverage with additional tailings, water, or another mitigation measure that will be effective at limiting the potential for ML/ARD”. The water quality model report indicates that at closure, the tailings will be covered by overburden but does not describe how ingress of oxygen and/or water will be reduced by the placement of the cover. The source term for runoff and infiltration through the tailings has a sulphate concentration of 1.82 mg/L. Beach runoff during all years of operations is calculated to be 231 mg/L. Both concentrations assumed neutral pH leaching. It is unclear how the placement of an overburden cover will reduce oxygen ingress or infiltration of water to the tailings. Importantly, according to Figure 2.6, the pond volume in TSF C will be maintained by a spillway with a volume of 2,000,000 m3. This volume is significantly less than the pond volume maintained during operations. The pond volume in TSF D is expected to increase at year 2042 at 2,000,000 m3; however, the VCC cases shows periodic reductions of this pond volume to 0 m3. Information Requirement: Please describe the predicted water level within the tailings sands deposited in TSF C and D for all phases of mine life, particularly during closure, to ensure the water level does not drop with time and that tailings remain saturated. Describe how the placement of the cover will reduce oxygen ingress such that metal loadings are reduced and acidic drainage is prevented. (Source Comment ID#109)	(The EAC Condition 33 management plan and the requirements in the EAC condition itself is not applicable to the MW's MAEMA application.) If we can still address the comment, great but I included the wording at the top because Condition 33 is listed in the comment. TD, 15-Jun The water management strategy for the TSF is to maintain saturation of the waste rock and a pond on the surface of the TSF during Operations through Post-Closure. To achieve this, the water table in the TSF will be maintained above the elevation of the waste rock (Section 9.2 of Appendix 3-K). The cover will serve to reduce both net percolation and oxygen ingress into underlying PAG materials. The TSF cover design will be refined based on continued development of closure water management plans and reclamation research. In the event that LGO is not processed, PAG waste rock exposed in TSF D would require a water cover or dry cover to mitigate ARD potential.		CSFN	KP	Lorax		AT/KP	Ready for Submission	KP, June 22	Ready for Publishing

542	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model / Source Term Development – Reduction of Oxygen Ingress	CSFN -K. Jones	Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	The question is largely related to the acidic conditions developing in the tailings material at closure; however, the response largely referenced the waste rock. As it is understood, the source terms for the tailings assume neutral metal leaching. It is unclear why the tailings will not develop acidic drainage at closure if the tailings are unsaturated. A crushed waste rock and/or overburden cover cannot be relied upon to reduce oxygen ingress. Clarification: Will the tailings in the final year of closure be desulphurized, intimately mixed with lime to prevent ARD in the tailings material, or will some other measure be used to prevent this from occurring? (Source Comment ID#109)	The reclamation and Closure Plan (Ch 4 of Application) states that the final configuration of the TSF includes a slurried NAG waste rock and OVB cover surface across all PAG tailings. This cover will be approx. 30cm. Approx. 70cm of OVB overlain by 30 cm of mixed-parent-material surface will be placed on tailings beaches. The total depth of the cover is planned to be approx. 130 cm. The TSF cover design will be refined based on continued development of closure water management plans and reclamation research A draft plan (EAC Plan 33 - Mine Waste and Water Management Plan) was submitted April 28, and the final plan will be completed no later than 6 months after issuance of the Mines Act and EMA permits. Alternative closure designs (i.e., desulphurized tailings/NP additions) can be adressed as part of the EAC Plan 33 review process. 543	Chapter 5: Modelling, Mitigation and Discharges	LOW Water Balance, Water Quality Model – Incorporation of Water Management Activities	CSFN	Knight Piésold Ltd. and Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	The VCC water balance results indicate that water management contingency measures may be required for some scenarios. Some of these scenarios include water storage onsite prior to treatment, redirection of diversion ditches to the mine site, pumping water to maintain adequate flow rates in Davidson Creek. Clarification: Describe if the water balance model and water quality model include the contingency measures in the model, either as "if" statements or switches to ensure the evaluate the impact of these contingency measures on water quantity and water quality. (Source Comment ID#110)	Please see attachment "R1_CSFN Comment IDs 531-536 538 539 543 559.pdf".		CSFN	KP	Lorax	Cindy	AT/KP	Ready for Submission	KP, June 29	Ready for Publishing
544	Chapter 5: Modelling, Mitigation and Discharges	Water Management – Water Treatment	CSFN	Kareena Gill, M.Eng., P.Eng., Romick Bhatti, P.Eng.,, and Lynda Smithard, P.Eng.; McCue Engineering Contractors	Jun 02, 2022	1	New	Clarification	No	It is understood that water treatment is being incorporated into the mine plan as a best practice waste management and mitigation measure. The water quality predictions are highly dependent on the effluent water quality source terms and assumptions and thus any uncertainty in these assumptions will propagate through the predictions. Clarification: Please clarify if any circumstances exist where the water treatment measures/strategies may not be operational, whether these are related to weather, operational constraints, or economic constraints, that could result in discharge of untreated effluent to the environment. (Source Comment ID#111)	All the circumstances that could lead to discharge of untreated effluent to environment are listed below: 1.Change in inlet water quality/chemistry (e.g. pH, TSS, metal concentrations, etc...) 2.Failure in effluent water quality monitoring 3.Water level in the Metals Treatment Pond and TSF exceeding system capacity 4.Depletion of WTP chemicals/reagents 5.Disruption of equipment service (water, chemical and sludge pumps, mixers, chemical make-up equipment) 6.Disruption of Lime Supply to WTP 7.Fouling of hydrated lime injection line to Reactor Tank These risks are presented in the risk assessment submitted to BW Gold as part of the WTP Detailed Design Package (July 30, 2021). Specific risk mitigation plan or actions are also included for each of the above-mentioned risks.		CSFN	McCue		Lynda	GM	Ready for Submission	GM; June 17	Ready for Publishing
544	Chapter 5: Modelling, Mitigation and Discharges	Water Management – Water Treatment	CSFN -K. Jones	Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	A loading calculation to evaluate the percentage of untreated water that can be discharged before ENV WQGs and Yinka Dene water quality standards are exceeded in the receiving environment has not been completed to date. The capacity for the receiver to absorb untreated discharge would be expected to vary on a monthly basis and with the different project phases; however, overall it is expected to have little to no capacity. As an example, the predictions for D-Cd at WQ28 are occasionally above 80% of the long-term WQG from Closure onwards. In addition, an untreated effluent model scenario was developed in response to Round 1 Comment 99 (Lorax, 2022). In this scenario, the membrane and metals water treatment plants were turned off. The elevated concentrations for several parameters predicted under this scenario underscores the importance to develop robust water treatment plans, water management strategies and related surveillance monitoring in receiving streams below the project. Reference Lorax Environmental Services Ltd. (Lorax). 2022. Response to Round 1 Review Comment 99. Prepared for BW Gold Ltd. Technical Memorandum dated June 30, 2022. 545	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model / Source Terms – Modelled Parameters	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	The list of parameters incorporated into the water quality model is comprehensive and includes total and dissolved metals. Clarification: Please clarify how total concentrations are modelled, particularly with respect to source term development using humidity cell leachate as well as solubility constraints applied within the water quality model. (Source Comment ID#112)	Source terms are developed as dissolved concentrations. The difference in total and dissolved predictions are in the receiving environment is based on background water quality where both total and dissolved results were available. In general, dissolved and total concentrations are very similar when total suspended solids are <15mg/L as required by MDMER end for mine effluent.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
545	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model / Source Terms – Modelled Parameters	CSFN -K. Jones	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	Thank you. Please confirm that TSS <15 mg/L will be a permit limit (Source Comment ID#112)	Effluent permit limits for Project discharges to the receiving environment have not yet been approved. However, a discharge limit for TSS equivalent to MDMER maximum authorized concentrations are proposed for Project surface discharges. Per MDMER, the maximum authorized monthly mean concentration for suspended solids (i.e., TSS) is 15 mg/L.		CSFN	Lorax				Ready for Submission	GM; Aug 30	Ready for Publishing
545	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model / Source Terms – Modelled Parameters	CSFN -K. Jones	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: The target limits for all direct discharges to the environment must be developed prior to the issuance of the permit and prescribed in the permit as a condition. The target limits must be developed in consultation with CSFN. (Source Comment ID#112)	The *Environmental Management Act* (EMA) effluent permit issued to BW Gold Ltd. will include flow and concentration limits for direct discharges to the environment. It is anticipated that the draft effluent permit will be provided to CSFN for review prior to permit approval. CFSN should reach ut directly to ENV, should CSFN have questions about the draft permit conditions review process.		CSFN	Lorax					GM; Oct 28	Ready for Publishing

546	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model/ Source Term Development – pH Controls (Importance Medium)	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	Figure 3.7 in the Water Quality Model Report indicates that parameter concentration can vary over several orders of magnitude at a given pH value. It is understood that pH is selected to constrain concentrations is based on laboratory testing data. Clarification: Has there been any attempt to predict the pH of mixing waters or evaluate how redox and PCO2 concentrations may impact concentrations? (Source Comment ID#113)	Estimates of pH and pCO2 were used to define geochemical loading rates and set solubility controls within geochemical source terms. These source terms are then input to the GoldSim model, which functions as a conservative mixing model, except where explicitly noted (e.g., Zn and Cd solubility dependence on SO4 within TSF pond).		CSFN	Lorax		John	GM	Ready for Submission	GM; June 21	Ready for Publishing
546	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model/ Source Term Development – pH Controls (Importance Medium)	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	An expanded response to this question is requested. Please confirm that the lowest pH in the source term for base case was 4.71 above Al(OH)3 buffering, and confirm this was the minimum pH for the base case and 4.41 for the conservative case. Please discuss if loading rates for exposed PAG (particularly on the pit wall) assume this pH or a mixed pH based on weighted average of pH (log scale) or if mixing was conducted in PHREEQC.	The minimum pH values used in source term development are correctly described in the R2 comment. The weathering state of mine rock (e.g., acidic or neutral) was considered in source term development. In regards to pit wall runoff, source terms were developed for each type of wall rock (including acidic PAG1 and acidic PAG2) and the resulting runoff contributes to the pit sump/pit lake where it is conservatively mixed with other pit inflows.		CSFN	Lorax				Ready for Submission	GM; Sept 1	Ready for Publishing
546	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model/ Source Term Development – pH Controls (Importance Medium)	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: This uncertainty can be addressed by the permit condition outlined in comment #4 of this memo. (Source Comment ID#113)	This comment is acknowledged. Please refer to the response provided in this ITT to Round 3 Comment #437.		CSFN	Lorax					GM; Oct 31	Ready for Publishing
547	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model/ Source Term Development – pH Controls	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	Figure 3.7 in the Water Quality Model Report indicates that parameter concentration can vary over several orders of magnitude at a given pH value. It is understood that pH is selected to constrain concentrations is based on laboratory testing data. Clarification: Please confirm if the constraints are assumed to be dependent on thermodynamics or potential sorption mechanisms. (Source Comment ID#114)	Arsenic was the only parameter where solubility was assumed to be controlled by a sorption mechanism. This was modelled using a PHREEQC-based hydrous-ferric oxide (HFO) sorption model, with inputs calibrated to HCT results. The HFO sorption model did not influence the concentration of any other parameter. Please refer to Section 3.6 of the Source Term Report for further description of the As HFO sorption model and other mineral solubility constraints applied in the model.		CSFN	Lorax		John	GM	Ready for Submission	AT, June 08	Ready for Publishing
548	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model/ Source Term Development – pH Controls	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	concentration can vary over several orders of magnitude at a given pH value. It is understood that pH is selected to constrain concentrations is based on laboratory testing data. Clarification: Over what scale range have the constraints been tested (i.e.., using large loading rates such as field leach bin data, seepage data, or analogue data) to ensure the pH constraint is not limited by load. (Source Comment ID#115)	Mine effluent pH is predicted based on kinetic testing. Kinetic testing included saturated columns (approx. 7kg), humidity cell tests (1kg), and field cells (2.5 to 3.0 kg). Assumptions around mine waste rock pH are described in Section 3.1.2 of the Source Term Report.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
549	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Scaling Factors	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	Scaling factors are used to adjust concentrations from the laboratory scale to the field scale. This practice relies largely on experience and analogue information from other mine sites, as well as theoretical calculations. However, one assumption incorporated into the scaling factors is that sulphide oxidation effectively does not occur during periods of the year where freezing conditions persist. The process of sulphide oxidation itself involves the generation of heat so it is unclear if this particular assumption is sufficiently conservative. The Arrhenius equation is applied as a scaling factor assuming the average annual temperature. Therefore, if this scaling factor is assumed, potential freezing of the material is inherently already considered. Clarification: Clarify if the temperature scaling factor accounts for average annual temperature at the mine site and if the generation of heat through sulphide oxidation has been considered. (Source Comment ID#116)	Sulphide oxidation rates, along with most other geochemical reactions will essentially be halted under frozen conditions, because these reactions require the presence of liquid water to proceed. Therefore, geochemical weathering rates are set to zero under frozen conditions, and the Arrhenius equation is used to account for temperature effects on sulphide oxidation when temperatures are above freezing. Waste stockpiles and waste rock stored in the TSF are assumed to be above 0ºC year round, and no consideration was given to seasonal freezing of waste rock or overburden, which may occur near the surface of these facilities during winter months. The Arrhenius correction of 0.66 was applied to these source terms, which equates to an average temperature of 15ºC and is consistent with the correction factor applied in the EA source term calculations for the Project. Source terms related to surficial weathering of rock exposures (tailings beach and pit wall) were assumed to be frozen for 4 months of the year. Sulphide oxidation is expected to be inhibited under frozen conditions, and an additional scaling factor was applied to these source terms to account for this. Please refer to Section 3.4 of the Source Term Report for a full description of scaling factors.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing

550	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Annual Distribution of Load	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	The loading rates are based on laboratory testing rates that are multiplied by scaling factors and ultimately divided by the amount of water infiltrating through the waste to develop a concentration. However, as has been correctly pointed out as part of the source terms, the loading rates can vary depending on temperature. Furthermore, the rate of infiltration/runoff also varies as a function of temperature and season. For this reason, there is often a seasonal variation observed in seepage water concentrations collected at mine sites. Clarification: Has seasonality been considered as part of source term development and do potential seasonal variations have the potential to impact concentrations that are ultimately discharged to the environment? (Source Comment ID#117)	Source terms are applied on an annual time step and do not vary seasonally. Seasonality of geochemical loadings in mine discharges predicted in the water quality model is controlled by the water balance.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
551	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Background Concentrations	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	It is understood that background concentrations in the receiving environment are based on observed water qualities. Clarification: Please clarify the percentile statistic for the conservative case water qualities. (Source Comment ID#118)	Monthly median concentrations from the baseline surface water quality datasets (on a station-by-station basis) were used as background terms in all model cases.		CSFN	Lorax		Meghan	GM	Ready for Submission	GM; June 14	Ready for Publishing
551	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Background Concentrations	CSFN -K. Jones	Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	Please confirm if any additional exceedances would be expected if the 75th percentile parameter statistic was used to calculate background concentrations due to reduced capacity for dilution (Source Comment ID#118)	Please see attachment "R2_CSFN Comment ID 551_vS.pdf"		CSFN	Lorax				Ready for Submission	GM; Sept 2	Ready for Publishing
551	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Background Concentrations	CSFN -K. Jones	Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: This uncertainty can be addressed by the permit condition outlined in comment #4 in this memo.(Source Comment ID#118)	This comment is acknowledged. Please refer to the response provided in this ITT to Round 3 Comment #437.		CSFN	Lorax					GM; Oct 31	Ready for Publishing
552	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Background Concentrations	CSFN	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	During the winter, creeks tend to be baseflow dominated. This means the majority of the water that discharges to the creeks is from the groundwater system. Groundwater inflows (i.e.., baseflow) tend to have higher observed concentrations than overland runoff or snowmelt inflows. During dry years, the amount of runoff can be significantly reduced relative to the baseflow proportion of flow. Therefore, segregation of these flow terms can be important with respect to climate sensitivity analyses. Clarification: Please clarify if the water quality in the creeks/streams accounted for baseflow and overland flow loading inputs. (Source Comment ID#119)	Background water quality terms for creeks/streams were derived from baseline surface water quality data, which inherently reflect baseflow and overland flow loading inputs.		CSFN	Lorax		Meghan	GM	Ready for Submission	GM; June 14	Ready for Publishing
553	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Calibration	CSFN	Colin Fraser, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	Calibration of a model refers to changing inputs of the model within reason to better match observed data. Benchmarking refers to a direct comparison of predicted values to observed values. Clarification: Please clarify if the water quality model calibration was conducted for all parameters of interest in the WQM and which inputs, if any, where adjusted to improve calibration. (Source Comment ID#120)	As indicated in Lorax (2021), prior to predicting water quality concentrations for the Construction, Operations, Closure and Post-Closure phases, an initial screening was conducted to assess the reasonableness of WQM outputs for the Baseline/Pre-construction period. None of the background water quality source terms inputted to the water quality were 'adjusted' or calibrated. In this regard, the initial screening steps discussed in Lorax (2021) (see Section 3.2.10) is a benchmarking exercise. Lorax Environmental Services Ltd. (Lorax). 2021. Blackwater Gold Project: Water Balance and Water Quality Model Report. Rev F. November 24, 2021. 1053 pp.		CSFN	Lorax		Colin	GM	Ready for Submission	GM; June 21	Ready for Publishing
553	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Calibration	CSFN -K. Jones	Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	It is understood that water quality was benchmarked and that no adjustments to concentrations or loading rates were made other than those related to effluent concentrations or due to solubility constraints, or adsorption constraints in the case of arsenic. If this understanding is correct, this comment can be considered closed. (Source Comment ID#120)	The description in R2 comment is correct. Therefore the comment will be considered closed.		CSFN	Lorax		John		Ready for Submission	GM; Sept 1	Ready for Publishing
554	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Brine Flow Term	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	During Post-Closure, the water treatment brine is assumed to be diverted to the open pit. This flow term has high concentrations associated with treatment. Clarification: Please confirm the open pit is a fully mixed reservoir that includes the brine term. (Source Comment ID#121)	Pit lake modelling results presented in the Application (submitted April 2022) consider the pit as a fully mixed reservoir and model coding includes the addition of brine to the pit lake. Note that version 12b water quality model results (see Application) were computed on October 26, 2021. Since that time, Lorax has further refined the water quality model predictions for the pit lake focusing on items such as: 1) modelling the pit lake as a one-cell versus two-cell (stratified) system, with brine directed to the deeper layer of the two-cell model domain; 2) modelling the pit lake scenario using revised assumptions for brine circulation between the WTP and pit lake; and 3) configuring a detailed pit lake model using PitMod (hydrodynamic model) to confirm timing of stratification and expected surface layer thickness of the pit lake, in post-closure. As indicated in Response 509, Version 13c water quality predictions are the most recent model output available for the Project. Version 13c predictions were presented to EMLI, ENV and First Nations technical consultants on June 15, 2022, and are summarized in Lorax 2022.		CSFN	Lorax	BQE	Colin/Veneil	GM	Ready for Submission	GM; June 21	Ready for Publishing
554	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Brine Flow Term	CSFN -K. Jones	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	Thank you for the update to the model. It is acknowledged this comment is a pivot from the initial question; however, the pit lake zinc and cadmium concentrations are very high. Will efforts be made to maintain a clear water cap to protect wildlife? Further, were the concentrations presented in the PowerPoint from June 15 representative of mixed or stratified concentrations in the pit with time? (Source Comment ID#121)	With respect to the first question, please refer to the latest pit lake modelling sensitivity presented in "R2_EMLI Geoscience LDNUFN Comments 411 1309 1348 1624.pdf", which incorporates pit lake stratification, for further detail. A key component of the pit lake water management is the conveyance of brine from the WTP to the bottom of the pit. This serves to engineer permanent stratification in the water column, thereby physically isolating the brine flows from the surface water system (i.e., the clear water cap). In the pit lake sensitivity model referenced above, predicted Cd and Zn concentrations in the pit lake surface layer fall below BC water quality guidelines for the protection of wildlife. It is further expected that the elevation of the pit lake is expected to prevent access for most terrestrial wildlife. With respect to the second question, concentrations presented for the pit lake in the June 15 PowerPoint presentation reflected a fully-mixed (one-cell) pit.		CSFN	Lorax				Ready for Submission	GM; Aug 30	Ready for Publishing

554	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Brine Flow Term	CSFN -K. Jones	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up		No	Please refer to the Round 3 comments under comment IDs 487 and 490.(Source Comment ID#121)	Please refer to the respective responses to Round 3 Comments 487 and 490 in this tracking table.		CSFN	Lorax				28-Oct-22	GM; Nov 1	Ready for Publishing
555	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Capacity of the Open Pit to Maintain Brine Water	CSFN	Colin Fraser, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Figure 3.16 indicates you are treating about 170 m3/month of water from the open pit but discharging approximately 130 m3/month of the brine water back to the pit. Given the inflow and outflow volumes are relatively similar, it is unclear if the pit water quality will progressively worsen with time or what the capacity of the open pit is to contain the brine if brine effluent volumes are greater than 130 m3/month, particularly during wet years. Information Request: Please discuss the predicted water quality of the open pit with time and what realistic conditions (i.e.. treatment discharge rates), if any, would result in capacity of the open pit capacity to retain water being exceeded. (Source Comment ID#122)	For the modelling work presented in the Application, the Membrane WTP capacity is 190 L/s (or 492,500 m3/month) during Post-Closure. Make-up water to maintain the constant influent rate is sourced from TSF C when flows from the ECD and Pit Lake are not sufficient. Brine created during the treatment process is discharged to the Pit Lake, with treated effluent from the Membrane WTP being discharged to applicable infrastructure (i.e.., the FWR/Plunge Pool). For the scenarios modelled as part of the Application submission (i.e.., Average climate case, Climate change case and Variable climate case), water balance simulations did not show uncontrolled/passive discharge. In other words, the capacity of the pit lake to retain contact water wasn't exceeded during the simulations.		CSFN	Lorax	KP	Colin/Cindy	GM	Ready for Submission	GM; June 21	Ready for Publishing
555	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Capacity of the Open Pit to Maintain Brine Water	CSFN -K. Jones	Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	Thank you for the response. Please clarify if the brine inflow and water quality in the Open Pit reaches steady state conditions. (Source Comment ID#122)	With respect to brine inflow to the pit, the water balance assumes a variable water treatment rate (and therefore brine inflow rate to the pit) that depends on site water management needs under the range of variable climate conditions considered in the model. In the water balance average climate case, this treatment rate effectively achieves steady at the onset of the Post-Closure phase. With respect to open pit water quality, please refer to updated pit lake model results presented in Round 2 attachment "R2_EMLI Geoscience LDNUFN Comments 411 1309 1348 1624". This updated model presents the predicted spatial and temporal distribution of temperature, density, dissolved oxygen and water quality parameters in the lake. As shown in Appendix A of "R2_EMLI Geoscience LDNUFN Comments 411 1309 1348 1624", certain parameters such as dissolved oxygen, are predicted to reach steady state within the model time frame from the perspective of spatial distribution within the pit lake water column (Figure 4-4 of Appendix A). Other parameters, such as TDS, do not achieve steady state within the model time (Figure 4-3 of Appendix A)		CSFN	Lorax				Ready for Submission	GM; Sept 2	Ready for Publishing
555	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Capacity of the Open Pit to Maintain Brine Water	CSFN -K. Jones	Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up		No	Please refer to the Round 3 comments under comment IDs 487 and 490. 556	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model / Source Term Development – Sludge Characterization	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommended Permit Condition	Yes	Sludge will be generated at the site. A source term for the sludge has not been developed as it is assumed to contribute a negligible amount of load to the overall load in the TSF. Recommended Permit Condition: It is recommended that sludge characterization and stability in varying redox conditions be determined as a requirement of the permit. Incorporation of the sludge into predictions should also be completed should it be determined that resulting concentrations will be significant. (Source Comment ID#123)	This comment is acknowledged.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
557	Chapter 5: Modelling, Mitigation and Discharges	Waste Management Alternatives – Backfill to Open Pit	CSFN	Greg Smyth, B.Sc.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	The open pit will be filled with water and the water quality model indicates that water from the open pit will not be discharged to the downstream environment. The dry scenarios in the Water Balance Report indicate that PAG waste may be exposed during certain dry years. Clarification: Given this potential, please describe if backfilling waste rock material to the open pit has been considered. (Source Comment ID#124)	Backfilling of waste rock material to the open pit has not been considered as a mitigation for the dry scenarios contemplated in the water balance model. A more practicable alternative is to augment water supply to the TSF to maintain waste rock saturation.		CSFN	KP		Greg/Cindy	AT/KP	Ready for Submission	KP, June 29	Ready for Publishing
558	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Excess Water	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	As tailings are progressively deposited into the TSFs, the weight of the tailings will cause the tailings to compact and excess pore water released from this settling will discharge into the tailings pond. This excess water will largely be similar to process water. The concentration of select parameters was set equal to the TSF pond concentration. It is not immediately clear if this is a conservative approach. Figure 4.5 and Figure 4.6 suggest that it does represent a reasonable assumption for sulphate and molybdenum but a comparison of other parameters was not provided. Clarification: If the source term impacts concentrations significantly, please confirm that the concentration applied to this source reasonably represents the excess pore water. (Source Comment ID#125)	Trace metal concentrations were set equal to median and 90th percentile saturated column concentrations for base case and upper case, respectively. This approach was taken so that tailings consolidation water could reflect interaction with tailings under saturated conditions. Consolidation water constitutes 3.4% to 8.5% of annual inflow volume to TSFC, and 4.2% to 5.7% of annual inflow volume to TSF D during active tailings deposition.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
558	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Excess Water	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	Saturated columns do not consider the load released to the slurry (i.e. process water which will be the water that is within the pores at deposition). The response does indicate that excess water is less than 10% of the inflow and therefore the implications associated with this source term are low. Therefore, confirmation that the process water chemistry will be within an order of magnitude of the concentration associated with the subaqueous column leachate is requested. (Source Comment ID#125)	Please see attachment "R1_CSFN_Comment IDs 437 and 558.pdf"		CSFN	Lorax				Ready for Submission	GM; Sept 2	Ready for Publishing

559	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Inflow and Outflow Figures	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Figures 2.6 and Figure 2.7 indicate the storage capacity of the TSF Ponds. However, the open pit storage capacity figure was not identified in the main body of the report. Information Request: Please provide the storage capacity figure of the Open Pit for the VCC case and a 1:100 year wet scenario, assuming maximum water treatment rates. (Source Comment ID#126)	Please see attachment "R1_CSFN Comment IDs 531-536 538 539 543 559.pdf".		CSFN	KP		Cindy	AT/KP	Ready for Submission		Ready for Publishing
560	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Seepage Rates	CSFN	Knight Piésold Ltd. and Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	The groundwater seepage flow terms were based on incorporating mean or median or flow time estimates. Seepages with a median or mean travel time greater than 125 years were not included in the model. Clarification: Please describe if the lower travel time estimate of the mean or average was incorporated into the model and/or if this has resulted in the exclusion of a flow term that otherwise would have been included. Further, does the inclusion of a portion of an excluded seepage flow term result (e.g., Incorporating 20% of the seepage if the median travel time is 200 years) result in measurable changes to receiving water quality? (Source Comment ID#127)	Seepage travel times incorporated into the water quality modelling were based on median travel time estimates. The median travel times were equal to or lower than the average travel times for approximately 75% of the potential seepage paths predicted to originate from the TSF and stockpiles. There are no instances where incorporating the average travel time rather than the median would have resulted in the inclusion of an additional seepage path in the modelled analysis. The inclusion of a seepage flow term that constitutes recoverable seepage would not be expected to result in a measurable change to receiving water quality, as recovered seepage is ultimately directed to treatment. The inclusion of a flow term that constitutes unrecoverable seepage has potential to change receiving water quality, but the degree of change has not been quantified in the water balance/water quality model to date. As noted in Comment response 130, BW Gold acknowledges uncertainty in TSF seepage and potential changes to predicted receiving environment water quality and quantity. A model sensitivity will be conducted to address Comments 130, 142, and 417. The predicted water quality results of model output will be presented in a memorandum provided to MRC on or before July 20, 2022.		CSFN	KP	Lorax	Cindy	AT/KP	Ready for Submission	KP, June 28	Ready for Publishing
560	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Model – Seepage Rates	CSFN -K. Jones	Knight Piésold Ltd. and Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	It is understood the open pit will maintain a lower water level to capture potential escape of recoverable seepage. Please confirm if any flow pathways with travel time estimates with average/median travel time estimates greater than 100 years have the potential to exceed guidelines if only a portion of the seepage discharges to the receiving environment (eg. 20%), if not recovered. Please confirm if additional PAG rock will be exposed at closure due to this change in operational management. If so, how will this impact the pH of the pit and potential stratification that would preclude the development of a clear water cap at closure due to elevated loadings from the rock walls to surface? (Source Comment ID#127)	The closure plan is to maintain the pit lake water level surface at a level that causes the pit lake to function as a groundwater sink and prevent seepage from leaving the lake. The pit lake water level and groundwater levels surrounding the pit lake will be monitored while the pit lake is filling during Closure and in Post-Closure to ensure the pit lake level remains below the surrounding groundwater levels. Seepage is unable to leave the pit lake when it is maintained as a groundwater sink and seepage would consequently be unable to contribute to the downstream environment. The pit lake will be managed at a lower elevation if maintained as a groundwater sink. This will result in additional pit wall rock being exposed at closure, which includes additional PAG1 and PAG2. The PAG1 exposure increases from approximately 7 ha with the higher pit lake elevation up to 13 ha with the lower pit lake elevation (10% to 14% of exposed pit wall) and the PAG2 exposure increases from approximately 8 ha to 12 ha (10% to 13% of exposed pit wall). The water quality model does not include predictions for pit lake pH. The additional modelling conducted for the two cell pit lake in GoldSim and PitMod have used the lower elevation (1,440 masl). These results have been presented in "R1_CSFN_LDN-UFN Comment IDs 844, 1280, 1281, 1309, 1344 to 1346, 1348, and 1624.pdf" and "R2_EMLI Geoscience LDNUFN Comments 411 1309 1348 1624.pdf". The TDS of pit wall rock runoff is minimal in comparison to brine, and therefore would have little or no impact on pit stratification. For comparison, the TDS in pit wall runoff calculated using the pit wall proportions and pit wall source terms for the different rock types (e.g., PAG1, PAG2, NAG3, etc.) is approximately 550 mg/L, while the TDS of the brine is approximately 5,500 mg/L. 561	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Anoxic Saturated Waste	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	The source terms for saturated anoxic waste rock assumes a one-time release of soluble constitutes upon submergence. Clarification: Please confirm leachate results of anoxic tests, such as subaqueous columns, are consistent with this finding, particularly as they relate to dissolution. (Source Comment ID#128)	Metal release associated with saturation of waste rock is modelled as a function of exposure time. The release of this geochemical load is conservatively assumed to be instantaneous upon submergence, rather than gradual over time. These peak concentrations are applied to water passing through waste rock throughout the post-closure period, with no consideration of rinsing out of peak concentrations. This is generally consistent with submerged column results, which show peak concentrations immediately after test initiation.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
561	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Anoxic Saturated Waste Rock	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	The objective of the question was to determine if release of contaminants due to a change in redox conditions may occur. Therefore, the comment has been rephrased. Clarification: What was the DO and/or Eh of the leachate of the subaqueous columns? Can they be used to identify potential release due to a change in redox conditions? Is there the potential release of contaminants through reductive dissolution, once flooding occurs that may not be accounted for in the source term, and if so, will the impact of that be significant or negligible? The response indicates that peak concentrations are applied to water passing through waste rock throughout the post-closure period, with no consideration of rinsing out of peak concentrations. Further clarification is requested on this statement. Is the flushing term applied as a constant term throughout operations and closure? If so, this would be a highly conservative source term and this item can be closed. However, if it is applied as a one-time instantaneous load, please briefly respond to the additional questions. (Source Comment ID#128)	The flushing term is applied as a constant term throughout operations and closure. No consideration of rinsing out of these peak concentrations is incorporated into the source terms. The high degree of conservatism in this approach is acknowledged.		CSFN	Lorax				Ready for Submission	GM; Sept 1	Ready for Publishing
562	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – LGO Tailings Source Term	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	The LGO head samples results show higher zinc concentrations. The source term report does not describe the use of LGO metallurgical samples in the source term for the exposed beach tailings. Clarification: Given the LGO is exposed for a longer period of time than ROM material, describe if this is expected to deplete the neutralizing minerals and impact lag time and leaching rates of the tailings. (Source Comment ID#129)	Source Term Approach The tailings beach source term was based on a single HCT (WOT-HCT) constructed from whole ore tailings produced from metallurgical testing in 2011. These results were applied to both HGO and LGO tailings beach exposures. The overall approach was consistent with what was applied in the EA source term calculations for the Project. Onset of ARD Ore is generally classified as PAG1, which would have minimal lag time until onset to ARD - refer to Section 3.5 of the Geochemical Source Term Report. Addition of lime in the mill will neutralize any acidity associated with ore, and amend a modest amount of NP to both HGO and LGO tailings samples. Metal Leaching The reviewer is correct to note that process water and saturated column tests show higher metal leaching potential from LGO compared to HGO tailings. This result is consistent with accumulation of oxide minerals during subaerial weathering, which are rinsed upon processing and submergence. However, in the subaerial tailings beach environment, metal leaching rates would largely be driven by sulphide mineral oxidation. The reactivity of sulphide minerals would not increase as a result of stockpiling of LGO ore. Subaerial weathering of LGO ore would potentially consume the most reactive sulphide mineral phases, and sulphide mineral reactivity would decline with age. For these reasons, applying the same subaerial weathering rates to LGO and HGO tailings beaches is considered reasonable.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing

562	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – LGO Tailings Source Term	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	Thank you for the response. It is understood that sulphides will deplete; however, neutralizing minerals will also deplete with time. The question was in regard to the accelerated depletion of NP and thus a potentially lower pH for infiltrating water and potentially higher metal release rate for some trace metals. Clarification: Please confirm that the depletion of NP is not expected to result in tailings with an overall higher potential for metal leaching (once deposited on the beach) as the additional NP in the mill will be sufficient to maintain neutral drainage for the period tailings are exposed. (Source Comment ID#129)	The tailings beach metal leaching rate will be strongly influenced by pH. The tailings will initially be deposited with slurry water at pH 8.5 and be buffered by residual lime and NP bearing carbonate minerals. A neutral to alkaline pH will be maintained while these NP sources are available. The lag time until ARD development will largely be a function of the availability of NP, which will be determined by lime addition, rock types being processed (andesite, fragmental volcanics, laminated volcanics) and ore source (ROM vs. LGO). Maintaining neutral-alkaline conditions on the tailings beach will be achieved through spigot management, which will be a key component of tailings beach operations. The tailings beach source term is developed assuming a pH of 6.9, which assumes spigot management is not able to maintain the alkaline conditions of initial tailings slurry. This pH assumes that the most effective NP sources (Ca&Mg-carbonate minerals and lime) are unavailable, and the pH has declined to circumneutral values. This has a pronounced impact on source term derivation. For example, the current source terms predict Zn and Cd concentrations in TSF beach runoff of 1.4 mg/L and 0.028 mg/L, respectively. If the pH of slurry water was assumed (pH 8.5) the solubility of these elements would be limited to 0.30 mg/L and 0.005 mg/L, respectively, based on secondary mineral solubility constraints developed within PHREEQC.		CSFN	Lorax				Ready for Submission	GM; Sept 1	Ready for Publishing
562	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – LGO Tailings Source Term	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: The concentrations of the many parameters may increase if the pH of the tailings declines below 6.9. Therefore, this can be addressed through permit condition listed in comment #4 of this memo. (Source Comment ID#129)	See comment 437 R3 response		CSFN	Lorax					GM; Oct 31	Ready for Publishing
563	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Modelling – Detection Limit Constraints	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	Be and Hg are set to DLs due to interference with detection limits as is standard practice. Clarification: Please confirm that all leachate geochemical tests and/or field scale tests and seeps similarly have beryllium and mercury concentrations measured below the analytical detection limit. (Source Comment ID#130)	BW Gold confirms that these elements are generally at or below detection limits in neutral pH kinetic tests. In general, Be and Hg are insoluble under neutral pH conditions in the absence of CN or other complexing ligands.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
563	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Modelling – Detection Limit Constraints	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	Beryllium concentrations can increase in acidic drainage by an order of magnitude. Please confirm that beryllium is largely below the BC ENV WQG for beryllium in the acidic leachate. If this is the case, this comment can be closed. If not, please confirm that beryllium concentrations in acidic leachate were included in the source terms. (Source Comment ID#130)	Please see the response to Comment #417h in the attachment "R2_EMLI Comment ID 417 h.pdf"		CSFN	Lorax				Ready for Submission	GM; Sept 1	Ready for Publishing
563	Chapter 5: Modelling, Mitigation and Discharges	Water Quality Modelling – Detection Limit Constraints	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	The pH was not discussed in the response; however, given the maximum observed concentration of beryllium was marginally above the working guideline, this comment can be closed as metal leaching of pH sensitive parameters will be addressed in the permit condition outlined in comment #4 of this memo.. (Source Comment ID#130)	See comment 437 R3 response		CSFN	Lorax					GM; Oct 17	Ready for Publishing
564	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Loading Rates from HCTs	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The loading rates from the HCT were adjusted so that they were based on the dataset compiled over a 52-week period rather than having an operational rate and a closure rate. It is understood that the base case source terms also did not include the initial flush in the value (i.e.., the first 5 weeks). It is unclear if, in some cases, the expanded dataset resulted in lower base case source terms. This is particularly true if pH decreases over the course of the test or if there was a significant flushing source term. Information Request: Please compare the base caseloads to base caseloads calculated by including the first 5 weeks of the leachate data and base caseloads calculated on the last 10 weeks of data only (ending at 52 weeks). This information can also be presented as concentrations if preferred. (Source Comment ID#131)	Please see attachment "R1_CSFN Comment ID 564".		CSFN	Lorax		John	GM	Ready for Submission	GM; June 22	Ready for Publishing
565	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Conservative Loading Rates	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	HCT ARD2-9 represented the 95th percentile sulphur content. It is understood that this HCT was excluded from the source term development. Depending on HCT sample size and loading rates, the difference between the conservative case source term and the base case source term can be minimal if variability between tests is low and the concentrations in the leachate dataset were relatively constant. Therefore, it is sometimes appropriate to use extreme material as an upper bound as it provides a broader range in variability. Using loading rates material representative of higher end sulphide content often results in chemistry that is unlikely to be observed in the field, depending on the range of variability in the datasets. However, given the large uncertainty associated with source term development and water quality models, this information can be useful for the development of contingency measures. Information Requirement: Compare the loading rates from ARD2-9 (last 10 weeks or average concentration) to the conservative case loading rates used as part of source term development. (Source Comment ID#132)	Please see attachment "R1_CSFN Comment ID 565".		CSFN	Lorax		John	GM	Ready for Submission	GM; June 22	Ready for Publishing
566	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Appropriateness of the pH Value Applied to Source Terms	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The pH ranges used to develop source terms tended to be relatively high and above alumino-silicate buffering. The base case pH was 4.71 and upper case was 4.41 for the conservative case source term for acidic waste rock. It is understood that PAG rock will be submerged within a year and therefore silicate buffering may maintain a relatively elevated pH value. Information Request: Can the pH used to develop source terms be compared to the pH value measured in the last 5 weeks of each HCT ending at week 52, as well as the last 5 weeks of the HCT tests, assuming the tests ran longer than 52 weeks? (Source Comment ID#133)	Please see attachment "R1_CSFN Comment ID 566".		CSFN	Lorax		John	GM	Ready for Submission	GM; June 22	Ready for Publishing
567	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Beach Tailings	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	The beach tailings contribute a load during operations. The reaction depth for the tailing beach used to develop the loading rates was 10 cm. Clarification: Was this depth also used for the conservative case? (Source Comment ID#134)	Yes, 10cm was used in both Base Case and Upper Case tailings beach source terms.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing

568	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Beach Tailings	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The beach tailings contribute a load during operations. The reaction depth for the tailing beach used to develop the loading rates was 10 cm. Information Request: What analogue data was used to establish the reaction depth for the tailing beach depth and will/has it been verified? (Source Comment ID#135)	Please see attachment "R1_CSFN Comment ID 568".		CSFN	Lorax		John	GM	Ready for Submission	GM; June 22	Ready for Publishing
568	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Beach Tailings	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	Thank you for the response. There are similar studies that show that oxygen can penetrate between 1 m and 0.5 m beneath ground surface. The penetration depth can also be based on sulphide content. Elevated sulphide content can consume oxygen and reduce the penetration depth. Therefore, it remains unclear if 10 cm is a reasonable penetration depth. Recommendation: Please discuss the implications of a 20 cm penetration depth. This is especially true considering the uncertainty associated with source terms and water quality predictions that cannot be validated. A model update is not being requested at this stage, just an assessment of the implications. (Source Comment ID#135)	The depth of oxygen ingress is used as a scaling factor to relate the HCT loading rates to field conditions. Doubling the depth of oxygen ingress from 10 cm to 20cm would double the upscaled loading rate. This would result in a proportional increase in conservatively treated parameters (F, SO4, Ba, Ca, Cd, Co, Fe, K, Mg, Mn, Mo, Na, Ni, Pb, Sb, Se, Si, Sr, Tl, U, V and Zn) in the absence of additional solubility considerations. Note refer comment 562 R2 response for additional details on tailings beach source term conservatism.		CSFN	Lorax				Ready for Submission	GM; Sept 1	Ready for Publishing
568	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Beach Tailings	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: This can be addressed by the permit condition outlined in comment #4 of this memo.(Source Comment ID#135)	See comment 437 R3 response		CSFN	Lorax					GM; Oct 17	Ready for Publishing
569	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Loading Rates vs Concentrations	CSFN	Jennifer Stevenson, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	The source terms are presented as concentrations. It is possible the rate of sulphide oxidation will remain constant in the field, but the rate of flushing will be variable. Clarification: In the VCC case, was the loading rate applied to the model constant or was the concentration applied to the loading rate constant? (Source Comment ID#136)	The source terms were applied to the VCC model using the same approach as the base case model. This results in increased loadings during wet years within the VCC model.		CSFN	Lorax		Jen	GM	Ready for Submission	GM; June 20	Ready for Publishing
570	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – LGO Loading Rate	CSFN	Jennifer Stevenson, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	The loading rate for LGO is 118 mg/kg/wk which is almost an order of magnitude greater than the loading rate for all other cells. This loading rate is taken from Table 3.4. However, the source for low grade ore is surprising low and ranges between 24 and 87 mg/L in year 16 (Table 4.13). This appears to be related to a translation error. Clarification: Please confirm the loading rates in Table 4.13 and confirm the translation error did not propagate through the model. (Source Comment ID#137)	There is an error in Table 4-13 where the rows should be shifted up by one row from sulphate downwards. The source terms for untreated LGO seepage included in Appendix C1-4 (Base Case) and Appendix C2-4 (Upper Case) of the Geochemistry Source Term report (Appendix A.6 of Appendix 5-D) are correct. The inputs to the model were verified and are correct.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
571	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Pit Wall Source Term	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	According to the information presented in Table 4.9, the concentration associated with pit wall runoff was 1067 mg/L. The generation of acidic drainage on pit walls can often be a dominant load source to pit water. Clarification: Please confirm if the following statement is correct. If the pit wall was entirely PAG 1 rock, would the associated drainage in the Open pit only be 1067 mg/L? (Source Comment ID#138)	Yes, this statement is correct.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
571	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Pit Wall Source Term	CSFN -K. Jones	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	Please briefly describe the % area attributed to this rock type and the periods of time this rock type is exposed, and the contribution (by flow and not load) that this rock type contributes to the open pit water quality. (Source Comment ID#138)	Please see attachment "R2_CSFN_Comment ID 571_vS.pdf"		CSFN	Lorax				Ready for Submission	GM; Sept 2	Ready for Publishing
572	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Pit Wall Source Term	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	According to the information presented in Table 4.9, the concentration associated with pit wall runoff was 1067 mg/L. The generation of acidic drainage on pit walls can often be a dominant load source to pit water. Clarification: Was the pit wall concentration calculated by assuming the load of the exposed rock and an annual volume equivalent to the annual amount of runoff over pit walls, or does it include flow from the other inflows to the pit during closure? (Source Comment ID#139)	Pit wall source terms were calculated by scaling laboratory kinetic test results for each rock class and converting loadings into concentrations using runoff volumes followed by application of solubility controls. Source terms were developed for each rock class individually. The relative exposure of these rock types will evolve as the mine pit is excavated, with increasing quantities of PAG 1 and PAG 2 reached at depth. The concentrations presented in Table 4-9 and 4-10 of the Geochemical Source term Report are for wall rock runoff. This does not incorporate pit inflows from other sources (e.g., groundwater).		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
572	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Pit Wall Source Term	CSFN -K. Jones	Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: Thank you for the information. To address the uncertainty of source terms, a permit condition is recommended to conduct validation of the source terms and of the WQM predictions. (Source Comment ID#139)	The comment is acknowledged. Note that existing commitments for the 5-Year Update commitments include a review of source terms and modelling every 5 years.		CSFN	Lorax				Ready for Submission	GM; Sept 1	Ready for Publishing
572	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Pit Wall Source Term	CSFN -K. Jones	Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: A permit condition will include annual model validation of the water quality model to observed water quality and flow. The validation should be provided in the Annual Reports submitted to EMLI and CSFN by March 31 of the following year. The validation must be completed by a QP. Should the model validation indicate that the predictions are not conservative, the model should be updated by Dec 31st of the same year the model validation was completed. The model should be used as a working tool to improve predictions on an ongoing basis. (Source Comment ID#139)	This recommendation is acknowledged. It is noted that water quality and flow predictions from the latest, finalized water balance/water quality model will be compared to measured water quality and flows as part of BW Gold's annual reporting commitments, consistent with ENV (2016), thereby providing a validation of the model. If predicted parameter values are significantly lower than measured values, BW Gold will provide planned actions to ensure continuous environmental protection (ENV 2016) and an evaluation will be conducted to identify the cause of the non-conservative predictions. In some cases, the source of non-conservative predictions may be readily rectified by BW Gold and a model update may not be warranted (e.g., if a water treatment plant is not treating as efficiently as originally estimated, but the treatment efficiency can be improved by adjusting the dosing within the plant). It is anticipated that the water balance/water quality model will undergo updates every five years, per commitments made under separate Review comments, in addition to a Year 2 update per Comment Response 437. 572	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Pit Wall Source Term	CSFN -K. Jones	Lorax Environmental Services Ltd.	Dec 12, 2022	4	Follow Up	Recommended Permit Condition	Yes	Regarding the term "significantly lower", this should be quantified in the permit. The maximum time between water quality model updates is acknowledged to be 5 years in the absence of permit amendments. However, should the model and/or source terms result in predictions that are "significantly lower", which can be defined as resulting in water quality exceedances in the receiving environment during any phase of mine life, the water quality model should be updated and the predictions should be refined and mitigation and management plans should be developed accordingly.	BW Gold acknowledges the reviewer's recommendations and looks forward to reviewer the draft permit conditiosn from EMLI and ENV. BW Gold has made several commitments around updating water quality models. These have been documented through the following which were recetly re-communicated to CSFN during an RLCE review meeting on Dec. 14th, 2022. **Mines Act Permit Req's:** • The 5-year mine and reclamation plan update is excpected to include a regulatory requirement to update the water balance and water quality modelling and subsequently the bond. • Furthermore, the interim reclamation bonding policy from EMLI (April 2022) requires that the permit includes a bonding schedule, so in between 5-year plan review periods, there is also a requirement to bond based on LGO stockpiles volumes as well as water treatment costs. **EAC Plan 33 Mine Waste and Water Management Plan: includes the following requirement:** • The MWWMP will be updated at least every five years from the planned commencement of Construction, unless otherwise authorized by the EAO. • Revisions to the MWWMP every 5 years will include any updates from the outcomes of the modelling scenarios defined in the EAC Condition 11 Care and Maintenance Plan (BW Gold 2022e). • The 5-year updates will be consistent and aligned with the timing for an updated detailed 5-year mine plan and reclamation and closure plan. **Brine Management Workplan (MRC comment 411c):** • BW Gold submitted the first two deliverables to the MRC on November 22, 2022 which included a report identifying if there is a preferred alternative treatment option for post-closure (excluding reverse osmosis or nano-filtration),areport on alternative treatment option (if one is identified through the risk assessment) and finally an evaluation of parameters of concern in post-closure. • The brine management workplan also includes a requirement to develop a water balance/water quality model (WB/WQM) sensitivity(ies) that evaluates and ultimately identifies preferred options identified near term-evaluation tasks 1-6. The delivery date for this item is planned for May 2024, which is prior to the requirements for a 5 year plan update.		CSFN	BWG					TD, Dec 19	Ready for Publishing
573	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Recirculation Term	CSFN	John Dockrey, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	It remains unclear if there is the potential for parameter recirculation from the mine waters to the mill during various mining operational, treatment scenarios, for each phase of mine life. Information Request: Describe the potential for the need to consider recirculation of parameters sourced from reclaim water in additional detail, particularly as it relates to N-species and sodium/sulphate. (Source Comment ID#140)			CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
573	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Recirculation Term	CSFN -K. Jones	Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: Thank you for the information. To address the uncertainty of source terms, a permit condition is recommended to conduct validation of the source terms and of the WQM predictions. (Source Comment ID#140)	Reference: British Columbia Ministry of Environment (ENV). 2016. Annual Reporting Under the Environmental Management Act. Technical Guidance 4 Environmental Management Act Authorizations. Version 1.3 May 2016. 574	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development - Water Treatment Effluent Water Quality	CSFN	Kareena Gill, M.Eng., P.Eng., Romick Bhatti, P.Eng.,, and Lynda Smithard, P.Eng.; McCue Engineering Contractors	Jun 02, 2022	1	New	Information Requirement	No	The treatment effluent used is Test 9 in Table 4.18. Information Request: What is the likelihood the effluent quality will be attained consistently in the field or in the event concentrations are higher than predicted and what was the variability between the tests, if applicable? (Source Comment ID#141)	The Metals WTP design provides flexibility to optimize the removal of parameters of concern to meet the discharge limits. The reagent dosing can be adjusted based on the variation in the influent water quality. A range for estimated treatable concentrations for the parameters of concern has been presented in our response to Comment 424. The estimated maximum influent treatable concentration is higher than the predicted maximum influent concentration. To achieve effective treatment in the field, the influent water quality should be monitored regularly, and the dosing rate should be adjusted by the operator accordingly. During bench test program conducted in 2016, synthetic water sample with the same water quality was used to conduct all the tests, including Test 9. There was no variation in the water quality.		CSFN	McCue			GM	Ready for Submission	GM; June 28	Ready for Publishing
574	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development - Water Treatment Effluent Water Quality	CSFN -K. Jones, F. Mohamm	Kareena Gill, M.Eng., P.Eng., Romick Bhatti, P.Eng.,, and Lynda Smithard, P.Eng.; McCue Engineering Contractors	Aug 22, 2022	2	Follow Up	Information Requirement	No	See also 220822 Source Round 2 Detailed Comments on the Revised Blackwater Major Works Application (Batch 2C).docx Information Request: Please provide the results of bench testing that indicates that minimum concentrations of all COPCs can be achieved simultaneously (i.e. coming from a single bench test mimicking a specific set of process conditions). Recommendation: If such results are not available, further treatment testing should be conducted to assess what level of removal rates can be achieved simultaneously. Further, the treatment efficiency and design for the removal of contaminants including antimony, cadmium, and manganese must be verified through additional testing that involves spiking water to the maximum concentrations expected for all contaminants, as maximums expected values of Cd and Mn used in bench work were approximately an order of magnitude lower than those expected from the water quality model. Alternatively, design modifications in the Metals WTP should be made that allow multiple stages of removal. For example, the Metals WTP could use multiple pH adjustment/reagent injection points to more optimally remove metals (i.e. run the clarifier at pH 9.5-10 to maximize manganese removal followed by operating the MMF at pH 6.5-7 to maximize antimony removal). Making this design change would require addition of reagent injection points ahead of the MMF (i.e. inject pH adjustment/sulphide/ferric reagent into T-301A, see Fig PID-003 of Appendix 5-G of the application). (Source Comment ID#141)	Please see attachment "R2_CSFN_Comment ID574.pdf"		CSFN	McCue			GM	Ready for Submission	GM; Sept 2	Ready for Publishing

575	Chapter 5: Modelling, Mitigation and Discharges	Source Term Development – Saturated Waste Rock Load	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	Please clarify if the waste rock saturated load in the TSF is mg/yr. or mg/L as both units are listed in the tables presented in Appendix C (pdf page 466 and 467). It is assumed this is a minor typo as the loads are consistent with the loads outlined in the report. (Source Comment ID#142)	Yes, this is a typo. The units for the source terms presented on these two pages of the document are mg/yr.		CSFN	Lorax		John	GM	Ready for Submission	GM; June 20	Ready for Publishing
576	Chapter 5: Modelling, Mitigation and Discharges	Numerical Groundwater Quality Monitoring report – Watershed Areas	CSFN	Jordan Zak, M.Sc., P.Geo.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	Catchment loss and dewatering can impact runoff and baseflow estimates. Clarification: Please confirm the baseflow changes predicted with the numerical model correspond to the baseflow changes predicted in the water balance. (Source Comment ID#143)	The baseflow changes predicted with the numerical groundwater model correspond well to the baseflow changes calculated in the water balance. Modelled baseflow changes include the following: •Baseflow changes estimated in Operations with the groundwater model attributed to pit dewatering and pumping are 5 L/s in the drainages to Creek 661. The reported baseflow change in the water balance model is 5 L/s in early operations and approximately 10 L/s in later operations/closure when the TSF footprint expands into the catchment and the Spillway is constructed and diverts water from the Creek 661 catchment to Davidson Creek. Loss of contributing catchment area in Creek 661 due to expansion of the TSF and construction of the Closure Spillway was not considered in the estimate of baseflow reductions in the groundwater model. •Baseflow changes estimated in Post-Closure with the groundwater model attributed to the open pit are 1 L/s in sub-catchment H1 and 3.6 L/s in sub-catchment H11. Baseflow reductions in the water balance model are the same in H1 and are on par in H11, when the effects of the reduced contributing catchment area are considered.		CSFN	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 30	Ready for Publishing
577	Chapter 5: Modelling, Mitigation and Discharges	Numerical Groundwater Quality Modelling Report – Transient Model	CSFN	Jordan Zak, M.Sc., P.Geo.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Please comment on the potential need for a transient model to adequately model open pit dewatering and open pit filling time for this project.. (Source Comment ID#144)	A transient model may be used to model open pit dewatering for this project. A preliminary model would be developed during the planning and pre-mine stages. As dewatering advances, groundwater removal and water level drawdown around the open pit will be tracked. Based on the collected data, the conceptual model will be revisited and the numerical model recalibrated, resulting in improved estimates of hydraulic conductivity and storage values. Dewatering plans would be refined based on the data and model output. Flooding of the pit lake will be accelerated by water pumped from the ECD, TSF, and Upper Waste Stockpile. These augmented contributions account for approximately 97% of the 10 Mm3 average annual inflows to the pit lake during that time and will ultimately control the time it takes to fill the pit lake. A transient groundwater model developed for the purpose of assessing pit filling time would have limited benefit given that the managed flows directed to the pit control the pit filling time.		CSFN	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 28	Ready for Publishing
577	Chapter 5: Modelling, Mitigation and Discharges	Numerical Groundwater Quality Modelling Report – Transient Model	CSFN -K. Jones	Jordan Zak, M.Sc., P.Geo.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	Thank you for the response. It is acknowledged that the benefits of a transient model will be limited during preferential flooding. However, the development of a transient model would be preferred during the detailed design stage. (Source Comment ID#144)	BWG acknowledges this comment. Development of a transient groundwater model will be undertaken to support future open pit dewatering and depressurization considerations.		CSFN	KP		Cindy		Ready for Submission	AT, Aug 30	Ready for Publishing
577	Chapter 5: Modelling, Mitigation and Discharges	Numerical Groundwater Quality Modelling Report – Transient Model	CSFN -K. Jones	Jordan Zak, M.Sc., P.Geo.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Oct 11, 2022	3	Follow Up	Potential Permit Condition	Yes	Potential Permit Condition: A transient model should be developed prior to mining as per the commitment indicated as part of the response. This should be considered a potential permit condition if not developed prior to permit issuance.(Source Comment ID#144)	A transient groundwater model will be developed to support open pit mining. A transient groundwater model will be developed prior May 2024, consistent with the proposed timing to complete the updated water balance and water quality modelling to assess alternative Post-Closure water management and treatment strategies.		CSFN	KP		Cindy	GM	Ready for Submission	GM; Oct 21	Ready for Publishing

578	Chapter 5: Modelling, Mitigation and Discharges	Numerical Groundwater Quality Modelling Report – Calibrated Values	CSFN	Jordan Zak, M.Sc., P.Geo.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	Calibration of the model involves varying recharge rates. The rates were initially set to match the water balance but were adjusted through calibrated. Clarification: Please confirm that the final values resulting from the calibration did not result in significant changes to baseflow estimates and if so would not significantly impact the receiving environment quality and quantity predictions (Source Comment ID#145	The final recharge values assigned to the calibrated groundwater model were within +/-15% of the calculated recharge values assigned to sub-catchments in the baseline watershed model in Davidson Creek. The final recharge values assigned to the calibrated model were within +/-1% of calculated recharge values assigned to the two sub-catchments in Creek 661 that were calibrated to streamflow data (H1 and H11) in the baseline watershed model and within 10% at the downstream-most sub-catchment (1-661) that did not have available streamflow measurements. Recharge values assigned to the calibrated groundwater model in sub-catchments in Davidson Creek and Creek 661 are a very good match to calculated recharge values in the watershed model (within the range of measurement error) and there is therefore no consequential impact on predicted receiving environment quantity or quality. This is reasonable since the focus of calibrating the groundwater model was placed on obtaining a good match to the available data in Davidson Creek and Creek 661 where potential impacts to flows may occur. The comparison between recharge values assigned to Creek 705 and Turtle Creek are a less good match, which was considered acceptable during the model calibration considering impacts to groundwater are not anticipated in these catchments.		CSFN	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 30	Ready for Publishing
579	Chapter 5: Modelling, Mitigation and Discharges	Numerical Groundwater Quality Modelling Report – Liners	CSFN	Jordan Zak, M.Sc., P.Geo.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	The numerical model report indicates that "placement of a geosynthetic liner is proposed along the upstream face of the Saddle Dam and West Dam and above the elevation of the low permeability core along Main Dam C." and "The LGO liner system will incorporate two types of low permeability liners to limit seepage, including compacted glacial till and HDPE geomembrane. The till liner will be graded to convey surface runoff and foundation drains will be installed below the till liner to collect potential seepage and limit development of groundwater pressures below the liner with flows from both conveyed to the contact water collection channels. An HDPE liner will be installed where water ponding or concentrated flows are expected within the contact water collection channels and at the collection pond. Clarification: Please confirm the assumptions regarding liner placement are consistent with the current water management plan. (Source Comment ID#146)	Boundary conditions representing HDPE liners within the TSF were incorporated in the numerical groundwater model consistently with designs presented in Appendix 3-K. The objective of the seepage analysis completed at the LGO stockpile was to assess potential seepage pathways if seepage was to bypass the engineered liner and seepage collection system; therefore the liner system was not represented in the model in this case.		CSFN	KP		Jordan	AT/KP	Ready for Submission	KP, June 29	Ready for Publishing
579	Chapter 5: Modelling, Mitigation and Discharges	Numerical Groundwater Quality Modelling Report – Liners	CSFN -K. Jones	Jordan Zak, M.Sc., P.Geo.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Aug 22, 2022	2	Follow Up	Clarification	No	Please confirm that the seepage analysis completed for the LGO were incorporated into the predictions or that a loading calculation has been completed to assess the impact (spreadsheet or modelled). If these assessments have not been completed, please confirm that costing reflects the placement of the HDPE liner, and or costs associated with potential contingency measures. (Source Comment ID#146)	Results of the seepage analysis conducted with the numerical groundwater model on potential seepage from the LGO stockpile (Section 5.2.4.6 of Appendix 5-F) were incorporated into a water balance model seepage sensitivity as discussed in Section 7.1 of Appendix 5-B of the Application. Loadings associated with the potential seepage pathway from the LGO Stockpile were then subsequently assessed with the water quality model (Scenario 4) as described in Section 4.4 of the water quality model in Appendix 5-D of the Application.		CSFN	KP	Lorax/BWG	Cindy		Ready for Submission	AT, Aug 31	Ready for Publishing
579	Chapter 5: Modelling, Mitigation and Discharges	Numerical Groundwater Quality Modelling Report – Liners	CSFN -K. Jones	Jordan Zak, M.Sc., P.Geo.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: The permit should reference the groundwater monitoring plan and a robust trigger action response plan for seepage from the mine site. This plan should be developed and approved prior to mining and referenced in the permit. (Source Comment ID#146)	BWG defers to EMLI and MOE for permit conditions. Please see the Mine Site Water and Discharge Monitoring and Management Plan (MSDP) - Appendix 9-E of the Application: mine site groundwater quality and flow monitoring procedures, including for seeps, are described in detail in Section 7.3.4 of the MSDP. A trigger response plan that is focused on regularly monitored parameters with quick turnaround analysis times relative to specific metrics is expected to be required, as this is a standard condition included in most EMA effluent discharge authorizations. The trigger response plan is expected to be developed prior to construction. Section 11 of the MSDP describes the groundwater components for which triggers will be set – specific to groundwater, these components include groundwater levels and groundwater quality. As stated in the MSDP "Generally, triggers related to groundwater quantity will include piezometric elevations in monitoring wells and standpipe piezometers. Groundwater quantity triggers will also consider groundwater and seepage quality indicators, since changes in quality may be indications of increased seepage rates".		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, Oct 21	Ready for Publishing
580	Chapter 5: Modelling, Mitigation and Discharges	Numerical Groundwater Quality Modelling Report – Baseflow Estimates	CSFN	Jordan Zak, M.Sc., P.Geo.; Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Clarification	No	The report indicates that "Reductions in streamflow in tributaries to the Backwater River are not expected. Streamflows in the Creek 661 catchment are predicted to decrease by approximately 5 L/s attributed to dewatering activity in Operations. Groundwater drawdowns in the Davidson Creek catchment are predicted to extend approximately 700 m north toward the TSF. The WMP and TSF already capture and prevent surface flows from contributing to Davidson Creek so no additional impacts to baseflows are predicted in Davidson Creek as a result of open pit dewatering". Clarification: Please confirm these estimates are similar to estimates in the Water Balance. (Source Comment ID#147)	As discussed in the response to Comment 576, the baseflow reductions predicted with the groundwater model and consistent with the values in the water balance model in Creek 661. Similarly, no baseflow reductions attributed to pit development extend beyond the TSF in the water balance model, consistent with the groundwater model. The Blackwater River catchment is not included in the water balance model.		CSFN	KP		Jordan/Cindy	AT/KP	Ready for Submission	KP, June 30	Ready for Publishing
581	Chapter 5: Modelling, Mitigation and Discharges	EMA Permit for Construction and Operations Phases	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Recommendation	No	BW Gold has developed the draft Joint Mines Act / Environmental Management Act Permits Application for the Construction and Operations phases of the project only. BW Gold is requesting that a new application (or amendment to this application) be considered for the Closure/Post-Closure phase at a later date. This approach is unacceptable as it may lead to the need for discharging degraded waters into the receiving environment that likely pose unacceptable risks to the environment. More specifically, the 95th percentile Base Case results from the water quality model, presented in Appendix 5-D, for surface waters downstream of the Project shows occasionally exceedances of some long- and short-term BC water quality guidelines (WQGs), long-term CCME WQGs, and/or Yinka Dene water quality standards (YD-WQSs) during the Closure and Post-Closure phases. In addition, the mean Base Case results show occasional exceedances of dissolved cadmium and total zinc long-term BC WQGs in Davidson Creek during the Closure and Post-Closure Phases. Recommendation: The draft Joint Mines Act / Environmental Management Act Permits Application should be revised to apply to all phases of mine life and detail appropriate mitigations for managing the predicted exceedances of WQGs and YD-WQSs during the closure and post-closure period. (Source Comment ID#148)	During IRT development, the temporal scope of the Joint Mines Act / EMA permits application was agreed to include the Construction and Operations phases. That said, BW Gold has been working to optimize water management during the Closure and Post-Closure phases of the mine with a view to improving water quality predictions during these phases and looks forward to presenting these results to the MRC. 582	Chapter 5: Modelling, Mitigation and Discharges	Instream Flow Needs for Davidson Creek	CSFN	Palmer	Jun 02, 2022	1	New	Information Requirement	No	Table 5.3-8 provides the mean stanza-based instream flow needs (IFNs) for Davidson Creek; however the supporting documentation for the proposed IFNs does not appear to be included in the Application. Information Request: Please provide a copy of Palmer (2020) for review. Also please express the stanza-based mean IFNs as both L/s and % of baseline flows over the same stanzas. (Source Comment ID#149)	The IFN for Davidson Creek is presented in the attached summary table, along with the long-term mean discharge for each stanza. Further information regarding how the IFN was determined is provided in Attachment "R1_CSFN Comment ID 582.pdf"	ERM	CSFN	Palmer			TD	Ready for Submission	TD, Jun 28	Ready for Publishing
583	Chapter 5: Modelling, Mitigation and Discharges	Instream Flow Needs Targets	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	Section 5.3.3.2 provides the results of the simulated streamflow for the base case and mine phases. Instream flow need targets, that will be assessed at H2B (Figure 5.3-13), are not shown. This is a gap in demonstrating how the IFNs will be met in each phase of the mine. Recommendation: Please include IFNs on Figure 5.3-13 to demonstrate whether the IFNs will be met during each phase of mine life. In addition, please clarify if the late operations and closure predicted stream flows for H2B are consistent with the target IFNs. (Source Comment ID#150)	Please see attachment "R1_CSFN Comment IDs 498 506 583.pdf".		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, June 29	Ready for Publishing

583	Chapter 5: Modelling, Mitigation and Discharges	Instream Flow Needs Targets	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Aug 11, 2022	2	Follow Up	Recommendation	No	Thank you for providing the requested information. It is noted that post-closure streamflows may be below IFNs and baseline streamflows. In response to ITT ID #506, the authors suggest that mitigations during the post-closure phase would be considered to augment streamflows above the natural range. Is there sufficient information, at this time, to describe what sources of water would be relied upon to augment flows? If so, please provide this information along with any risks with the potential mitigations with respect to water quality. (Source Comment ID#150)	Specific flow augmentation mitigations to employ during the Post-Closure phase have not been developed at this time. As noted in the Round 1 response, results of the ongoing monitoring will be used to inform adaptive management strategies during mine development, operations, and the closure periods to prevent significant adverse effects to fish or fish habitat. Additional active management of flows, if deemed necessary following the multi-decade monitoring and assessment, could include some of those employed during the Operations and Closure phases, such as storing water and actively releasing to Davidson Creek when required.		CSFN	KP		Cindy	TD	Ready for Submission	TD, Aug 15	Ready for Publishing
583	Chapter 5: Modelling, Mitigation and Discharges	Instream Flow Needs Targets	CSFN (Jesse Sinclair)	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Oct 11, 2022	3	Follow Up	Recommendation	No	Recommendation: Thank you for the response. If monitored flows will be tracked in the AEMP, then this comment can be closed. (Source Comment ID#150)	Streamflow monitoring will be tracked in the AEMP and is described in Section 4.3 of the AEMP: monitoring will be conducted at several sites in the project area, including station H2B (new site code DC-05). Section 5 of the AEMP outlines the Trigger Action Response Plan. Station DC-05 in upper Davidson Creek is considered the point of compliance at which water flows are expected to meet IFN.		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, Oct 19	Ready for Publishing
584	Chapter 5: Modelling, Mitigation and Discharges	Seepage and Collection Channels	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Knight Piésold Ltd.	Jun 02, 2022	1	New	Recommendation	No	Section 5.3.5.3 describes the Simulated Mine Site Water Management. On page 5-73 (Figure 5.3-37), the annual water sources to the water management pond (WMP) are shown, but seepage rates from lower waste stock pile, upper waste stockpile, and the associated collection channels are not shown (see Section 5.3.3.7 for description of water sources to the WMP). The proportion of inflows attributed to seepage is uncertain. Recommendation: Please include the estimated inflows due to seepage and collection channels from the upper and lower waste stockpiles. (Source Comment ID#151)	Please see attachment "R1_CSFN Comment IDs 507 584.pdf"		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, June 24	Ready for Publishing
585	Chapter 5: Modelling, Mitigation and Discharges	Source of Ammonia	CSFN	Colin Fraser, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	It is unclear what the source of ammonia is in the freshwater reservoir (FWR) during later operations and closure. Based on the schematics provided in 5.3-8 and 5.3-9 the main sources are catchment runoff (in operations) and the WMP (operations and closure). Recommendation: Please describe the source of ammonia in the FWR in late operations and closure (Source Comment ID#152)	Figure 5.3-8 and Figure 5.3-9 are simplified water balance diagrams for the Operations and Closure periods and do not capture the full detail built into the site-wide water balance and water quality models. For a more detailed discussion on water and load balance modelling at the WMP and FWR, the reader is directed to Lorax (2021), Section 3.3.9 and Section 3.3.10. Of note, source chemistries are assigned to roughly a dozen LOM WBM inflow and outflow terms to predict water quality concentrations and loads at the WMP (Lorax 2021, Table 3-22). Time series plots showing dominant inflows and outflows to the WMP are also provided in Lorax (2021). While a considerable portion of the water directed to the WMP is background/non-contact flow; contact waters also report to this facility, including unrecoverable seepages from the Waste Stockpiles; effluent from the Metals WTP (Operations) and effluent from the Membrane WTP (Operations). The dominant outflow from the WMP is water that is pumped to the FWR. Regarding sources of nitrate by Project phase, there is a nitrate signature evident at WMP and FWR between years 2024 and 2042 that corresponds to the Operations period. Two nitrate sources dominate the load signature at WMP, which then reports to FWR: effluent from the Metals WTP (Operations); and effluent from the Membrane WTP (Operations). Reference: Lorax Environmental Services Ltd. (Lorax). 2021. Blackwater Gold Project: Water Balance and Water Quality Model Report. Rev F. November 24, 2021. 1053 pp.		CSFN	Lorax		Colin	GM	Ready for Submission	GM; June 21	Ready for Publishing
586	Chapter 5: Modelling, Mitigation and Discharges	Short-Term Exceedances	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	In Section 5.4.10.2, it is stated that “minor exceedances for some parameters are observed in Closure / Post-Closure, with factors of exceedance generally within a factor of 2 of the screening value.” Table 5.4-5 and 5.4-6 show exceedances of the short-term water quality guidelines (WQGs) for cadmium. The short-term guidelines represent risk thresholds for lethality during short-term exposure (i.e.., less than 96-hr) and should not be used as screening thresholds. Recommendation: Please provide a water management scenario with clear mitigations that could be implemented to reduce projected concentrations to below short-term WQGs. It is not acceptable to provide a discharge scenario with concentrations above short-term WQGs in the receiving environment. (Source Comment ID#153)	Version 12b water quality model results (as presented in the Application) were computed on October 26, 2021. Since that time, BW Gold and their consultants have revised the site-wide water balance model and the site-wide water quality model with a focus on mitigating Project changes for the Closure and Post-closure phases. Version 13e water quality predictions were presented to EMLI, ENV and First Nations technical consultants on June 15, 2022, and are summarized in Lorax (2022). References: BW Gold Ltd. 2022. Revised Base Case Closure and Post-Closure WQ Predictions. Prepared for ENV and EMLI. June 30, 2022. Please see attachment "R1_ENV_EMLI_CSFN_LDN-UFN Comment IDs 102 126 415 490 586 607 610 612 1263 1289 1320 1615 1853.pdf"		CSFN	Lorax		Meghan	GM	Ready for Submission	TD, Jun 28	Ready for Publishing
587	Chapter 5: Modelling, Mitigation and Discharges	Discharge Limits	CSFN	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	Tables 5.8-9 and 5.8-10 provide proposed permit limits for the Camp Site and Plant Site Sediment Control Pond Discharge and for the downstream aggregate borrow area sediment control pond, respectively. The proposed permit limits for total arsenic, dissolved cadmium, dissolved copper, total manganese, and total zinc exceed the short-term BC WQG for the protection of aquatic life. Discharge limits should not reflect concentrations that have the potential to result in acute toxicity. No information is provided that would demonstrate that this effluent mixture would not result in acute toxicity if effluent concentrations achieved the upper-case predictions. Recommendation: Please propose permit limits that are below short-term WQGs and that can be demonstrated to not result in acute toxicity if realized in the effluent mixture. For example, short-term toxicity tests with the rainbow trout and Daphnia magna could be conducted in simulated effluents to support the application. (Source Comment ID#154)	This recommendation is acknowledged. It is noted that the predicted water qualities for the SCPs presented in Section 5.8 of the Application represent preliminary, conservative estimates. The design of the SCPs is ongoing and the quality of discharge will be dependent on the final materials used within the catchment of each SCP. Refinement of the predicted discharge quality is ongoing. Management options exist for the small volume of water anticipated to occur in SCPs should this water be unacceptable for discharge (e.g., pump system or trucking to the WTP). It is also noted that, since the Application, changes to the SCP discharge configuration have occurred (BW Gold Ltd. 2022); most notably, the Plant Site SCP is no longer anticipated to produce a surface discharge. Discharge from the Camp Site SCP is anticipated to occur in Year -1, approximately one year later than presented in the Application.		CSFN	Lorax		Meghan	GM	Ready for Submission	GM; June 28	Ready for Publishing
587	Chapter 5: Modelling, Mitigation and Discharges	Discharge Limits	CSFN	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Aug 11, 2022	2	Follow Up	Recommendation	No	Please provide the time-frame in which refined predicted discharges will be available to inform permit limits. (Source Comment ID#154)	BW Gold will provide a response to comments related to the SCPs in a follow-up response on the date provided to the MMO in the most recent version of the Round 2 BW workplan.		CSFN	Lorax		Meghan		Ready for Submission	GM; Aug 16	Ready for Publishing

	Chapter 5: Modelling, Mitigation and Discharges	Discharge Limits	CSFN (Jesse Sinclair)	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	The reviewer has reviewed the files R2_ENV Comment ID 2175_R3_ENV Comment IDs 84, 85, 87, 2097.pdf and R2_ENV Comment ID 2175_R3_ENV Comment IDs 84, 85, 87, 2097_AppendixA.xlsx. The authorization for discharges from the Camp Site SCP is being removed from the current permit. However, the proposed permit limits for the Downstream Aggregate Borrow Area SCP are ambiguous. The authors provide a series of recommendations to reduce uncertainty in any proposed permit limits and appear to suggest that the short-term BC WQGs, approved SBEBs, and the MDMER TSS limit be used as interim permit limits. The authors further suggest that meeting these benchmarks should be sufficient, from a water quality perspective, for water collected in the SCP to be discharged. The accompanying condition of no acute toxicity to Daphnia magna and rainbow trout are not mentioned, but must be met as a condition of release from the reviewer's perspective. The reviewer suggests the proposed recommendations be considered as permit conditions, subject to the resolution of the one recommendation below. Recommended Permit Condition: The recommendations provided in R2_ENV Comment ID 2175_R3_ENV Comment IDs 84, 85, 87, 2097.pdf should become permit conditions that must be fulfilled as a condition of release from the Downstream Aggregate Borrow Area SCP, subject to the resolution of the comment below. Recommendation: The toxicity tests stated in Recommendation 2 (section 4.2.2 of R2_ENV Comment ID 2175_R3_ENV Comment IDs 84, 85, 87, 2097.pdf) are proposed to be spiked with cadmium and zinc. However, there are a few predicted water quality parameters that are near or above the BC WQGs, such as copper and arsenic. The reviewer recommends that the spiked tests include arsenic, cadmium, copper, and zinc at concentrations in the revised Upper-Case predictions. (Source Comment ID#154)	Thank you for the response. We agree *Daphnia magna* and rainbow trout acute toxicity testing should be included as a condition of Downstream Aggregate Borrow Area SCP discharge. *D. magna* and rainbow trout acute toxicity tests are proposed for SCP discharge in the Application (Table 5.8-11 of Section 5.8 of the Joint Permit Application). The omission of these proposed requirements from "R2_ENV Comment ID 2175_R3_ENV Comment IDs 84, 85, 87, 2097.pdf" was an oversight. Regarding the reviewer's Recommended Permit Condition: this comment is acknowledged. We recommend one clarification to the proposed condition in that the recommendations presented in "R2_ENV Comment ID 2175_R3_ENV Comment IDs 84, 85, 87, 2097.pdf" do not need to be fulfilled in order for the SCP to discharge if the water contains parameter concentrations equal to or below BC WQGs. Regarding the reviewer's Recommendation: we acknowledge SCP discharge may contain a mixture of parameters, and parameter mixtures have the potential to result in synergistic or antagonistic effects beyond those observed in toxicity tests of individual parameters. However, single parameter toxicity tests are recommended in "R2_ENV Comment ID 2175_R3_ENV Comment IDs 84, 85, 87, 2097.pdf" to allow for the development of quantitative dose-effect curves for Cd and for Zn (e.g., to allow the test parameter to be available for uptake with limited confounding factors present, such as other metals). The quantitative dose-effect curves are important as they will form the basis for SCP discharge limits, which will be established for individual parameters. Further, the information gained from a toxicity test spiked with a parameter mixture (e.g., metals) is limited to the specific conditions, and parameter concentrations and ratios used in that particular test, whereas nearly infinite combinations of parameter concentrations and ratios may occur in the SCP. Therefore, a multi-toxicant toxicity test representing SCP effluent is not recommended by BW Gold at this time.		CSFN	Lorax		Meghan	GM	07-Nov-22	GM; Oct 31	Ready for Publishing
587	Chapter 5: Modelling, Mitigation and Discharges	Discharge Limits	CSFN (Jesse Sinclair)	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Dec 12, 2022	4	Follow Up	Recommended Permit Condition	Yes	Thank you for the response. If I understand the response related to including the recommendations in "R2_ENV Comment ID 2175_R3_ENV Comment IDs 84, 85, 87, 2097.pdf" correctly, the Proponent is proposing to complete the recommendations only if effluent quality exceeds BC WQGs. I would argue that recommendations #1 and #2 should be completed regardless of effluent quality conditions as both recommendations will provide the basis for Permit Limits that are achievable and protective. I do agree that recommendation #3 can be responsive. I agree with the Proponent's response regarding the other recommendation for multi-parameter testing and acknowledge this will be a condition of release (i.e., acute toxicity testing and demonstration of non-lethality).	Thank you for the response and we look forward to discussing this comment in a meeting if necessary. The intent of the statement in the previous response ("...the recommendations presented in "R2_ENV Comment ID 2175_R3_ENV Comment IDs 84, 85, 87, 2097.pdf" do not need to be fulfilled in order for the SCP to discharge if the water contains parameter concentrations equal to or below BC WQGs.") is to allow BW Gold the flexibility to discharge SCP water if necessary and if demonstrated to contain parameter concentrations below WQGs and SBEBs in the event that toxicity tests, per Recommendation #2, are delayed or that final test results have not yet been issued. This is intent is perhaps more clearly worded in "R2_ENV Comment ID 2175_R3_ENV Comment IDs 84, 85, 87, 2097.pdf" (wording copied below) and we apologize for the confusion this may have caused:		CSFN	Lorax				Dec. 19	TD, Dec 19	Ready for Publishing
588	Chapter 6: Environmental Assessment Predictions	Complete Effects Assessment	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	BW Gold has developed the draft Joint Mines Act / Environmental Management Act Permits Application for the Construction and Operations phases of the project only. The effects assessment in Chapter 6 should be updated to include a complete effects assessment. As mentioned above, water quality modelling results for surface waters downstream of the Project are projected to occasionally exceed some long-term and short-term BC water quality guidelines (WQGs), long-term CCME WQGs, and/or Yinka Dene water quality standards (WQSs) during the Closure and Post-Closure phases. The full extent of the potential effects on aquatic receptors during these phases is not adequately characterized in the draft Joint Mines Act / Environmental Management Act Permits Application. Recommendation: Please update Chapter 6 to include a complete effects assessment that characterizes impacts to receptors through all phases of mine life. (Source Comment ID#155)	Please refer to comment response #102.		CSFN	Lorax	Entia		GM	Ready for Submission	GM; June 28	Ready for Publishing
588	Chapter 6: Environmental Assessment Predictions	Complete Effects Assessment	CSFN	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Aug 11, 2022	2	Follow Up	Recommendation	No	Thank you. I have reviewed the response to ENV comment (ITT ID #102) and acknowledge that projected exceedances of the WQGs noted above have largely been resolved in the closure and post-closure project phases. However, effects related to exceedances of the long-term WQG for zinc in Creek 661 are not described. While I acknowledge that the IRT process defined the scope of the MA/EMA application as the construction and operation phase, risks that extend into closure and post-closure should be characterized so that CSFN has a comprehensive understanding of potential effects over the entire life of the project. (Source Comment ID#155)	The predicted exceedances of the long-term WQG for T-Zn in Creek 661 are driven by the January model background term for WQ5 rather than Project discharges. As such, the Zn exceedances noted occur in all model phases, from the "Pre-Construction" phase (2007 to 2022, representing model output in the absence of Project development) through the Post-Closure phase. Please refer to Section 2.2.2.2 of the below memo generated for Round 1 Comment 99 for further information: Memo: R1_ENV Comment ID 99.pdf Appendix: R1_ENV Comment ID 99 Appendix B.xlsx It is noted the Zn discussion presented in Section 2.2.2.2 of the above memo is focused on the Construction and Operation phases. Therefore, please consider the below January maximum predicted concentrations for total Zn for the Closure and Post-Closure phases (v13e water balance/water quality model; 95th percentile concentrations): January background model term: 0.0281 mg/L WQ5 predicted January maximum in Closure: 0.0277 mg/L WQ5 predicted January maximum in Post-Closure: 0.0279 mg/L		CSFN	Lorax	Entia			Ready for Submission	GM; Aug 16	Ready for Publishing
589	Chapter 6: Environmental Assessment Predictions	Characterization of Risks	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	Section 6.3.2 on Project Interactions with Aquatic Resources does not include an evaluation of interactions for the Closure and Post-Closure periods. This is rationalized by stating that an effluent discharge permit is sought only for the Construction and Operations periods. The results of water quality modeling (presented in Chapter 5) show that concentrations of total mercury, total antimony, and dissolved cadmium will exceed short-term and long-term water quality guidelines in Davidson Creek; and total zinc will exceed long-term water quality guidelines in Creek 661. The estimated residual effects of these exceedances should be characterized at this time to give the reviewers a fulsome understanding of the potential for effects over the life of the project. Recommendation: We recommend that the residual effects assessment include a characterization of risks to aquatic biota from effluent discharges over the life of the project. (Source Comment ID#156)	Please refer to comment response #102.		CSFN	Lorax		Meghan	GM	Ready for Submission	GM; June 28	Ready for Publishing
589	Chapter 6: Environmental Assessment Predictions	Characterization of Risks	CSFN	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd. 590	Chapter 7: Environmental Monitoring	Waste Rock Dump Seepage Monitoring	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada	Jun 02, 2022	1	New	Information Requirement	No	One of the programs must be a waste rock dump seepage monitoring program to monitor change in oxidation products coming off the dumps, referencing humidity cells and seep monitoring. (Source Comment ID#157)	Section 7.2 of Chapter 7 identifies seepage surveys to be conducted as part of the Mine Site Water and Discharge Monitoring and Management Plan (MSDP; Appendix 9-E). Seep surveys will also be conducted during construction and operations to enhance the understanding of groundwater flow in the Project area and, specifically, down-gradient of the TSF, stockpiles and the Pit Lake, and to identify potential pathways for seepage from these facilities. Seep monitoring will include descriptions of seeps and waterbodies		CSFN	ERM		Tonia	RT	Ready for Submission		Ready for Publishing

591	Chapter 8: Health and Safety	Occupational Health and Safety – CSFNs	CSFN	Lesley Shelley, Ph.D., R.P.Bio, Entia Environmental Consultants	Jun 02, 2022	1	New	Information Requirement	No	The Application must include an initial occupational health risk assessment, developed by a qualified person which considers anticipated physical, chemical, biological, and ergonomic hazards and strategies to minimize and control those hazards. Identify information sources used to inform this assessment. This should consider construction and operation activities. (Source Comment ID#158)	A preliminary Occupational Health and Safety Risk is included as Appendix 8-A of the joint application. As stated in section 8.5.1 of the joint application, at the current stage of Project design, a detailed OHS risk assessment is not yet possible. Section 8.5 of the joint application sets out the framework by which the risk assessment will occur at the appropriate time.		CSFN	ERM		Lesley	RT	Ready for Submission	RT; June 27	Ready for Publishing
592	Chapter 8: Health and Safety	Advanced Training for Employees Working with Cyanide or Responding to Cyanide Incidents	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Information Requirement	No	A main objective of the OHSP is to ensure employees and contractors are trained to carry out their jobs safely and productively. Preliminary training requirements for employees with different roles and responsibilities are listed in Appendix C. However, the only training related to cyanide listed is the general Cyanide Hazard Awareness training for all employees. Considering that cyanide is a major risk to health and safety, the OHSP must include more advanced training for employees working with cyanide or responding to cyanide incidents related to the use, transportation, and storage of cyanide reagents. Such staff includes workers in the mill/cyanidation plant, those involved in transport/handling of cyanide deliveries to the site, and any employee with Health and Safety responsibilities above and beyond what is expected of all staff. Information Request: Please include advanced and job-specific training for employees dealing with different aspects of cyanide reagents storage, usage, transportation and incidents. (Source Comment ID#159)	Section 8.1.1 of the Occupational Health and Safety Plan refers to the Blackwater Cyanide Management Plan (CMP; Appendix A of Appendix 9-M), which details the cyanide training requirements specific to employees and contractors that are required to perform work in the mill (Section 10.1 of CMP). Section 10.2 of the CMP details the training required for workers to perform their normal production tasks, including unloading, mixing, production and maintenance, with minimum risk to worker health and safety and in a manner that prevents unplanned cyanide releases. Section 10.3 of the CMP details the training requirements for all cyanide unloading, mixing, production and maintenance personnel. Section 9.1 of the CMP includes an emergency response plan for cyanide release. Transportation requirements are outlined in Sections 4 and 5 of the CMP.		CSFN	ERM		Tonia	RT	Ready for Submission	RT; June 27	Ready for Publishing
593	Chapter 8: Health and Safety	On-Site Health and Medical Protocols and Services	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Recommendation	No	As a condition of the Environmental Assessment Certificate (EAC) and a condition of the Decision Statement for the Blackwater project, disease and infection prevention, health promotion and worker wellness must be achieved through communication and coordination with Northern Health, BC Ambulance Services and local health service providers. Section 8.7.2 of the OHSP states that Artemis Gold expects these services will be available but does not provide any information as to how and through what sources on-site health and medical protocols will be implemented. Recommendation: Please include in the OHSP a description of how and through what sources the on-site health and safety protocols will be implemented. (Source Comment ID#160)	A separate Health and Medical Service Plan (HMSP) has been developed to outline the on-site medical services and programs to be delivered for the Project workforce and describe the measures to coordinate health service delivery with Northern Health. The HMSP is a requirement and forms part of the overall Blackwater Gold Mine Emergency Response Plan and addresses Condition 40 of the Environmental Assessment Certificate #M19 01. The plan was developed in consultation with Northern Health, Indigenous nations, the District of Vanderhoof, and the Village of Fraser Lake. The plan was then submitted to the EAO and to the aforementioned parties for review more than 60 days prior to the planned commencement of Construction.		CSFN	ERM		Tonia	RT	Ready for Submission	RT; June 27	Ready for Publishing
594	Chapter 9: Management Plans	Nitrogen Management Plan	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The application must include a nitrogen management plan covering management of nitrogen species in contact water including both blasting residue as well as nitrogen species from cyanide and cyanide destruction. Recommendation: Please refer to Source's memo titled 220131 – Blackwater Nitrogen Reconciliation Plan.docx, provided through email to the Artemis team on February 2, 2022, for clarification and guidance on CSFN's expectations for a Nitrogen Reconciliation Plan. (Source Comment ID#161)	This comment was raised by CSFN during pre-application review of the Cyanide Management Plan on July 21, 2021. BW Gold responded and updated the Cyanide Management Plan to include the following: *As per section 6.4, BW Gold will comply with the ICMC requirement of ensuring that all TSF pond waters and effluent discharge contain < 50 ppm CN-WAD.* *Section 6.4 revised to state: Furthermore, process and receiving water quality sampling and analysis requirements are detailed in the Mine Site Water Monitoring and Discharge Plan (MSWDP) and the Aquatic Effects Monitoring Plan (AEMP). Actual cyanide concentrations in the TSF ponds (C,D) and process plant process water streams will be compared to predictions and actual cyanide consumption and opportunities to reduce cyanide consumption will be identified through plant optimization and ramp-up. This will be reported on through the annual EMA and ARR provincial annual reports.* *6 months prior to development of the first EMA report for the site in the year that cyanide is first used on site, Artemis will provide to the Nations, an annual report template for the section on cyanide and* ***nitrate*** *with cyanide/* ***nitrogen species*** *to ensure the correct parameters and graphs will be included.* Furthermore, the membrane treatment plant selected by BW Gold has been designed to treat nitrogen species prior to release of effluent to the FWR and, ultimately, the receiving environment. Furthermore, monitoring of nitrogen species is also included in all contact water management sources on site through the Ch 9-E - Mine Site Water and Discharge Monitoring Plan (MSDP). Moreover, nitrogen species will be monitored in all receiving waters in accordance with the Chapter 7-A - Aquatic Effects Monitoring Program (AEMP) Plan. Consequently, BW Gold respectfully disagrees with the reviewer that a Nitrogen Management Plan is required for the project.		CSFN	ERM		Rolf	RT	Ready for Submission	AT, June 27 Response provided by TD, June 28	Ready for Publishing

594	Chapter 9: Management Plans	Nitrogen Management Plan	CSFN - P. Littlejohn,	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Aug 22, 2022	2	Follow Up	Recommended Permit Condition	Yes	This comment is also relevant to comment #162 (ITT ID 595). The key aspect of the CSFN team's original comments is the reconciliation of predicted versus actual levels of N species and sulphate in mine contact water and the predicted versus actual levels of removal achieved by the water treatment plant. These species can be difficult to model accurately and so the intent of our original comment was to watch for deviations from predictions proactively. Recommended Permit Condition: A commitment from BW Gold to reconcile predicted versus actual levels of N species and SO4 in mine contact water and treated effluent, supported by a permit condition requiring annual reporting on this reconciliation, addresses this risk without need for a N/SO4 management plan. If BW Gold and EMLI support this approach, then this comment can be resolved by mitigating risk through a permit condition. (Source Comment ID#161)	This commitment and requirement has already been incorporated into the reporting out on the the Cyanide Management Plan, Mine Site Water Management Plan and Aquatic Effects Management Plan as per our previous response to round 1 comment 594. BW Gold supports this condition being reported out on through the above noted plans.		CSFN	BWG	ERM			Ready for Submission	TD, Aug 24	Ready for Publishing
594	Chapter 9: Management Plans	Nitrogen Management Plan	CSFN - P. Littlejohn,	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Acknowledged. Please carry the reviewer's Round 2 comment forward as a permit condition.(Source Comment ID#161)	This commitment and requirement has already been incorporated into the reporting out on the the Cyanide Management Plan, Mine Site Water Management Plan and Aquatic Effects Management Plan as per our previous response to round 1 comment 594. BW Gold supports the reconciliation of predicted versus actual levels of N species and sulphate in mine contact water and the predicted versus actual levels of removal		CSFN	BWG	ERM	Travis			TD, Oct 17	Ready for Publishing
595	Chapter 9: Management Plans	Sulphate Management Plan	CSFN	BW Gold Ltd.	Jun 02, 2022	1	New	Information Requirement	Yes	A sulphate management plan must be developed. Sulphate is a key contaminant of concern for the project and is an important driver of water treatment and discharge in operations and closure/post-closure and so development of a sulphate management plan is warranted. Recommended Permit Condition: A permit condition is required to develop a Sulphate Management Plan. The Plan must include inventory tracking, the amount of sulphate present in mine water year-to-year, annual reporting, reconciliation between the WQ model and actual WQ, adaptive management/monitoring triggers, etc... (Source Comment ID#162)	The membrane treatment plant selected by BW Gold has been designed to treat sulphate prior to release of effluent to the FWR and, ultimately, the receiving environment. Furthermore, monitoring of sulphate is also included in all contact water management sources on site through the Ch 9-E - Mine Site Water and Discharge Monitoring Plan (MSDP). Moreover, sulphate will be monitored in all receiving waters in accordance with the Chapter 7-A - Aquatic Effects Monitoring Program (AEMP) Plan. Consequently, BW Gold respectfully disagrees with the reviewer that an SO4 MP is required for the project.		CSFN	BWG	BW Gold	Travis	TD	Ready for Submission	TD, 15-Jun	Ready for Publishing
595	Chapter 9: Management Plans	Sulphate Management Plan	CSFN -K. Jones	BW Gold Ltd.	Aug 22, 2022	2	Follow Up	Information Requirement	Yes	Please see the Round 2 comment for comment #161 (ITT ID 594) (Source Comment ID#162)	Please refer to round 2 response to comment 594. Monitoring of sulphate is included for all contact water monitoring and management sources on site through the Ch 9-E - Mine Site Water and Discharge Monitoring Plan (MSDP). Moreover, sulphate will be monitored in all receiving waters in accordance with the Chapter 7-A - Aquatic Effects Monitoring Program (AEMP) Plan. BW Gold supports a condition to report out on sulphate as is already planned under the annual reporting for those plans. 595	Chapter 9: Management Plans	Sulphate Management Plan	CSFN -K. Jones	BW Gold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: A condition of the permit should include target limits for the effluent discharged from the mine site as well as trigger limits as part of the TARP for sulphate.(Source Comment ID#162)	BW Gold ackknowledges the comment and looks forward to discussing draft permit conditions with EMLI, ENV and CSFN during the next phase of the MRC process.		CSFN	BWG	BW Gold	Travis			TD, Oct 17	Ready for Publishing
596	Chapter 9-D: ML./ARD Management Plan	Contingency Treatment for ARD	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The application must include a contingency plan to modify the water treatment plant system to handle large scale onset of ARD. This plan must also include strategies to reduce the risk of impacts from large scale onset of ARD at site in the case that significant acidity develops (i.e.., the TSF becomes acidic). (Source Comment ID#163)	Contingencies and adaptive management actions specific to TSF pond water quality are outlined in Table 11-1 of the Mine Site Water and Discharge Monitoring and Management Plan (Appendix 9-E of the Application). If pH instability (i.e.., pH < 6.5) is detected in the TSF ponds, for example, the adaptive management actions include a follow-up investigation and possible additional management (e.g., lime dosing in the mill, adjustments to waste rock flooding schedule, temporary lime addition to re-establish neutral pH conditions in the pond), per Appendix 9-E. This approach is designed to trigger actions prior to the onset of large scale ARD. Therefore, modification of the water treatment plant system to handle large scale onset of ARD is not proposed.		CSFN	Lorax			GM	Ready for Submission	GM; June 29	Ready for Publishing
597	Chapter 9-D: ML./ARD Management Plan	Metal Digestion Method	CSFN	Timo Kirchner, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Clarification	No	Solid content concentrations can be evaluated using various digestion methods, such as the multi acid digestion method or the Aqua Regia digestion method. The various methods can impact both the detection limits used to determine if parameters are enriched and the concentration of the parameters. Clarification: Please describe the digestion method that will be used to identify solid metal contents. (Source Comment ID#164)	As stated under Section 7.1.7 of the ML/ARD Management Plan, the aqua regia digestion method will be used for operational monitoring purposes.		CSFN	Lorax		Timo	GM	Ready for Submission	GM; June 24	Ready for Publishing
598	Chapter 9-D: ML./ARD Management Plan	In-situ Tailings Monitoring	CSFN	Timo Kirchner, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommended Permit Condition	Yes	The plan indicates that opportunistic tailings samples will be collected from the beaches within the TSFs. It is assumed that tailings exposed on the beaches will not be depleted in neutralizing minerals for one year and that acidic conditions will not develop because the tailings will be covered within the one-year timeframe. However, this lag time estimate is only applicable to the tailings used during bench scale testing and is limited to 5 HCT tests. The lag time of these tests is somewhat dependent on the geochemical characteristics of the ore sampled. Due to the limited sample size, the lag times estimate for the tailings samples is subject to uncertainty. Recommended Permit Condition: Please update the ML-ARD management plan to include regular sampling of tailings beach material for tailings for areas that are safe to sample. (Source Comment ID#165)	Given the Health and Safety concerns around accessing freshly deposited tailings beaches, it is believed that the word "opportunistic" reflects the practicality of such sampling campaigns. Depending on access, in-situ tailings beach sampling may become a regular component of the program. The suggested wording change will be considered in the next update of the ML/ARD Management Plan. The prescribed pre-deposition tailings monitoring program will adequately capture the variability of tailings geochemistry and allow the evaluation of kinetic test sample representativeness.		CSFN	Lorax		Timo	GM	Ready for Submission	GM; June 24	Ready for Publishing

598	Chapter 9-D: ML./ARD Management Plan	In-situ Tailings Monitoring	CSFN -K. Jones	Timo Kirchner, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Recommended Permit Condition	Yes	Thank you for the response. Given the assumptions in the model, it is recommended that a permit condition be developed for beach sampling to be conducted for tailings that are safe to sample and are older than 6 months. The objective will be to identify any localized acidity in the facility and therefore, sampling freshly deposited tailings is not recommended. (Source Comment ID#165)	This recommendation is acknowledged. Please note that opportunistic sampling does not preclude regular sampling. It is BW Gold's intention to sample deposited tailings as regularly as possible, safe access permitting. However, the safety of access to even aged tailings beaches is difficult to predict and as such, a specific sampling frequency has not been proposed in the current version of the ML/ARD Management Plan. The importance of quantifying the kinetic behaviour of deposited, aged tailings to verify source term and water quality model assumptions is recognized.		CSFN	Lorax				Ready for Submission	GM; Aug 30	Ready for Publishing
598	Chapter 9-D: ML./ARD Management Plan	In-situ Tailings Monitoring	CSFN -K. Jones	Timo Kirchner, P.Geo.; Lorax Environmental Services Ltd.	Oct 11, 2022	3	Follow Up		Yes	Thanks. To clarify, the previous comment was in reference to additional composite sampling - not to the regular sampling outlined in the ML/ARD Management Plan which continues to be supported. The ML/ARD management plan should include sampling of deposited beach tailings unless unsafe to do so, with documented justification for safety concerns.(Source Comment ID#165)	The comment is acknowledged and updates to the ML/ARD Management Plan will be made in the next document version as necessary.		CSFN	Lorax					GM; Oct 17	Ready for Publishing
599	Chapter 9-D: ML./ARD Management Plan	Tailings Sampling	CSFN	Timo Kirchner, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Four tailings samples will be collected per quarter. It is understood that the tailings will largely be PAG and managed as PAG; however, it is useful to understand variability in the tailings. Information Request: Please provide a discussion of why daily samples will not be collected to create monthly composite samples, for comparison to the grab samples, particularly during periods of LGO mining. (Source Comment ID#166)	The proposed sampling frequency will collect 20 samples per year, which would provide information on the geochemical heterogeneity of tailings being deposited in the TSF. Monthly composite samples would provide better information on average tailings composition, but would not provide as much detail on tailings variability. Adjustments to the sampling frequency and methodology will be considered in the next update to the ML/ARD Management Plan.		CSFN	Lorax		Timo	GM	Ready for Submission	GM; June 24	Ready for Publishing
599	Chapter 9-D: ML./ARD Management Plan	Tailings Sampling	CSFN -K. Jones	Timo Kirchner, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Information Requirement	Yes	Please confirm the number of samples that will be collected per quarter. A composite sample will be valuable to determine the representativeness of the grab samples. If the variability of the samples is low, a composite sample may not be required. Beach sampling will be a better measure of the potential for acid generation in the field. As indicated in the Round 2 response to comment #165 (ITT ID 598), beach sampling is recommended as a potential permit condition. (Source Comment ID#166)	As outlined in the ML/ARD Management Plan (Table 7.1-1), a total of five fresh tailings and associated supernatant samples will be collected per quarter from a suitable sampling port within the mill. The importance of quantifying the kinetic behaviour of deposited, aged tailings to verify source term and water quality model assumptions is recognized.		CSFN	Lorax				Ready for Submission	GM; Aug 30	Ready for Publishing
600	Chapter 9-D: ML./ARD Management Plan	Sampling Frequency	CSFN	Timo Kirchner, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Confirmatory sampling will be conducted on waste mined at the site. The waste is categorized into four categories, including PAG 1, PAG 2, NAG 3, NAG 4, and NAG 5. The sampling frequency of the waste rock is scheduled to occur on the frequency of 1 sample for 50,000 tonnes of rock. Information Request: Please describe if this sampling frequency will adequately be able to verify the ABA model as well as facilitate adequate rock segregation. Describe measures that will be enacted if confirmatory sampling is inconsistent with the ABA model, capacity requirements for rock storage volumes. (Source Comment ID#167)	Part a: The frequency of 1 sample per 50,000 t of mine rock is considered adequate for monitoring purposes for the following reasons: - The geochemical characteristics of the deposit have been well-defined by a comprehensive pre-mine characterization program which included >1,000 mine rock samples and >285,000 assay samples. - The pre-blast sample will comprise a well-spaced composite which will, in most cases, be representative of a whole mining bench. - By applying geostatistics to this data, a reliable and representative mining model can be created for ARD purposes. - A higher resolution of blast hole samples near boundaries of unique PAG/NAG rock units will be collected and submitted for analysis. Part b: If the confirmatory sampling is inconsistent with the ABA model, the assay proxies will be adjusted based on available data and the block model will be refined using ML/ARD monitoring results. If this results in a higher proportion of PAG waste rock, the design of the PAG storage facilities will be reviewed and adjustments to the mine plan may be made. In addition, source term assumptions and water quality models will be revisited using the revised waste rock estimates. In specific cases, rehandling of misclassified material may be undertaken under the guidance of a QP.		CSFN	Lorax		Timo	GM	Ready for Submission	GM; June 24	Ready for Publishing
601	Chapter 9-E: Mine Water and Discharge Management Plan	Prepare a TSF Supernatant Water Management Plan	CSFN	Stephanie Eagen, R.P.Bio..; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The Application must include a TSF Supernatant Water Management Plan detailing the procedures for monitoring of liquid levels and seeps, sampling, and analysis of water quality, determining when to divert supernatant to the mine Water Treatment Plant for treatment, and contingency plans including emergency procedures for system malfunctions/upsets and storm events. The Application must also include a water management/treatment plant operating strategy to avoid frequent start/stop of the system. (Source Comment ID#168)	Procedures and locations for monitoring liquid levels and seeps (quantity and quality) for the TSF are included within Appendix 9-E. Section 7.3.2.1 "an OMS manual will be prepared following construction ...to provide comprehensive operating instructions and monitoring frequencies and will identify how and when water will be pumped to the membrane WTP". Non-conformities and corrective actions are outlined in Section 11 of Appendix 9-E. As outlined in Table 11-1 in Appendix 9-E, tier-based operational instructions will be included in the OMS manual that will provide threshold values and response plans for instances when the TSF pond volume exceeds the needs of mine operations. WTP maintenance activities are described in Section 8 of Appendix 5-H, including procedures to start up and shut down the plant: and OMS manual will be prepared following selection and purchase of equipment (BQE, 2022).		CSFN	KP		Greg	AT/KP	Ready for Submission	AT, June 28	Ready for Publishing
601	Chapter 9-E: Mine Water and Discharge Management Plan	Prepare a TSF Supernatant Water Management Plan	CSFN - P. Littlejohn,	Stephanie Eagen, R.P.Bio..; Dan Fontaine, P.Eng., Knight Piésold Ltd.	Aug 22, 2022	2	Follow Up	Recommendation	No	Differences between how TSF-C and TSF-D will be operated warrant creation of an OMS manual for each facility. Please see comment #21 (ITT ID 453) from CSFN's first batch of Round 2 comments (memo titled 220808 Source Round 2 Detailed Comments on the Blackwater Major Works Application (Batch 2A)) for recommendations on the OMS manuals for TSF-C and TSF-D. CSFN request to be engaged in the development of these manuals. (Source Comment ID#168)	As noted in the response to comment 453 (R1), monitoring and operational requirements related to the TSF are summarized in Section 9 of Appendix 3-K of the Application. These preliminary operations and monitoring requirements will be incorporated into Operations, Maintenance and Surveillance (OMS) Manual following construction of TSF C along with other pertinent content. The OMS Manual will be reviewed annually and updated as required during progressive development of the TSF. It will incorporate requirements for TSF D once it is constructed. Development of an OMS Manual for a TSF is a Code requirement (10.5.2). It must be reviewed by the Engineer of Record (EOR) for the TSF, and approved by the Mine Manager. BW Gold acknowledges the CSFN request to be engaged in the development of the OMS Manual for the TSF.		CSFN	KP			AT	Ready for Submission	AT, Aug 31	Ready for Publishing
601	Chapter 9-E: Mine Water and Discharge Management Plan	Prepare a TSF Supernatant Water Management Plan	CSFN - P. Littlejohn,	Stephanie Eagen, R.P.Bio..; Dan Fontaine, P.Eng., Knight Piésold Ltd.	Oct 11, 2022	3	Follow Up	Recommended Permit Condition	Yes	Recommended Permit Condition: Acknowledged. The reviewer recommends capturing the requirement to engage with CSFN on the TSF OMS as a permit condition. For more detail on recommended permit conditions for the OMS, please refer to CSFN's comments under ITT ID 453 for Round 3. (Source Comment ID#168)	BW Gold acknowledges this comment and has referred to comment ID 453 for further discussion of the topic.		CSFN	KP		Dan	AT/KP	Ready for Submission	At, Oct26	Ready for Publishing

602	Chapter 9-E: Mine Water and Discharge Management Plan	Balance Flows	CSFN	Stephanie Eagen, R.P.Bio..; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The Application must contain the optimization plan for the water taking and flow augmentation. As agreed during the EA process, permitting will need to balance the reduction of flows in upper Chedakuz Creek and augmented flow to Davidson Creek (as the balancing of flows to the two creeks was not completed). (Source Comment ID#169)	Palmer (Application for a Fisheries Act Authorization 2021) assessed flow changes in Chedakuz Creek resulting from the use of the FWSS to augment flow in Davidson Creek. Palmer concluded: "During Operations and Closure phases when the FWSS is operating, flows in lower Chedakuz Creek will be reduced, particularly between Tatelkuz Lake and the confluence with Davidson Creek (a 900 m section). Hydrological modelling completed during the EA indicated this withdrawal will result in the maximum reduction of 2% in rainbow trout spawning habitat in spring; an increase in total rainbow trout fry rearing habitat in summer and fall; and no more than 2% reduction in juvenile rainbow trout rearing and kokanee spawning habitat. In winter the physical change in the creek depth is a reduction of 2-3 centimetres (cm) in a wide and deep channel." Palmer (2021) further notes: "since 2015, the baseline hydrology has been updated and the mine plan now proposes to divert more runoff that originates in the upper portion of the Davidson Creek catchment around the TSF, increase water recycled on site and treat and discharge water from the start of Operations. These changes result in more water originating from the upper portions of Davidson Creek to contribute downstream to meet the IFN, thus reducing the demand on the volume of water from Tatelkuz Lake. The increased freshwater diversions reduce the amount of water that will need to be withdrawn from Tatelkuz Lake to support IFN. Given this, and that fact that pumping from Tatelkuz Lake is not planned to commence until Year 6, the previously-analyzed timeseries of habitat conditions from Chedakuz Creek represent a conservative over-estimate of the necessary withdrawals from Tatelkuz Lake, and subsequently, the actual habitat losses in Chedakuz Creek." Flows are monitored in the FWR to track release of IFN releases into Davidson Creek. The FWSS flow monitoring systems are described in the Water Management Structures Detailed Design Report (Appendix 3-O). The FWR outlet pipes will feed into a Temperature and Flow Control Chamber, and each pipe will be fitted with a main valve and maintenance valve with the ability to regulate flows according to water surface levels and IFN requirements. Ultrasonic flow meters will be installed on the pipes upstream of the outlet valves to accurately measure flows for compliance reporting requirements. The FWSS Report (Appendix 3-P) describes the intake in Tatelkuz Lake. The maximum IFN is 0.56 m3/s during the spring; the FWSS will draw water from Tatelkuz Lake through two pipes (for redundancy), which will passively convey water from the lake to a concrete wet well. The intake screen design basis assumption includes a 0.67 m3/s capacity for each screen (20% higher than the maximum IFN). Three vertical turbine pumps within the pump station will provide a total maximum flowrate of 0.67 m3/s . Each of the pumps will be equipped with a variable frequency drive and motor to accommodate variable flow demand.		CSFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 29	Ready for Publishing
602	Chapter 9-E: Mine Water and Discharge Management Plan	Balance Flows	CSFN	Cindy Starzyk, Ph.D., P.Eng.; Stephanie Eagen, R.P.Bio..; Knight Piésold Ltd.	Aug 08, 2022	2	New	Recommendation	No	BW Gold's response indicates that more water will originate from the upper portions of Davidson Creek to contribute downstream to meet the IFN, thus reducing the demand on the volume of water from Tatelkuz Lake. However, starting from year 7, a significant amount of water is still expected to be withdrawn from Tatelkuz Lake, affecting the flows in upper Chedakuz Creek. It is still unclear if this optimization plan considers flow monitoring in upper Chedakuz Creek to balance the augmented flow to Davidson Creek. Recommendation: Please indicate if the WBM takes into account the updated baseline hydrology since 2015 and the increased amount of runoff diverted from the upper portion of the Davidson Creek catchment around the TSF, among other considerations. These updates should be quantified to accurately assess the flows in upper Chedakuz Creek and augmented flow to Davidson Creek. (Source Comment ID#169)	Yes, the water balance model includes the baseline hydrology updated since 2015. The water balance model is based on baseline watershed modelling that includes hydrology data collected through the end of 2020. The inclusion of the updated hydrology information is presented in the Baseline Watershed Model report (Appendix A of Appendix 5-B of the Application), and the subsequent water balance modelling update to represent the optimized Closure/Post-Closure water management plan (KP, 2022). The water balance model is based on the updated mine plan referenced in the response to the Round 1 comment. This mine plan includes the diversions that originate in the upper portion of the Davidson Creek catchment and direct water around the TSF. The Northern Diversion System directs water to Davidson Creek via the FWR; the Central Diversion System directs water to the WMP and thence to the FWR and Davidson Creek. Predicted streamflows in Davidson Creek and Chedakuz Creek considering the updated mine plan are presented in Appendix 5-B and in KP (2022). Predicted monthly flows and percent change in flow at locations in Davidson Creek and Chedakuz Creek relevant for all phases of mining are presented in Appendices D and E (of KP, 2022). Reference: Knight Piésold Ltd (KP). 2022. Blackwater Gold Project - Updated Water Balance Modelling in Support of Closure/Post-Closure Water Quality Optimization. Included as an attachment to BW Gold Ltd. 2022. Revised Base Case Closure and Post-Closure WQ Predictions. Prepared for ENV and EMLI. June 30, 2022. "R1_ENV_EMLI_CSFN_LDN-UFN Comment IDs 102 126 415 490 586 607 610 612 1263 1289 1320 1615 1853.pdf"		CSFN	KP		Cindy	AT/KP	Ready for Submission	KP, Aug 14	Ready for Publishing
603	Chapter 9-E: Mine Water and Discharge Management Plan	Pumping of Tatelkuz Lake to Davidson Creek	CSFN	Palmer	Jun 02, 2022	1	New	Information Requirement	No	Develop additional project design and planning to minimize pumping of Tatelkuz Lake to Davidson Creek. The proposed pumping of water from Tatelkuz Lake to make up flow in Davidson Creek could impact aquatic habitat in Tatelkuz Lake and the downstream environment. Alternative solutions to these issues should be explored before committing to water withdrawal from Tatelkuz Lake. In addition, the application must clarify proposed long-term water taking from the lake is only for the Operational Phase. The submitted plan must include the process for and successes/ challenges with the collaborative development of this plan. (Source Comment ID#170)	Long-term water withdrawal from Tatelkuz Lake is proposed from Year 6 of Operations through to the end of Closure. This timeline will be clarified in the text. Long-term water withdrawal from Tatelkuz Lake is not predicted to have a significant effect on water surface elevation (i.e.., indistinguishable from natural variation) based on water modelling. Section 5.3.9..4.5 Reduction in Littoral Fish Habitat of Tatelkuz Lake of the EIS/Application states that "The magnitude of change is negligible to low, because some months will differ from mean baseline values, but will remain within range of natural variation. On average, WSE of the lake fluctuates 0.8 m over a year, but the greatest change estimated to be caused by pumping 0.11 m from baseline conditions or 14% of the baseline range". Effects on littoral habitat in Tatelkuz Lake were not considered to have changed in the subsequent updated assessments (Blackwater Gold Project – Consolidated Fish and Fish Habitat Effects Assessment, ERM September 2017). Conclusions presented in the Application/EIS are considered to be conservative, as water withdrawal from Tatelkuz Lake to augment flows in Davidson Creek will be decreased based on project design changes. Any potential changes in aquatic habitat will be monitored as part of the follow-up program for the CEAA Decision Statement Condition 3.16 pertaining to fish habitat in Tatelkuz Lake and Chedakuz Creek. A memo on this follow-up plan was submitted to Indigenous groups for review.	KP requested transfer to Palmer	CSFN	Palmer			TD	Ready for Submission	TD, Jun 27	Ready for Publishing
603	Chapter 9-E: Mine Water and Discharge Management Plan	Pumping of Tatelkuz Lake to Davidson Creek	CSFN	Palmer	Aug 08, 2022	2	New	Recommendation	No	The reviewer acknowledges the response to this comment and looks forward to reviewing the final 3.16 Follow Up Program. (Source Comment ID#170)	This comment is acknowledged and we also look forward to submitting the updated 3.16 follow up program.		CSFN	Palmer			TD	Ready for Submission	TD; Aug 16	Ready for Publishing
603	Chapter 9-E: Mine Water and Discharge Management Plan	Pumping of Tatelkuz Lake to Davidson Creek	CSFN (Martin Shin)	Palmer	Oct 11, 2022	3	New	Recommended Permit Condition	Yes	The reviewer has reviewed the updated 3.16 follow-up program (FUP). Section 6 of the FUP states: "In collaboration with the indigenous groups, further refine and plan Follow-up Programs 3.16.1, 3.16.2, and 3.16.3"." Please discuss the collaboration process and include a section describing the success and challenges with the collaborative development of this plan. This will be a helpful record for future CSFN representatives and BW Gold staff. (Source Comment ID#170)	BW Gold supports continuing collaboration with the Nations on the Federal Decision Statement (DS) Fisheries Follow-up Programs, and maintaining a record of the successes and challenges with the collaborative development of this plan by maintaining consultation meeting minutes on an information portal to maintain an open record of the engagement process. **However, it should be noted that compliance with the federal decision (DS) statement is governed by IAAC and consequently does not need to be addressed through the major works applciation with the province of BC.**		CSFN	Palmer			TD		TD, Oct 24	Ready for Publishing

604	Chapter 9-E: Mine Water and Discharge Management Plan	Trigger Action Response Plan	CSFN	Stephanie Eagen, R.P.Bio..; Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The Application must include a TARP to minimize water withdrawals from natural sources. The TARP should include levels to trigger stop pumping when flows are adequate in Davidson Creek. The TARP must also define clear targets and ranges of flows for success with creek flows. (Source Comment ID#171)	"Flows are monitored in the FWR to track release of water into Davidson Creek. The FWR flow monitoring systems are described in the Water Management Structures Detailed Design Report (Appendix 3-O). The FWR outlet pipes will feed into a Temperature and Flow Control Chamber, and each pipe will be fitted with a main valve and maintenance valve with the ability to regulate flows according to water surface levels and IFN requirements. Ultrasonic flow meters will be installed on the pipes upstream of the outlet valves to accurately measure flows for compliance reporting requirements. Surface water level monitoring will be used to quantify the total volume in the reservoir and also to indicate when the spillway is being used. In addition, a hydrometric monitoring station downstream of the FWR can be used as a backup to confirm the IFN release. These flow and level monitoring instrumentation are to be used in conjunction to determine if any supplemental water is required from the FWSS to meet IFN and by how much. The FWSS Report (Appendix 3-P) describes the pumping system from Tatelkuz Lake. The objective of this system is to only provide additional flow when the IFN cannot be met by diversions and mine water management. The maximum IFN is 0.56 m3/s during the spring; the FWSS will draw water from Tatelkuz Lake through two pipes (for redundancy), which will passively convey water from the lake to a concrete wet well. The intake screen design basis assumption includes a 0.67 m3/s capacity for each screen. Three vertical turbine pumps within the pump station will provide a total maximum flowrate of 0.67 m3/s . Each of the pumps will be equipped with a variable frequency drive and motor to accommodate variable flow demand. As described in Section 3.5.6.7 of the Application, the design of the FWSS takes into consideration the requirements to provide variable and controlled flow from Tatelkuz Lake." Following disucssions and outcomes of the permit review phase, BW Gold will be developing a site-wide water management plan as a stand-alone document. It will encompass the flow logic from each of the contact and non-contact water sources, mill water demands, open pit closure needs, flow needs in Davidson Creek from the various water sources, etc.... The intent is to bring together the flow information that exists across numerous technical documents that is usable by the mine operations team. This document will be prepared as part of the commissioning phase, similar to the logic to have other operating manuals prepared and ready prior to the start of Operations.		CSFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 29	Ready for Publishing
604	Chapter 9-E: Mine Water and Discharge Management Plan	Trigger Action Response Plan	CSFN - P. Littlejohn,	Palmer	Aug 22, 2022	2	Follow Up	Recommendation	No	Please refer to comment #66 (ITT ID 499) from CSFN's first batch of Round 2 comments (memo titled 220808 Source Round 2 Detailed Comments on the Blackwater Major Works Application (Batch 2A)) for recommendations on meeting IFN in Davidson Creek and Chedakuz Creek. (Source Comment ID#171)	The Tatelkuz Lake Protection Plan referred to in ITT Comment #497 (Source comment #64) will define the framework for FWSS pumping from Tatelkuz Lake to minimize adverse effects on aquatic habitat in Chedakuz Creek and Davidson Creek during a variety of flow scenarios. The framework will include trigger levels to reduce or stop pumping from Tatelkuz Lake while meeting the Davidson Creek IFN and the proposed Chedakuz Creek EFN regimes.		CSFN	Palmer			TD	Ready for Submission	TD, Aug 25	Ready for Publishing
604	Chapter 9-E: Mine Water and Discharge Management Plan	Trigger Action Response Plan	CSFN - P. Littlejohn,	Palmer	Oct 11, 2022	3	Follow Up	Recommendation	Yes	Acknowledged. The reviewer recommends carrying BW Gold's comment forward as a permit condition. Please also refer to CSFN's Round 3 comments under ITT ID 497 for more details on recommended permit conditions for the Tatelkuz Lake Protection Plan.(Source Comment ID#171)	BW Gold supports inclusion of the Tatelkuz Lake Protection Plan (TLPP) defining the framework for FWSS pumping from Tatelkuz Lake to minimize adverse effects on aquatic habitat in Chedakuz Creek and Davidson Creek during a variety of flow scenarios. The framework will include trigger levels to reduce or stop pumping from Tatelkuz Lake while meeting the Davidson Creek IFN and the proposed Chedakuz Creek EFN regimes. 605	Chapter 9-E: Mine Water and Discharge Management Plan	Trigger Response Plan	CSFN	Stephanie Eagen, R.P.Bio., Knight Piésold Ltd.	Jun 02, 2022	1	New	Information Requirement	No	The application must include a TRP that contains trigger values and action levels that would be linked to specific measures that could be implemented should particular conditions arise (e.g., if seepage from TSF is greater than predicted). A more detailed mitigation and contingency plan that accounts for risks related to uncertainties must be developed. (Source Comment ID#172)	Please see Section 10 of Appendix-9E, which discusses potential non-conformities and corrective actions associated with mine site discharges.		CSFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 29	Ready for Publishing
606	Chapter 9-E: Mine Water and Discharge Management Plan	Closure Water Quality Exceedances	CSFN	Colin Fraser, P.Geo.; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Figure 7.1-5 of Appendix 9-E shows a conceptual water balance schematic for the site during Closure. During this phase, water treatment is not employed. This schematic indicates that all contact water is kept within the site boundary, while catchment runoff is directed to the WMP and then to the FWR and to the environment without treatment. Comparison of water quality modeling results for the pre-operation period to closure (i.e., Figure 4-10 and Figure 4-14 of Appendix 5-D) shows the dramatic change in water quality from baseline conditions to closure. This indicates that untreated or contact water is expected to report to Davidson Creek during Closure. Information Request: Please explain the source of untreated contact water that is making its way to the environment. (Source Comment ID#173)	The reviewer is directed to the plots and discussion under ENV - Comment 125. In short, the Closure period exceedances are linked to loads from an overburden seepage pathway that reports to the WMP during this Project phase. Discharges from WMP report to FWR and then eventually to Davidson Creek nodes. A loading plot for the WMP (see figure provided as part of Comment 125) is provided to illustrate the importance of this flow/load pathway in the Closure period.		CSFN	Lorax		Meghan	GM	Ready for Submission	GM; June 21	Ready for Publishing
606	Chapter 9-E: Mine Water and Discharge Management Plan	Closure Water Quality Exceedances	CSFN - P. Littlejohn,	Colin Fraser, P.Geo.; Jennifer Stevenson, P.Geo.; Lorax Environmental Services Ltd.	Aug 22, 2022	2	Follow Up	Information Requirement	No	If this specific known source is causing exceedances during closure, then why not capture and treat this water (or otherwise prevent it from being released to the environment)? (Source Comment ID#173)	Since the responses to Round 1 comments 125 and 606 were drafted, an updated water balance/water quality model has been issued (please refer to Round 1 attachment "R1_ENV_EMLI_CSFN_LDN-UFN Comment IDs 102 126 415 490 586 607 610 612 1263 1289 1320 1615 1853.pdf"). The Davidson Creek water quality guideline exceedances that were predicted to occur in the previous Application water balance/water quality model no longer occur in this updated model. Therefore, capture and treatment of the overburden seepage pathway referenced in Round 1 comment response 606 is not required to meet receiving environment objectives.		CSFN	Lorax	KP			Ready for Submission	GM; Aug 30	Ready for Publishing
607	Chapter 9-E: Mine Water and Discharge Management Plan	Post-Closure Water Treatment	CSFN	Knight Piésold Ltd. and Lorax Environmental Service Ltd.	Jun 02, 2022	1	New	Information Requirement	No	Figure 7.1-6 of Appendix 9-E shows conceptual water balance schematics for the site during Post-Closure. During this phase, water treatment is to be conducted primarily on ECD seepage, pit lake overflow, contact water from the upper waste stockpile, and a portion of the surplus water from the TSF. It is puzzling that only a portion of surplus water from the TSF is to be treated and discharged. Table 4-3 of Appendix 5-D shows that the predicted TSF seepage quality is expected to exceed acute water quality guidelines for total zinc and dissolved cadmium a majority of the time, with regular exceedances of acute guidelines for ammonia and silver. Long term guidelines are expected to be exceeded for many parameters on a near constant basis. Clearly this mine contact water presents a major risk to the receiving environment, but it is only partially treated. Typically, mine operators choose to either treat a source of contamination or not. It is this reviewer's opinion that the proposed membrane water treatment plant would address the contaminants of concern in the TSF spillway during post closure. Information Request: Please describe Artemis's thinking that led to proposing a project where only partial treatment of a highly impacted source of contact water is considered. (Source Comment ID#174)	Since the Application, BW Gold Ltd. and their consultants have revised the site-wide water balance model and the site-wide water quality model with a focus on mitigating Project changes for the Closure and Post-closure phases. Updated water quality predictions that reflected optimized water management and quality were presented to EMLI, ENV and First Nations on June 15, 2022, and are summarized in Lorax (2022), as part of BW Gold Ltd. (2022). Those documents demonstrate Project-influenced parameters that were previously predicted to exceed their BC WQGs in Closure and Post-Closure (Application version 12b) are no longer predicted to exceed BC WQGs. The updated predictions also show improved water quality discharged in the Post-Closure phase from the TSF Spillway. While the project water management plan continues to include (untreated) discharge from the TSF Spillway, the updated water balance/water quality model shows that BC WQGs can be achieved in the receiving environment without treating this discharge. Please refer to BW Gold Ltd. (2022) for further information. References: BW Gold Ltd. 2022. Revised Base Case Closure and Post-Closure WQ Predictions. Prepared for ENV and EMLI. June 30, 2022. 609	Chapter 9-E: Mine Water and Discharge Management Plan	Evaluation of Detection Limits	CSFN	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	Table 7.3-2 provides the detection limits for measured parameters. The proposed detection limits for some parameters (e.g., cadmium and copper) are not 10 times below the WQG, which is standard practice. An evaluation of the proposed detection limits against WQGs should be completed. Baseline hardness should be used (e.g., median baseline hardness) for guidelines that are hardness-dependent. Recommendation: Please conduct a screening evaluation against WQGs to determine whether the proposed detection limits are adequate for the monitoring program. (Source Comment ID#176)	Please refer to attachment "R1_CSFN Comment ID 609.pdf"		CSFN	Lorax		Meghan /Sophie	GM	Ready for Submission	GM; June 29	Ready for Publishing

610	Chapter 9-E: Mine Water and Discharge Management Plan	Development of Permit Limits	CSFN	Lorax Environmental Service Ltd.	Jun 02, 2022	1	New	Recommendation	No	Table 8.2-1 provides proposed permit limits for the freshwater reservoir. Considering the projected exceedances of WQGs during closure for some parameters (e.g., cadmium). The list of permit limits should be developed using the full suite of COPCs identified in Chapter 6 over the life of mine to ensure that water is not released in closure that may result in exceedances of receiving environment WQGs. This is based on the understanding that any permit granted would remain in effect until an amendment is approved. Recommendation: Please revise the list of proposed permit limits in Table 8.2-1 to include all COPCs identified for Davidson Creek over the life of mine. (Source Comment ID#177)	BW Gold Ltd. has elected to apply for an EMA effluent discharge permit for the Construction and Operation phases based on discussions with ENV. Therefore, permit limits are proposed for those phases. Since the Application, BW Gold Ltd. and their consultants have revised the site-wide water balance model and the site-wide water quality model with a focus on mitigating Project changes for the Closure and Post-closure phases. Updated water quality predictions that reflected optimized water management and quality were presented to EMLI, ENV and First Nations on June 15, 2022, and are summarized in Lorax (2022), as part of BW Gold Ltd. (2022). Those documents demonstrate Project-influenced parameters that were previously predicted to exceed their BC WQGs in Closure and Post-Closure (Application version 12b) in the project receiving environment are no longer predicted to exceed BC WQGs. Please refer to BW Gold Ltd. (2022) for further information. References: BW Gold Ltd. 2022. Revised Base Case Closure and Post-Closure WQ Predictions. Prepared for ENV and EMLI. June 30, 2022. Please see attachment "R1_ENV_EMLI_CSFN_LDN-UFN Comment IDs 102 126 415 490 586 607 610 612 1263 1289 1320 1615 1853.pdf"		CSFN	Lorax		Meghan	GM	Ready for Submission	GM; June 28	Ready for Publishing
611	Chapter 9-E: Mine Water and Discharge Management Plan	Permit Limits below Short-Term WQGs	CSFN	Meghan Goertzen, R.P.Bio; Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	Tables 8.2-3 and 8.2-4 provide proposed permit limits for the Camp Site and Plant Site Sediment Control Pond Discharge and for the downstream aggregate borrow area sediment control pond, respectively. The proposed permit limits for total arsenic, dissolved cadmium, dissolved copper, total manganese, and total zinc exceed the short-term BC WQG for the protection of aquatic life. Discharge limits should not reflect concentrations that have the potential to result in acute toxicity. No information is provided that would demonstrate that this effluent mixture would not result in acute toxicity if effluent concentrations achieved the upper-case predictions. Recommendation: Please propose permit limits that are below short-term WQGs and that can be demonstrated to not result in acute toxicity if realized in the effluent mixture. For example, short-term toxicity tests with the rainbow trout and Daphnia magna could be conducted in simulated effluents to support the application. (Source Comment ID#178)	Please refer to comment response #587.		CSFN	Lorax		Meghan	GM	Ready for Submission	GM; June 28	Ready for Publishing

612	Chapter 9-E: Mine Water and Discharge Management Plan	Mitigations for Exceedances in Closure and Post-Closure	CSFN	Lorax Environmental Services Ltd.	Jun 02, 2022	1	New	Recommendation	No	No effluent limits are proposed for the TSF spillway in post-closure. The Application is incomplete without detailing appropriate mitigations for managing the predicted exceedances of WQGs and YD-WQSs during the closure and post-closure period. Recommendation: The draft Joint Mines Act / Environmental Management Act Permits Application should be revised to apply to all phases of mine life and detail appropriate mitigations for managing the predicted exceedances of WQGs and YD-WQSs during the closure and post-closure period. (Source Comment ID#179)	BW Gold Ltd. has elected to apply for an EMA effluent discharge permit for the Construction and Operation phases based on discussions with ENV. Therefore, permit limits are proposed for those phases. Since the Application, BW Gold Ltd. and their consultants have revised the site-wide water balance model and the site-wide water quality model with a focus on mitigating Project changes for the Closure and Post-closure phases. Updated water quality predictions that reflected optimized water management and quality were presented to EMLI, ENV and First Nations on June 15, 2022, and are summarized in Lorax (2022), as part of BW Gold Ltd. (2022). Those documents demonstrate Project-influenced parameters that were previously predicted to exceed their BC WQGs in Closure and Post-Closure (Application version 12b) in the project receiving environment are no longer predicted to exceed BC WQGs. Please refer to BW Gold Ltd. (2022) for further information. References: BW Gold Ltd. 2022. Revised Base Case Closure and Post-Closure WQ Predictions. Prepared for ENV and EMLI. June 30, 2022. Please see attachment "R1_ENV_EMLI_CSFN_LDN-UFN Comment IDs 102 126 415 490 586 607 610 612 1263 1289 1320 1615 1853.pdf"		CSFN	Lorax		Meghan	GM	Ready for Submission	GM; June 28	Ready for Publishing

613	Chapter 9-J: Mine Emergency Response Plan	Commitments in MERP	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Recommendation	No	The Mine Emergency Response Plan (MERP) outlines many commitments the company will undertake, prior to Construction, annually and ongoing. Please include a commitment checklist at the beginning of the document or as an appendix, that outlines the timing of these commitments when Indigenous involvement is required, and the forum for engagement. For example, the Dam Breach Inundation response plan and the Water Treatment Shutdown/Failure plan are to be developed prior to Construction and should be provided to CSFNs for comment and engagement. Such plans could be discussed at the EMC table. Additionally, an incident response plan that requires significant updates, due to adaptive management or annual review, may also require CSFNs' input at the EMC table. Developing such a commitment checklist and engagement plan to keep the MERP and associated documents updated, will assist BW Gold in maintaining a transparent and positive working relationship with its Indigenous partners. Furthermore, proactive communication and engagement will help BW Gold identify gaps and improve adaptive management. And finally, CSFNs will have the benefit of knowing emergency plans are up to date, follow established communication protocols, and are as comprehensive as they can be to protest CSFNs' rights. Recommendation: a)Develop a commitment checklist for the MERP as an appendix or at the beginning of the document. b)Include the commitment timing (prior to construction, annually, ongoing – as needed), when Indigenous engagement would occur, and the forum for engagement. (Source Comment ID#180)	The Mine Emergency Response Plan (MERP) outlines BW Gold's commitments and protocols in the event of an emergency or incident at the Blackwater mine site. The MERP needs to be a focused and concise document to provide an easy access to contact information in the event of an emergency. The information requested by the reviewer is more applicable to the Environmental Assessment Certificate Condition 36 (Accidents and Malfunctions Administration and Communication Plan) and the associated Condition 35 (Tailings Dam Safety Transparency Plan). The plans required by the EAC Condition 36 and 35 will provide BW Gold's commitments through the life of the mine, including what is required when, as well as the approach to Indigenous engagement.		CSFN	ERM		Jesse/Tonia	RT	Ready for Submission	RT; June 22	Ready for Publishing
614	Chapter 9-J: Mine Emergency Response Plan	Indigenous Contact Information	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Recommendation	No	Table 7.6-1: Indigenous Contacts is missing information required, as per the Communication Protocol Summary in Table 7-1. Depending on the consequence level of an incident, a number of Indigenous representatives may need to be contacted ranging from EMC members to Chiefs of Nations. The EMC member contact information is missing. Additionally, the phone numbers listed for each Chief are the band office numbers only, which are not open after business hours. Incidents requiring immediate notification of Chiefs will require their personal cell phone numbers. Please confirm with each Chief an appropriate number to reach them, day or night, and who from BW Gold would brief them during the event of a level 4 or 5 incident. Also, please note, Chief Marten Louie is the newly elected Chief for the Nadleh Whut'en First Nation. Recommendation: a)Include individual EMC member contact information in Table 7.6-1 for each Indigenous Nation. b)Update the Chiefs' contact information with appropriate cell phone numbers, respectively. Inform Chiefs who would be their main point of contact during a Level 4 or 5 incident. c)Update Table 7.6-1 and Table A-1: Indigenous Contacts to include newly elected Nadleh Whut'en Chief Marten Louie: chunih@nadleh.ca. (Source Comment ID#181)	BW Gold will coordinate with each Indigenous Group to maintain the appropriate contact information in a central location. The EMC is an EAC condition construct and EMC members may not be the appropriate contacts for all Indigenous Groups in the contact of the MERP. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		CSFN	ERM		Jesse	RT	Ready for Submission	RT; June 14	Ready for Publishing
614	Chapter 9-J: Mine Emergency Response Plan	Indigenous Contact Information	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Aug 11, 2022	2	Follow Up	Recommendation	No	Thank you for your response regarding updating management plans. With respect to EMC members, Table 7-1 of the AMCP already includes notification of Indigenous EMC representatives, therefore, please include their contact information in Table 7.6-1. Please update this table with newly elected Chief's contact information and that all Chiefs' phone numbers will be revised with personal cell phone numbers, pending their approval. (Source Comment ID#181)	Contact information for EMC representatives is included in Table 7.6-1. The contact information will be updated during plan updates as described in the previous response and BW Gold will coordinate with each Indigenous group to maintain the appropriate contact information (including cell phone numbers if permission is granted) in a central location.		CSFN	ERM		Valerie		Ready for Submission	RT; Aug. 14	Ready for Publishing
614	Chapter 9-J: Mine Emergency Response Plan	Indigenous Contact Information	CSFN (Georgina Farah)	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Oct 11, 2022	3	Follow Up		No	Thank you for your response. To clarify, Table A-1 in Appendix A and Table 7.6-1 of the AMCP will need to be updated, prior to Construction. Contact information for CSFN EMC representatives Kirsten Chapman (Nadleh Whut'en First Nation) and Kasandra Turbide (Saik'uz First Nation) and Doug Casimel/Deane Carlson (Stellat'en First Nation) is missing. Additionally, the new Nadleh Chief's contact information will need to be updated. Once these tables are updated, this comment can be considered closed. (Source Comment ID#181)(Source Comment ID#181)	A revised Table A-1 in Appendix A of the Mine Emergency Response Plan and Table D-1 in Appendix D of the Accidents and Malfunctions Administration and Communication Plan (formerly Table 7.6-1) will be provided to the Carrier Sekani First Nations the week of October 24th for review. 615	Chapter 9-J: Mine Emergency Response Plan	Indigenous Contact Information	CSFN (Georgina Farah)	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Oct 11, 2022	3	Follow Up	Recommendation	Yes	Please see the Round 3 comment under comment #181 of this memo. (Source Comment ID#182)(Source Comment ID#182)	A revised Table A-1 in Appendix A of the Mine Emergency Response Plan and Table D-1 in Appendix D of the Accidents and Malfunctions Administration and Communication Plan (formerly Table 7.6-1) will be provided to the Carrier Sekani First Nations the week of October 24th for review.		CSFN	ERM		Valerie		Ready for Submission	19-Oct-22	Ready for Publishing

616	Chapter 9-L: Fuel Management and Spill Control Management Plan	External Communication	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Information Requirement	No	In the event of a spill, Table 9.1-1 identifies when Indigenous Groups would be notified, according to the spill classification level. All communication to CSFNs that relate to any kind of spill incident should align with the communication protocol outlined in the Accidents and Malfunctions Plan. For example, in the Fuel plan, Table 5.2-1 External Contact Information includes Indigenous band office phone numbers. Calling the band office about a fuel spill would not be following the communication protocol. While the Fuel plan is distinct from the Mine Emergency Response Plan, CSFNs expect that fuel spills reporting will not have a different method of notification. All fuel spills should be reported according to the Accidents and Malfunction Plan's Communication Protocol Summary in Table 7.1 (appendix to the MERP). This table captures fuel spill classifications and the respective actions required. These actions should be integrated into the Fuel Spill plan Table 9.1-1: Fuel Spill Severity Classifications. Additionally, the Indigenous contact information should be included in Fuel spill plan. Finally, any amount of a fuel spill that impacts or may impact a Yinka Dene Class I, II or III water body is to be considered a Level 3 consequence at a minimum, and notification should be accordingly. Recommendation: a)Include Tables 7.1 and 7.6-1 from the Accidents and Malfunction Plan to identify how CSFNs should be communicated with, in the event of a level 2 or 3 fuel spill. b)Include updated Indigenous contact information, similar to the Accidents and Malfunction Plan. c)Spills to Yinka Dene water bodies are to be considered a Level 3 consequence at a minimum, and notification should be accordingly. (Source Comment ID#183)	(a) BW Gold acknowledges the recommendation to incorporate Tables 7.1 and 7.6-1 from the Accidents and Malfunction Plan into the Fuel Management and Spill Control Management Plan. Reference to the Accidents and Malfunction Plan will be included in a future iteration of the Fuel Management and Spill Control Management Plan. (b) BW Gold acknowledges the recommendation to incorporate Indigenous contact information into the Fuel Management and Spill Control Management Plan. Reference to the Accidents and Malfunction Plan and updated contact list will be included in a future iteration of the Fuel Management and Spill Control Management Plan. (c) The Level 2 and Level 3 spill severity will be clarified in a future iteration of the plan to indicate that a Level 2 spill may enter a body of water that does not leave the site boundaries, while a Level 3 spill may enter a body of water that may leave the site boundary (which could include a Yinka Dene water body). BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		CSFN	ERM		Jesse/Tonia	RT	Ready for Submission	RT; June 20	Ready for Publishing
616	Chapter 9-L: Fuel Management and Spill Control Management Plan	External Communication	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Aug 11, 2022	2	Follow Up	Information Requirement	No	The reviewer looks forward to seeing the updates included in future iterations of the Fuel Management and Spill Control Plan. (Source Comment ID#183)	BW Gold commits to updating the plans/procedures as outlined in Round 1 responses.		CSFN	ERM		Jesse/Tonia		Ready for Submission	RT; Aug. 14	Ready for Publishing
617	Chapter 9-L: Fuel Management and Spill Control Management Plan	Corrective Active Plan	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Information Requirement	No	In section 11.1, BW Gold identifies that fuel transport companies should be aware of various spill scenarios that could result in potential impacts on waterbodies and habitat. Information Request: What steps will BW Gold take to ensure that fuel contractors are aware of the fuel spill requirements, particularly off-site, and/or en-route to site, including reporting duties to Indigenous Nations? (Source Comment ID#184)	BW Gold will require emergency response plans from fuel trucking contractors and request that it includes reporting requirements to Indigenous nations when off-site or en-route. BW Gold will retain responsibility for reporting on-site spills to Indigenous Nations.		CSFN	ERM		Rolf	RT	Ready for Submission	RT: June 26	Ready for Publishing
618	Chapter 9-M: Chemicals and Materials Storage Plan	Transport and Management of Sulphur Dioxide	CSFN	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Jun 02, 2022	1	New	Recommendation	No	Section 6.5.1 of the updated CMSP refers to the whole document itself (Appendix 9-M) for procedures for transport to site and onsite management of Sulphur dioxide reagent. Recommendation: Simply refer to Section 8. (Source Comment ID#185)	BW Gold acknowledges the recommendations for the next update to the Chemicals and Materials Storage Plan (CMSP). BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		CSFN	ERM		Jesse	RT	Ready for Submission	RT; June 14	Ready for Publishing
619	Appendix 9-G	Invasive Plant Management Plan Section 3.1 (9)	LDN_UFN		Jun 06, 2022	0	-	-	No	Clarify: how will 2013 baseline invasive plant data be updated to ensure most accurate data is being used to inform strategies?	The following text has been added to Section 9: "Baseline information related to invasive plants will be updated based on monitoring results. Any changes to invasive plant species will be reflected in annual updates to the IPMP." The following text is in Section 10 (Reporting and Record Keeping): "The EM is responsible for data management, reporting and records related to invasive plants. The EM will report key results of invasive plant monitoring to the Blackwater Environment Committee and Aboriginal Groups during routine meetings. Monitoring data will be entered into an electronic database and have quality control checks completed upon receipt of results. Data will be entered into a standard format that allows for data reporting and analyses. Data and data comparisons will be stored in a single file format for each type of survey or monitoring activity. Monitoring data will be stored for the life of the mine and will be made available for review upon request. Changes to invasive plant species will be recorded and reported annually in the Blackwater Project Annual Reclamation Report."	7/TD to revie	LDN/UFN	ERM		Tonia	RT	N/A		
619	Appendix 9-G	Invasive Plant Management Plan Section 3.1 (9)	LDN_UFN		Jun 06, 2022	1	New	-	No	Invasive species change over time. 2013 is a very old baseline data. Has this been updated at all?	BW Gold acknowledges the comment and will be completing vegetation surveys in 2022 (including invasive plant surveys). Collected invasive plant data will be used to inform future iterations of the IPMP.	7/TD to revie	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
620	Appendix 9-G	Invasive Plant Management Plan Section 3.1 (8)	LDN_UFN		Jun 06, 2022	0	-	-	No	Clarify: what is known about invasive plant species along the other access roads (e.g., Kluskus-Ootsa FSR)? This is a major vector for species to spread onto the mine site if not managed appropriately. How has this been considered in the MP?	The IPMP scope focuses on the mine site. BW Gold will be responsible for invasive species management on BW Gold-controlled roads.	No	LDN/UFN	ERM		Tonia	RT	N/A		
620	Appendix 9-G	Invasive Plant Management Plan Section 3.1 (8)	LDN_UFN		Jun 06, 2022	1	New	-	No	BW comment has been acknowledged. However invasive species do not know boundaries, therefore BW Gold controlled roads must be considered within the IPMP. How will these major vectrs of spread be managed appropriately?	BW Gold continues to commit to invasive species management on BW Gold controlled roads. BW Gold understands that the holder of each road permit (e.g., Kluskus-Ootsa FSR) will hold the responsibility for managing invasive plants. In addition, the site security will perform a visual inspection for cleanliness (Section 8.1) on all earth moving equipment and vehicles upon arrival to the mine site. Mine equipment and vehicles will be restricted to Project roads, trails, and pullouts through a combination of training, mapping and signage.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 16	Ready for Publishing
621	Appendix 9-G	Invasive Plant Management Plan 3.1 (Appendix A)	LDN_UFN		Jun 06, 2022	0	-	-	No	(Tables 3-1 and 3-2) Add: table for provincial priority species. This list is updated more frequently and should be used in addition to regional targets.	Appendix A of the IPMP provides the following priority species information and lists: - Table 1-1 describes the provincial priority invasive plant definitions and management objectives; - Table 1-2 lists the provincial priority invasive plant species from the BC Inter-Ministry Invasive Species Working Group (BC IMISWG); - Table 2-1 describes the invasive plant priority ranking descriptions for the Cariboo Chilcotin region; and - Table 2-2 lists the priority invasive plant species for the CCCIPC sub-regions.	No	LDN/UFN	ERM		Tonia	RT	N/A		

621	Appendix 9-G	Invasive Plant Management Plan 3.1 (Appendix A)	LDN_UFN		Jun 06, 2022	1	New	-	No	Comment is largely resolved. However it needs to be made clear exactly when information was gathered for tables A-2 and A-4 (month and year where possible)	The source for Tables A-2 (BC Inter-Ministry Invasive Species Working Group, 2021) and Table A-4 (CCCIPC 2020) are indicated in the Notes for each table in Appendix A of the Invasive Plant Management Plan (IPMP) . The Appendix A References indicate that the information was gathered from the sources for the tables in August 2021. The timing of IPMP updates will be informed by monitoring results and changes to provincial and regional (CCCIPC) priority invasive species lists and new management recommendations (see Section 12 of the IPMP); at which time the information in the Tables A-2 and A-4 may be updated.	T/TD to revie	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 20	Ready for Publishing
622	Appendix 9-G	Invasive Plant Management Plan Section 5 (8)	LDN_UFN		Jun 06, 2022	0	-	-	No	Clarify: personnel routinely clean clothing and boots when travelling from areas on site where invasive plan infestations are known to occur… where do they do this? How is spread from the cleaning area prevented? How is this mitigation measure monitored? How can its effectiveness be tracked?	Following text added to Section 8.1: "Any employees coming from offsite will have clean equipment, boots, and clothes. Employees are expected to arrive fit for duty with clean equipment and apparel. Employees will clean their boots with a boot brush provided as part of health and safety."	No	LDN/UFN	ERM		Tonia	RT	N/A		
622	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN		Jun 06, 2022	1	New	-	No	"Any employees coming from offsite will have clean equipment, boots, and clothes. Employees are expected to arrive fit for duty with clean equipment and apparel. Employees will clean their boots with a boot brush provided as part of health and safety." This has not been added to the IPMP. Response to the "additional" text: Where will they be cleaning their equipment? On site? Offsite? In a designated area? Will this area be monitored for invasive species establishment? What will happen if invasives start to grow in the designated area (if there is one)? Who will monitor staff to ensure this is happening?	The following text will be added to Section 8.1 of the Invasive Plant Management Plan: "Any employees/contractors coming from offsite will be expected to arrive fit for duty with clean equipment, boots, and clothes. Boot brushes will be available at offices/site entrances for employees to clean off their boots prior to entry. These areas will be monitored for invasive plants as part of the overall monitoring program." The expectation for clean boots/equipment will be set in site training and will be reinforced through opportunistic checks and reminders by EMs. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission		Ready for Publishing
622	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN		Jul 22, 2022	2	Follow Up	Comment	No	Partially resolved when additional text has been added to the edited plan. However, within the additional text, it is not clear what will happen if invasive species are found where employees will be cleaning their equipment. Suggest adding, 'if invasive species are observed during routine monitoring of the designated cleaning stations (i.e., site entrances), appropriate follow up treatment will take	Section 8.1 of the Invasive Plant Management Plan will be revised to include the suggested text:" Any employees/contractors coming from offsite will be expected to arrive fit for duty with clean equipment, boots, and clothes. Boot brushes will be available at offices/site entrances for employees to clean off their boots prior to entry. These areas will be monitored for invasive plants as part of the routine monitoring		LDN/UFN	ERM		Tonia		Ready for Submission	RT; Aug. 7	Ready for Publishing
623	Appendix 9-G	Invasive Plant Management Plan Section 5 (8)	LDN_UFN		Jun 06, 2022	0	-	-	No	Add: "cleaning earth moving equipment" … to make sure it is free of soil and vegetation.	Section 8.1 includes the following: "Earth moving equipment and trucks are expected to be clean and free of soil and vegetation when they arrive on the mine site. Upon arrival on the mine site, EM or designate inspects earth moving equipment and trucks. Upon arrival at the mine site, EM or designate inspects earth moving equipment and trucks and direct cleaning if required. Cleaning will be in designated areas using high pressure power washers. Water will be contained to remove seeds and propagules to prevent dispersion of invasive species on the mine site."	No	LDN/UFN	ERM		Tonia	RT	N/A		
623	Appendix 9-G	Invasive Plant Management Plan Section 8.1 and 8.2	LDN_UFN		Jun 06, 2022	1	New	-	No	"Upon arrival at the mine site, EM or designate inspects earth moving equipment and trucks and direct cleaning if required. Cleaning will be in designated areas using high pressure power washers. Water will be contained to remove seeds and propagules to prevent dispersion of invasive species on the mine site." This language is not included in the plan.	The following text will be added to Section 8.1 of the Invasive Plant Management Plan: "Trucks and equipment are expected to be clean upon arrival at site. The EM or designate will inspect earth moving equipment and trucks when they arrive at site and direct cleaning if required. Cleaning will be in designated areas using high pressure power washers or similar means to achieve the same objective. Water will be contained and/or filtered to remove seeds and propagules to prevent dispersion of invasive species on the mine site." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission		Ready for Publishing
623	Appendix 9-G	Invasive Plant Management Plan Section 8.1 and 8.2	LDN_UFN		Jul 22, 2022	2	Follow Up	Clarification	No	How will "Water will be contained and/or filtered to remove seeds and propagules to prevent dispersion of invasive species on the mine site."?	The methods to contain water and/or filter to remove seeds and propugules will likely be the use of a catchment/filtration area and potentially use of filter cloth. Wash water will be directed towards a sump which will be periodically cleaned out, with the waste being placed in a location that would prevent seeds from germinating (e.g., deep burial, placement in the TSF or other means). The method will be determined when designated cleaning areas are assigned by the Environmental Manager to meet the requirements of the Invasive Plant Management Plan.		LDN/UFN	ERM		Valerie/Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
623	Appendix 9-G	Invasive Plant Management Plan Section 8.1 and 8.2	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up	Clarification	No	A more definitive answer is required to resolve this comment. Please explain, and include within the IPMP, precisely how water will be contained and filtered to remove seeds and propagules after clearning earth moving equipment and trucks with a power washer	The text provided in response to the Round 2 comment (i.e., the use of a catchment/filtration area and potentially use of a filter cloth) will be provided in the next iteration of the Invasive Plant Management Plan (IPMP). However as stated in the response to the Round 2 comment, the definitive method will be determined when designated cleaning areas are assigned by the Environmental Manager to meet the requirements of the Invasive Plant Management Plan. Upon designation of the cleaning area(s), the definitive method(s) to contain wash water and filter seeds will be provided in the revised IPMP.		LDN/UFN	ERM		Valerie/Tonia		Ready for Submission	TD, Sept 13	Ready for Publishing
624	Appendix 9-G	Invasive Plant Management Plan Section 5 (8.1)	LDN_UFN		Jun 06, 2022	0	-	-	No	Clarify: Re "cleaning earth moving equipment" Where will this take place? Will there be a designated on-site cleaning area/wash station? Which methods will be used for what type of vehicles/machinery? How will this be documented?	See response to ID #70. {Stockpiling and storage has been added to Section 8.1 as follows: "Minimize soil erosion and degradation through adherence to the SEPSCP. If straw bales are used for erosion control, only certified weed-free straw will be used. In accordance with the RCP and SMP, salvage topsoil during construction and operations. Topsoil will not be stockpiled or stored in areas containing invasive plant species. Stabilize exposed soils and promptly re-seed with native seeds mix and monitor confirm effective vegetation recolonization." }	No	LDN/UFN	ERM		Tonia	RT	N/A		
624	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN		Jun 06, 2022	1	New	-	No	Text is missing in the plan from comment #71 (not #70) response. [ID#622] Further, how will this be documented has not been addressed. Please clarify.	The text indicated in response to the Round 0 comment ID#624 is provided in bulleted list in Section 8.1 of the Invasive Plant Management Plan.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
625	Appendix 9-G	Invasive Plant Management Plan 5 (8)	LDN_UFN		Jun 06, 2022	0	-	-	No	Clarify: monitoring to ensure treatment objectives are being met - do you mean recording efficacy? Where are treatment objectives defined?	Treatment objectives has been revised as "Management objectives" in Section 8.2.1 as follows: "When invasive plants are identified on site, the CCCIPC or an appropriate authority will be consulted to determine optimal approach for management. For each species, a management objective will be established to guide the approach to treatment activities. Management objectives may include the following: - Eradication: completely remove all individuals of invasive plant species. This objective is typically applied to species that occur in limited distributions. - Containment: limit the extent of an infestation and prevent spread to un-infested areas or areas of high value, such as undisturbed or revegetated areas. This objective is typically applied when infestations are established but not widespread.	No	LDN/UFN	ERM		Tonia	RT	N/A		

625	Appendix 9-G	Invasive Plant Management Plan Section 8.2.2	LDN_UFN		Jun 06, 2022	1	New	-	No	The following text from the response is not included in the management plan. Please add: "When invasive plants are identified on site, the CCCIPC or an appropriate authority will be consulted to determine optimal approach for management. For each species, a management objective will be established to guide the approach to treatment activities. Management objectives may include the following:" Who is the appropriate authority? In the current IPMP it states that CCCIPC, Aboriginal Groups and ENV will be consulted.	The following text will be added to Section 8.2.1 of the Invasive Plant Management Plan: "When invasive plants are identified on site, the CCCIPC or an appropriate authority will be consulted to determine optimal approach for management. For each species a treatment plan and management objective will be established, which may include:" BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
625	Appendix 9-G	Invasive Plant Management section 8.2.2	LDN_UFN (Danny Smart)		Jul 22, 2022	2	Follow Up	Clarification	No	The following question has not been answered in BW Gold's response "Who is the appropriate authority? In the current IPMP it states that CCCIPC, Aboriginal Groups and ENV will be consulted. "	While the CCCIPC is the authority on invasive plant management for the region that the Blackwater mine site is in (Nazko sub-region of Cariboo Regional District Electoral Area 1) there are other agencies that can be consulted for invasive species management. The appropriate authority may include but are not limited to the Province and Indigenous groups (e.g., Inter-Ministry Invasive Species Working Group) and dependent on the invasive species. The statement in the Invasive Plant Management Plan will be edited to indicate that the CCCIPC is the primary authority to consult, others such as the Inter-Ministry Invasive Species Working Group or Indigenous groups or ENV may be consulted and dependent on the invasive species. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate,		LDN/UFN	ERM		Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
626	Appendix 9-G	Invasive Plant Management Plan Section 5 (6)	LDN_UFN		Jun 06, 2022	0	-	-	No	Add: updating IP list and providing updated maps for the mine site to employees annually	Section 6 indicates updated invasive plant lists and maps available to mine site personnel.	No	LDN/UFN	ERM		Tonia	RT	N/A		
626	Appendix 9-G	Invasive Plant Management Section 6	LDN_UFN		Jun 06, 2022	1	New	-	No	There is no indication of how often updated plant lists and maps will be provided to mine personnel. Please clarify.	As identified in Section 6 of the Invasive Plant Management Plan, BW Gold will review and update the training and awareness documentation based on changes in training needs and regulatory requirements annually. This will include updates to plant lists and maps as required and will be clarified in the revised plan following completion of the Application review.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission		Ready for Publishing
626	Appendix 9-G	Invasive Plant Management Section 6	LDN_UFN (Danny Smart)		Jul 22, 2022	2	Follow Up	Comment	No	Please add to the IPMP "This will include updates to plant lists and maps as required" from BW Gold response	The statement 'This will include updates to plant lists and maps as required' will be added to Section 6 of the Invasive Plant Management Plan. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	ERM		Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
627	Appendix 9-G	Invasive Plant Management Plan Section 6 (8.2.2)	LDN_UFN		Jun 06, 2022	0	-	-	No	Add: Please include more detail on invasive plant disposal. Where will they be taken and how will this be documented?	Section 8.2.2 Mechanical Control indicates: "Disposal methods may vary by species and could include burning, deep burial in a landfill, or bagging. In remote areas, the CCCIPC recommends bagging flowers/seeds for disposal and leaving uprooted plant parts to dry out and decay (CCCIPC 2021)".	No	LDN/UFN	ERM		Tonia	RT	N/A		
627	Appendix 9-G	Invasive Plant Management Plan Section 8.2.2.1	LDN_UFN		Jun 06, 2022	1	New	-	No	Provide a reference to "disposal methods may vary by species". This is incorrect. All invasive plant material should be removed from site. If treatment has happened, how will this be documented?	Acceptable disposal methods (depending species/life stage) also include burning and deep burial, both of which could be available on site. See Dispose with Care Invasive Plant Disposal in BC (Factsheet December 2021; https://bcinvasives.ca/wp-content/uploads/2022/03/Dispose-with-Care-FS-1221_20211210.pdf).	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission		Ready for Publishing

628	Appendix 9-G	Invasive Plant Management Plan 8.2.2.1	LDN_UFN		Jun 06, 2022	1	New	-	No	Add details of where approved biological control agents can be found, and who regulates the release of biocontrol agents (i.e.., provincial website). Who will be releasing agents if they will be used. Add info such as "as of May 2022 species X, Y, Z do/do not have agents that may be used for control"	The following text will be added to Section 8.2.2.1 of the Invasive Plant Management Plan: " A complete list of species that do/do not have agents that may be used for control is maintained by the Government of BC (https://www2.gov.bc.ca/gov/content/environment/plants-animals-ecosystems/invasive-species/management/plants/biological-control/biological-control-agents-host-plants). This list (as is periodically updated) will be reviewed if biological control is considered and a contractor will be engaged to release and monitor biological control agents as required." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission		Ready for Publishing
628	Appendix 9-G	Invasive Plant Management Plan 8.2.2.1	LDN_UFN		Jul 28, 2022	2	Follow Up		No	Carry forward	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.							Ready for Submission	TD; Aug 16	Ready for Publishing
628	Appendix 9-G	Invasive Plant Management Plan 6.2 (8.2.2)	LDN_UFN		Jun 06, 2022	0	-	-	Yes	Add: commitment to only use biological control that is proven effective (approved for use) and appropriate for the area	The following has been added to Section 8.2.2 Biological Control 8.2.3.2: "Only biological control that is proven effective, approved for use, and appropriate for the area and target species will be used."	No	LDN/UFN	ERM		Tonia	RT	N/A		
629	Appendix 9-G	Invasive Plant Management Plan 6.4 (8.2.2)	LDN_UFN		Jun 06, 2022	0	-	-	No	Clarify: where will pesticides be stored and disposed of? Please reference sections of the appropriate MP. Who will be qualified to use the pesticides? Washing station and disposal of waste?	Refer to Appendix E Pesticide Use and Application. It identifies requirements in the Integrated Pest Management Regulation related to herbicide use and handling.	No	LDN/UFN	ERM		Tonia	RT	N/A		
629	Appendix 9-G	Invasive Plant Management Plan 8.2.2. & appendix E	LDN_UFN		Jun 06, 2022	1	New	-	No	Information in Appendix F is applicable, however it does not address what BW Gold will be doing. i.e.., where will BW Gold store herbicides? If a contractor is being hired, this must be stated in the IPMP. Who (specifically) will be conducting treatments? i.e.., who in BW Gold? Or which contractor/company?	A contractor will be engaged for herbicide application (the company is yet to be determined). If BW Gold decides to do herbicide treatments itself in future, the requested information will be provided in an updated Invasive Plant Management Plan.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission		Ready for Publishing
629	Appendix 9-G	Invasive Plant Management Plan 8.2.2. & appendix E	LDN_UFN (Danny Smart)		Jul 22, 2022	2	Follow Up		No	The information provided in the response must be included in the updated management plan. i.e., it must state that BW Gold will hire a contractor to complete herbicide treatments for invasive plant management on site.	The following statement will be added to Section 8.2.2.1 of the Invasive Plant Management Plan (IPMP): 'If herbicide treatments are recommended for invasive plant species management, a contractor will be hired by BW Gold to implement the herbicide application. The contractor administering the treatment will have BC Pest Control Service Licence, and each supervising applicator must have a valid BC Pesticide Applicator Certificate in the Industrial Vegetation and Noxious Weed Category.' Additional requirements for herbicide treatments will be provided in Section 8.2.2.1 of the IPMP in accordance with the LDN Herbicide Use Policy		LDN/UFN	ERM		Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
630	Appendix 9-G	Invasive Plant Management Plan 6.4 (n/a)	LDN_UFN		Jun 06, 2022	0	-	-	No	Clarify: is targeted grazing a viable option? Not likely at the mine site. Has this been considered for the transmission line?	The scope of the IPMP is the mine site. This comment will be considered in the invasive plant management plan to be developed for the transmission line.	No	LDN/UFN	ERM		Tonia	RT	N/A		
630	Appendix 9-G	Invasive Plant Management Plan 8.2.2.1	LDN_UFN		Jun 06, 2022	1	Follow Up	Information requirement	No	Suggest adding a section referring to control measures. It should be noted that cultural control through targeted grazing has been considered but is not an option at the mine because of X, Y, Z... e.g., accessibility, site of infestations, species observed etc... Expand more on this.	The current extent of known invasive plant occurrences on or near the mine site do not warrant consideration of cultural control, and can be managed using the control methods presented in the Invasive Plant Management Plan (IPMP). For this reason, BW Gold does not plan to include a discussion on cultural grazing in the IPMP.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
630	Appendix 9-G	Invasive Plant Management Plan	LDN_UFN (Danny Smart)		Jul 22, 2022	2	New	-	No	"The scope of the IPMP is the mine site. This comment will be considered in the invasive plant management plan to be developed for the transmission line." Is another IPMP being provided for review as per BW Gold response?	A Transmission Line Integrated Vegetation Management Plan has been drafted (May 2022) for review and includes the objective 'prevent and manage invasive plants'. The scope of the joint application excludes the transmission line - the Transmission Line Integrated Vegetation Management Plan will be provided for review as part of the transmission line permitting process.		LDN/UFN	ERM		Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
630	Appendix 9-G	Invasive Plant Management Plan 8.2.2.1	LDN_UFN (Danny Smart)		Jul 22, 2022	2	Follow Up	Information Requirement	No	LDN and UFN are strongly opposed to herbicide application within their territory. Please explain how BW Gold will address this and again justify why cultural control is not warranted. Request a memo addressing this.	A memo will not be provided in response to the comment. BW Gold received the LDN Herbicide Policy in August 2022 and will revise the Invasive Plant Management Plan (IPMP) in accordance with the policy. BW Gold reiterates that the current extent of known invasive plant occurrences on or near the mine site do not warrant consideration of cultural control, and will provide in the required invasive plant treatment plan a clear justification of why other management methods are not being used (per the LDN Herbicide Policy, August 2022). BW Gold anticipates future updates to the IPMP in consideration of updates to current policies or other Indigenous nations policies received (see Section 12 of the IPMP). BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	ERM	BWG	Tonia		Ready for Submission	RT; Aug. 10	Ready for Publishing
630	Appendix 9-G	Invasive Plant Management Plan 8.2.2.1	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		Yes	The LDN herbicide policy is for LDN only and does not address UFN's opposition to herbicide. KES and UFN are meeting August 26th to discuss herbicide use and anticipates providing a response to Artemis on their stance shortly after this. However, if UFN remain opposed to herbicide use, how will BW Gold address this? BW Gold must provide a justification for why cultural control does not warrant consideration, especially as UFN are currently opposed to herbcide use. Cultural control also include applying fertilizer or mulch and is not limited to just goat grazing, therefore why is this not considered? Are BW Gold committing to mechanical treatment only in this case?	BW Gold acknowledges the comment and can update the Invasive Plant Management Plan (IPMP) upon receipt of the UFN's herbicide policy. As stated Section 8.2.2 of the IPMP BW Gold will consult Indigenous nations (along with Cariboo Chilcotin Coast Invasive Plant Committee, and BC Ministry of Environment and Climate Change Strategy) to determine the best strategy for treatment. Therefore in the case that herbicide is prohibited in the territory at which the invasive plant species is identified, an alternative treatment will be developed in consultation with Indigenous nations.		LDN/UFN	ERM	BWG	Tonia		Ready for Submission	TD, Sept 14	Ready for Publishing
630	Appendix 9-G	Invasive Plant Management Plan 8.2.2.1	LDN_UFN (Danny Smart)		Oct 06, 2022	4	Follow Up		No	UFN do not approve of the use of herbicide. Discussions are ongoing with UFN regarding the use of herbicide in their Territory, and there is no current herbicide policy. BW Gold will be kept updated on these discussions. Because UFN are opposed to herbicide, it is expected that BW Gold will committ to ongoing discussions regarding the use of herbicide for invasive plant treatment. The best strategy for treatment may inclide fertilizer application, seeding, mulching, or solarization which are cultural control methods. Please provide a justification for why these methods are not considered and/or	BW Gold acknowledges that UFN will keep BW Gold updated on discussions regarding the use of herbicide in their Territory. BW Gold commits to ongoing discussions regarding the use of herbicide for invasive plant treatment. Table 8.2.2 - Mechanical Control Methods for Invasive Plants includes revegetation and seeding along with hand pulling/digging, collecting and bagging and hand mowing and mowing.		LDN/UFN	BWG	BWG	Travis		18-Oct-22	TD, Oct 17	Ready for Publishing

630	Appendix 9-G	Invasive Plant Management Plan 8.2.2.1	LDN_UFN (Danny Smart)		Nov 17, 2022	5	Follow Up		No	UFN remain opposed to the use of herbicide in their Territory. Because some of the invasive plants identified in the 2011 baseline data do not respond well to manual treatment (e.g., handpulling orange hawkweed or common tansy), as referenced in the IPMP, the best strategy for treatment that is not herbicide use may include fertilizer application, seeding, mulching, or solarization. Please include this information to your treatment options for invasive plant management. OR, is Artemis committing to using mechanical methods (e.g., mowing, clipping at ground level, weed whacker etc) to all identified invasive plants regardless of the size of the infestation? Please further explain treatment methods that will be used that are not herbicide application.	Please refer to attachment "R5_LDN UFN_Comment ID 630.pdf"		LDN/UFN	BWG					TD, Nov 24	Ready for Publishing
631	Appendix 9-G	Invasive Plant Management Plan 6.4 (Table 8.2.3)	LDN_UFN		Jun 06, 2022	0	-	-	No	Add: Please note measures to prevent stray drift or runoff into PFZs during treatment (e.g., buffer strip?). Will there be a variety of setback distances based on the herbicide(s) being applied and weather?	Table 8.2.3 provides buffers for NTZ and PTZ buffers based on guidance from BC Hydro's Integrated Vegetation Management Plan (BC Hydro 2016).	No	LDN/UFN	ERM		Tonia	RT	N/A		
631	Appendix 9-G	Invasive Plant Management Plan Table 8.2.3	LDN_UFN		Jun 06, 2022	1	New	-	No	Table 8.2.3 provides guidance for NTZ and PFZs, however it does not address challenges with chemical treatment such as spray drift, run off, herbicide carryover, damage to non-target species, operator error. NTZ and PFZ should be clearly defined, how each is measured (e.g., section 73(1(2)) for PFZ) and demonstrate the difference. Also include why these are important (i.e.., examples listed above), and how they will be implemented.	Mitigation measures to address challenges chemical treatment are presented in Section 8.2.2 and Appendix F of the Invasive Plant Management Plan (IPMP), and include the following commitments: Herbicides will not be used under the following conditions: when it is raining; when ground winds are over 8km/h; when site conditions prevent the use of herbicides (e.g., coarse textured soils); and when the benefit of using a herbicide is negligible. Any herbicide application will be targeted rather than broad spraying to reduce the amount of herbicide used and to minimize adverse effects to the surrounding environment. Definitions of PFZ and NTZ will be provided in the next iteration of the IPMP. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate,	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
631	Appendix 9-G	Invasive Plant Management Plan Table 8.2.3	LDN_UFN (Danny Smart)		Jul 22, 2022	2	Follow Up	Information requirement	No	BW Gold must acknowledge that additional errors and environmental damage can occur from incorrect chemical treatment of invasive plants. E.g., operator error (including incorrect application rates, improper calibration of equipment, inconsistent speed or pressure of spray) that may impact non-target species. In addition, soil type, weather, adverse growing conditions, herbicide carryover (residual elements that can affect native and/or newly planted species), herbicide drift after high winds or rain. Why has this information not been included in detail within the IPMP? Please include PFZ and NTZ definitions BW Gold will be using within app review so that we can ensure correct definitions and acknowledgment of the areas has been reviewed.	As stated in Section 8.2.2.1 'Herbicide application must comply with BC's Integrated Pest Management Act and be documented using the BC MFLNRO Invasive Plant Chemical & Mechanical Treatment Record (BC MOFR 2010b)'. The measures provided in the Invasive Plant Management Plan are general procedures and (as identified in response to comment #629) a contractor with a valid BC Pest Control Service Licence will be hired. Prior to conducting work, the contractor will provide a treatment plan for BW Gold approval specific to the herbicide and invasive species for the purpose of section 7 (1) (a) of the IPMR and as described in 58(1) (2) (3) and (4) of the IPMR. The treatment plan will also be in accordance with the LDN Herbicide Policy received August 2022 (see response to Comment #630). The treatment plan is expected to provide the additional errors and environmental damage that can occur from incorrect chemical treatment of invasives species identified by the reviewer. As defined by the *Integrated Pest Management Regulation* :		LDN/UFN	ERM		Tonia		Ready for Submission	RT; Aug. 10	Ready for Publishing
631	Appendix 9-G	Invasive Plant Management Plan Table 8.2.3	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		No	BW Gold response has been acknowledged. Please add to the IPMP that once a contractor has been chosen to complete invasive plant treatment, the contractor will provide a treatment plan for BW Gold approval (which includes approval from LDN Chief and Council) which will address errors and envirnmental damage that may occur during treatment (examples provided in previious comments). Please confirm that the PFZ and NTZ definitions will be included in the updated IPMP	BW Gold will update the Invasive Plant Management Plan (IPMP) to indicate that a contractor will provide a treatment plan for BW Gold approval (and includes LDN review) that will address errors and environmental damage that may occur during treatment. The definitions for PFZ and NTZ will be included in the updated IPMP. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	ERM		Tonia		Ready for Submission	TD, Sept 14	Ready for Publishing
632	Appendix 9-G	Invasive Plant Management Plan 7.1 (9)	LDN_UFN		Jun 06, 2022	0	-	-	No	Clarify: Will invasive plant observations be mapped or delineated in the field with signage or flagging?	During visual surveys, a photograph and GPS location will be recorded for each invasive plant observation and retained in database.	No	LDN/UFN	ERM		Tonia	RT	N/A		
632	Appendix 9-G	Invasive Plant Management Plan (9)	LDN_UFN		Jun 06, 2022	1	New	-	No	Retained in what database? Will information be shared or inputted to the provincial database? If not, why?	All incidental observations will be retained in an onsite database and provided to IAPP via an IAPP report (see Appendix G of the Invasive Plant Management Plan; IPMP) and, as outlined the Section 10.2 (Record Keeping) of the IPMP, all monitoring data will be entered into a suitable electronic database.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
632	Appendix 9-G	Invasive Plant Management Plan (9)	LDN_UFN (Danny Smart)		Jul 22, 2022	2	Follow Up	Clarification	No	Clarify within the plan what 'suitable electronic database' will be used. Section 10.2 (Record Keeping) does not currently commit to entering information into IAPP. Is BW Gold committing to this? Plan will need updating.	A commitment to 'entering incidental observations in an onsite database and provided to IAPP via an IAPP report (provided in Appendix G of the Invasive Plant Management Plan [IPMP])' will be provided in Section 10.2 of the IPMP. A suitable electronic database will be one that allows for all relevant information to be entered and subsequently ported to analytical programs such as Microsoft Excel or R project to all for comparison between years and be stored in a single file format for each type of monitoring activity or survey. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	ERM		Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
633	Appendix 9-G	Invasive Plant Management (Table 9-1)	LDN_UFN		Jun 06, 2022	0	-	-	No	(Table 7.2-1) Add: consideration for monitoring beyond known locations to confirm/refute spread	Table 9-1: Invasive Plant Monitoring Program has been revised to include the following: "Areas proximate to known locations of invasive plant species will also be monitored to confirm/refute spread"	No	LDN/UFN	ERM		Tonia	RT	N/A		
633	Appendix 9-G	Invasive Plant Management (Table 9-1)	LDN_UFN		Jun 06, 2022	1	New	-	No	"Areas proximate to known locations of invasive plant species will also be monitored to confirm/refute spread" has not been added to the IPMP. Proximate should be further defined. Will monitoring/surveys occur within 500m? 1 km? 2km? to known locations to confirm infestations have not spread. How will infestations be compared between each year to ensure they have not increased?	Table 9-1 of the Invasive Plant Monitoring Program will be revised as follows: "Monitor areas proximate to known sites. Monitoring will occur within 500 m extent around the known sites to confirm/refute spread." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	T/TD to revie	LDN/UFN	ERM		Mark	RT	Ready for Submission	RT; June 19	Ready for Publishing

633	Appendix 9-G	Invasive Plant Management (Table 9-1)	LDN_UFN		Jul 28, 2022	2	Follow Up	-	No	Carry forward	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.							Ready for Submission	TD; Aug 16	Ready for Publishing
634	Appendix 9-G	Invasive Plant Management (Table 9-1)	LDN_UFN		Jun 06, 2022	1	New	-	No	How will this be recorded?	As stated in Section 9 of the Invasive Plant Management Plan, if invasive plants are observed, surveyors will: record the GPS location; take photographs; and, if needed to confirm the invasive plant species, collect a sample (bag and label). If invasive species or noxious weeds are observed, the Environmental Monitor will report to the EM, who will designate a qualified professional to select the appropriate treatment method, oversee the treatment, conduct follow-up monitoring to document treatment efficacy and document and report the activities, findings and recommendations to the EM. The EM will consult Indigenous Groups, ENV and CCCIPC on the treatment method. If herbicide treatment is required, it will be applied before the flowering stage (early spring) when plants are most susceptible (BC MOFR 2010b)."	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission		Ready for Publishing
634	Appendix 9-G	Invasive Plant Management (Table 9-1)	LDN_UFN (Danny Smart)		Jul 22, 2022	2	Follow Up	Clarification	No	BW Gold response has been acknowledged. However, the question of 'how will this be recorded' is referring to monitoring efforts for treatment efficacy, not observations of invasive species. i.e., how will monitoring of treatment be recorded, and will this information be available and provided in a report (which includes pictures of treatments)?	Section 10.1.2 of the Invasive Plant Management Plan will be revised to include additional detail regarding what will be reported in the Annual Reclamation Report (ARR).: 'The ARR will provide a summary of monitoring results and describe mitigation measures, including treatments applied and the next year's monitoring program. If treatment is applied, details of how, where, when, treatments were applied in addition to follow-up monitoring completed or to be completed to assess the efficacy of the treatment'. If herbicide treatment is applied, BW Gold will provide the follow-up report provided by the contractor in accordance with BC's Integrated Pest Management Act . BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	ERM		Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
634	Appendix 9-G	Invasive Plant Management (Table 9-1)	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		No	BW Gold response has been acknowledged. Please clarify/ensure that in addition to what has been mentioned for the ARR report, the chemical used, treatment method (backpack/boom sprayer) and quanitity on herbicide will also be included in the report	BW Gold commits to including in the Annual Reclamation Report summary of monitoring results and mitigation measures: the chemical used, treatment method (backpack/boom sprayer) and quanitity on herbicide. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans. 634	Appendix 9-G	Invasive Plant Management (Table 9-1)	LDN_UFN		Jun 06, 2022	0	-	-	No	(Table 7.2-1, Treatment Locations) Add: bi-weekly observations between treatments to observe efficacy of treatment (see commitment in 7.2)	Table 9-1: Invasive Plant Monitoring Program has been revised to include the following: "Bi-weekly observations between treatments to assess efficacy of selected treatment."	No	LDN/UFN	ERM		Tonia	RT	N/A		
635	Appendix 9-G	Invasive Plant Management Plan 7.3 (9)	LDN_UFN		Jun 06, 2022	0	-	-	No	Add: Please include field data form template in an appendix. What kind of database and who will perform the review? The review serves what purpose? Field technicians participating in the survey will be trained in what and by who? Please note if a QP specializing in invasive plant management will be involved.	A field data form will be prepared prior to the commencement of construction. Section 6 Training and Awareness indicates the training will be done by BW Gold Environment Dept. Section 9 indicates that monitoring will be performed by an appropriately qualified Environmental Monitor, under the direction of the BW Gold EM.Section 9 has been revised to include the following: Qualified professionals would be consulted on changes to the monitoring program and mitigation measures, and decisions on treatment methods. Section 10.2 describes record keeping and data management.	T/TD to revie	LDN/UFN	ERM		Tonia	RT	N/A		
635	Appendix 9-G	Invasive Plant Management6 & 9	LDN_UFN		Jun 06, 2022	1	New	-	No	Section 6 only highlights that "employees and contractors will receive training in vegetation management", and does not include who will performing the training. Please add. "Qualified professionals would be consulted on changes to the monitoring program and mitigation measures, and decisions on treatment methods." is not included in section 9 as per the response. Please add.	Section 6 of the Invasive Plant Management Plan (IPMP) states: "Employees and contractors will receive training in vegetation management on their arrival on site and prior to the start of work as part of the Site Orientation." The trainer will be responsible for delivering the site orientation. No change will be made to this sentence. The final paragraph in Section 9 (Monitoring) of the IPMP addresses the requirement for a qualified professional to oversee monitoring, mitigation, and treatment methods. No additional text is required in Section 6.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
636	Appendix 9-G	Invasive Plant Management Plan N/A (8.2.2)	LDN_UFN		Jun 06, 2022	0	-	-	No	Add: Plan appears to be missing PMP requirements outlined in Section 58 of the Integrated Pest Mangement Regs. Please refer to 58 (2)(d), (3) and adjust as appropriate.	A reference to Section 58 of the Regulation and brief discussion of pest management plans has been added in Section 8.2.2. Injury levels and treatment thresholds are also discussed.	No	LDN/UFN	ERM		Tonia	RT	N/A		
636	Appendix 9-G	Invasive Plant Management Plan8.2.2	LDN_UFN		Jun 06, 2022	1	New	-	No	It should be noted in the IPMP that treatments will align with the *Invasive Alien Plants Pest Management Plan for Provincial Crown Lands in Central and Northern British Columbia*	The following text will be added to Section 8.2.2 of the Invasive Plant Management Plan: "Treatments will align with the Invasive Alien Plants Pest Management Plan for Provincial Crown Lands in Central and Northern British Columbia." (above sub-heading Injury Levels and Treatment Thresholds.) BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission		Ready for Publishing
636	Appendix 9-G	Invasive Plant Management Plan8.2.2	LDN_UFN		Jul 28, 2022	2	Follow Up		No	Carry forward	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans. 637	Appendix 9-G	Invasive Plant Management Plan Section 2.0	LDN_UFN		Jun 06, 2022	1	New		No	Edit: "avoid the introduction and spread of invasive plants through early detection" suggest changing to "limit the introduction"	The following text will be revised in Section 2.0 of the Invasive Plant Management Plan to state "limit the introduction and spread of invasive plants through early detection". BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission		Ready for Publishing
637	Appendix 9-G	Invasive Plant Management Plan Section 2.0	LDN_UFN		Jul 28, 2022	2	Follow Up		No	Carry forward	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.							Ready for Submission	TD; Aug 16	Ready for Publishing
638	Appendix 9-G	Invasive Plant Management Plan Section 2.0	LDN_UFN		Jun 06, 2022	1	New		No	Map 7.1 highlights the access road and invasive plant infestations to the mine site. These roads will be a vector of spread for invasive species and may bring species identified to the mine site. Please be clear and address why the access roads have not been included within the management plan.	There are no known invasive plant locations on the Mine Access Road (Figure 7-1). See Response to Comment #620 for management activities that will be implement to reduce the spread of invasive species to the Project site.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 16	Ready for Publishing
638	Appendix 9-G	Invasive Plant Management Plan Section Table 9-1	LDN_UFN (Danny Smart)		Jul 22, 2022	2	Follow Up	Clarification	No	BW Gold response has been acknowledge. It is important to note that currently the access road does not have any known invasive species. However, overtime, it is likely that species can/will be introduced. Comment #620 and Table 9-1 does not clearly suggest that the length of the mine access road will be surveyed/monitored/treated for invasive species if they become present. Table 9-1 only suggests the junction of the mine access road and kluskus-ootsa FSR will be monitored. Please clarify and confirm that the length of the road is incorporated into monitoring.	BW Gold continues to commit to invasive species management on BW Gold controlled roads. Invasive species management includes survey/monitoring and treatment. The junction is a priority monitoring area because it is the transition area from the Klukus-ootsa FSR (i.e.., not BW Gold-controlled) to the mine access road (i.e.., BW Gold-controlled) and an area for early detection before plants encroach up the mine access road. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	ERM		Valerie/Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
638	Appendix 9-G	Invasive Plant Management Plan Section Table 9-1	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		No	Please clarify in the updated plan that the junciton is a priority monitoring area because it is a transition area from the Klusklus-Ootsa FSR to the mine access road and an area for early detection before plants encroach up the mine access road, and that the mine access road will also be monitored. Table 9.1 does not clearly state that the length of teh mine access road will be monitored as well.	BW Gold will provide clarity within the Invasive Plant Management Plan regarding the priority monitoring at the transition area Klukus-Ootsa FSR (i.e.., not BW Gold-controlled) to the mine access road (i.e.., BW Gold-controlled) and an area for early detection before plants encroach up the mine access road. Table 9.1 will be updated to indicate the length of the mine access road will be monitored for invasive plants. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	ERM		Valerie/Tonia		Ready for Submission	RT; sept 15	Ready for Publishing
639	Appendix 9-G	Invasive Plant Management Plan Section 2.1	LDN_UFN		Jun 06, 2022	1	New		No	Add information why they can displace native vegetation. E.g., because of rapid growth rate, prolific seed producers, easily dispersed, largely disease and insect resistant, form large dense monocultures, reduce soil productivity etc…	The following text will be added to Section 2.1 of the Invasive Plant Management Plan: "Invasive plant species can outcompete native vegetation through rapid growth, prolific seed production and distribution, disease and insect resistance, the formation of dense monocultures and reduced soil productivity." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission		Ready for Publishing
639	Appendix 9-G	Invasive Plant Management Plan Section 2.1	LDN_UFN		Jul 28, 2022	2	Follow Up		No	Carry forward	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans. 646	Appendix 9-G	Invasive Plant Management Plan Section 7	LDN_UFN		Jun 06, 2022	1	New		No	Who completed the baseline surveys? When? Where is the data stored?	Baseline studies were completed by AMEC in 2011 to 2013. Results are provided in Appendix 5.1.3.3A Vegetation 2011 – 2013 Baseline Report of the Blackwater Gold Project Application for an Environmental Assessment Certificate / Environmental Impact Statement Assessment of Potential Environmental Effects (New Gold 2015). Baseline data will be stored in an onsite database along with the results of the surveys completed beginning in 2022. Occurrences of Invasive Plants will also be reported to the IAPP using the IAPP Site & Invasive Plant Survey Record form (see Appendix G of the Invasive Plant Management Plan).	No	LDN/UFN	ERM		Valerie/Toni a	RT	Ready for Submission	RT; June 16	Ready for Publishing
646	Appendix 9-G	Invasive Plant Management Plan Section 7	LDN_UFN (Danny Smart)		Jul 22, 2022	2	Follow Up	Comment	No	Please add reference to the baseline data document (be specific for invasive plant sections because this document is very large). Although Kluskus FSR is not maintained by BW Gold, baseline data highlights that Field scabious and common tansy have been observed on the FSR. These are high priority species in the Nazko region and should be acknowledged within the IPMP (i.e., within the baseline data section) due to the possibility of it spreading to the mine site access road	A reference to baseline studies completed by AMEC in 2011 to 2013 (Appendix 5.1.3.3A Vegetation 2011 – 2013 Baseline Report of the Blackwater Gold Project Application for an Environmental Assessment Certificate / Environmental Impact Statement Assessment of Potential Environmental Effects (New Gold 2015)) and a reference to he 2022 baseline data will be included in the Invasive Plant Management Plan Section 7. Similar to the previous baselines, the updated 2022 baseline will include invasive plant records/observations from the surrounding area. Specific attention will be made to include the field scabious and common tansy on the Kluskus FSR. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	ERM		Valerie/Toni a		Ready for Submission	RT; Aug. 2	Ready for Publishing
646	Appendix 9-G	Invasive Plant Management Plan Section 7	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		No	We need to be confident that Artemis will address the uncertainty of new species, or larger infestations being identified within the new 2022 baseline data. For example, if a significant Field Scabious infestation has been found, how will Artemis deal with this?	The Invasive Plant Management Plan will be implemented if baseline data indicate infestation of invasives within the Certified Project Description (e.g., BW Gold owned mine access road). It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	ERM		Valerie/Toni a		Ready for Submission	TD, Sept 14	Ready for Publishing
646	Appendix 9-G	Invasive Plant Management Plan Section 7	LDN_UFN (Danny Smart)		Oct 06, 2022	4	Follow Up		No	Because we have not seen the 2022 baseline data, within section 7 (baseline data) please include acknowledgement that Field scabious and common tansy have previously been observed along the Klusklus FSR and that these species are a high priority in the Nazko region. During staff training these species should be provided as examples of species of concern to watch for.	As stated in response to the Round 2 review comment, Section 7 of the Invasive Plant Management Plan will summarize all baseline data and include invasive plant records/observations from the surrounding area (including the observations of field scabious and common tansy along the Kluskus FSR). As stated in Section 6 (Training and Awareness) of the IPMP 'Invasive plant lists and species profiles (Appendices B, C, and E), and maps of known occurrences at or near the mine site will be made available to personnel.' Appendix E (CCCIPC Invasive Plant Species Profile) provides the a description and picture of the plants field scabious and common tansy. 648	Appendix 9-G	Invasive Plant Management Plan Section 7	LDN_UFN		Jul 22, 2022	2	Follow Up	Information requirement	No	Please provide rationale within the IPMP. As this is a living document, demonstrating when and why treatment has taken place is important for transparency of efforts	The when and why of treatment methods are documented is in Section 8.2.2 of the Invasive Plant Management Plan (IPMP) that will be revised to indicate (see response to Comment #625) who will be consulted in terms of authority on the invasive species and how an optimal approach to treatment will be determined. Section 10.1.2 of the IPMP will be revised (see response to Comment #634) to indicate that the Annual Reclamation Report will provide the documentation of the treatment including how, where, when,		LDN/UFN	ERM		Valerie/Toni a		Ready for Submission	RT; Aug. 2	Ready for Publishing
649	Appendix 9-G	Invasive Plant Management Plan Section 8	LDN_UFN		Jun 06, 2022	1	New		No	"invasive plants may be introduced and spread throughout the life of the Blackwater mine". How? Why? Add explanation of identified vectors of spread within the IPMP (i.e.., access roads, easy seed dispersal, attach to vehicles etc...). Include what species have the potential to be transported to the mine site i.e.., some species identified in figure 7-1.	The primary methods of inadvertent introduction are provided in the following text and can be expanded further to detail how and why (in Section 8 of the Invasive Plant Management Plan): Invasive plants may be introduced and spread throughout the life of the Blackwater mine. The Project's construction activities will generate the largest initial ground disturbances and create suitable conditions for both the introduction and establishment of invasive plants. Vehicles and machinery are common transport and dispersal mechanisms for invasive plants. Additionally, invasive plants can be found in seed mixes used for reclamation purposes, although this risk is low with certified 100% weed-free seed mixes. The following text will also be included in Invasive Plant Management Plan: "See Figure 7-1 for the location and type of invasive plants located near site. These plants have the highest likelihood of being inadvertently spread on site because of their existing proximity to site." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Toni a	RT	Ready for Submission		Ready for Publishing

654	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN		Jul 28, 2022	2	Follow Up		No	Carry forward	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.							Ready for Submission	TD; Aug 16	Ready for Publishing
655	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN		Jun 06, 2022	1	New		No	What is the protocol for inspecting clothes and vehicles when working in, prior to leaving, and in areas known to have infestations. What will happen if equipment/clothing has excessive debris?	The following text will be added to Section 8.1 of the Invasive Plant Management Plan: "If debris is noted on clothing brush off within infested area before leaving." Section (8.2.1) provides protocols for vehicles and earth moving equipment after working in areas with known infestations (i.e.., all vehicles and earth moving equipment will be cleaned using portable higher pressure washers within a portable containment structure at the infested site). BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
655	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN		Jul 22, 2022	2	Follow Up	Comment	No	Add to new sentence "If debris (including plant material, seeds, or clods of dirt) is noted on clothing and/or footwear after working within an infested area, brush off within infested area before leaving. Employees and contractors will ensure to clean clothing away from natural watercourses and vegetation to minimize the spread of invasive species"	This suggested addition may not be universally applied. For example it would not be applicable if the infested area is along a stream bank (e.g., Japanese knotweed and policeman's helmet). Restricting the removal of debris to the already infested area (within the area that has the invasive plants that the debris originated from) will minimize the risk of causing further spread beyond what would naturally occur.		LDN/UFN	ERM		Valerie/Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
655	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		No	BW gold response is unclear. BW Gold has previously agreed to adding "if debris is noted on clothing, brush off within infested area before leaving". We are asking to further explain the sentence with the suggestion of adding a definition of debris to the sentence, i.e., including plant material, seeds, or clods of dirt, and to note that cleaning will occur away from natural watercourses and native vegetation to minimize the spread of invasive species. It is unclear why japanese knotweed and policeman's helmet are being mentioned in this response.	We can amend the added sentence to include a definition of what debris will include, the updated text in Section 8.1 of the IPMP will read: "If debris (plant material, seeds, infested soil) is noted on clothing brush off within infested area before leaving." The example of policeman's helmet and Japanese knotweed were provided because these are examples of invasive species found primarily along waterways (and therefore would create a contradiction in the request to clear off debris within the infested area while being setback from a waterway). It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	ERM		Valerie/Tonia		Ready for Submission	TD, Sept 14	Ready for Publishing
655	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN (Danny Smart)		Oct 06, 2022	4	Follow Up		No	BW Golds response is acknowledged. Please ensure to also include "cleaning will occur away from natural watercourses and native vegetation to minimize the spread of invasive species" as part of the added sentence.	The revision to address Round 1 comment ID#655 will also include the statement "Cleaning of debris from clothing will occur away from natural watercourses and native vegetation to minimize the spread of invasive species".		LDN/UFN	ERM		Valerie/Tonia		18-Oct-22	TD, Oct 17	Ready for Publishing
656	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN		Jun 06, 2022	1	New		No	Please explain/clarify what is meant by "depending on the risk of invasive species spread and establishment" as part of invasive plant monitoring post revegetation	The control of invasive plants (spread and establishment) during reclamation activities will follow the assessment and management criteria outlined in Section 8 of the Invasive Plant Management Plan.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
657	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN		Jun 06, 2022	1	New		No	Section 9 of the RCP does not discuss monitoring. Please adjust to reference the correct sections	This reference error will be corrected in the updated Invasive Plant Management Plan. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission		Ready for Publishing
657	Appendix 9-G	Invasive Plant Management Plan Section 8.1	LDN_UFN		Jul 28, 2022	2	Follow Up		No	Carry forward	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.							Ready for Submission	TD; Aug 16	Ready for Publishing

658	Appendix 9-G	Invasive Plant Management Plan Section 8.21	LDN_UFN		Jun 06, 2022	1	New		No	"cleaning will be done in an area where contamination and seed spread is unlikely" suggest changing to limited. Because some seeds are small and easily move by the wind, the term unlikely implies seeds cannot move.	Section 8.2.1 of the Invasive Plant Management Plan will be revised as follows: "cleaning will be done in an area where contamination and seed spread is limited". BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
658	Appendix 9-G	Invasive Plant Management Plan Section 8.21	LDN_UFN		Jul 28, 2022	2	Follow Up		No	Carry forward	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.							Ready for Submission	TD; Aug 16	Ready for Publishing
659	Appendix 9-G	Invasive Plant Management Plan Section 8.21	LDN_UFN		Jun 06, 2022	1	New		No	Clarify "truck wash water will be collected and de-contaminated at a central location". Is BW Gold committing to collecting water used to clean vehicles/equipment and dispose of it? If so, how will this be done?	Section 8.21 of the Invasive Plant Management Plan will be revised to indicate that vehicles will be washed 30 m away from watercourses and areas of vegetation, wash water be collected (and not disposed). All vehicles and equipment that require washing at site (to remove potential invasive plant species) will be cleaned in designated area(s) with debris collected/bagged and incinerated or otherwise disposed of in a manner that does not promote dispersal of viable seeds. Vehicles will be cleaned with a high pressure hose in combination with a stiff brush and/or pry bar as needed to further assist the removal of dirt clods. Wash water will be directed to a nearby sump or pit away from vegetation or natural waterways. BW Gold recognizes that management plans may need various updates as a result of permitting. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Ben	RT	Ready for Submission		Ready for Publishing
659	Appendix 9-G	Invasive Plant Management Plan Section 8.21	LDN_UFN		Jul 22, 2022	2	Follow Up	Information requirement	No	BW Gold comment has been accepted and acknowledged. However, it does not address how water will be collected. Please advise.	As stated in response to the Round 1 review comment, wash water (filtered of debris) will be directed to a nearby sump or pit away from vegetation or natural waterways. See response to 623 for additional information.		LDN/UFN	ERM		Ben		Ready for Submission	RT; Aug. 2	Ready for Publishing
659	Appendix 9-G	Invasive Plant Management Plan Section 8.21	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		No	"Vehicles will be cleaned with a high pressure hose in combination with a stiff brush and/or pry bar as needed to further assist the removal of dirt clods. Wash water will be directed to a nearby sump or pit away from vegetation or natural waterways." Please include this sentence within the IPMP. BW Gold has not clearly state how wash water will be collected. See comment 623 for our response - no further information has been provided by BW Gold.	The folowing statement will be provided in the revised Invasive Plant Management Plan (as indicated in the Round 1 response): "Vehicles will be cleaned with a high pressure hose in combination with a stiff brush and/or pry bar as needed to further assist the removal of dirt clods. Wash water will be directed to a nearby sump or pit away from vegetation or natural waterways." As indicated in the Round 2 and 3 response to comment ID#623, the methods to contain water and/or filter to remove seeds and propugules will likely be the use of a catchment/filtration area and potentially use of filter cloth. Wash water will be directed towards a sump which will be periodically cleaned out, with the waste being placed in a location that would prevent seeds from germinating (e.g., deep burial, placement in the TSF or other means). The specific method(s) will be determined when designated cleaning areas are assigned by the Environmental Manager to meet the requirements of the IPMP. The IPMP will be updated to provide the detailed methods for management of vehicle wash water. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	ERM		Valerie/Tonia		Ready for Submission	TD, Sept 13	Ready for Publishing
660	Appendix 9-G	Invasive Plant Management Plan Section General	LDN_UFN		Jun 06, 2022	1	New		No	In the objectives of the IPMP BW Gold highlights " promptly detect and eradicate invasive plants through effective inventory, control, and monitoring program". However in section 8.2.2. of the IPMP addresses the criterial to be considered to determine the appropriate treatment and states " the potential to eradicate the species from the site". The objectives and treatment and control measures do not align. Is BW Gold committing to eradicate species or not.	The objective (i.e., to detect and eradicate invasive plants) is the desired goal of the Invasive Plant Management Plan. However, this is not always achievable, and the ability/requirement to eradicate a particular invasive plant will be dependent on the outlined criteria in Section 8.	T/TD to revie	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
660	Appendix 9-G	Invasive Plant Management Plan Section General	LDN_UFN		Jul 22, 2022	2	Follow Up		No	KES agrees that it is not always possible to eradicate a species, rather move to long term management. Please update the objectives of the IPMP because as it currently is written, it suggests that the objectives are to eradicate all species	While the objective is to eradicate it is acknowledged in Section 8.2.2 that there are different management objectives that may be realized through treatment and control. The term 'eradicate' will be replaced with 'managed' in Sections 2 and 5 to highlight this management strategy. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	ERM		Valerie/Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
661	Appendix 9-G	Invasive Plant Management Plan Section 8.2.2	LDN_UFN		Jun 06, 2022	1	New		No	The difference between containment and control is unclear. Please clarify that containment is to prevent further expansion through the use of containment lines, and control (perhaps management is better suited) is related to a more established species but are a concern in high value areas.	Appendix A (Table A-1) clearly defines containment and containment/control. The table will be moved into Section 8.2.2 of the Invasive Plant Management Plan to replace the existing text in the next iteration of the plan. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing

672	Appendix 9-G	Invasive Plant Management Plan Section 8.2.2.1	LDN_UFN		Jun 06, 2022	1	New		No	Add "Herbicide action will be targeted through the use of a backpack sprayer or wick rather than broad spraying"	The following text will be added to Section 8.2.2.1 to the Invasive Plant Management Plan: "Herbicide action will be targeted through the use of a backpack sprayer or wick or similar mode of application." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
672	Appendix 9-G	Invasive Plant Management Plan Section 8.2.2.1	LDN_UFN		Jul 22, 2022	2	Follow Up	Question	No	What do you mean "or similar mode of application" as per BW Gold response to previous comment	The statement 'or similar mode of application' allows flexibility to include a hand sprayer or other targeted spray method of a similar size/application type as the backpack sprayer. The term 'targeted' limits the mode of application as requested by the reviewer.		LDN/UFN	ERM		Valerie/Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
672	Appendix 9-G	Invasive Plant Management Plan Section 8.2.2.1	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		No	"similar mode of application" is too open for interpretation within this plan for chemical treatment, especially as LDN and UFN are opposed to chemical treatment. Therefore. please be more explicit with chemical treatment methods you intend to use, i.e., include all chemical treatment methods you wish to use within this plan	As stated in Section 8.2.2.2 of the Invasive Plant Management Plan (IPMP): "Herbicide selection will be informed by consultation with Indigenous nations and CCCIPC as well as site conditions, target species and treatment objectives." Thus the chemical treatment method will be determined based on the invasive species, risk to native communities, sensitivie ecosystems, and extent of the infestation. Therefore not all chemical treatment methods have been detailed in the IPMP. Instead BW Gold has provided in the draft IPMP and/or in response to comments on the draft IPMP how methods will be selected (i.e., to meet Indigenous nation herbicide use policies) and guidance documents that will be used to develop workplans for chemical treatment of invasive plant species (e.g., herbicide application must comply with BC *Integrated Pest Management Act*). The additional revised text provided in response to the Round 1 comment (i.e., "Herbicide action will be targeted through the use of a backpack sprayer or wick or similar mode of application") will not be revised in the IPMP. However as indicated in response to #630, prior to the use of chemical treatment for invasive plant species, BW Gold will provide in the required invasive plant treatment plan with detailed methods and a clear justification of why other management methods are not being used (per the LDN Herbicide Policy, August 2022). BW Gold anticipates future updates to the IPMP in consideration of updates to current policies or other Indigenous nations policies received (see Section 12 of the IPMP). 674	Appendix 9-G	Invasive Plant Management Table 8.2-3	LDN_UFN		Jun 06, 2022	1	New		No	Please clarify the difference between the 2m and 5m PFZ requirements under glyphosate applications	Table 8.2-3 of the Invasive Plant Management Plan details the permitted glyphosate application with regards to a 2m and 5m PFZ.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
675	Appendix 9-G	Invasive Plant Management Table 8.2-3	LDN_UFN		Jun 06, 2022	1	New		No	Change to 74(2) to follow the regulation language of "up to but not below the high water mark of a temporary free-standing body of water and over dry streams" glyphosate regulation for clarity	The text in the row that references regulation clause 74(2) in Table 8.2-3 of the Invasive Plant Management Plan will be replaced with recommended language: "up to but not below the high water mark of a temporary free-standing body of water and over dry streams". BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
675	Appendix 9-G	Invasive Plant Management Table 8.2-3	LDN_UFN		Jul 28, 2022	2	Follow Up		No	Carry forward	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.							Ready for Submission	GM; Aug 15	Ready for Publishing

676	Appendix 9-G	Invasive Plant Management Plan Section 9.0	LDN_UFN		Jun 06, 2022	1	New		No	"Treatments applies after flowering will involve the removal and disposal of seed heads to an appropriate waste disposal location" If a plant is in flower, chemical treatment often shocks it into seed. Is BW Gold committing to removing all seed heads from site if chemical treatment has occurred after flowering or only mechanical? How will this be recorded and monitored? most monitoring activities will occur between late spring and early summer" Please be explicit with what exact monitoring activities will take place at this time.	A qualified professional will determine if chemical treatment is required and the most appropriate timing for the invasive species. As stated in Section 8.2.2.1 of the Invasive Plant Management Plan (IPMP), a combination of more than one control strategy may be the most effective for the successful management of invasive plants. Therefore, if removal of seed heads are required after chemical treatment, then seed heads will be collected and disposed of in an appropriate waste disposal location. Monitoring activities as identified in Table 9-1 will be completed to monitor the effectiveness of treatment. In this scenario (i.e.., treatment of the flowering plant), monitoring will not be limited to only late spring and early summer, and will be directed by the Environmental Manager, who will designate a qualified professional to conduct follow-up monitoring to document treatment efficacy and document and report the activities, findings and recommendations to the EM (Section 9 of the IPMP). BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.							Ready for Submission	GM; Aug 15	Ready for Publishing
690	Appendix 9-G	Invasive Plant Management Plan Appendix H	LDN_UFN		Jun 06, 2022	1	New		No	"Generally, continuous invasive plant occurrences with less than 100m gap between plants are recorded as one site" Correct, this follows IAPP's guidance. However, it is more beneficial to record all locations so that infestations are easier to find at a later date. 100m could be in any direction of the point. This makes it a large area to monitor if time is limited.	The methods follow IAPPs guidance to survey an area. BW Gold appreciates the suggestion but does not feel the text needs to be modified. As indicated by IAPP, recording the site location with a UTM at the center of the infestation and then making note of the aerial extent will allow monitors to define the infested area in a way that all known occurrences are captured.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
691	Appendix 9-F	Vegetation Management Plan 1	LDN_UFN		Jun 06, 2022	0	New		No	Clarify: Please provide a brief summary of vegetation management activities (e.g., clearing, re-veg) that occurred at the Blackwater site as part of Early Works. Include a list of example activities and planned future works that will be guided by the contents of this management plan. Note that the VMP is intended to mitigate impacts to streams, fish, and wildlife as well.	There has not yet been any clearing as part of Early Works. The VMP applies to construction and operations. Details on mine components, activities, and development schedule are provided in Chapter 3 of the Joint Mines Act/Environmental Management Act Permits Application. As noted by the reviewer, the VMP is intended to impacts to streams, fish, and wildlife. This has been added to Section 2.	No	LDN/UFN	ERM		Tonia	RT	N/A		
691	Appendix 9-F	Vegetation Management Plan 2 (2)	LDN_UFN		Jun 06, 2022	1	New		No	While response does address parts of the above comment, an intro list of "example activities" would still assist in clarification of this section, which is to outline the purpose and objectives of this document. Please state in brief format, with what tools, "example activities," you might use to achieve these goals. Suggestion is to nest a secondary list of item by which to achieve goals under current list items. This document must stand alone w/o reference to outside chapters.	The following text will be added in the next plan iteration after the bullets in Section 2: "see Section 8.0 for a detailed list of mitigation and management measures recommended to achieve these objectives". The preference here is to not duplicate text or to prioritize (highlight) certain activities over others, but rather to direct the reader to the appropriate section to learn about all recommended activities. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
691	Appendix 9-F	Vegetation Management Plan 2 (2)	LDN_UFN		Jul 22, 2022	2	New	Comment	No	Suggest adding StFN and NWFN herbicide use policies as appendices to the plan as they are referenced within the current IPMP	BW Gold acknowledges the comment, however the company has never been provided with a copy of the policy, only been told there is a policy prohibiting use within the StFN and NWFN territories. If a policy is provided, it will be appended in a future iteration the plan. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; Aug. 2	Ready for Publishing

691	Appendix 9-F	Vegetation Management Plan 2 (2)	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		No	KES does not represent Stfn and NWFN, therefore it is Artemis's responisbility to receive these documents and incorprate them into the plan for us to review and ensure the policies are being followed within the management plan. Within the IPMP it states, "herbicide use will mee the Stfn and NWFN herbicide use policies", however as BW Gold have acknoweldged, "the company has never been provided with a copy of the policy, only been told there is a policy prohibiting use within the Stfn and NWFN territoties". Therefore, please explain how Artemis will follow these policies if they have not receieved or reviewed the documents to begin with? In addition, if herbicide is prohibited in these territories, how will BW Gold implement chemical treatment, and why are they doing so?	The mitigation 'Comply with the StFN herbicide use policy in StFN territory' is mitigation 5-15 of the Mitigation Table, submitted to the Environmental Assessment Offices to address the Environmental Assessment Condition 43. Therefore in the first draft of the Invasive Plant Management Plan (IPMP), BW Gold committed to adhering to StFN and NWFN herbicide use policy. Section 8.2.2 of the IPMP does not state chemical control is the only option for treatment and control of invasive plants; BW Gold will consult Indigenous Nations (along with Cariboo Chilcotin Coast Invasive Plant Committee, and BC Ministry of Environment and Climate Change Strategy) to determine the best strategy for treatment. If, following consultation, it is determined that the herbicide use is not permitted in the territory at which the invasive plant species is identified and that a better alternative is available, an alternative treatment will be developed in consultation with Indigenous nations. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	ERM		Tonia		Ready for Submission	TD, Sept 14	Ready for Publishing
691	Appendix 9-F	Vegetation Management Plan 2 (2)	LDN_UFN (Danny Smart)		Oct 06, 2022	4	Follow Up		No	KES does not represent Stfn and NWFN, therefore it is Artemis's responsibility to receive these documents and incorporate them into the plan for us to review and ensure the policies are being followed within the management plan. Please confirm that Artemis has received these policies and attach as appendices to the plan. We need to be confident that Artemis are complying with Stfn and NWFN's herbicide policies as stated in the mitigations table (5-17), the IPMP (section 8.2.2.1) and the VMP (section 8.2). Therefore, these must be included as appendices for the IPMP and VMP. Although Artemis have committed to 'consult Indigenous Nations to determine the best strategy for treatment' because these policies have been referenced, they must be reviewed.	Despite BW Gold's requests, StFN and NWFN have not shared their herbicide policies to date. If and when those policies are received, they will be considered in updating the plan as needed. BW Gold is unclear why Keefer Eco needs to be confident that BW Gold is complying with the policies of StFN and NWFN. The plan has been developed based on available information. BW Gold is available to discuss this matter at the convenience of LDN and UFN.		LDN/UFN	BWG		Ryan			TD, Oct 17	Ready for Publishing
691	Appendix 9-F	Vegetation Management Plan 2 (2)	LDN_UFN (Danny Smart)		Nov 17, 2022	5	Follow Up		No	If BW Gold has not received these policies, please explain how you propose to follow their guidelines within the IPMP, VMP, and Riparian SOP where they are referenced.	BW Gold has not received written policies from StFN and NWFN regarding herbicide use in their Traditional Territory. However, SFN, StFN and NWFN have verbally expressed that herbicides are not to be used within their Traditional Territory. In absence of a written policy, BW Gold is committed to complying with the verbal position on herbicide use within Indigenous nation territories. As stated in the Round 5 response to Comment ID#630, the Invasive Plant Management Plan will be updated to reflect that BW Gold will comply with LDN's written herbicide use policy and the verbal position on no herbicide use with the territories of UFN, SFN, StFN, and NWFN. The potential treatment options for invasive plant management will be updated to include cultural control methods (instead of chemical treatment). For associated updates to be completed in the Riparian Management SOP please see the Round 5 response to Comment #1994 and see the Round 5 response to Comment #2122 for associated updates to the Vegetation Management Plan. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	BWG					TD, Nov 24	Ready for Publishing
692	Appendix 9-F	Vegetation Management Plan 1.1 (Table 3-1)	LDN_UFN		Jun 06, 2022	0	New		No	(Table 1.1-1, Department Managers) Clarify: who is the Environmental Superintendent? How is their role defined?	Table 3-1: BW Gold Roles and Responsibilities has been revised to state that the Departmental Managers report to the Mine Manager. BW Gold recognizes that management plans may need various updates as a result of permitting. BW Gold has discussed the best approach with EMLI, and we will track all edits and submit updated plans toward the end of the Application Review process. As appropriate, updated plans will then be filed with other relevant regulators and Indigenous nations.	No	LDN/UFN	ERM		Tonia	RT	N/A	TD, Jun 29	Ready for Publishing
692	Appendix 9-F	Vegetation Management Plan 1.1 (Table 3-1)	LDN_UFN		Jun 06, 2022	1	New		No	Comment not addressed in the reply. Clarifications regarding the qualifications of the Environmental Superintendent (QP ??) and their role in management should be added to table 3-1. There is no mention of such a person in the table.	Table 3-1 (Blackwater Gold Roles and Responsibilities) lists the responsibilities of the Environmental Manager (EM) or designate. The EM and designate have the overall responsibility for environmental management on site, supported by technical field staff and consulting qualified professionals. The Environmental Superintendent is a designate of the EM. Therefore, the Environmental Superintendent will not be added to Table 3-1. 693	Appendix 9-F	Vegetation Management Plan 1.2.1 (4.1)	LDN_UFN		Jun 06, 2022	0	New		No	Add: Migratory Birds Convention Act; Weed Control Act and Regulation; Integrated Pest Management Act and Regulation; Environmental Management Act; Mitigation Hierarchy Policy; Health, Safety, and Reclamation Code for Mines in BC	The suggested legislation has been added to Section 4.1 Legislation of the VMP. BW Gold recognizes that management plans may need various updates as a result of permitting. BW Gold has discussed the best approach with EMLI, and we will track all edits and submit updated plans toward the end of the Application Review process. As appropriate, updated plans will then be filed with other relevant regulators and Indigenous nations.	No	LDN/UFN	ERM		Tonia	RT	N/A	TD, Jun 29	Ready for Publishing
693	Appendix 9-F	Vegetation Management Plan 1.2.1 (4.1)	LDN_UFN		Jun 06, 2022	1	New		No	No mention of the Regulations (Weed control Act), Environmental Management Act or Mitigation Hierarchy Policy.	The following will be added to Section 4.1 of the Vegetation Management Plan: "Weed Control Regulation (as a sub-section of the Weed Control Act)." The Environmental Management Act will also be added but is more appropriately referenced under other EMPs. Only Acts and Regulations are included in this list, it does not extend to the Policy level.	No	LDN/UFN	ERM		Valerie/Toni a	RT	Ready for Submission	RT; June 14	Ready for Publishing
693	Appendix 9-F	Vegetation Management Plan 1.2.1 (4.1)	LDN_UFN		Jul 22, 2022	2	Follow Up	Clarification	No	The Environmental Management Act is an Act and should be listed in this section. Please clarify where the Mitigation Hierarchy Policy will be added.	The environmental mitigation policy will be added to Under Guidelines and Best Management Practices. BW Gold recognizes the Environmental Management Act is an Act and as stated in the response to Round 1 comments the Act will be listed in the Vegetation Management Plan (Section 4.1).		LDN/UFN	ERM		Valerie/Toni a		Ready for Submission	RT; Aug. 2	Ready for Publishing
693	Appendix 9-F	Vegetation Management Plan 1.2.1 (4.1)	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		No	The Environmental Management Act was not previously added to the VMP following round 1 comments. Please ensure it is added for round 3.	BW Gold acknowledges the comment and commits to referencing the Environmental Management Act in Section 4.1 of the Vegetation Management Plan. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	ERM		Valerie/Toni a		Ready for Submission	TD, Sept 14	Ready for Publishing

694	Appendix 9-F	Vegetation Management Plan 1.2.1 (4.3)	LDN_UFN		Jun 06, 2022	0			No	Add: How will vegetation be disposed of if not retained for reclamation purposes? Open Burning and Smoke Control Regulation may be applicable if waste wood is to be burned on-site. May be more suitable to the Air Quality and Dust MP?	The purpose of this section (Existing Permits) is to identify the Project's existing authorizations that include conditions related to vegetation management. BW Gold may apply for an open burning permit for disposal of woody debris that is not suitable for reclamation, if required.	No	LDN/UFN	ERM		Tonia	RT	N/A	TD, Jun 29	Ready for Publishing
694	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jul 27, 2022	2	Follow Up		No	We want a firm commitment from BW Gold to have ongoing consultation with LDN and UFN on the development and approval of these permits	BW Gold has an agreement which sets out requirements for engaging on regulatory permitting matters and is committed to following the agreement.	No	LDN/UFN	ERM	BWG	Tonia	RT	Ready for Submission	RT; Aug. 2	Ready for Publishing
694	Appendix 9-F	Vegetation Management Plan 1.2.1 (4.3)	LDN_UFN		Jun 06, 2022	1	New		No	The Nations request to review any future permit applications and understand how the potential impacts of those permits may impact other MPs that are implemented on site.	BW Gold will continue to engage with the Nations on permit applications in accordance with established practice (e.g. in agreements) and/or as directed by regulators.	No	LDN/UFN	ERM	BWG	Tonia	RT	Ready for Submission	RT; June 16	Ready for Publishing
695	Appendix 9-F	Vegetation Management Plan 1.2.3 (4.3)	LDN_UFN		Jun 06, 2022	0			No	Clarify: anything in the license to cut permit to mention?	There are no conditions related to vegetation management in the license to cut permit.	No	LDN/UFN	ERM		Tonia	RT	N/A	TD, Jun 29	Ready for Publishing
695	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jul 27, 2022	2	Follow Up	Information Requirement	No	We want a firm commitment from BW Gold to have ongoing consultation with LDN and UFN on the development and approval of these permits	BW Gold has an agreement which sets out requirements for engaging on regulatory permitting matters and is committed to following the agreement.	No	LDN/UFN	ERM				Ready for Submission	RT; Aug. 2	Ready for Publishing
695	Appendix 9-F	Vegetation Management Plan 1.2.1 (4.3)	LDN_UFN		Jun 06, 2022	1	New		No	The Nations request to review the permit to confirm.	Copies of the permits can be made available to the reviewer through a request to the BW Gold Environmental Manager.	No	LDN/UFN	ERM	BWG	Tonia	RT	Ready for Submission	RT; June 20	Ready for Publishing
696	Appendix 9-F	Vegetation Management Plan 1.2.4 (4.4)	LDN_UFN		Jun 06, 2022	0			No	Clarify: Several well-established guidance documents are listed here, but the only ones that I can find with in-text references are the BCTS Windthrow Manual and the Fish-stream Crossing Guidebook. Are there references missing?	The references identified by the reviewer have been included in Section 4.4 Guidelines and Best Management Practices. BW Gold recognizes that management plans may need various updates as a result of permitting. BW Gold has discussed the best approach with EMLI, and we will track all edits and submit updated plans toward the end of the Application Review process. As appropriate, updated plans will then be filed with other relevant regulators and Indigenous nations.	No	LDN/UFN	ERM		Tonia	RT	N/A	TD, Jun 29	Ready for Publishing
696	Appendix 9-F	Vegetation Management Plan 1.2.4 (4.4)	LDN_UFN		Jun 06, 2022	1	New		No	This comment refers to in text refences. It states that the reviewer did not find many of these guideline documents referenced within the text. I have revised it and did found that about 50% were referenced with the body of the document, however, that still means many were not. Consider adding more information sources within your text to support your plan.	A check will be done to add in more BMP/Guideline references within VMP text, if appropriate. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
697	Appendix 9-F	Vegetation Management Plan 2.1 (6)	LDN_UFN		Jun 06, 2022	0			No	Add: Please describe the type(s) of educational material you will provide to your site personnel. What will be covered in said material and who will provide the training? Will a worker training record be kept?	Section 6 Training and Awareness now reads: Educational material has not yet been developed for the Project. A person with experience in vegetation management will work with BW Gold to develop educational materials. A BW Gold employee will provide the training. BW Gold recognizes that management plans may need various updates as a result of permitting.	No	LDN/UFN	ERM		Tonia	RT	N/A	TD, Jun 29	Ready for Publishing
697	Appendix 9-F	Vegetation Management Plan 2.1 (6)	LDN_UFN		Jun 06, 2022	1	New		No	I do not see these phrases anywhere in section 6. After a second review of this document, I like the previous reviewer would like to see more details in this section.	Section 6 was edited further following the initial proposed proponent response (above). Details requested in the earlier comment have somewhat been addressed, but more detail will be added Section 6 to clarify 'what will be covered'. The following text will be added to Section 6: "Site Orientation training will include information about vegetation setbacks/buffers and boundaries and the requirement to respect those areas; details about clearing windows and the requirement to engage environment staff prior to planning any clearing activities; mitigation measures for limiting soil disturbance and dust control; and, a discussion of more specialized	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
697	Appendix 9-F	Vegetation Management Plan 2.1 (6)	LDN_UFN		Jul 27, 2022	2	Follow Up	Information requirement	No	BW Gold response has been acknowledged. Please clarify/add who will be conducting the training and if a worker training record will be kept (as per previous comment) as it is currently unclear if this will be included in the updated plan. Further explain: "A person with experience in vegetation management will work with BW Gold to develop educational materials. A BW Gold employee will provide the training." How much experience,	The Blackwater Gold Project Site Orientation will be completed by the Health, Safety, and Environment team. A suitably trained member of the BW Gold team will be responsible for orientation delivery. A worker training record will be maintained for orientation. This info will be added to the next iteration of the plan. The Site Orientation materials are limited in scope and cover the important high level topics such as 'obey clearing boundaries, let the environment team know if you need to clear an area so that they can determine	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; Aug. 2	Ready for Publishing

698	Appendix 9-F	Vegetation Management Plan 2.1 3.1 (Table 8.1-1)	LDN_UFN		Jun 06, 2022	0			No	(Table 3.1-1, Pre-clearing) Add: Please list the types of pre-disturbance surveys to be performed prior to beginning clearing activities or disturbance of vegetation. Include references for the surveys where applicable and the setback distance tables.	Table 8.1-1: General Mitigation Measures (pre-clearing now reads: - "Coordinate the timing of vegetation clearing and construction activities to occur outside of sensitive time periods (e.g., breeding birds, amphibians, fish). However, if vegetation clearing must occur during the sensitive season for a particular wildlife or fish species, conduct pre-clearing surveys prior to the planned timing of the clearing occurrence, to confirm a species is not present. If a species is present, establish setback buffers (See Table 3.2-1 in the WMMP for wildlife sensitive time periods and guidelines for buffers). - Coordinate in-water work within reduced risk work window (July 15 to August 31) in Region 7- Omineca (BC MWLAP 2004b). If in-water work must occur outside of the least risk work window, mitigation measures will be identified to avoid harm to fish in consultation with Aboriginal Groups, subject to Fisheries Act authorization. - Conduct pre-clearing surveys to identify environmentally sensitive features (e.g., riparian areas) that may interact with clearing and construction activities, taking into account setbacks in Table 8.3-1. Map and flag sensitive features and identify management actions (with restrictions, e.g., no heavy machinery, refueling, etc..) around these features, where possible. '- Conduct windthrow hazard assessments along all new openings greater than 1 ha referencing to BCTS Windthrow Manual: A Compendium of Information and Tools for Understanding, Predicting and Managing Windthrow on the BC Coast (Zielke et al. 2010). - Prior to commencement of clearing, map and flag sensitive features to identify no-work zones (with restrictions, e.g., no heavy machinery, refueling, etc..) around these features, where possible. BW Gold recognizes that management plans may need various updates as a result of permitting. BW Gold has discussed the best approach with EMLI, and we will track all edits and submit updated plans toward the end of the Application Review process. As appropriate, updated plans will then be filed with other relevant regulators and Indigenous nations.	No	LDN/UFN	ERM		Tonia	RT	N/A	TD, Jun 29	Ready for Publishing
698	Appendix 9-F	Vegetation Management Plan 2.1 3.1 (Table 8.1-1)	LDN_UFN		Jun 06, 2022	1	New		No	"I do not see a list of pre-construction surveys, only riparian is mentioned. Otherwise most of your response is in the table, though not exactly as stated here. Also, there is a typo in point 4..."(Reference: .....(Zielke et al. 2010)."" either add or remove bracket."	Under the first bullet in Table 8.1-1 (clearing), the requirement to conduct pre-clearing surveys during the breeding bird window is also listed. Additional mitigations will be referred to specifically in Table 8.1-1 (Pre-clearing), including pre-clearing surveys for listed plants/communities and at-risk plants (within areas identified in Section 7.0/Appendix A2) and pre-clearing surveys for invasive plants prior to clearing (and to manage prior to clearing). Section 3.3 (Pre-clearing and Construction Management) of the Wildlife Mitigation and Monitoring Plan will also be referenced in the Vegetation Management Plan (Table 8.1-1). BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Toni a	RT	Ready for Submission	RT; June 20	Ready for Publishing
698	Appendix 9-F	Vegetation Management Plan 2.1 3.1 (Table 8.1-1)	LDN_UFN		Jul 27, 2022	2	Follow Up	Comment	No	To address the comment "please list the types of pre-disturbance surveys to be performed prior to beginning clearing activities" please add additional information to the edited bullet point. For example, nest sweeps following X protocol, rare plant surveys following Y protocol, riparian areas following Z protocol	BW Gold has referenced the management plan (and relevant section of the plan) regarding the types of surveys to be performed prior to beginning clearing activities instead of providing the detail as indicated by the reviewer (in the revised Table 8.1-1). This is because surveys or protocols (e.g., invasive plants surveys) are subject to multiple conditions outlined in the management plan. This comprehensive approach to provide the reference to the section of the management plan where the protocols/BMPs are detailed limits perception by the reader that one plan can superceed other plan requirements..	No	LDN/UFN	ERM		Valerie/Toni a	RT	Ready for Submission	RT; Aug. 2	Ready for Publishing
698	Appendix 9-F	Vegetation Management Plan 2.1 3.1 (Table 8.1-1)	LDN_UFN (Danny Smart)		Sep 01, 2022	3	Follow Up		No	Following up on commetn 0, the final bullet point was not added to the amended plan ("prior to commencement of clearing, map and flag sensitive features to identify no-work zones (with restrictions e.g., no heavy machinery, refuelling etc.) around these features where possible). Please make sure this is added to the updated plan. Within the pre-clearing section of Table 8.1-1, management plans and relevant reference sections have not been referenced. Please update.	Text in Table 8.1-1 (Pre-clearing) of the Vegetation Management Plan (VMP) to address the Round 0 last bullet response willl be modified and presented in the next iteration of the VMP as follows: "Conduct pre-clearing surveys to identify environmentally sensitive features (e.g., riparian areas, listed species) that may interact with clearing and construction activities, taking into account riparian setbacks in Table 8.3-1. Map and flag sensitive features and identify management actions (e.g., restrictions, no heavy machinery, no refueling, etc.)." The response to the Round 2 comment ID#698 incorrectly referred to the revised Table 8.1-1 (a revised VMP was not issued following Round 2 comments). In the next iteration of the VMP, BWG will provide references to the management plan (and relevant section of the plan) regarding the types of surveys to be performed prior to beginning clearing. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								GM; Aug 15	Ready for Publishing
706	Appendix 9-F	Vegetation Management Plan 3.3 (Table	LDN_UFN		Jun 06, 2022	0			No	(Table 3.3-2) Edit: Please use bullet points inside the table to distinguish between BMPs.	Bullet points have been added to Table 8.3-2 to distinguish between BMPs.	No	LDN/UFN	ERM		Tonia	RT	N/A		
706	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jun 06, 2022	1	New		No	Table 8.3-2 is a representation of RMA buffers. Are we sure this comment is regarding this table?	The comment [ID#706] is regarding Table 8.3-3 in the April submission of the Vegetation Management Plan.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
707	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jun 06, 2022	0			No	(Table 3.3-2, ESC) "qualified sediment and erosion control professional should assess the potential for erosion" Please replace "should" with "will", and elaborate on what circumstances require a site-specific ESC plan. Also, please refer to the appropriate section of relevant Blackwater MPs. Is this sentence referring to a CPESC and/or PAg? Please specify.	Table 8.3-2: Mitigation Measures for Riparian Areas has been revised and now reads : - Prevent the release of silt, sediment or sediment-laden water, raw concrete or concrete leachate, or any other deleterious substances into any ditch, watercourse, ravine or storm sewer system; and - Implement erosion control measures (e.g., proper ditching, reducing slopes and placement of soil salvage piles, diversion and runoff collection ditches, sediment control ponds, erosion control mats and use of flocculants) as described in the SEPSCP, section 7.3. Examples of where site-specific ESC plans may be will be developed for plant site; borrow pits, tailings dam or other dams construction sites; freshwater reservoir and dams, areas with significant soil or overburden stripping/salvage.	No	LDN/UFN	ERM		Tonia	RT	N/A		

707	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jun 06, 2022	1	New		No	Same comment as above regarding table number. (8.3-3, not 8.3-2) Phrase, "prevent the release of silt, sediment or sediment-laden water, raw concrete or concrete leachate, or any other deleterious substances into any ditch, watercourse, ravine or storm sewer system; and" is not found anywhere in this table. Please insert that last response into the document to add clarity on if and when these ESC plans might be developed. Please clarify qualifications of the QP	Riparian Area Management Standard Operating Procedure (SOP) mitigation measures are detailed in Appendix A3 (as referenced in Section 8.3 of the Vegetation Management Plan (VMP)). Prevention of the release of deleterious substances is provided in this SOP. The reference to the prevention of the release of deleterious substances will also be provided in Table 8.3-3 of the VMP. The statement regarding where site-specific ESC plans may be developed will be provided in Section 8.3 of the VMP. As stated in the Section 8.2 of the Surface Erosion Prevention and Sediment Control Plan (SEPSCP), "ESC measures will primarily be field-fit based on conditions encountered in the field, under the direction of the Environmental Monitor." In addition, the Section 9 of the SEPSCP indicates that BW Gold will engage suitably qualified individuals to supervise the construction activities. Section 11 of the SEPSCP indicates that: "Once the ESC measures have been installed, their effectiveness will be monitored by the Environmental Monitor, and maintenance will be carried out, as necessary. All ESC measures will be inspected by the	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 20	Ready for Publishing
707	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jul 27, 2022	2	Follow Up	Clarification	No	As per the first comment, BW Gold comment (below in " ") is not included in the plan or the SOP. Please add. "Table 8.3-2: Mitigation Measures for Riparian Areas has been revised and now reads : - Prevent the release of silt, sediment or sediment-laden water, raw concrete or concrete leachate, or any other deleterious substances into any ditch, watercourse, ravine or storm sewer system; and - Implement erosion control measures (e.g., proper ditching, reducing slopes and placement of soil salvage piles, diversion and runoff collection ditches, sediment control ponds, erosion control mats and use of flocculants) as described in the SEPSCP, section 7.3." Please provide sentence to address "where site-specific ESC plans may be developed will be provided in section 8.3 of the VMP" as per BW gold response	Table 5.1-2 (bullet #10) in the Riparian Area Management Standard Operating Procedure (SOP) states (Appendix A3 of the Vegetation Management Plan): "Prevent sediment and deleterious substances from entering the stream by implementing sediment and erosion control measures in accordance with the Surface Erosion Prevention and Sediment Control plan." This bullet will also be provided in Table 8.3-3 of the Vegetation Management Plan. BW Gold approach to management plans is to focus each plan or SOP, to the extent possible, as closely as possible on a specific value. When cross-over text is included it can create misunderstanding about priority management methods and objectives and/or requires edits in multiple plans when revisions are made to one plan. BW Gold's preference is to refer the reader to the management plan where the most comprehensive discussion about a mitigation measure is included. With reference to terms, deleterious encompasses all of the listed substances that could enter a stream and the term stream encompasses all the potential types of streams/waterbodies (as defined in the Fisheries Act and the WSA). These all encompassing terms are preferred because they are comprehensive. As indicated in response to the Round 1 comment Section 8.3 will provide a statement regarding where site-specific Erosion and Sediment Control plans may be developed. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; Aug. 2	Ready for Publishing
707	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Sep 01, 2022	3	Follow Up		No	Referring to Round 0, BW Gold's response states that the following bullet points will be included in Table 8.3-3 Mitigation Measures for Riparian Areas of the VMP. The bullet points are not included in the VMP. To omit confusion of these details, the revised version of the VMP must include this information. These sentences are also not included in the current Riaparian Area Management SOP. Please update and include. - Prevent the release of silt, sediment or sediment-laden water, raw concrete or concrete leachate, or any other deleterious substances into any ditch, watercourse, ravine or storm sewer system; and - Implement erosion control measures (e.g., proper ditching, reducing slopes and placement of soil salvage piles, diversion and runoff collection ditches, sediment control ponds, erosion control mats and use of flocculants) as described in the SEPSCP, section 7.3. These sentences are also not included in the current Riaparian Area Management SOP. Please update and include.	The last row of Table 8.3-3 (Sediment and Erosion Control) will be revised to state: 'The SEPSCP (Best Management Practices) will be implemented and will identify erosion control measures (e.g., proper ditching, reducing slopes and placement of soil salvage piles, diversion and runoff collection ditches, sediment control ponds, erosion control mats, and use of flocculants)." As stated in the response to the Round 2 comment the following statement will be provided in the Vegetation Management Plan "Prevent sediment and deleterious substances from entering the stream by implementing sediment and erosion control measures in accordance with the Surface Erosion Prevention and Sediment Control plan." BW Gold's preference is to refer the reader to the management plan where the most comprehensive discussion about a mitigation measure is included. With reference to terms, deleterious encompasses all of the listed substances that could enter a stream and the term stream encompasses all the potential types of streams/waterbodies (as defined in the *Fisheries Act* and the WSA). These all encompassing terms are preferred because they are comprehensive. The statements will be included in the next iteration of the Riparian Area Management Standard Operating Procedure		LDN/UFN	ERM		Valerie/Tonia		Ready for Submission	TD, Sept 14	Ready for Publishing
708	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jun 06, 2022	0			No	(Table 3.3-2, Construction Activities) Clarify: "streams by vehicles and/or heavy machinery (unless at an existing road or ford crossing), unless authorized as a special provision in a site-specific prescription or with specific regulatory agency approval." Temporary crossing through a stream by way of a ford makes sense to me, but I don't see how you can be on a road crossing and go throug a stream unless your crossing structure is underwater. Please clarify and provide reference where applicable. Consider breaking this into several points. Include fording procedure and relevant BMPs or reference section of guidance document.	Table 8.3-2: Mitigation Measures for Riparian Areas has been revised regarding construction activities to remove ford crossing and edited as follows: "- Avoid crossing through streams by vehicles and/or heavy machinery. Refer to the Fish-Stream Crossing Guidebook Part 2: Fish-stream Crossings: Design, Installation, and Maintenance Considerations (BC MFLNRO, BC MOE and DFO 2012) for stream crossings."	No	LDN/UFN	ERM		Tonia	RT	N/A		
708	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jun 06, 2022	1	New		No	No such phrase exists within table 8.3-3, " Avoid crossing through streams by vehicles and/or heavy machinery. Refer to the Fish-Stream Crossing Guidebook Part 2: Fish-stream Crossings: Design, Installation, and Maintenance Considerations (BC MFLNRO, BC MOE and DFO 2012) for stream crossings."	This mitigation measures has been included in Appendix A3 (SOP for Riparian Area Management): "Use temporary crossing structures (rather than fording) to transport machinery across streams. If this is not possible, locate fords in areas with shallow, stable banks and limit crossings to once over and back". The reference (BC MFLNRO, BC MOE and DFO 2012) will be added to this text. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
708	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jul 27, 2022	2	Follow Up	Clarification	No	As per BW Gold response to comment 0 of ID 708, include suggested updates directly into the plan. In addition, add a specific appendices reference (i.e., A3) for further clarity on the comment. For example, update the plan to include: "Avoid crossing through streams by vehicles and/or heavy machinery. Refer to the Fish-Stream Crossing Guidebook Part 2: Fish-stream Crossings: Design, Installation, and Maintenance Considerations (BC MFLNRO, BC MOE and DFO 2012) for stream crossings. See further details in Appendix A3"	BW Gold's preference is to refer the reader to the details provided in the Standard Operating Procedure (SOPs) or management plan where the most comprehensive discussion about a mitigation measure is included. This avoid unnecessary updates to multiple plans and SOPs. Table 8.3-3 will be revised as follows "Avoid crossing through streams by vehicles and /or heavy machinery; however if required crossings will be in accordance with the Riparian Area Management SOP." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; Aug. 2	Ready for Publishing
709	Appendix 9-F	Vegetation Management Plan 3.3 (Table	LDN_UFN		Jun 06, 2022	0			No	(Table 3.3-2, Construction Activities) Clarify: "Restrict debris from remaining within the high-water mark or placed into a stream without specific regulatory agency approval." Please clarify what is meant by "debris", and when it is appropriate for it to enter a stream, be left in a stream, and/or placed in a stream. Approval from which regulatory agency and in what context?	Table 8.3-2: Mitigation Measures for Riparian Areas has been revised regarding construction activities as follows: " Remove all slash and debris from felling and place it outside the RMA." After forest clearing, debris would consist of non-living, up-rooted fragments of vegetation.	No	LDN/UFN	ERM		Tonia	RT	N/A		

709	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jun 06, 2022	1	New		No	Not certain if comment was requesting the clarification be in the table but a reference here would be helpful. Which guidelines apply here?	The reference (BC MFLNRO, BC MOE and DFO 2012) will be added as the second bullet in Table 8.3-3 (Clearing activities). BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
709	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry forward until we see updated revisions of management plan.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								GM; Aug 15	Ready for Publishing
710	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jun 06, 2022	1	New		No	Qualified person and Qualified Professional are not the same. Please update.	Qualified person will be replaced with Qualified Professional in Table 8.3-3 (Revegetation). BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
710	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry forward until we see updated revisions of management plan.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								GM; Aug 15	Ready for Publishing

710	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jun 06, 2022	0			No	(Table 3.3-2, Revegetation) Add: comments from early works pertaining to 1) appropriate vegetation species and methods will be employed as instructed by the qualified professional; 2) measures may include consideration of planting of suitable tree species, live staking of willows, and planting of riparian shrub vegetation; 3) seeding can be accomplished by hand or mechanical methods, or by hydraulic application (Hydroseeding) and will be considered the most effective practice chosen by the Environmental Monitor for areas identified as being at risk for erosion or sedimentation. Hand seeding may be used in small areas that are difficult to reach with equipment, and hydroseeding may be used on steep slopes that are highly susceptible to erosion. Fertilizers will not be used in hydroseeding in riparian areas	Table 8.3-2: Mitigation Measures for Riparian Areas has been revised regarding Revegetation has been revised as follows: "Use native plants, seeds, or approved weed-free certified seed mixes, timing and scheduling appropriate for the ecosystems in accordance with the RCP. Appropriate vegetation species and methods will be employed as instructed by a qualified person. Measures may include consideration of planting of suitable tree species, live staking of willows, and planting of riparian shrub vegetation. Seeding may be accomplished by hand or mechanical methods, or by hydraulic application (hydroseeding). The Environmental Monitor will consider the most effective practice for areas identified as being at risk for erosion or sedimentation. Hand seeding may be used in small areas that are difficult to reach with equipment, and hydroseeding may be used on steep slopes that are highly susceptible to erosion. Fertilizers will not be used in hydroseeding in riparian areas."	No	LDN/UFN	ERM		Tonia	RT	N/A		
711	Appendix 9-F	Vegetation Management Plan 3.3 (Table	LDN_UFN		Jun 06, 2022	0			No	Add: from 3.2, commitment to monitor CDC status updates, monitoring of mitigation measures if implemented, conformance with herbicide application	A commitment to monitor federal and BC CDC status updates, conformance with herbicide application, implementation of mitigation measures is included in Plan Revision section.	No	LDN/UFN	ERM		Tonia	RT	N/A		
711	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jun 06, 2022	1	New		No	There is no mention in section 12 of conformance with herbicide application updates or implementation of mitigation measures.	Section 12 of the Vegetation Management Plan states: "The VMP is a living document and will be reviewed annually to assess its effectiveness and to ensure that it remains current with legislation and best management practices. The timing of plan updates will be informed by monitoring results and changes to regulations and best management practices. Federal species at risk and the BC CDC will be reviewed annually to check status updates to listed species and ecosystems at risk." Therefore, should legislated herbicide application updates be required or if mitigation/management measures are identified as not being effective, this will be reviewed and updated on an annual basis. As stated in Section 12: "Proposed revisions will be reviewed and discussed with the Blackwater Environmental Monitoring Committee and Aboriginal Groups, FLNRORD and EMLI prior to adopting and implementing the changes."	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
712	Appendix 9-F	Vegetation Management Plan 3.3 (Table	LDN_UFN		Jun 06, 2022	0			No	Clarify: Consider including this information in 3.2 and distinguish between provincial and federal ranking systems. As comment above, a commitment to monitor would be appropriate here.	See response to ID #34.	No	LDN/UFN	ERM		Tonia	RT	N/A		
712	Appendix 9-F	Vegetation Management Plan 3.3 (Table 8.3-2)	LDN_UFN		Jun 06, 2022	1	New		No	Not entirely certain what this comment is in relation to, however the same goes here as Round 1 comment for 34.	As stated in the response to comment #711 [Round 0 comment ID#34], BW Gold commits to review of both federal species at risk and the BC CDC on an annual basis. Section 8.2 of the Vegetation Management Plan the following statement also addresses the distinction between provincial and federal ranking systems: "In the event rare plants, new provincially or federally listed species or ecosystems at risk are identified, or changes to the listed status of known plants, communities, or ecosystems occur, the following mitigation measures will be implemented:"	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 20	Ready for Publishing
713	Appendix 9-F	Vegetation Management Plan 4.4 (11)	LDN_UFN		Jun 06, 2022	0			No	(Table 4.4-1) Review provincial condition #3 for adaptive management requirements and amend table as needed - be specific. These requirements further inform your monitoring strategy and data collection methodologies throughout the implementation of the VMP. No mention of vegetation tissue analysis.	The VMP must meet the requirements of section 9.8 of the Joint Information Requirement for the Mines Act/Environmental Management Act permits application. This plan is not required by the EAC. Vegetation tissue analysis is outside the scope of the VMP. Vegetation and soil metal concentrations will be monitored as required by the Mines Act and Part 10.7.17 of the Health, Safety and Reclamation Code for Mines in British Columbia (EMLI 2021) to identify trends and mitigation (see RCP in Section 4.3 (Trace Element in Soils and Vegetation of the Application).	No	LDN/UFN	ERM		Tonia	RT	N/A		
713	Appendix 9-F	Vegetation Management Plan 4.4 (11)	LDN_UFN		Jun 06, 2022	1	New		No	Please reference relevant EAC management plans in the text or in a table. This will help provide a more complete picture of veg mgmt. and monitoring activities across the site.	Environmental Assessment Certificate Conditions and Decision Statement Conditions associated with the Vegetation Management Plan (VMP) are listed and described in Section 4.2 of the VMP.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
714	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	0			No	(Table 4.4-1) Add: consideration of when restoration activities are warranted based on level of exceedance (e.g., when would wetland restoration be required if the RMA was breached?)	Restoration activities would depend on the magnitude of the impact and the degree of intervention required to restore natural processes or conditions.	No	LDN/UFN	ERM		Tonia	RT	N/A		
714	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	1	New		No	Response does not address the comment requestion the addition to trigger action table regarding restoration in the event of a breach/	A breach of an RMA is considered in Table 11-1, third line. In the event of an RMA breach, a Level 2 Alert would be triggered ("clearing and work activities do not meet the approved work practices for the management zone"). The Level 2 Alert response to this would be to "implement progressive reclamation and/or offsetting as required".	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 20	Ready for Publishing
714	Appendix 9-F	Vegetation Management Plan 4.4 (11)	LDN_UFN		Jul 27, 2022	2	Follow Up	Information requirement	No	It is unclear what defines a level 1 and level 2 alert response (specifically in line three) because the triggers are the same. For clarity, suggest providing additional information or a table with examples of what would constitute a level 1 or 2 response to a trigger	The difference between a Level 1 and Level 2 Alert for 'management area zones and mitigation followed' is that in the Level 2 trigger, clearing has occurred outside the approved work windows (Table 11-1 of the Vegetation Management Plan; the Level 1 trigger maintains clearing within the approved work windows). Clearing outside the work window (the Level 2 trigger) requires a higher level of action/response as outlined in the table.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; Aug. 2	Ready for Publishing
715	Appendix 9-F	Vegetation Management Plan 4.4 (11)	LDN_UFN		Jun 06, 2022	0			No	(Table 4.4-1, Timing) Clarify: As written, the clearing portion of the table is paradoxical. Maybe "Outside the least-risk timing window" is more accurate? It suggests that the EM is monitoring for unplanned clearing outside the appropriate timing windows. The adaptive management strategy should be overhauled to meet requirements before considering this point.	Section 9 notes that monitoring will be conducted when clearing and construction activities occur outside the appropriate timing window.	No	LDN/UFN	ERM		Tonia	RT	N/A		

715	Appendix 9-F	Vegetation Management Plan 4.4 (11)	LDN_UFN		Jun 06, 2022	1	New		No	Is the response in reference to table 9-1, vegetation clearing section? Otherwise I see no mention of this in section 9. Also, this table only mentions breeding birds and in-stream works…no mention of any other timing windows.	The correct section reference in response to the comment should have been Table 8.1-1 of the Vegetation Management Plan, where pre-clearing measures include "the timing of vegetation clearing and construction activities to occur outside of sensitive time periods (e.g., breeding birds, amphibians)"; "Coordinate in-water work within reduced risk work window (July 15 to August 31) in Region 7 - Omineca". The plan also refers to Table 3.3-1 in the Wildlife Mitigation and Monitoring Plan for wildlife sensitive time periods and guidelines for buffers.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 20	Ready for Publishing
716	Appendix 9-F	Vegetation Management Plan 4.4 (11)	LDN_UFN		Jun 06, 2022	0			No	Add: What are your QA/QC procedures? Please include mentioned data sheet in the appendix. "[…] reviewed prior to finalization" of what? Who will perform the training?	Field datasheets will be developed and incorporated into a Standard Operating Procedure that will be in place prior to the commencement of construction. Section 8.5 has been revised as follows: "Quality assurance/quality control (QA/QC) procedures will be followed during surveys and monitoring. Qualified persons will conduct the surveys and will be provided with training on appropriate monitoring techniques to standardize field methods. Field data sheets or a digital survey form will be used to standardize data collection. Observations indicated in either field data sheets or digital survey forms will be reviewed at the end of day by the surveyor. All data will be transferred to a database and will be reviewed prior to analysis and reporting. Depending on the amount of data, a random, statistically representative sample of the data may be queried or the entire database may be queried for QA/QC."	No	LDN/UFN	ERM		Tonia	RT	N/A		
716	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	1	New		No	What is this in reference to? There is no section 9.5 or 8.5.	Section 9 of the Vegetation Management Plan provides the text referred to in Round 0 response to comment ID#716.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
717	Appendix 9-F	Vegetation Management Plan 5.1 (10.2)	LDN_UFN		Jun 06, 2022	0			No	Add: Describe reporting requirements, such as information/data collected, and include the monitoring field forms to be used in an appendix of this document. "Monitoring data will be stored for the life of mine." Please be more specific. Where, how, and who is responsible?	Reporting and Record Keeping are described in Section 10.1. Section 10.2 now reads: The EM is responsible for data management, reporting and records related to vegetation management. Monitoring data will be entered into an electronic database and have quality control checks completed upon receipt of results. Data will be entered into a standard format that allows for data reporting and analyses. Data and data comparisons will be stored in a single file format for each type of survey or monitoring activity. Monitoring data will be stored for the life of the mine and will be made available for review upon request." Monitoring field forms will be developed prior to commencing construction.	No	LDN/UFN	ERM		Tonia	RT	N/A		
717	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	1	New		No	This will be carried forward until such time as the Monitoring field forms have been developed and inserted as an appendix	BW Gold acknowledges the comment.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
717	Appendix 9-F	Vegetation Management Plan 5.1 (10.2)	LDN_UFN		Jan 02, 1900	2	Follow Up	Comment	No	Acknowledging the comment is not sufficient. We want a firm commitment from BW Gold to have ongoing consultation with LDN and UFN on development and approval of monitoring field forms	BW Gold commits to engaging in ongoing consultation with LDN and UFN on the development of monitoring field forms. BW Gold has an agreement which sets out requirements for engaging on regulatory permitting matters and is committed to following the agreement.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; Aug. 7	Ready for Publishing
718	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	0			No	Clarify: "Environmental incidents and non-compliance related to the VMP will be reported to the EM. All incidents and related actions will be recorded and maintained in an incident database." What types of incidents? E.g., incidental take, provincially reportable spill, timber trespass, HADD? Recorded on an Incident Report Form?	Incidental observations, including non-compliances, will be recorded using a standard field data sheet and submitted to the EM on a daily basis. The EM will follow up on incidental observation reports within one week.	No	LDN/UFN	ERM		Tonia	RT	N/A		
718	Appendix 9-F	Vegetation Management Plan 5.1 (10.2)	LDN_UFN		Jun 06, 2022	1	New		No	Response does not address the entire comment. Please add examples of non-compliance.	Section 10.1.1 of the Vegetation Management Plan will be updated as follows: "Incidental observations, including non-compliances, will be recorded using a standard field data sheet and submitted to the EM on a daily basis. Non-compliances could include (are not limited to) infringing on boundaries or RMAs, not conducting the required pre-clearing surveys, incidental take, spill within a vegetated area." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Toni a	RT	Ready for Submission	RT; June 14	Ready for Publishing
718	Appendix 9-F	Vegetation Management Plan 5.1 (10.2)	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry forward until we see updated revisions of management plan.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								GM; Aug 15	Ready for Publishing
719	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	0			No	Clarify: Please reword the following sentence to be more clear - "Results and monitoring activities will be reported until further monitoring of and management is not required […]" How will this be determined? Refer to N/A comments below.	The sentence will be deleted in the updated vegetation management plan.	No	LDN/UFN	ERM		Tonia	RT	N/A		
719	Appendix 9-F	Vegetation Management Plan 5.1 (10.2)	LDN_UFN		Jun 06, 2022	1	New		No	What has replaced this sentence to get the information you were communicating across from the original?	Section 10.1.1 will be updated in the Vegetation Management Plan as follows: "Non-compliances could include (are not limited to) infringing on boundaries or RMAs, not conducting the required pre-clearing surveys, incidental take, spill within a vegetated area. Non-compliances along with proposed corrective actions and final resolutions will be tracked until such a time as considered closed." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Toni a	RT	Ready for Submission	RT; June 16	Ready for Publishing
719	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry forward until we see updated revisions of management plan.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								GM; Aug 15	Ready for Publishing
720	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	0			No	Clarify: Please provide specific details regarding the type of activities that will be monitored, how they will be monitored, data/observations you plan on collecting/recording, how you plan on collecting them, and how you plan to store monitoring data. A table showing monitoring frequency would be beneficial. These are basic monitoring requirements.	Table 9-1 identifies monitoring activities, method and timing. Record keeping and data storage is identified in Section 10.2.	No	LDN/UFN	ERM		Tonia	RT	N/A		

720	Appendix 9-F	Vegetation Management Plan 5.1 (10.2)	LDN_UFN		Jun 06, 2022	1	New		No	Section 10.2 is 2 sentences long. It requires more details as outlined in original comment. Please elaborate on the above mentioned items.	Section 9.0 and Table 9.1 of the Vegetation Management Plan (VMP) address all of the Comment #720 Round 0, requested clarifications regarding monitoring activities, method and timing. Table 9.1 includes information on types of activities that will be monitored, data/observations planned on being collected/recorded, and frequency. Section 9.0 of the VMP includes information on how monitoring will be completed, how data is collected, and how monitoring data will be stored. Standard operating procedures have been developed for field procedures for the collection of vegetation and soils for the purpose of metals analysis and provided in Appendix A of the VMP.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 20	Ready for Publishing
721	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	0			No	Clarify: the project inherently causes changes to ecosystem function and loss of biodiversity. How will this be measured in a meaningful way?	Section 11 identifies monitoring objectives and methods, and adaptive management triggers.	No	LDN/UFN	ERM		Tonia	RT	N/A		
721	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	1	New		No	Response does not address comment. While table is good, it makes no mention of measurables. It's fine to say you will monitor, review and update plans etc... but how will you monitor, what parameters will be measured in order to ascertain weather of not actions, review or updates are required. More detail is required here.	Monitoring measurables (volume/presence etc...) are provided in Table 9-1 of the Vegetation Management Plan. If the request for clarification is in reference to post-closure reclamation planting, please refer to the Reclamation Closure Plan (Section 10) for details on post-closure monitoring and maintenance.	/TD to revie	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
721	Appendix 9-F	Vegetation Management Plan 6.1 (10)	LDN_UFN		Jul 27, 2022	2	Follow Up	Information requirement	No	Response does not address original comment. We are looking for measurable parameters in change in ecosystem function and loss of biodiversity. Comment also was not transferred over properly, this comment should include the following "is there baseline data". Please respond to that as well.	The Vegetation Management Plan details monitoring of parameters related to the objectives of the plan "to minimize impacts on native vegetation, sensitive areas (riparian, old growth forests), and plant species and ecosystems at risk and ensure the successful revegetation of disturbed areas to reduce soil erosion and the establishment of invasive plants." The reviewer is directed to the End Land Use Plan (ELUP) where the objective is to 'Assess the potential for end land use objective success based on the pre- and post-mine land and aquatic environment conditions'. An end land use objective for Blackwater Project is 'Self-sustaining vegetation that will progress to plant communities similar to pre disturbance ecosystems as supported by the results of the ecohydrological modelling'. Section 5.1.1.1 of the ELUP details the baseline or pre-mine land capability (i.e., ecosystem function and biodiversity). Section 5.1.5 of the ELUP provides a summary of the reclamation monitoring to assess the success of reclamation in reclaimed areas and compare the trajectory of reclaimed sites relative to baseline and reference conditions (methods will be further detailed in the Reclamation and Closure Plan).	/TD to revie	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; Aug. 11	Ready for Publishing
722	Appendix 9-F	Vegetation Management Plan (Table 8.1-1)	LDN_UFN		Jun 06, 2022	0			No	Clarify: How will your EM determine, in a measurable way, whether the site has been successfully revegetated in areas susceptible to erosion? Please include a section that discusses/summarizes ESC and revegetation efforts, provide references to the appropriate MPs.	SEPSCP includes monitoring for early signs of erosion and sediment transport processes (e.g., physical alteration of the surface) and feature (e.g., turbid water). Post-clearing mitigations related to revegetation and erosion in Table 8.1-1: "- Minimize soil degradation and erosion by leaving stumps and understory vegetation intact where possible and adhering to the SMP, SEPSCP and RCP. Cutting prescriptions for each site will consider Soil Conservation Planning and Practices in the Quesnel and Vanderhoof Forest Districts (FPB 2010).	No	LDN/UFN	ERM		Tonia	RT	N/A		
722	Appendix 9-F	Vegetation Management Plan (Table 8.1-1)	LDN_UFN		Jun 06, 2022	1	New		No	Similarly to comment 47,[Comment ID 720] I think the original comment is looking for monitoring and data collection post re-vegetation to show that a certain amount of bare ground has been successfully re-vegetated. It is not enough to plant or seed vegetation, you have to make sure it takes and fill plant/seed where it is less or unsuccessful.	Please refer to the Reclamation Closure Plan (Chapter 4) for details on revegetation requirements and monitoring commitments.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
722	Appendix 9-F	Vegetation Management Plan (Table 8.1-1)	LDN_UFN		Jul 27, 2022	2	Follow Up	Information requirement	No	Please add a reference (be specific) within the VMP to clarify and address the original comment regarding monitoring and measuring successful revegetation	The Vegetation Management Plan (VMP) details monitoring of parameters related to the objectives of the plan "to minimize impacts on native vegetation, sensitive areas (riparian, old growth forests), and plant species and ecosystems at risk and ensure the successful revegetation of disturbed areas to reduce soil erosion and the establishment of invasive plants." Table 9-1 of the VMP does indicate monitoring of 'Post-clearing revegetation' to document the total area revegetated, periodic inspectections of the revegetated areas to assess performance objectives, and evaluation of the success of the revegetation prescriptions in meeting the objectives and, if required, identification of additional mitigation activities. The reviewer is also directed to the End Land Use Plan (ELUP) where the objective is to 'Assess the potential for end land use objective success based on the pre- and post-mine land and aquatic environment conditions'. An end land use objective for the Blackwater Project is 'Self-sustaining vegetation that will progress to plant communities similar to pre disturbance ecosystems as supported by the results of the ecohydrological modelling'. Section 5.1.1.1 of the ELUP details the baseline or pre-mine land capability (i.e., ecosystem function and biodiversity). Section 5.1.5 of the ELUP provides a summary of the reclamation monitoring to assess the success of reclamation in reclaimed areas and compare the trajectory of reclaimed sites relative to baseline and reference conditions (methods will be further detailed in the Reclamation and Closure Plan). The ELUP outlines an adaptive management framework (Section 5.1.6) to address if revegetation success is not on the tractectory relative to baseline and reference conditions.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; Aug. 7	Ready for Publishing
723	Appendix 9-F	Vegetation Management Plan (Table 8.1-	LDN_UFN		Jun 06, 2022	0			No	Little mention of riparian area mitigating measures relating to riparian clearing, crossing structures, and associated erosion potential. Will these be included in a different plan?	Table 8.3-2 has been revised to include mitigations related to riparian and wetland areas.	No	LDN/UFN	ERM		Tonia	RT	N/A		
723	Appendix 9-F	Vegetation Management Plan (Table 8.1-1)	LDN_UFN		Jun 06, 2022	1	New		Yes	Please include more details on mitigation during bridge or culvert construction or any other time there may be encroachment on riparian areas	A bullet will be added to Table 8.1-1 (Clearing) to address encroachment on riparian areas: "Where encroachment into riparian areas cannot be avoided (bridge/culvert construction and maintenance), follow permit conditions and/or management plan requirements regarding the removal of riparian vegetation, limit equipment impact to vegetation through the use of swamp mats if possible, restore areas as soon as is practical and revegetate disturbed areas with native plants following disturbance." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
723	Appendix 9-F	Vegetation Management Plan (Table 8.1-	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry forward until we see updated revisions of management plan.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								GM; Aug 15	Ready for Publishing

724	Appendix 9-F	Vegetation Management Plan (Table 8.1-1)	LDN_UFN		Jun 06, 2022	0			No	How have effects to wildlife been captured? How will vegetation be managed to ensure wildlife is not attracted to the site and associated roadways, how will metal uptake be managed such that it minimizes risk to wildlife? See iRT Section 9.8.	The following as been included in Table 8.1-1: General Mitigation Measure: "Species that prevent erosion and are not wildlife attractants will be used to re-vegetate roadways to prevent the establishment of invasive plants in accordance with the IPMP. Wildlife attracting species include legumes (family Fabaceae), brome (Bromus sp.), alfalfa (Medicago sativa), annual rye (Lolium multiflorum), barley (Hordeum vulgare), timothy (Phleum pretense), alpine bluegrass (Poa Alpina), and American sloughgrass (Beckmannia syzigachne) (Matheus & Omtzigt 2013)." Vegetation tissue analysis is outside the scope of the VMP. Vegetation and soil metal concentrations will be monitored as required by the Mines Act and Part 10.7.17 of the Health, Safety and Reclamation Code for Mines in British Columbia (EMLI 2021) to identify trends and mitigation (see RCP in Section 4.3 (Trace Element in Soils and Vegetation of the Application). Condition 41 of the EAC requires the Holder to develop a CFMP, which includes sampling methods and locations for sampling contaminants of potential concern in vegetation and other media (Section 4.4 of the CFMP). The CFMP must be developed in consultation with the Indigenous groups, Ministry of Energy, Mines and Low Carbon Innovation, Ministry of Environment and Climate Change Strategy, and Northern Health and submitted to these parties and the Environmental Assessment Office a minimum of 60 days prior to the planned commencement of construction.	No	LDN/UFN	ERM		Tonia	RT	N/A		
724	Appendix 9-F	Vegetation Management Plan (Table 8.1-1)	LDN_UFN		Jun 06, 2022	1	New		No	According to the iRT and Guidance document, metal uptake is within the scope of the VMP so far as it should provide an SOP for addressing metal uptake. Section 9.8 reads, "Include SOPs for addressing, if applicable, riparian areas, old growth and mature forests, rare and at-risk species and ecosystems, metal uptake, large/coarse woody debris, and invasive plant species. If prudent, develop a separate invasive plant management plan to highlight the key considerations for early identification and effective management of invasive plants to facilitate successful site reclamation."	As stated in Section 9 of the Vegetation Management Plan (VMP): "Vegetation and soil metal concentrations will be monitored as required by the Mines Act and Part 10.7.17 of the Health, Safety and Reclamation Code for Mines in British Columbia (EMLI 2021) to identify trends and mitigation. Metal uptake monitoring is addressed in the Country Food Monitoring Program, which includes sampling methods and locations for sampling contaminants of potential concern in vegetation and other media (Section 4.4 of the CFMP)." However, to address the requirements of the Joint Application Information Requirements, standard operating procedures have been developed for field procedures for the collection of vegetation and soils for the purpose of metals analysis and provided in Appendix A of the VMP.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
724	Appendix 9-F	Vegetation Management Plan (Table 8.1-1)	LDN_UFN		Jul 27, 2022	2	Follow Up	Comment	No	Add reference to appropriate MP (and section) in the VMP to answer "how will metal uptake be managed such that is minimizes risk to wildlife" as per original comment	A reference will be added in the next version of the Vegetation Management Plan to refer to Section 6.2.5 of the Wildlife Management and Mitigation Plan (WMMP), which includes information about data collected under the Country Foods Monitoring Program (CFMP) that can be used to evaluate caribou (and ultimately other wildlife) health. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; Aug. 7	Ready for Publishing
725	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	1	New		No	Unable to resolve this screening requirement until SOPs are provided for review.	Draft SOPs were provided in Appendix A of the Vegetation Management Plan (Appendix 9-F) of the Application submitted in April 2022.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
726	Appendix 9-F	Vegetation Management Plan	LDN_UFN		Jun 06, 2022	1	New		No	SOP's have been received as part of CEMP submission (05/25/2022) review is in progress.	BW Gold acknowledges the comment and no response is required.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 14	Ready for Publishing
728	Appendix 9-F	Vegetation Management Plan Whole Document	LDN_UFN		Jun 06, 2022	1	New		No	While current provincial documents may still use the term "Aboriginal Groups" it is an outdated term that should no longer be used. Consider revising all documents for this and using either First Nations or Indigenous in its place.	BW Gold has been using the term Aboriginal Groups when referring to the 6 Nations prescribed in the EAC, and the term Indigenous Groups when referring to the 10 Nations prescribed in the Decision Statement (i.e.., these are defined terms in the documents). This is an important distinction, as not all management plan requirements apply to all Nations. That said, BW Gold will revise the use of the term Aboriginal Groups to Indigenous nations for all management plans. However, the use of Aboriginal Groups may still be used as a stated in the Environmental Assessment Conditions when making specific reference to EAC requirements.	/TD to revie	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing

BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								GM; Aug 15	Ready for Publishing
738	Appendix 9-F	Vegetation Management Plan Table 8.1-1	LDN_UFN		Jun 06, 2022	1	New		No	General, point 3: sentence is confusing, please revise and explain what is meant by reducing dimensions of clearing, regardless of size...makes no sense.	The following text will be revised in Table 8.1-1 of the Vegetation Management Plan (General) bullet 4 to put the emphasis on reducing the clearing size (with no conditions): "Minimize all clearing dimensions." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 16	Ready for Publishing
738	Appendix 9-F	Vegetation Management Plan Table 8.1-1	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry forward until we see updated revisions of management plan.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								GM; Aug 15	Ready for Publishing
739	Appendix 9-F	Vegetation Management Plan Table 8.1-1	LDN_UFN		Jun 06, 2022	1	New		No	Pre-clearing, point 4: "Conduct windthrow...all new openings..." suggest changing wording to, "within blocks greater than..." Otherwise it doesn't make sense as at this stage there is no opening, it's only proposed as a layed out block. The purpose of these assessments, among other things, is to indicate whether or not the shape, size and orientation etc... of the proposed opening might be susceptible to windthrow, therefore you should add something to that effect. "Should assessments suggest a high or very high potential for windthrow, block layout will be revised"	Table 8.1-1 (Windthrow) of the Vegetation Management Plan will be revised as follows: "Conduct windthrow hazard assessments within blocks greater than 1 ha. Should assessments suggest a high or very high potential for windthrow, block layout will be revised. Monitor annually for windthrow hazard." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Tonia	RT	Ready for Submission	RT; June 16	Ready for Publishing
739	Appendix 9-F	Vegetation Management Plan Table 8.1-1	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry forward until we see updated revisions of management plan.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								TD; Aug 16	Ready for Publishing

740	Appendix 9-F	Vegetation Management Plan Table 8.1-1	LDN_UFN		Jun 06, 2022	1	New		No	Assuming that since Artemis has received its permit to cut, that terrain stability assessments have already been carried out and therefore are not required in this table. Please confirm.	Terrain stability assessments to determine if it was safe to log or not were not required by the province in the License to Cut permit application.	T/TD to revie	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 19	Ready for Publishing
741	Appendix 9-F	Vegetation Management Plan Table 8.1-1	LDN_UFN		Jun 06, 2022	1	New		No	Pre-clearing, point 4: "Conduct windthrow...all new openings..." suggest changing wording to, "within blocks greater than..." Otherwise it doesn't make sense as at this stage there is no opening, it's only proposed as a layed out block.	Table 8.1-1 (Pre-Clearing) bullet 4, of the Vegetation Management Plan will be revised as follows: "Conduct windthrow hazard assessments within blocks greater than 1 ha." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Toni a	RT	Ready for Submission	RT; June 16	Ready for Publishing

752	Appendix 9-F	SOPs	LDN_UFN		Jun 06, 2022	1	New		No	Not reviewed as part of this document as newer versions were sent to KES in May. Please revise and attach new SOPs to VMP document	Draft SOPs were provided in Appendix A of the Vegetation Management Plan (Appendix 9-F) of the Application submitted in April 2022.	/TD to revie	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 16	Ready for Publishing
753	Chapter 4: Section 4.1	Wildlife Habitat	LDN_UFN		Jun 06, 2022	0			No	Objective 1. given that this area is caribou habitat and Artemis is required to replace this habitat, does opening this area up to the public make sense? It was raised as a concern throughout the EA that increased pressure on the land within the traditional territories of LDN and UFN by visitors was undesirable and conditions were drafted to limit that (e.g., not allowing workers to use the area for recreation).	Section 4.1 has been revised as follows: A mix of sustainable conditions supporting wildlife habitat (Table 4.1-1), traditional and current use by Indigenous peoples. The end land use objectives do not require new access from trails or roads, consequently, use of the closed mine site will not include adding or maintaining trails for recreation purposes.	/TD to revie	LDN/UFN	ERM		Rolf/Greg/H annah	RT	22-Jun-22		
753	Chapter 4: Section 4.1	Wildlife Habitat	LDN_UFN		Jun 06, 2022	1	New		No	"""A mix of sustainable conditions supporting wildlife habitat (Table 4.1-1), traditional and current use by Indigenous peoples."" Worded a bit confusing. Should read as: ""A mix of sustainable conditions supporting wildlife habitat (Table 4.1-1) and traditional and current use by Indigenous peoples.""""	BW Gold will make the suggested revision in a subsequent version of the plan. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Rolf/Greg/H annah	RT	Ready for Submission	RT; jun 17	Ready for Publishing
754	Chapter 4: Section 4.1	Objectives	LDN_UFN		Jun 06, 2022	0			No	What is the definition of "similar"?	Having resemblance or likeness. It is difficult to provide a concise definition at this point in the document, but there is a lot of discussion throughout Section 4.1 as to what "similar" means in the context of the RCP.	No	LDN/UFN	ERM		Rolf/Greg/H annah	RT	N/A		

754	Chapter 4: Section 4.1	Objectives	LDN_UFN		Jun 06, 2022	1	New		No	Perhaps a different word should be used to avoid any misinterpretation on desired outcomes, or at least a reference within this statement to the types of ecosystems that are being sought.	We're open to alternative wording if you have specific recommendations, but believe this is an appropriate word to indicate that pre-mining ecosystems are the end-land-use target, while recognizing that the post-mining landscape will not be identical. As noted in the previous response, there is more detailed discussion throughout Section 4.1 as to what "similar" means in the context of the RCP. We could add a footnote directing the reader to Section 4.1.2.3, which defines targets in more detail.	T/TD to revie	LDN/UFN	IEG			TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
755	Chapter 4: Table 4.1-1	Soil	LDN_UFN		Jun 06, 2022	0			No	Is it realistic to plan for the establishment of different ecosystems across an elevational gradient on waste stockpiles? How big will these be (elevation, slope)?	The variation in ecosystems is in alignment with ecohydrological modeling results. Glaciofluvial surface soil will be applied to the uppermost portions of the waste stockpiles, which supports the xeric-subxeric site series. The mixed-mineral (predominantly morainal) surface soil will be applied to slopes and is projected to form a submesic-mesic site series that is expected to revegetate faster, reducing erosion risk (and also create ecosystem heterogeneity). These subzone variant/site series projections account for slope, aspect, slope position and location (including elevation).	No	LDN/UFN	IEG			TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
755	Chapter 4: Table 4.1-1	Soil	LDN_UFN		Jun 06, 2022	1	New		No	This doesn't exactly address the question being asked. While the relationship to SMRs is understood (although on a very small scale), how will this stockpile (stockpiles) account for elevational changes across the mine site? How tall are these stockpiles? What are the elevations of the different treatments? This information should be available from engineered drawings. Overall, this is still a simplistic attempt at understanding ecosystems across the reclaimed mine site - not all high elevation areas will be xeric, surely, and not all mid-elevation areas will be mesic.	Elevation ranges (from Appendix 3-C): - Upper Waste Stockpile 1410-1470 m (60 m) - Lower Waste Stockpile 1490-1620 m (130 m) Glaciofluvial soil is only prescribed for the top, flat surfaces (see Figure 8.1-1 of the Soil Management Plan). The modelled xeric ecosystems on dump tops and wetter ecosystems on dump slopes are not based on elevation, nor on a simplistic assumption that all high-elevation areas will be xeric and all mid-elevation areas mesic. Modelled post-closure ecosystems are based on placed materials and slope/aspect, with glaciofluvial materials supporting establishment of xeric-subxeric ecosystems and mixed-mineral soil materials supporting establishment of wetter (submesic and mesic) ecosystems. See Fig. 4.2-1 for correspondence of ecosystems with cover materials.	T/TD to revie	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
756	Chapter 4: Table 4.1-1 / Section 4.2.6.2 Permanent Sample Plots	Whitebark Pine	LDN_UFN		Jun 06, 2022	0			No	Why is no ESSFmvp planned for? This is the ecosystem in which whitebark pine grows.	Most of the ESSFmvp that is lost during mine development overlaps the open pit mine, which will not be reclaimed, and other structures that will be required during closure. This is the reason that of the 27.6 ha present prior to construction in the ESSFmvp, 0.1 ha will be reclaimed during closure. The rest of the reclaimed areas occurs at elevations below the ESSFmvp boundary.	No	LDN/UFN	IEG			TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
756	Chapter 4: Table 4.1-1 / Section 4.2.6.2 Permanent Sample Plots	Whitebark Pine	LDN_UFN		Jun 06, 2022	1	New		No	In understanding the ESSFmvp zone is not being reclaimed, there are plans to establish permanent sample plots for whitebark pine in areas it has not grown in pre-mining. Please include within this statement, "Monitoring will continue post-closure until monitoring criteria have been achieved and agreed-upon reclamation objectives met" who will be consulted and agreeing on the reclamation objectives for these plots (i.e.., inclusion of Indigenous communities in the final say).	The statement "Monitoring will continue post-closure until monitoring criteria have been achieved and agreed-upon reclamation objectives met." is included in Section 4.2.6.2 (Permanent Sample Plots). Regarding input of Indigenous Groups on reclamation objectives, Section 4.2.6 (Reclamation Monitoring) states: "Details of the monitoring plan, including criteria and indicators of reclamation success and associated measures and thresholds will be developed as more detailed reclamation planning and implementation is conducted, and based on ongoing collaboration with Aboriginal Groups."	No	LDN/UFN	IEG			TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
757	Chapter 4: Table Figure 4.1-1	Reclamation	LDN_UFN		Jun 06, 2022	0			No	Is there any outstanding exploration reclamation that needs to be added to this (e.g., north of Dam D)?	Please refer to comment response to comment #2.	No	LDN/UFN	BWG			TD	N/A	TD, Aug 16	Ready for Publishing
757	Chapter 4: Table Figure 4.1-1	Reclamation	LDN_UFN		Jun 06, 2022	1	New		No	Question not adequately answered.	Exploration reclamation liability is fully bonded for by way of previous permitting, and is subject to the reclamation prescriptions agreed upon during that permitting. LDN and UFN were consulted on previous exploration permitting and reclamation plans at Blackwater.	No	LDN/UFN	BWG		Ryan	TD	Ready for Submission	RT; June 13	Ready for Publishing
758	Chapter 4: Table 4.1-2	Wetlands Caribou	LDN_UFN		Jun 06, 2022	0			No	Why are wetter ecosystems in both dominant BEC zones not reflected in the table for reclamation priorities? These ecosystems are important for caribou (as well as many other species) and must be part of the reclamation landscape. The mine site runs a water surplus, it would be good to direct some of this to establishing wetter ecosystems within or nearby the project footprint. LDN/UFN would like to understand why there are no opportunities to increase depressional features, etc.. within the post-closure landscape.	Wetland area is anticipated to be reduced on the post-closure landscape due to the changes in topography and substrate. Post-closure hydrologic conditions will not be conducive to replacement or maintenance of wet, organic-rich soils (and associated shallow groundwater inputs), which are required for wetland formation. Wetland reclamation will be conducted as mine and reclamation plans evolve—and opportunistically—where possible, and an offset plan is in place to compensate for losses.	No	LDN/UFN	IEG			TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
758	Chapter 4: Table 4.1-2	Wetlands Caribou	LDN_UFN		Jun 06, 2022	1	New		No	This does not answer why opportunities are not being sought for more depressional features. Reclamation should be re-evaluated and revised based on the ongoing feedback and changes to the Wetland Management Plan.	As noted in Section 4.2.7.3 (Wetlands Management and Offsetting Plan), BW Gold is applying the environmental mitigation hierarchy of avoidance, minimization, restoration, and offsetting to wetland management. Following avoidance and minimization, restoration will be the focus. Specific areas are not currently delineated, as the hydrologic conditions necessary for wetland formation are specific and will need to be identified as the project proceeds. BW Gold agrees that reclamation of wetlands will be re-evaluated and revised based on the ongoing feedback on and changes to the Wetland Management and Offsetting Plan.	No	LDN/UFN	IEG			TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
759	Chapter 4: Page 4-8	TSS	LDN_UFN		Jun 06, 2022	0			No	Why are there elevated TSS in fall? Is this a year-over-year trend?	There are elevated TSS in fall due to lower flows during that time of year, but with isolated higher intensity rain events causing runoff. Yes, this is a year-over-year trend.	No	LDN/UFN	BWG		Georges	TD	Ready for Submission	GM; june 14	Ready for Publishing
759	Chapter 4: Page 4-9	TSS	LDN_UFN		Jun 06, 2022	1	New		No	Please explain this reasoning within the plan, or a reference to where an explanation can be found.	BW Gold is not updating Chapter 4 as part of review of the joint application, however the reviewer's comment will be considered in future iterations of the reclamation and closure plan.	No	LDN/UFN	BWG		Ryan	TD	Ready for Submission	RT; June 13	Ready for Publishing
760	Chapter 4: Section 4.1.3.1	Soil Eco Model	LDN_UFN		Jun 06, 2022	0			No	Typical soils of the SBSmc3 are luvisols why does this differ within the project footprint?	Reclamation site series—IEG has put a lot of effort into understanding the edaphic conditions that will support vegetation communities (i.e., analysis of 1,000s of BEC-database plots from across the province and a resultant model that produces a fit between SMR and site series that is as good as the guidebook keys https://open.library.ubc.ca/soa/clRcle/collections/59367/items/1.0402425?o=0.). A version of this model is available at qea.iegsoil.com. The SBSmc3-02 site series occurs in the driest conditions in the variant. On natural sites these conditions may be observed on shallow soils (typically luviols) over bedrock on mid to upper slopes, but we believe that it can occur in other xeric conditions on a primary-successional landscape.	No	LDN/UFN	IEG			TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
760	Chapter 4: Section 4.1.3.1	Soil Eco Model	LDN_UFN		Jun 06, 2022	1	New		No	Confirm these ecosystems with these SMRs are proposed to be established through reclamation trials	Yes, these site series will be included in the research plan (see Table 4.2-9). As stated in Section 4.2.5.1 (Vegetation and Cover Trials): "Vegetation trials are proposed for four areas that encompass a range of conditions projected to be present on the post-closure landscape (Figure 4.2-6), including both BEC subzone variants (ESSFmv1 and SBSmc3). All site series projected to be present on the post-closure ecosystem are included in vegetation trials except SBSmc3-01, 04, 05 and 06, however they will only be present on surface soil stockpile footprints, which will likely require less intensive intervention to reclaim."	No	LDN/UFN	IEG			TD	Ready for Submission	TD, 14-Jun	Ready for Publishing
761	Chapter 4: Section 4.1.3.1	Wetlands	LDN_UFN		Jun 06, 2022	0			No	Are wetland compensation areas at equal elevation to those lost through the project?	The Wetland Management and Offsetting Plan addresses compensation for wetlands lost in the Project footprint. This compensation plan focuses on the Matthews Creek offset site, which is at relatively low elevation, similar to the majority of wetland ecosystems mapped on the mine site.	No	LDN/UFN	ERM		Greg	RT	N/A		
761	Chapter 4: Section 4.1.3.1	Wetlands	LDN_UFN		Jun 06, 2022	1	New		No	Can plans that describe offsetting in more detail (i.e.., wetlands, caribou, fish, etc...) be referenced throughout to make it clear that more research and planning has gone in than what is provided in this plan?	BW Gold will make the suggested revision to include more references to the plans that include research and planning. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Shannon	RT	Ready for Submission	RT; June 17	Ready for Publishing
762	Chapter 4: Section 4.1.3.1	Revegetation Whitebark Pine	LDN_UFN		Jun 06, 2022	0			No	During early works we discussed how planting will be determined (species, density) and we were referred to stocking standards for the BEC zones. SBSmc3 stocking standards are not in the 2019 update, what will be planted here? Whitebark pine is not a recommended species for stocking standards in the other SBSmc variants	Whitebark pine has been removed from the planting list (Table 4.2-6, Table 4.2-7) and lodgepole pine and hybrid spruce planting density will be increased. It is proposed that research trials in the SBSmc3 incorporate whitebark pine to assess viability for planting on xeric and subxeric sites.	No	LDN/UFN	ERM		Greg	RT	N/A		

762	Chapter 4: Section 4.1.3.1	Revegetation Whitebark Pine	LDN_UFN		Jun 06, 2022	1	New		No	What contingency plan is in place if these research trials fail to produce viable planting of whitebark pine? Will offsetting in an area outside of BW Gold permit occur?	An offset outside of the BW Gold permit area was discussed with ECCC in January, and it was indicated that on-site mitigation, per the federal condition, was the preferred approach. Should the first round of research trials fail to produce viable plantings of whitebark pine, BW Gold will follow the adaptive management approach and update the methods of seed collection, propagation and testing to produce viable plantings. BW Gold has begun monitoring the cone crop in 2022 to provide sufficient time to gather further seeds if the first batch of seeds fails. At this time, an off-site offsetting is not planned.	/TD to revie	LDN/UFN	ERM		Shannon	RT	Ready for Submission	RT; June 17	Ready for Publishing
762	Chapter 4: Section 4.1.3.1	Revegetation Whitebark Pine	LDN_UFN		Jul 27, 2022	2	New	Information Requirement	No	Just to expand on the above and below questions, as the best area for planting whitebark (Pit area) is not being restored do you have a contingency if whitebark fails to grow at lower elevations that are being explored through trials? Having this contingency explicitly mentioned should be part of you adaptive management strategy as there is a lot of uncertainty regarding whitebark growing at the lower elevations and the novel post-closure conditions, and there are also climate change effects that may come more into play 25 + years from now. Please write this continency plan for whitebark restoration, would like to see a memo.	A memo is not provided for this response because the requested details for whitebark pine restoration contingency are provided in the Whitebark Pine Management Plan (WPMP; May 2022) that was developed in accordance with the federal Decision Statement 8.20. Table 11-1 of the WPMP provides actions/contingencies in response to observations made (e.g., health of seedlings) during the whitebark pine restoration trials outlined in Section 4.2.5.2 of the Reclamation Closure Plan (and detailed in Section 9 of the WPMP) . Climate change is also specifically considered in Section 9.3.3 of the WPMP with the proposed reclamation planting trials that aim to assess conditions that will reduce the effects of climate change on whitebark pine recovery. LDN and UFN were previously provided with a draft version of the plan for comment and BW Gold is in the process of updating the plan to reflect feedback received.	/TD to revie	LDN/UFN	ERM		Lis/Shannon	RT		rt; Aug. 15	Ready for Publishing
763	Chapter 4: Section 4.1.3.3	Whitebark Pine	LDN_UFN		Jun 06, 2022	0			No	So all whitebark pine ecosystems are lost but losses are offset by planting whitebark pine in potentially unsuitable locations?	Whitebark pine will be used to reclaim exploration roads in the ESSFmvp and will be planted in the ESSFmv1 on reclaimed mine footprints (Please see Table 4.2-7). Additional reclamation trials will be conducted to assess the potential use of Pa on xeric and subxeric edaphic conditions on the reclaimed areas in the ESSFmv1.	No	LDN/UFN	ERM		Greg	RT	N/A		
763	Chapter 4: Section 4.1.3.3	Whitebark Pine	LDN_UFN		Jun 06, 2022	1	New		No	Same question as above: What contingency plan is in place if these research trials fail to produce viable planting of whitebark pine? Will offsetting in an area outside of BW Gold permit occur?	Please see the response to comment 762.	No	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT; June 17	Ready for Publishing
764	Chapter 4: Section 4.1.3.3	Objectives	LDN_UFN		Jun 06, 2022	0			No	"There is potential for decreased hunting and trapping success as a result of localized changes to wildlife availability" diverting the blame elsewhere is not a fair assessment of impacts related to the project. We aren't expecting Artemis to replenish wildlife pollutions, but recognizing that changes to ecosystems and the resultant effect on wildlife should not be overshadowed by this statement.	The RCP acknowledges that the habitat capability on the mine footprint will likely be different following closure. Section 4.1.3.3 includes the statement that: "Current land use for traditional purposes (e.g., hunting and gathering) is predicted to change in the Post-closure phase when compared to the baseline due to changes in post-mine ecosystems (Table 4.1-5) and land capability."	No	LDN/UFN	ERM		Rolf/Greg/Hannah	RT	N/A		
764	Chapter 4: Section 4.1.3.3	Objectives	LDN_UFN		Jun 06, 2022	1	New		No	LDN and UFN do not accept this overarching statement that does not appear to be backed by science (ERM, 2017) reference is insufficient	In a future iteration, the RCP will be updated to improve the discussion on habitat capability for wildlife, following comments from UFN and LDN. Differences in land capability will be discussed in the document and will be highlighted in the next version of the document. The RCP is not being updated at this time. However, to list changes in capability for each wildlife and fish species would require habitat suitability modeling for the mine site in post-closure, which is beyond the scope of the RCP.	No	LDN/UFN	ERM		Rolf/Greg/Hannah	RT	Ready for Submission	RT; June 17	Ready for Publishing
764	Chapter 4: Section 4.1.3.3	Objectives	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry Forward. Unresolved until we can review a updated RCP with the revisions made. Further we want a commitment from BW Gold to have ongoing consultation on this topic.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans. BW Gold will continue to consult with LDN and UFN in accordance with the terms and conditions of our participation agreement and as required by relevant regulatory processes. 767	Chapter 4 Page 4-10	Wetlands	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry Forward. Unresolved until we can see an updated RCP plan with the revisions.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								TD; Aug 16	Ready for Publishing
768	Chapter 4 Page 4-10	Caribou	LDN_UFN		Jun 06, 2022	0			No	The increase in the drier ESSFmv1-02 and -03 site series on the post-closure landscape relative to predisturbance conditions (1,053 ha versus 454 ha) represents an overall increase in potential caribou habitat that compensates for the decreases of 253 ha (51 ha versus 287 ha) and 28 ha (0 ha versus 28 ha) in the SBSmc3 and ESSFmvp, respectively: While the habitat type you mention is caribou habitat, the wetland and other habitat types that are being replaced are also important seasonal caribou habitats so you cannot say there will be an increase in caribou habitat, All of these planted habitats also have a risk of failure and of being lower quality than natural habitats so please refrain from indicating the habitat will be better for any species as this is not likely.	The EAC Application evaluated the loss of caribou habitat in the mine footprint. The text in the RCP will be updated to make it clear that the objective is to make the best possible caribou habitat given the constraints of the post-closure landscape.	T/TD to revie	LDN/UFN	ERM		Rolf/Greg/Hannah	RT	Ready for Submission	RT: June 24	Ready for Publishing
768	Chapter 4 Page 4-10	Caribou	LDN_UFN		Jun 06, 2022	1	New		No	"The increase in the drier ESSFmv1-02 and -03 site series on the post-closure landscape relative to predisturbance conditions (1,053 ha versus 454 ha) represents an overall increase in potential caribou habitat that compensates for the decreases of 253 ha (51 ha versus 287 ha) and 28 ha (0 ha versus 28 ha) in the SBSmc3 and ESSFmvp, respectively:" Although the addition that quality carbious habitat is good, the wording still suggests that the loss of SBSmc3 and ESSFmvp is ok because ESSFmv1 - 02 and -03 will increase. As previously mentioned, wetland zones and other habitats are essential for reasons that ESSFmv1 - 02 and -03 cannot provide. Therefore, stating that the increase will "compensate" for the decrease is not a valid statement. Please rephase this to make clear that overall caribou habitat will not be "increasing" because of this.	BW Gold will make the suggested revision. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	Yes	LDN/UFN	ERM		Rolf/Greg/Hannah	RT	Ready for Submission	RT: June 24	Ready for Publishing
768	Chapter 4 Page 4-10	Caribou	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry Forward. Unresolved until we can see an updated RCP plan with the revisions.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								TD; Aug 16	Ready for Publishing
769	Chapter 4 Page 4-11; Table 4.1-4	ESSFmvp Whitebark Pine	LDN_UFN		Jun 06, 2022	0			No	The ESSFmvp units are important and rare ecosystems with regionally important species such as whitebark pine. It was our understanding that these would be restored but here you say you are changing the sites nutrient status and suggesting these won't / can't be restored? How is the loss of whitebark pine being mitigated?	Most of the ESSFmvp that is lost during mine development overlaps the open pit mine, which will not be reclaimed, and other structures that will be required during closure. This is the reason that of the 27.6 ha present prior to construction in the ESSFmvp, 0.1 ha will be reclaimed during closure. The rest of the reclaimed areas occurs at elevations below the ESSFmvp boundary. Whitebark pine will be used to reclaim exploration roads in the ESSFmvp and will be planted in the ESSFmv1 on reclaimed mine footprints (Please see Table 4.2-7).	Yes	LDN/UFN	ERM		Rolf	AT	N/A		
769	Chapter 4 Page 4-11; Table 4.1-4	ESSFmvp Whitebark Pine	LDN_UFN		Jun 06, 2022	1	New		No	Will areas that are required during closure be appropriately restored once all reclamation activities are complete? Please incorporate response into Plan.	BW Gold will incorporate any areas that are required during closure into the updated plan.	Yes	LDN/UFN	ERM		Tonia	AT	Ready for Submission	AT, June 25	Ready for Publishing
770	Chapter 4 Table 4.1-4	Whitebark Pine	LDN_UFN		Jun 06, 2022	0			No	Please explain table 4.1-4 better as it suggests that no whitebark pine will exist post closure but reading 4.1.4 Habitat for Focal Reclamation Species - you are saying whitebark will be planted alongside other species. These sections are confusing and will bring criticism unless you quantify what will be restored.	Table 4.1-5 (previously Table 4.1-4) includes the site unit names which are not inclusive of all species that may occur on these sites. Section 4.2 describes the species that will be used during reclamation. Text was added to section 4.1.3 to provide clarification: Table 4.1-5 shows the changes in abundance between the pre-mine and post-closure ecosystems. The names in Table 4.1-5 do not reflect the full suite of plant species that will be used to reclaim these ecosystems, for example the ESSFmv1 02 (Lodgepole pine - Huckleberry – Cladonia) will include planting of whitebark pine. Whitebark pine will be used to reclaim exploration roads in the ESSFmvp and will be planted in the ESSFmv1 on reclaimed mine footprints (Please see Table 4.2-7).	No	LDN/UFN	ERM	IEG	Rolf/Katie	RT	N/A		
770	Chapter 4 Table 4.1-4	Whitebark Pine	LDN_UFN		Jun 06, 2022	1	New		No	Table 4.1-5: RCP Ecosystem Summary for Vegetation and Wildlife is still confusing. It suggests that no vegetation or wildlife will be established in the in post-closure ESSFmvp. Is there a way to revise the table to make it clear what type of ecosystem this will be converted to?	The table reflects the projected post-closure ecosystems. As stated in Section 4.1.2.3 Summary of Changes to Landscape Capability: "In the post-mine landscape, all but 0.1 ha of the ESSFmvp will be exempt from reclamation as part of roads, the pit footprint, or water-diversion structures. The small parkland area (0.1 ha) that will be reclaimed is projected to support the FM site unit (Subalpine fir – Heather parkland), which was not present on the reclaimed footprint prior to mining and is not suited for whitebark pine growth."	Yes	LDN/UFN	ERM	IEG	Rolf/Katie	RT	Ready for Submission	RT: June 26	Ready for Publishing

771	Chapter 4 Table 4.1-4	Information requirements	LDN_UFN		Jun 06, 2022	0			No	Based on the overarching principle of equivalent capability - EA information requirements Based on these requirements the table suggests that the post mine ecosystem is not very equivalent to the pre-mine ecosystem can you please justify this change	The following has been added to Section 4.1.2 - Pre- and Post-Mine Land Capability Assessment: We cannot entirely replicate the pre-development landscape and its ecosystems and do not claim otherwise - as a result of the substantive landscape-scale changes involved in the mining process (e.g., loss of higher-elevation areas to retained infrastructure, construction of ecosystems on a well-drained waste-rock substrate). However, significant effort has gone into iterative attempts to reduce differences between pre-development and post-mining conditions, and we will actively look for opportunities to continue this reduction throughout the life of mine through reclamation research trials and other initiatives (e.g., constructing small wetland areas and appropriate revegetation of opportunistic wetlands). Despite differences between pre-development and post-closure conditions, it is anticipated that ecosystems established on the post-mining landscape will provide value for intended land uses.	T/TD to revie	LDN/UFN	ERM		Rolf/Mark	RT	N/A		
771	Chapter 4 Table 4.1-4	Information requirements	LDN_UFN		Jun 06, 2022	1	New		No	This was not added to Section 4.1.2	Thank you for noting this. While BW Gold acknowledges that we have previously indicated that this line would be added to Section 4.1.2, the Application is not being edited further at this time. This comment will be noted, and this edit will be incorporated into a future version of the Application.	T/TD to revie	LDN/UFN	ERM		Rolf/Mark	RT	Ready for Submission	CB, 17-Jun	Ready for Publishing
771	Chapter 4 Table 4.1-4	Information requirements	LDN_UFN		Jul 27, 2022	2	Follow Up	Comment	No	It is our understanding that chapter 4 will become the reclamation and closure plan, therefore it will be revised in the future-Artemis communicated this to MMO. We want a commitment for this revision to be made in RCP.	BW Gold commits to revision of the Reclamation and Closure Plan (as a stand-alone document) to include the information provided in response to the Round 0 comment. This document had already been provided to LDN and UFN through a separate regulatory process through the EAC as the End Land Use Plan. Whenever the RCP is updated (on 5 year intervals through the required 5 year plan updated) it will be submitted as a standalone plan.	T/TD to revie	LDN/UFN	ERM		Rolf/Mark	RT	Ready for Submission	TD, Aug 15	Ready for Publishing
772	Chapter 4 Page 4-12, Table 4.1-4	Wetlands	LDN_UFN		Jun 06, 2022	0			No	The new permanent water features are no substitute for the wetland areas that existed on the mine footprint. These are important caribou and moose habitats as well as numerous wetland species. Why are these wetland habitats not being restored given there is an excess of water sources onsite?	Wetland area is anticipated to be reduced on the post-closure landscape due to the changes in topography and substrate. Post-closure hydrologic conditions will not be conducive to replacement or maintenance of wet, organic-rich soils (and associated shallow groundwater inputs), which are required for wetland formation. Wetland reclamation will be conducted as mine and reclamation plans evolve—and opportunistically—where possible, and an offset plan has been developed to compensate for losses.	No	LDN/UFN	ERM		Greg	RT	Ready for Submission		Ready for Publishing
772	Chapter 4 Page 4-12, Table 4.1-4	Wetlands	LDN_UFN		Jun 06, 2022	1	New		No	Focus should be centered around contouring the land for the re-creation of wetlands. As per previous comment, statement should be included to say that plans will be adapted as the Wetlands Management and Offsetting Plan evolves.	BW Gold will make the suggested revision. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT: June 24	Ready for Publishing
772	Chapter 4 Page 4-12, Table 4.1-4	Wetlands	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry Forward. Unresolved until we see the reclamation and closure plan that has this revision.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								TD; Aug 16	Ready for Publishing
773	Chapter 4 Table 4.1-5	Whitebark Pine	LDN_UFN		Jun 06, 2022	0			No	Whitebark pine growing in ecosystems not suitable to its establishment - SBS may be too low for the species	Whitebark pine has been removed from the planting list (Table 4.2-6, Table 4.2-7) and lodgepole pine and hybrid spruce planting density will be increased. It is proposed that research trials in the SBSmc3 incorporate whitebark pine to assess viability for planting on xeric and subxeric sites.	No	LDN/UFN	ERM	IEG	Shannon	TD	Ready for BWG Review		
773	Chapter 4 Table 4.1-5	Whitebark Pine	LDN_UFN		Jun 06, 2022	1	New		No	Same question as above: What contingency plan is in place if these research trials fail to produce viable planting of whitebark pine? Will offsetting in an area outside of BW Gold permit occur?	Whitebark pine will be planted during reclamation on sites where reclamation cover depths and materials have been specifically designed to create xeric to submesic soil moisture regimes (02 and 03 site series in the ESSFmv1; please see Table 4.2-7). Whitebark pine will also be used to reclaim exploration roads in the ESSFmvp. Additional reclamation research trials will be conducted during the Operation Phase to evaluate establishment success of whitebark pine on xeric to submesic edaphic conditions on the reclaimed areas in the ESSFmv1. Should the initial reclamation research trials fail to establish whitebark pine, Blackwater gold will follow the adaptive management approach and update the methods of seed collection, propagation, and testing to produce viable plantings. Blackwater has begun monitoring the cone crop in 2022 to provide sufficient time to gather further seeds if the first batch of seeds fails. At this time an off-site offsetting is not planned.	No	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT; June 18	Ready for Publishing
774	Chapter 4 Page 4-25	Whitebark Pine	LDN_UFN		Jun 06, 2022	0			No	If climate predictions suggest whitebark pine habitat conditions will be lost it seems sensible to suggest potential planting / assisted colonisation of whitebark at higher elevations adjacent to the pit extent to offset this potential loss.	Whitebark pine will be planted on reclaimed exploration roads in the ESSFmvp. This will include areas where whitebark pine are not currently established.	No	LDN/UFN	ERM		Greg	TD	N/A		
774	Chapter 4 Page 4-25	Whitebark Pine	LDN_UFN		Jun 06, 2022	1	New		No	This still seems to be at a much lower elevation than the original habitat. Has BW Gold explored opportunities for offsetting at high elevation plots to help counteract climate change impacts?	Whitebark pine seedlings will be planted below, at and above their current elevational limit on Mount Davidson to determine utility of local assisted migration along an elevational gradient. Sites will not only be selected based on elevation, but will test establishment success on the range of existing ecosystems at multiple elevations (Section 9.2.2).	No	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT; June 18	Ready for Publishing
775	Chapter 4 Page 4-28	Wetlands	LDN_UFN		Jun 06, 2022	0			No	Assessment, there is expected to be a loss of wetter ecosystems that rely on groundwater inputs, Can you explain why the groundwater inputs onsite will not be there following closure? I think some justification of why a dryer site is being reclaimed is needed, saying that caribou prefer these dryer conditions is not correct, wetlands are commonly used by caribou to feed and supplement their diet with high protein sedges. Maintaining habitat diversity also promotes species diversity and resilience. If it is just much more challenging to restore the wetlands then this needs to be explained.	Wetland area is anticipated to be reduced on the post-closure landscape due to the changes in topography and substrate. Post-closure hydrologic conditions will not be conducive to replacement or maintenance of wet, organic-rich soils (and associated shallow groundwater inputs), which are required for wetland formation. Wetland reclamation will be conducted as mine and reclamation plans evolve—and opportunistically—where possible, and an offset plan is in place to compensate for losses. Our initial model runs showed loss of drier and wetter ecosystems, so we worked to increase representation of post-closure site series where achievable with the post-mine topography and substrates. While opportunities for re-creating wet site series were limited, revisions were made (including segregation and targeted application of coarse glaciofluvial soil) to minimize losses of drier site series. We did not intend to convey a focus primarily on creating only drier site series, this was not the intent. Revisions have been made to the text to reflect this. 775	Chapter 4 Page 4-28	Wetlands	LDN_UFN		Jun 06, 2022	1	New		No	Response does not adequately address the question, "why the groundwater inputs onsite will not be there following closure?" It is understood that currently modelling shows the unlikely replacement of wetlands, but are changes in topography and substrate that better re-create wetland areas not being looked into? The phrasing below does not explain why upland ecosystems will be prioritized other than that wetter ecosystems will be lost. As discussed in Section 4.1.2, Pre- and Post-mine Land Capability Assessment, there is expected to be a loss of wetter ecosystems that rely on groundwater inputs. Therefore, the focus of reclamation designs has been to replace upland ecosystems in proportions similar to pre-mining conditions.	Reclaimed landforms are often not analogous to natural soil systems, particularly the lack of impeding soil horizons or bedrock to force downslope conveyance of water within rooting zones. In other words, groundwater inputs on site will not be accessible to vegetation on many of the landforms (e.g., waste stockpiles) due to the properties of mine-waste materials (fast draining, coarse textured) underlying the soil covers. Given these conditions, the QEA model does not include input of subsurface flow and seepage water. Thus, the model results represent a conservative projection that considers only meteoric water inputs, although the model does include potential groundwater input for toe and depression slope positions. Select disturbances on sites where limited disturbances to soil occur (i.e.., only surface-level disturbance), may have the hydraulic conditions appropriate for seepage/groundwater inputs. In line with ongoing re-assessment of the potential to reclaim wetlands and wetter site series described in the response to comment 758, the potential to reclaim wetter site series will be continually evaluated through the mine life, based on site-specific conditions. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	IEG	ERM		TD	Ready for Submission	RT; June 18	Ready for Publishing
777	Chapter 4 Page 4-40	Metals	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry Forward. Unresolved until we see the reclamation and closure plan that has this revision.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								TD; Aug 16	Ready for Publishing
778	Chapter 4 Section 4.2.1.6	Soil	LDN_UFN		Jun 06, 2022	0			No	Inconsistent reference to where OVB is stored - sometimes listed as both upper and lower waste stockpiles, here just lower waste stockpile	BW Gold was unable to find any instances where it's stated that OVB will come from the Upper Waste Stockpile. BW Gold will revise any errors if found.	No	LDN/UFN	IEG			TD	N/A	TD, Jun 27	Ready for Publishing
778	Chapter 4 Section 4.2.1.6	Soil	LDN_UFN		Jun 06, 2022	1	New		No	Section 4.7.3.1 Design and Construction - "While the Upper Waste Stockpile will contain NAG waste rock, the outer surface will consist predominantly of OVB34 as this OVB is a component of the rooting zone modelled for the planning of soil covers and vegetation prescriptions." Section 4.7.3.3. Post-closure Water Management - "The post-closure water management plan for the Upper Waste Stockpile involves decommissioning of collection ditches around the stockpile and grading the surface of the stockpile to connect surface drainages with those of the downstream terrain." Table 4.2-1: Data Sources of Mine Waste Materials Used for Ecohydrological Modelling - "OVB = Lower and Upper Waste stockpiles" Section 4.2.1.3 Reclamation-material Supply - "OVB for use in reclamation will come from the Lower Waste Stockpile."	BW Gold considers "storage" to refer to locations where OVB is stored temporarily, and then moved to final landforms during reclamation for use in reclamation covers. "Storage" is not referring to the run-of-mine waste material that is placed in stockpiles over time. In the case of the Upper Waste Stockpile, OVB will be placed there (particularly in the upper lifts to act as a growing medium), but material is not being stored in the Upper Waste Stockpile to then be moved to other reclamation areas (in line with Section 4.7.3.1, Design and Construction, and Table 4.2-1, Data Sources of Mine Waste Materials Used for Ecohydrological Modeling). All OVB that will be moved to other reclamation areas and applied as cover material will come from the Lower Waste Stockpile (in line with Section 4.2.1.3, Reclamation-Material Supply). It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								TD; Aug 16	Ready for Publishing
780	Chapter 4 Table 4.2-6	Whitebark Pine	LDN_UFN		Jun 06, 2022	0			No	Concerns around planting WBP at such low elevations and mid-slope positions	Whitebark pine has been removed from the planting list (Table 4.2-6, Table 4.2-7), and lodgepole pine and hybrid spruce planting density will be increased. It is proposed that research trials in the SBSmc3 incorporate whitebark pine to assess viability for planting on xeric and subxeric sites.	No	LDN/UFN	IEG	ERM	Shannon	TD	Ready for Submission	RT: June 24	Ready for Publishing
780	Chapter 4 Table 4.2-6	Whitebark Pine	LDN_UFN		Jun 06, 2022	1	New		No	Same question as above: What contingency plan is in place if these research trials fail to produce viable planting of whitebark pine? Will offsetting in an area outside of BW Gold permit occur?	The current plan is to collect and propagate seeds for testing to determine if they rust-resistant, the so-called "plus" trees. If the first batch of seeds do not produce plus trees, the first contingency is to try a second batch of seedlings from different trees. BW Gold has begun seed collection studies in 2022 to maximize the number of iterations of seed collection and seedling testing possible during the operations phase of the Project. Offsetting would only be considered if multiple rounds contingency planning, collecting, propagating and testing seedlings was conducted.	No	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT: June 24	Ready for Publishing
780	Chapter 4 Table 4.2-6	Whitebark Pine	LDN_UFN		Jul 27, 2022	2	Follow Up	Information Requirement	No	Your answer to the last question (780) regarding a contingency plan should be put into the document as an adaptive management framework, while there are many uncertainties regarding restoration the success of whitebark currently seems more uncertain than most other activities. As this is a threatened species we would like to see a short plan in case things do fail, including your above step but also potential steps once all the other contingency measures have been exhausted, this could simply be a renegotiation of whitebark mitigation with the relevant authorities due to failed seedlings in the available habitats. Address in a memo please.	BW Gold appreciates the comment and will update the adaptive management framework for the Whitebark Pine management plan in the next iteration of the plan. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT; Aug. 11	Ready for Publishing
781	Chapter 4 Table 4.2-6	Revegetation	LDN_UFN		Jun 06, 2022	0			No	Why is there no proposed planting of spruce? Concerns have been raised about the impacts of lodgepole pine plantations that do not serve wildlife or First Nations, and are not representative of the pre-mining landscape	Please refer to Table 4.2-7, which includes spruce on mesic and moister sites in the SBSmc3.	No	LDN/UFN	IEG	ERM	Shannon	TD	Ready for Submission	TD, June 22	Ready for Publishing
781	Chapter 4 Table 4.2-6	Revegetation	LDN_UFN		Jun 06, 2022	1	New		No	In understanding that whitebark pine is being planted in ESSFmv1/03 for trials, why is Engelmann spruce not part of the tree species listed as a late-successional species?	Engelmann spruce will be included as a late-successional species for the ESSFmv1/03 trials. Note that mention of whitebark pine in the research section (Section 4.2.6, Vegetation and Cover Trials) is due to a it being a key species of concern; detailed vegetation prescriptions for research trials are not presented and will be developed prior to implementation but will test the species listed in Table 4.2-7. 785	Chapter 4 Page 4-56	Soil	LDN_UFN		Jun 06, 2022	0			No	Do you have plans for mycorrhizal and ectomycorrhizal fungi inoculation, is there capacity to do this? Mycorrhiza are known to increase survivorship and succession rates that you are seeking.	BW Gold will make the suggested revision. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	IEG			TD	Ready for Submission	TD, 15-Jun	Ready for Publishing
785	Chapter 4 Page 4-56	Soil	LDN_UFN		Jun 06, 2022	1	New		No	This presents a research opportunity for BW Gold, if successful would positively influence future industry reclamation. Trials should not be disregarded as a reclamation approach.	Acknowledged for future consideration.	No	LDN/UFN	IEG			TD	Ready for Submission	TD, 15-Jun	Ready for Publishing
785	Chapter 4 Page 4-56	Soil	LDN_UFN		Jul 27, 2022	2	Follow Up	Comment	No	Suggested revision has not been made. Unresolved until we see an updated RCP. When will this research opportunity be considered? "future" is not specific. Would like to see a discussion on this in the updated RCP .	BW Gold appreciates the comment, however the application is not being updated. BW Gold agrees that mycorrhizal innoculations can provide value to plant establishment, however, effects of inoculation are often context dependent. Literature on this topic generally shows inoculations to be primarily of value in low-quality soils that have a negligible presence of soil microbes (e.g., tailings, overburden). Conversely, materials like the salvaged surface soil that BW Gold intends to place in reclamation areas may contain residual mycorrhizal propagules and are also a more appropriate substrate for establishment of naturally dispersing microbes. Thus, establishment of native early successional mycorrhiza may be sufficient to support establishment of planted and naturally ingressing early successional vegetation (which typically have finer, more acquisitive roots for enhanced nutrient uptake and are less mycorrhizal dependent). Mycorrhizal inoculations will certainly be considered as an option if challenges in plant establishment are encountered during the research trials and progressive reclamation.	No	LDN/UFN	IEG			TD	Ready for Submission	TD, Aug 4	Ready for Publishing
785	Chapter 4 Page 4-56	Soil	LDN_UFN Baylie Sjodin		Sep 01, 2022	3	Follow Up	Comment	No	A revised version or memo should be provided regarding commitment to using mycorrhizal inoculation as a contingency plan should the salvaged surface soil not provide adequate microbes. This will ensure that there is a follow through plan if there are management changes in the future.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	IEG		Travis		Ready for Submission	TD, Sept 14	Ready for Publishing
786	Chapter 4 Page 4-74	Caribou	LDN_UFN		Jun 06, 2022	0			No	In addition, there is low evidence of use by caribou historically (when caribou numbers were high) and currently, there is low potential for future use even without the Project. As your evidence is based on a very limited amount of data (Data with large bias towards the protected area) it is important that you tone down how negligible the loss of habitat for caribou is. In particular due to the high cumulative effects in the soundings the value of the habitat taken by the mine (high elevation, mature forest, whitebark pine and subalpine habitats) is greatly increased, while the protected areas are relatively undisturbed the mine has taken some of the last good caribou habitat from the area. This habitat could have been used as a bases for reconnecting the itcha caribou and tweedsmuir populations through the Fauni range. Indeed there is traditional knowledge showing connectivity through the mine site itself. You should remove these assertions as they are opinion drawing a lot of opposition.	The conclusion that the mine site area has been rarely used over the last 30 years is well-founded based on over 30 years of satellite collared data. These collars, installed and maintained by provincial biologists, are the standard methods for determining herd range and usage areas. The EAC, IR response (ERM 2018), and CMMP all acknowledge that while Mt. Davidson is outside of the current herd range in most years, that TK indicates that it was used in the past and that it is currently sometimes used by caribou today (from TK and caribou sign observed during baseline and follow-up field studies). Acknowledging this, Artemis is planning an offset for the area of caribou habitat lost on the mine site. However, the description of caribou habitat usage, background and justification for offsetting belong in the CMMP document and will be removed from the R&C Plan, which will reference that an offset is occurring.	No	LDN/UFN	ERM		Rolf/Greg/Hannah	RT	N/A		
786	Chapter 4 Page 4-74	Caribou	LDN_UFN		Jun 06, 2022	1	New		No	"In addition, there is low evidence of use of the mine site by caribou historically (when caribou numbers were high) and currently, there is low potential for future use even without the Project." Please rephrase this sentence as it disregards TK as evidence.	Thank you for noting this. BW Gold recognizes that the Application contains some editorial errors. We will track substantive errors and omissions and will provide a memo that corrects them.	No	LDN/UFN	ERM		Rolf/Greg/Hannah	RT	Ready for Submission	CB, 17-Jun	Ready for Publishing
786	Chapter 4 Page 4-74	Caribou	LDN_UFN		Jul 27, 2022	2	Follow Up	Comment	No	IIn addition, there is low evidence of use by caribou historically (when caribou numbers were high) and currently, there is low potential for future use even without the Project. If the whole herd was GPS collared then what you are saying would be true but as only 30-40 caribou are collared (and less in the past) the data obviously do not represent the whole herd, so a relevant question here is 'what are the other 120-150 non-collared caribou from the tweedsmuir herd doing' it is not reasonable to assume they are following the GPS collared caribou' movements. Traditional knowledge, your own recent aerial surveys and recent sign surveys have confirmed caribou occupy Mount Davidson and corridors connecting to the fauni range it is important not to ignore valid data sources just because a we have GPS collar data.	Thank you for your comment. The CMMP has included reference to TK, statements on caribou habitat use made by LDN and UFN, habitat corridor mapping conducted by Keefer Environmental on behalf of LDN and UFN, as well as collar data.	No	LDN/UFN	ERM		Rolf/Greg/Hannah	RT	Ready for Submission	RT; Aug. 14	Ready for Publishing
786	Chapter 4 Page 4-74	Caribou	LDN_UFN		Sep 01, 2022	3	Follow Up	Comment	No	Have not seen any evidence of a memo or revisions in Ch 4 to suggest wording has been altered as to not disregard TK.	BW Gold has not altered any wording in Ch4 to disregard, or infer disregard of reliance on TK to inform reclamation and closure planning. Indeed, with direct reference to the CMMP, Ch 4, Section 4.2.7.1 - Caribou Offsetting Plan, places a high reliance on the CMMP and its collaborative development with Indigenous people, including the TK content, to guide the implementation of components of the CMMP through the RCP.		LDN/UFN	ERM		Greg/Hannah		Ready for Submission	RT; sept 15	Ready for Publishing

786	Chapter 4 Page 4-74	Caribou	LDN_UFN (Emma Cooke)		Oct 06, 2022	4	Follow Up	Comment	No	"BW Gold concluded there would be a residual effect of habitat loss and alteration for caribou, but that this effect would be not significant (negligible) for the Tweedsmuir caribou herd. The contribution of the Project to cumulative effects on winter habitat for caribou is assessed as not significant (negligible)." The last reviewer's comment is stating that a revision **needs** to be made to the wording as to not disregard TK. Although Section 4.2.7.1 references the CMMP, it still does not contain any mention or emphasis on Traditional Knowledge of caribou use around Mount Davidson. It only mentions the collar data as information used to come to the conclusion of being a "negligible" effect of habitat loss and alteration for caribou. This section needs to include mention of all sources of information, including aerial surveys, recent sign surveys, and Traditional Knowledge.	BW Gold understands the importance of Traditional Knowledge in evaluating effects on wildlife and takes its inclusion in the Project management plans serious. Section 4.2.7.1 of the Application references the Caribou Mitigation and Monitoring Plan (CMMP). The CMMP has been reviewed and approved and is the de facto source for describing effects of the project on caribou. The CMMP provides background from multiple information sources including Traditional Knowledge from the UFN and LDN, collar data, aerial survey, snow track surveys and incidental observations during other wildlife studies on-site. The CMMP also uses Resource Selection Function modeling conducted by consultants to the UFN and LDN that made extensive use of TK. Finally, the offsetting plan in the CMMP is based on locations provided by UFN and LDN through their habitat modeling and based on TK of historic movement corridors for caribou in the Project area. The CMMP states: The Project is on the eastern edge of the Tweedsmuir Local Population Unit (LPU) of southern mountain caribou (Rangifer tarandus caribou); with approximately half of the mine site falling inside the LPU. The mine site is within the historic range of the Tweedsmuir caribou based on Traditional Knowledge from UFN and LDN and includes areas mapped as winter caribou habitat (Figure 1.1-1). The mine site is outside of the annual range (1980-2020) used by collared female caribou, but is still used intermittently by caribou based on aerial surveys, snow track surveys and incidental observation. The construction of the Project will result in the removal and disturbance of three types of Type 1 Matrix habitat (high elevation, low elevation and general) and potential disturbance by noise of High Elevation Winter Range habitat (suitable habitat, but outside of the multi-year range of the herd). 788	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jun 06, 2022	1	New		No	Kinnikinnick should be added	BW Gold will make the suggested revision. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT; June 18	Ready for Publishing
788	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jul 27, 2022	2	Follow Up	Comment	No	Unresolved until we see the updated RCP with the revision made.	Please refer to response to comment ID# 771.	No	LDN/UFN	ERM		Greg	RT	Ready for Submission	TD, Aug 15	Ready for Publishing
789	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jun 06, 2022	0			No	ESSFmv1-01 should have white spruce, white-flowered rhododendron (quintessential ESSF), sitka alder prefers mesic and wetter SMRs - there are other drier alders that would be better suited to these locations, twinflower is a shrub (not sure how you've organized this - so is kinnikinnick, but by TEM rules it would also be in the herb layer)	Table 4.2-7: Vegetation Prescriptions for Projected Post-closure Ecosystems has been revised to include species suggestions from the LDN/UFN as well as incorporating species identified in the Attachment: Table 2 RCP Ecosystem Summary Table Veg Wildlife.xlsx included in the November 17, 2021 Memo (0575928-0014).	/TD to revie	LDN/UFN	IEG	ERM	Shannon	TD	N/A	TD, Jun 27	Ready for Publishing

789	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jun 06, 2022	1	New		No	White-flowered rhododendron not added.	Please see response to 790 re: white-flowered rhododendron.	/TD to revie	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT; June 18	Ready for Publishing
790	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jun 06, 2022	0			No	ESSFmv1-03 generally forms on an upper slope position - should have white spruce, white-flowered rhododendron, same comment re: sitka alder, unlikely to support common juniper	Sitka alder has been replaced with green alder. White spruce has been added. Common juniper has been removed but may be reconsidered during closure. White-flowered rhododendron is an ericaceous species that prefers acidic soils, mor or moder humus forms, and generally occurs in later successional forests. It is reported that it requires a fungal symbiont that does not survive transplantation. It was considered and rejected because of potential poor establishment probability. It could be added to research trials to determine suitability.	/TD to revie	LDN/UFN	IEG	ERM	Shannon	TD	N/A	TD, Jun 27	Ready for Publishing
790	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jun 06, 2022	1	New		No	Please add to research trials	BW Gold will make the suggested revision. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	/TD to revie	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT; June 18	Ready for Publishing
791	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jun 06, 2022	0			No	ESSFmv1-02 add white-flowered rhododendron	White-flowered rhododendron is an ericaceous species that prefers acidic soils, mor or moder humus forms, and generally occurs in later successional forests. It is reported that it requires a fungal symbiont that does not survive transplantation. It was considered and rejected because of potential poor establishment probability. It could be added to research trials to determine suitability.	No	LDN/UFN	IEG	ERM	Shannon	TD	N/A	TD, Jun 27	Ready for Publishing
791	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jun 06, 2022	1	New		No	Please add to research trials	White-flowered rhododendron is an ericaceous species that prefers acidic soils, mor or modern humus forms, and generally occurs in later successional forests. It is reported that it requires a fungal symbiont that does not survive transplantation. It was considered and rejected because of potential poor establishment probability. It could be added to research trials to determine suitability.	/TD to revie	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT; June 18	Ready for Publishing
791	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jul 27, 2022	2	Follow Up	Question	No	Is is being added to research trials? Many things "can" be added, that doesn't indicate to us that it will be.	BW Gold will add White-flowered rhododendron to research trials to determine suitability. The revision will be provided in a future update to the Reclamation and Closure Plan.	/TD to revie	LDN/UFN	ERM		Greg	RT	Ready for Submission	TD, Aug 15	Ready for Publishing
792	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jun 06, 2022	0			No	Grass-Shrub (dams) needs to prioritize native species - this proposed mix is unacceptable	Non-native species have been removed for the table. The exception is a caveat that non-propagating agronomic grasses (e.g., rye. oats) may be considered if needed for erosion control. See additional context on this in the responses to comments 185 and 186.	No	LDN/UFN	IEG			TD	N/A	TD, Jun 27	Ready for Publishing
792	Chapter 4 Table 4.2-7	Revegetation	LDN_UFN		Jun 06, 2022	1	New		No	There are native oatgrasses that thrive in submesic . These should still be considered for erosion control in preference to non-native.	Agreed. As stated in Section 4.2.2.3 (Erosion and Sediment Control), "Native grass and plant species will be preferred over non-native species unless erosion and sediment control risk cannot be safely addressed, in which case non-propagating agronomics will be considered. "	/TD to revie	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
793	Chapter 4 Section 4.2.4.1	Eco Model	LDN_UFN		Jun 06, 2022	0			No	Refer to Table 4.2-7 comments - SBSmc3-02/03 occur on shallow soils and in upper and crest slope positions - how is this area and proposed soil cover suitable for these ecosystems?	Reclamation site series—BW Gold put a lot of effort into understanding the edaphic conditions that will support vegetation communities (i.e., analysis of 1,000s of BEC-database plots from across the province and a resultant model that produces a fit between SMR and site series that is as good as the guidebook keys	No	LDN/UFN	IEG			TD	N/A	TD, Jun 27	Ready for Publishing
793	Chapter 4 Section 4.2.4.1	Eco Model	LDN_UFN		Jun 06, 2022	1	New		No	This is assuming that the area will be recreated as SBSmc3-02/03. Has modelling suggested any other results? Have these been discussed as a possibility should the reclamation not create the proposed BEC zone?	Projected ecosystems presented in the plan are based on modelling outputs; no modeling results were excluded (i.e.., modelling has not suggested other results). Post-placement soil sampling (Section 4.2.6.2, Permanent Sample Plots) will enable updates to model projections based on as-built conditions to validate/refine site series projections. Ongoing vegetation monitoring will support further validation of projected site series and implementation of adaptive management measures (e.g., supplemental planting of additional species). Given the overlap in vegetation communities of neighbouring site series, it is likely that a portion of planted plant species will establish, even if the actual site series deviations from projections.	No	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
794	Chapter 4 Section 4.2.4.1	Research	LDN_UFN		Jun 06, 2022	0			No	Where are your proposed lichen salvage/replacement/diversion methods outlined?	They are not. They will be developed prior to implementation of progressive reclamation at this site. There is good experience to draw on from B.C., eastern ON, and Yukon.	No	LDN/UFN	IEG			TD	N/A	TD, Jun 23	Ready for Publishing
794	Chapter 4 Section 4.2.4.1	Research	LDN_UFN		Jun 06, 2022	1	New		No	Why aren't they being developed now?	Lichen re-establishment methods are scheduled to start prior to mine operations and in year +1 with the Existing Camp and FWR research trials, respectively (Section 4.2.5.1 (Vegetation and Cover Trials)). The timelines of these trials will facilitate design and testing of proposed methods early on (starting before mining), and allow monitoring over the operating mine life.	No	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
794	Chapter 4 Section 4.2.4.1	Research	LDN_UFN		Jul 27, 2022	2	Follow Up	Comment	No	A clear timeline of all chapter 4 activities would be very useful to outline expected timing for activities- for instance lichen trials and rehab. A statement could be added saying the timeline will be adapted / changed as the work progresses. This would be useful for the readers, would give more confidence in the sequence of restoration, would help identify gaps and would be useful for the technitions working on the project. Please add a table showing the expected timeline and activities.	BW Gold appreciates the comment, however the application is not being updated. Please note that Table 4.2-9 (Revegetation and Cover Research Trial Site Characteristics) includes the "year available". "Year available" corresponds to when the land is projected to become available for research. BW Gold plans to implement trial as soon as possible i.e., in the year available. As stated in the trial descriptions below the table, lichen trials are planned for the Existing Camp and Freshwater Reservoir trials, which are scheduled to start in Y-2 and Y+1, respectively.	No	LDN/UFN	IEG			TD	Ready for Submission	TD, Aug 4	Ready for Publishing
795	Chapter 4 Figure 4.2-5	Map	LDN_UFN		Jun 06, 2022	0			No	Where are the progressive reclamation areas? Borrow pit? Add to/adjust legend. What is the elevation of this area?	Figure 4.2.5: Progressive Reclamation Areas near the Freshwater Reservoir has been removed from the final version of the Chapter. The associated text has been revised.	/TD to revie	LDN/UFN	IEG			TD	N/A		Ready for Publishing
795	Chapter 4 Figure 4.2-5	Map	LDN_UFN		Jun 06, 2022	1	New		No	The progressive reclamation of the FWR is still discussed in Section 4.2.5.1 Vegetation Cover. Does it encompass an area larger than the FWR on the map? If so, it should be labelled on the map.	Two areas around the FWR provide opportunities for progressive reclamation beginning in Y+1: a borrow area used for construction of the FWR (~3 ha) and a material stockpile from the excavation of the FWR (~3 ha) beginning in year +1 (Figure 4.2-6). Progressive reclamation of these areas will be carried out as part of the reclamation research program and details of planned reclamation are presented in Section 4.2.5.1, Vegetation and Cover Trials.	/TD to revie	LDN/UFN	ERM		Rolf	RT	Ready for Submission	RT; June 27	Ready for Publishing
796	Chapter 4 Section 4.2.4.2	Research	LDN_UFN		Jun 06, 2022	1	New		No	Table 4.2-9 Whitebark Pine isn't a trial area - is this the old exploration road/weather station area that Travis talked about?	Table 4.2-9 Revegetation and Cover Research Trial Site Characteristics refers to 7 areas where revegetation trials will occur, including the parkland on top of Mt. Davidson where Whitebark Pine revegetation trials will take place.	/TD to revie	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT: June 24	Ready for Publishing
796	Chapter 4 Section 4.2.4.2	Research	LDN_UFN		Jun 06, 2022	0			No	Request for additional reclamation research trials areas to be identified and utilized to inform reclamation well in advance of closure activities - especially with respect to addressing gaps/uncertainties and allowing for the opportunity to revise/renew reclamation research trials as/if needed - 5-6 years is insufficient time to collaborate with regulators and First Nations and to adjust prescriptions with new trials	An additional 1.6-ha research trial location has been identified in the ESSFmv1 near the current exploration camp (Section 4.2.5.4) that can be initiated at the beginning of the life of mine. With the addition of this new area, trials are proposed for four areas that encompass a range of conditions projected to be present on the post-closure landscape, including both BEC subzone variants. A variety of slopes, slope positions and aspects are included for the ESSFmv1, while only a flat trial area is planned for the SBSmc3, because all post-closure features in this zone will be flat (< 8°).	/TD to revie	LDN/UFN	IEG	ERM	Shannon	TD	Ready for Submission	RT: June 24	Ready for Publishing
797	Chapter 4 Table 4.2-8		LDN_UFN		Jun 06, 2022	0			No	Item #1 - how is this possible if only low-elevation areas are available for research?	See response to comment 91.	No	LDN/UFN	IEG			TD	N/A	TD, Jun 27	Ready for Publishing

797	Chapter 4 Table 4.2-8		LDN_UFN		Jun 06, 2022	1	New		No	Unclear how this comment is sufficiently addressed - only low elevation areas are discussed in comment ID91	Reclamation research areas have been expanded beyond low-elevation areas, as described in Section 4.2.5.1 (Vegetation and Cover Trials). "Vegetation trials are proposed for four areas that encompass a range of conditions projected to be present on the post-closure landscape (Figure 4.2-6), including both BEC subzone variants (ESSFmv1 and SBSmc3). All site series projected to be present on the post-closure ecosystem are included in vegetation trials except SBSmc3-01, 04, 05 and 06, however they will only be present on surface soil stockpile footprints, which will likely require less intensive intervention to reclaim."	No	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
798	Chapter 4 Table 4.2-8		LDN_UFN		Jun 06, 2022	0			No	Item #3 - reiterate concern about timeline for reclamation research and the ability to make adjustments and test those adjustments prior to closure	We have added additional details to the text clarifying timelines. The FWR (SBSmc3) and the Existing Camp (ESSFmv1) trial areas will run for the LOM (> 20 years). The North Collection Channel tailings trial will be a short-term trial, based on which a longer-running trial that can run for the rest of the LOM will be installed. While the Lower Waste Stockpile will only run for approximately 10 years, this is sufficient time to provide insight into initial survival and establishment of native species, and validate the AWSC (SMR) of cover designs.	No	LDN/UFN	IEG			TD	N/A	TD, Jun 27	Ready for Publishing
798	Chapter 4 Table 4.2-8		LDN_UFN		Jun 06, 2022	1	New		No	For the Lower Waste Stockpile, is 10 yrs. enough time should the initial research design fail?	The research design will trial a variety of approaches, making it unlikely that the trial will entirely fail, and instead will highlight more successful reclamation prescriptions and approaches. This trial will focus on initial survival and establishment of native vegetation--10 years is sufficient time to evaluate this, and longer-running trials of ESSSmv1 site series (e.g., Existing Camp, North Collection Channel, and TSF beach cover) will support longer-term results for these ESSmv1 reclamation.	No	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
799	Chapter 4 Table 4.2-8	Reclamation research	LDN_UFN		Jun 06, 2022	0			No	Item #4 - lichen planting methods (see earlier comment)? how will lichen cover be assessed? what are your targets for measuring success?	BW Gold has not developed in detail lichen transplant and evaluation methods. As stated, there is available information from similar efforts in B.C., eastern ON, and Yukon. Generally BW Gold would be evaluating lichen cover as a measure of our ability to establish lichen successfully and have the cover of those lichen increase over time. Text has been added to reflect this.	No	LDN/UFN	IEG			TD	N/A	TD, Jun 27	Ready for Publishing
799	Chapter 4 Table 4.2-8	Reclamation research	LDN_UFN		Jun 06, 2022	1	New		No	As per previous comment: Why aren't they being developed now?	Please refer to the response to comment 794.	No	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
800	Chapter 4 Table 4.2-8		LDN_UFN		Jun 06, 2022	0			No	Item #6 - what if whitebark pine does not establish on lower elevation sites as proposed? How does this change the overall program and ability to meet project conditions?	Whitebark pine will be removed from the planting list and lodgepole pine and hybrid spruce planting density will be increased. It is proposed that research trials in the SBSmc3 incorporate whitebark pine to assess viability for planting on xeric and subxeric sites.	No	LDN/UFN	IEG	ERM	Shannon	TD	Ready for Submission	RT: June 24	Ready for Publishing
800	Chapter 4 Table 4.2-8		LDN_UFN		Jun 06, 2022	1	New		No	Whitebark pine is a significant species of concern. Should research trials fail, what will BW Gold do to offset the loss due to the open pit?	Please see the answer to comment 780.	T/TD to revie	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT: June 24	Ready for Publishing
800	Chapter 4 Table 4.2-8		LDN_UFN		Jul 27, 2022	2	Follow Up	Comment	No	As mentioned above failure of whitebark pine and replacement of this species by lodgepole pine does not suitably mitigate the losses of whitebark in the mine area (pit mostly) as mentioned above we need to see some contingency of how the species losses will be offset should all trials fail.	BW Gold disagrees with the suggested revision and will not make the change, because this has been previously addressed in the response to Comment ID#780.	T/TD to revie	LDN/UFN	ERM		Greg		Ready for Submission	CB; July 29	Ready for Publishing
801	Chapter 4 Section 4.2.5.2		LDN_UFN		Jun 06, 2022	0			No	When will mill tailings be available - Y3?	Tailings will be available upon the start of the Operations phase (i.e. Year 1).	No	LDN/UFN	ERM		Rolf	RT	N/A		
801	Chapter 4 Section 4.2.5.2		LDN_UFN		Jun 06, 2022	1	New		No	Please update plan with this information.	Thank you for noting this. BW Gold will not be making further edits to the Application at this time. BW Gold will track substantive errors and omissions and will provide a memo that corrects them.	No	LDN/UFN	ERM		Rolf	RT	Ready for Submission	CB, 17-Jun	Ready for Publishing
801	Chapter 4 Section 4.2.5.2		LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry forward. It is our understanding that chapter 4 will become the reclamation and closure plan, therefore it will be revised in the future-Artemis communicated this to MMO. We want a commitment for this revision to be made in RCP.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								TD; Aug 16	Ready for Publishing
802	Chapter 4 Section 4.2.5		LDN_UFN		Jun 06, 2022	0			No	Provide more detail on planned lichen dispersal techniques at research trial plots (as mentioned in Section 4.8.3).	Lichen dispersal techniques will be based on the most current research, using methods that are determined to be most effective. The current methods used in research trials include aerial distribution (using helicopters and a hopper system) and manual distribution (which currently has more favourable results; Ronalds and Grant 2018). The following text has been added to Section 4.2.5.1: "Detailed methods for lichen re-	T/TD to revie	LDN/UFN	IEG			TD	N/A	TD, Jun 27	Ready for Publishing
802	Chapter 4 Section 4.2.5		LDN_UFN		Jun 06, 2022	1	New		No	As per previous comment: Why aren't they being developed now?	Please refer to the response to comment 794.	No	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
803	Chapter 4 Section 4.2.5.3		LDN_UFN		Jun 06, 2022	0			No	What is the elevation and aspect of this area? These ecosystems occur in mid through crest slope positions, how will this be incorporated? These ecosystems provide good caribou habitat partly for their composition, but also for their location (slope position) - this appears to be a big gap in your assumptions for suitability of these areas	[Note: unclear which area is being referred to, but this response assumes that it is bullet 3, FWR trial area]. Site characteristics of all research trials are provided in the response to comment 91. As noted in 91, this trial area is flat. All areas being reclaimed in the SBSmc3 are flat, so the trial results will be applicable to those areas.	No	LDN/UFN	IEG	ERM		TD	Ready for Submission	RT: June 24	Ready for Publishing
803	Chapter 4 Section 4.2.5.3		LDN_UFN		Jun 06, 2022	1	New		No	There are no bullets in this original section…. Is flat ground good caribou habitat or should you revise this section? Is what is being asked here. This section appears to have been removed from the updated version.	Section 4.2.5.3 Use of Wetlands to Treat Water does not deal with caribou habitat. Instead, it focuses on a research program to investigate the use of wetlands to remove contaminants in contact water. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT; June 18	Ready for Publishing
809	Chapter 4 Table 4.3-1		LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Carry forward. Unresolved until we see an updated RCP with the revisions.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								TD; Aug 16	Ready for Publishing
810	Chapter 4 Section 4.3.3.1		LDN_UFN		Jun 06, 2022	0			No	Unclear how a larger suite of vegetation species will be incorporated into future sampling (those suggested by First Nations) - recce seemed to focus only on those species collected in 2021	Reconnaissance in August 2021 included a total of 21 different species, 13 of which were identified by UFN and LDN as important species prior to August 2021. An additional list of important species was provided by UFN and LDN in September 2021, after the field season was complete. Not all species identified by Indigenous Nations can realistically be sampled on a regular basis to monitor for Project-related effects and the sampling program has been focused to a smaller subset of relevant species. It is possible that in the future, additional targeted studies separate from the Closure and Reclamation Plan (outside of mine site) or the regular CFMP sampling may be conducted of other species or for purposes other than monitoring to identify Project-related effects. This may be done under the Country Foods Monitoring Plan or other plans required by the EAC (e.g., EAC Condition 17) or federal Decision Statement, and sampling would be developed in consultation with Indigenous Nations.	No	LDN/UFN	Entia		Lesley	RT	N/A	TD, June 27	Ready for Publishing
810	Chapter 4 Section 4.3.3.1		LDN_UFN		Jun 06, 2022	1	New		No	Please explain why certain species cannot be sampled for monitoring. Why can't sampling schedules be altered to incorporate these species?	The sampling program for areas outside of the Mine Site (described in the Closure and Reclamation Plan but ultimately driven by the Country Foods Monitoring Plan [CFMP]) is already the largest soil, plant, and vegetation program that BW Gold is aware of for mines in BC. The program has already been expanded to include regular sampling of soil, three plant species, and three berry species. It is not possible to regularly sample all species of interest in a sampling program due to limitations in budget and time, so representative species are typically collected. BW Gold has consulted with LDN and UFN in developing the list of species to be sampled, and species have been selected to be representative of those of interest to Indigenous Nations, including species that are consumed or used by people and animals, are present in different types of habitats, have reasonable spatial distribution across the study area outside of the mine site, are reasonably abundant, and including species (e.g., willow) that are known to be hyper-accumulators of metals. As noted in the response to this comment in the previous round, there may be opportunity to develop "special" studies outside of the routine monitoring under the Closure and Reclamation Plan or the CFMP. The necessity, timing and extent of these special studies will be determined in consultation with Indigenous nations and regulators.	No	LDN/UFN	Entia		Lesley	RT	Ready for Submission	RTI June 20	Ready for Publishing
811	Chapter 4 Section 4.3.3.2		LDN_UFN		Jun 06, 2022	0			No	When does this on-site sampling begin?	As per reference in this section to Section 4.2.6.1 (reclamation monitoring section), this will be on the schedule of the reclamation monitoring of progressive/operational reclamation, so starting in year 1 after revegetation, with the caveat that vegetation sampling will only occur if it can happen without adversely impacting the young plants.	No	LDN/UFN	IEG		N/A	TD	N/A	N/A	N/A
811	Chapter 4 Section 4.3.3.2		LDN_UFN		Jun 06, 2022	1	New		No	Presumably this could be a long time after reclamation then - to avoid impacts to young plants - so what are the implications of waiting say 2, 3, 4+ years to conduct this sampling? What if there is uptake? What contingency measures could be included here (e.g., overplanting to accommodate this? that seems better than having to rip up an area and increase its cover materials or something)	Element vegetation-uptake sampling is scheduled to occur as part of reclamation research (Section 4.2.5.1, Vegetation and Cover Trials) during operations to support early indication of potential issues. Sampling of soil following placement, as recommended in Section 4.2.6.1 (Permanent Sample Plots), will also support early identification of potential issues. We expect faster-growing early successional plants to have sufficient biomass within a few years to enable sampling.	No	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
812	Chapter 4 Section 4.3.3.2		LDN_UFN		Jun 06, 2022	0			No	What sampling volumes are proposed? How will you collect (e.g., 125 mL) from a 0-2cm layer?	Sufficient sample volumes for laboratory analysis are determined in advance of each field trip in consultation with the laboratory. For thin layers, collection is done carefully. Adequate sample sizes can be collected from thin surface layers.	No	LDN/UFN	Entia	IEG	N/A	RT	N/A	TD, June 27	Ready for Publishing
812	Chapter 4 Section 4.3.3.2		LDN_UFN		Jun 06, 2022	1	New		No	Sampling volumes needed by the lab are standard. Have you experienced otherwise? Attempting to sample a sufficient volume from a 2cm thick layer has the potential to introduce considerable uncertainty in the subsequent lab analyses. The Nations are unconvinced this is possible and accurate.	The text being referenced by the reviewer is now located in Appendix 4-H, Section 4.2, not in Section 4.3.3.2 of Chapter 4. Sample volumes required by the lab vary depending on the suite of parameters or analysis being requested (e.g., higher volumes required if additional special analyses are included). Sampling volumes required may also change over time as analysis methods are modified or new methods added. It is generally good practice to confirm the volumes required by the laboratory prior to sampling to ensure that sufficient sample volumes are submitted. ICP-MS analyses require sub-1-g sample size (e.g., 0.4g of fine fraction). Even accounting for high coarse-fragment contents, this still means that less than 10g of sample are needed. We anticipate being able to collect approximately 100-200g total sample weight from a 0-2-cm layer, which would require a sampled area of approximately 10 x 10 cm. 813	Chapter 4 Section 4.3.4.1		LDN_UFN		Jun 06, 2022	1	New		No	Who decides if "additional soil sampling may be required … in areas of the mine site that experience greater dust deposition…" and when, and how are the Nations notified of these changes? Updates to the 5-year mine plan will be insufficient.	The Qualified Professional responsible for the reclamation/mine-site monitoring program would identify areas of dust deposition for additional soil sampling based on results of dust monitoring carried out through the life of mine, as well as based on in-field observations. BW Gold is committed to collaborating with Indigenous Groups in refinement and implementation of the reclamation-monitoring program, including engagement regarding any proposed changes to monitoring plans.	/TD to revie	LDN/UFN	IEG			TD	Ready for Submission	RT; June 23	Ready for Publishing
813	Chapter 4 Section 4.3.4.1		LDN_UFN		Jun 06, 2022	0			No	Soil sampling should occur more than once at reclamation trials to understand how pH and soil nutrients change over time - these are important soil properties that are known to degrade with stockpiling	This is the proposed approach for operational reclamation, not research trials, which will be monitored according to their experimental design, which (depending on the objectives of the specific research trial) may include more-intensive soil sampling to understand vegetation responses.	No	LDN/UFN	IEG		N/A	TD	Ready for Submission	TD, Jun 27	Ready for Publishing
814	Chapter 4 Section 4.3.5		LDN_UFN		Jun 06, 2022	0			No	No mention of avoiding cross contamination between sampling sites by washing equipment?	Equipment was cleaned between sampling sites to prevent cross-contamination between sites. The following has been added to the bullet list as the first bullet: "Samples will be collected by field staff trained in proper sample collection techniques and field SOPs will be used to ensure consistent sample collection and prevent cross-contamination between sampling sites."	/TD to revie	LDN/UFN	ERM		Tonia	RT	N/A	N/A	N/A
814	Chapter 4 Section 4.3.5		LDN_UFN		Jun 06, 2022	1	New		No	This was not found in the updated text.	The text is provided in Section 6 of Appendix 4-H Trace Element Uptake in Soils and Vegetation.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission		Ready for Publishing
815	Chapter 4 Table 4.3-1:		LDN_UFN		Jun 06, 2022	0			No	The sample sizes should be separated by distance from the mine site as these distances will be the sample units.	The update has been made in the version for submission.	/TD to revie	LDN/UFN	ERM		Tonia	RT	N/A	N/A	N/A
815	Chapter 4 Table 4.3-1:		LDN_UFN		Jun 06, 2022	1	New		No	Table 4.3-1 has been removed from most recent version.	The sample size for each species collected is provided in Table 2.2-1 of Appendix 4-H Trace Element Uptake in Soils and Vegetation. The number of samples collected at near-field, mid-field, road transect and control sites is provided.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission		Ready for Publishing
816	Chapter 4 Table 4.3-2		LDN_UFN		Jun 06, 2022	0	New	Comment	No	How are you developing predicted concentrations?	Predicted concentrations of soil are provided in the Human Health Risk Assessment (Attachment B of Appendix 6-A), which were based on predicted concentrations at soil and vegetation sampling sites from 2011/2012.	No	LDN/UFN	ERM		Tonia	RT	N/A	N/A	N/A
816	Chapter 4 Table 4.3-2		LDN_UFN		Jun 06, 2022	1	New	Comment	No	Why has this whole section been removed? At what time will this plan be updated to include 2021 sampling results? How often will it be updated to include annual sampling for country foods (near sites, within 1km of mine site)?	Section 4.3.9 and Table 4.3-2 were removed from Chapter 4 because they were essentially the adaptive management framework for the Country Foods Monitoring Plan (CFMP), which has different objectives and endpoints than the Reclamation and Closure Plan (RCP). The adaptive management framework for the CFMP is provided in Section 6 of the CFMP for soil, plants and berries sampled outside the Mine Site. Appendix 4-G [Possible Reclamation Success Criteria] provides the metrics specific to the RCP and Section 4.10.10 provides the adaptive management framework specific for the RCP. Sampling completed in 2021 was completed outside of the Certified Project Description boundaries. The last paragraph in Section 4.3 indicates that the results of this monitoring will be reported in CFMP reports in accordance with the reporting identified in that plan. A cumulative soil and vegetation baseline report that includes 2011, 2012, and 2021 data is in preparation and is planned to be available during application review. 825	Chapter 4 Section 4.10.5.1	Vegetation and Soil Monitoring	LDN_UFN		Jun 06, 2022	0			No	"Plots that are considered successful based on the selected indicators after two consecutive samplings can be removed from the monitoring program to decrease plot densities in heavily sampled early-reclamation areas." Provide more detail on selected indicators. What is the rationale for the basis of two consecutive samplings?	This relies on all indicators, which together represent a comprehensive picture of ecosystem function and composition, meeting thresholds that show the ecosystem is on the desired successional trajectory. Monitoring is scheduled to last for at least 10 years and every 5 years thereafter, so two consecutive monitoring events ensures that these trends are stable for at least 5 years.	No	LDN/UFN	IEG			TD	N/A	TD, June 27	Ready for Publishing
825	Chapter 4 Section 4.10.5.1	Vegetation and Soil Monitoring	LDN_UFN		Jun 06, 2022	1	New		No	Change wording to indicate all indicators then. Explain how you are arriving at your conclusion that 2 sampling equals stable ecosystems for 5 years.	This comment is acknowledged. BW Gold will update the wording in next version of the document. Achievement of the many proposed indicators (see Appendix 4-G), (e.g., self-sustaining native vegetation), is not anticipated to be achievable immediately following reclamation, necessitating longer-term monitoring, and is not expected to be possible without the ecosystem being steadily on the desired trajectory. The second sampling event five years after achievement of success criteria is proposed to act as confirmation of results.	T/TD to revie	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
826	Chapter 4 Section 4.10.5.5	Maintenance	LDN_UFN		Jun 06, 2022	0			No	"Seeding non-propagating agronomic grasses in areas where vegetation has been slow to establish and slumping or rilling has been observed." Isn't there a priority to use native species if possible?	If fast-growing native species establish successfully and quickly enough for erosion reduction, non-propagating agronomics would not be necessary. However, they are a good short-term option that provides vegetation cover and starts building organic matter, without impacting the long-term successional trajectory (the way that propagating agronomics do). BW Gold has revised the wording in this section to: "Seeding non-propagating agronomic grasses in areas where native vegetation has not established sufficiently quickly to reduce erosion and slumping or rilling has been observed".	No	LDN/UFN	IEG			TD	N/A	TD, Jun 27	Ready for Publishing
826	Chapter 4 Section 4.10.5.5	Maintenance	LDN_UFN		Jun 06, 2022	1	New		No	As mentioned in previous comments, if nonnative vegetation is to be used, First Nations species to be used should be shared with First Nations for consideration and for the opportunity to identify comparable native species.	BW Gold agrees to this.	T/TD to revie	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
826	Chapter 4 Section 4.10.5.5	Maintenance	LDN_UFN		Jul 22, 2022	2	Follow Up	Comment	No	Please make a commitment to include this in text in the next version of this plan.	BW Gold commits to revision of the Reclamation and Closure Plan (as a stand-alone document) to include the information provided in response to the Round 1 comment. 827	Chapter 4 Section 4.10.5.5	Maintenance	LDN_UFN		Jul 22, 2022	2	Follow Up	Comment	No	Please make a commitment to include this in text in the next version of this plan.	BW Gold commits to revision of the Reclamation and Closure Plan (as a stand-alone document) to include the information provided in response to the Round 1 comment.		LDN/UFN	ERM		Valerie		Ready for Submission	AT, Aug 09	Ready for Publishing
828	Chapter 4 Section 4.11		LDN_UFN		Jun 06, 2022	1	New		No	Comment not answered in BW response.	BW Gold provided the reclamation cost estimate to LDN and UFN on May 4, 2022.	No	LDN/UFN	BWG		Ryan	TD	Ready for Submission	RT; June 13	Ready for Publishing
828	Chapter 4 Section 4.11		LDN_UFN		Jun 06, 2022	0			No	Nations are requesting that information be provided on the reclamation bonding for this project as the Nations believe there is undue liability and risk in the current project design	As required by the IRT (dated November 25, 2021), BW Gold will be preparing a cost estimate for a low-grade ore stockpile contingency plan. The LGO contingency plan consists of moving the stockpile at its maximum planned storage volume and placement into the open pit where it will be flooded. The contingency plan includes the continued treatment of LGO contact water in accordance with the mitigation measures proposed for the project until the LGO has been rehandled to the open pit. Despite provision of the cost estimate for this contingency, BW Gold plans to mill the low-grade ore stockpile prior to closing the mine.	No	LDN/UFN	BWG			TD	N/A	TD, Jun 28	Ready for Publishing

829	Chapter 4 Section 4.14	References in list but not in text	LDN_UFN		Jun 06, 2022	0			No	ERM 2016a, ERM 2016b, ERM 2021, Government of Canada 2021, Health Canada 2010a, Health Canada 2010b, Smreciu et al. 2002, Vogt and Janin 2017,	ERM 2016a and ERM 2016b are referenced in Section 4.3.1.1 Baseline Sampling in 2011 and 2012. ERM 2021 has been removed from the reference list. Government of Canada 2021 has been added to Section 4.2.7.1. Health Canada 2010a and 2010b have been removed from the reference list. Smreciu et al. 2002 and Vogt and Janin 2017 have been removed from the reference list.	No	LDN/UFN	ERM	Entia		RT	N/A	N/A	N/A
829	Chapter 4 Section 4.14	References in list but not in text	LDN_UFN		Jun 06, 2022	1	New		No	There is no section 4.3.11, ERM references still missing from text.	In Chapter 4 (issued April 2022 version D.1), we could not identify a reference to Section 4.3.11 in Section 4.14, and a search of the pdf document for "4.3.11" yielded no results. ERM (2021) refers to the surface water quality baseline report and is cited in Section 4.1.2.1. The ERM (2016a and 2016b) references should have been removed from the reference list in Chapter 4 when the text in which they were cited was moved to Appendix 4-H. Please disregard these two citations in the reference list for Chapter 4.	No	LDN/UFN	ERM	Entia	Tonia/Mark/ Lesley	RT	Ready for Submission	RT; June 29	Ready for Publishing
830	Chapter 4 Appendix 4-A	Concordance	LDN_UFN		Jun 06, 2022	0			No	"Names and, if applicable, professional certifications and professional stamps/seals, of those responsible for the preparation of the plan, program, or other document" - Please provide this.	Contributors to Chapter 4 have been identified in Chapter 1. Where applicable, reports included as appendices have been signed and/or stamped.	No	LDN/UFN	ERM			RT	N/A	N/A	N/A
830	Chapter 4 Appendix 4-A	Concordance	LDN_UFN		Jun 06, 2022	1	New		No	Provide reference to a location found within the EAO application/this plan for contributors of this plan.	Section 8 of Appendix 4-A (End Land Use Plan) provides the names of Rolf Schmitt, P Geo and Justin Straker, MSc P.Ag as the two Qualified Professionals that prepared the plan.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission		Ready for Publishing
831	Chapter 4 Appendix 4-A	Concordance	LDN_UFN		Jun 06, 2022	0			No	"The adaptive management in the plan must include…the methods that will be applied to detect when a numeric trigger, or type or level of change has occurred" Please provide more specific detail on these methods relevant to this plan.	Methods are included in Section 4.10. In some cases, detailed methods are referenced from other Chapters of the Application.	No	LDN/UFN	ERM			RT	N/A	N/A	N/A
831	Chapter 4 Appendix 4-A	Concordance	LDN_UFN		Jun 06, 2022	1	New		No	Monitoring methods are included in Section 4.10 however, there is very little mention of the methods to be applied to detect when triggers or changes occur.	BW Gold has followed up with MMO and we understand that MMO is discussing this with LDN/UFN.	T/TD to revie	LDN/UFN	ERM		Rolf	RT	Ready for Submission	CB; 20-Jun	Ready for Publishing
831	Chapter 4 Appendix 4-A	Concordance	LDN_UFN		Jul 22, 2022	2	Follow Up	Comment	No	Discussion have not been had with MMO on this, request comment from MMO.	The Chapter 4 Appendix A (ELUP) has been updated with Sections 5.1.4 and 5.1.5 related to relcamation research and monitoring. The monitoring section (5.1.5) includes references to several monitoring programs such as reclamation material monitoring during salvage and stockpiling, water quality monitoring, trace element update in soils and vegetation as well as sub-plans to support the RCP such as the white bark pine management plan. The programs and sub-plans all provide methods to be applied when triggers or changes occur such as in the aquatic effects management plan, white bark pine management plan and trace element uptake in soils and vegetation (through the country foods monitoring program).		LDN/UFN	BWG		Travis	TD	Ready for Submission	TD; July 29	Ready for Publishing
831	Chapter 4 Appendix 4-A	Concordance	LDN_UFN Baylie Sjodin		Sep 01, 2022	3	Follow Up	Comment	No	Section 5.1.5 states that details of the monitoring plan, including thresholds, will be developed in the future. This does not describe the methods that will be applied when a trigger or change occurs for each objective (only referenced vagely in 5.1.4.1, not much detail), as the numeric trigger is not even established yet. The Nations understand that details into mine operation are a priority to the proponent, however the proponent needs to recognize that end land use is a priority to the Nations over anything else and should not be "pushed" into future planning. Time should be spent determine the specifics outlined above.	This comment is acknowledged. A robust reclamation research and monitoring program has been proposed through the Chapter 4 Reclamation and Closure Plan and was outlined in the round 2 response. BW Gold will report out annually on the RCP through the Annual Reclamation Report (ARR) and continue to seek input from Indigenous Nations through that reporting process.		LDN/UFN	BWG		Travis		Ready for Submission	TD, Sept 14	Ready for Publishing
831	Chapter 4 Appendix 4-A	Concordance	LDN_UFN Baylie Sjodin		Oct 06, 2022	4	Follow Up	Comment	No	Proposing a robust reclamation research and monitoring program to be developed at a later date does not meet the current requirement to have an adaptive management plan that includes "the methods that will be applied to detect when a numeric trigger, or type or level of change has occurred, " We are requesting a memo detailing methods to detect when a type or level of change has occurred, including explicit numeric triggers.	BW Gold respectfully disagrees with the comment. A robust reclamation research and monitoring program has been proposed through the Chapter 4 Reclamation and Closure Plan and was outlined in the round 2 response. Reclamation research is different than active progressive reclamation in that it follows the scientific method (i.e. question -> research topcis area -> hypothesis -> test with experiment -> analyze data -> report conclusions). This is different than active progressive reclamation where you would likely have active triggers such as percent cover vegetated, vegetation mortaility targets etc that may require adaptive management. These triggers around progressive reclamations would come in future iterations of the reclamation and closure plan that has also been informed at that point by the reclamation research. Essentially, the outcomes of the research and monitoring programs will be used to inform "methods to be applied to detect when triggers or changes occur", basically the adaptive management measures for the actual reclamation of the mine.		LDN/UFN	BWG		Travis		19-Oct-22	TD, Oct 20	Ready for Publishing
831	Chapter 4 Appendix 4-A	Concordance	LDN_UFN Baylie Sjodin		Nov 17, 2022	5	Follow Up		Yes	Thank you for your response. It is understood that varying levels of programs have been established, and provide robust methods for monitoring. However, what is being asked here is to provide a numeric trigger point in which these robust methods will be deployed. For example, if X amount of vegetation cover in an area is not achieved in Y time, then method Z will be implemented. It is understood that under adpative management things will continually change, as it should. Yet, determining a trigger for this stage is not unreasonable, and reassures the Nations that certain parameters of concern will not go beyond a pre-determined level before adaptive management procedures are implemented. If these specific trigger points already exist in other plans, the reviewer is asking for a summarized list that is both easy for the Nations to understand and find, as well as the proponent to ensure these triggers are not accidentally overlooked from being scattered in various plans. Please see page 2 of Appendix A: Concordance Table with Environmental Assessment Certificate #M10-01 Conditions (June 21, 2019): Condition 3 (Adaptive Management) E within the End Land Use Plan for reference to this request. 834	Chapter 4 Appendix 4-A	Concordance	LDN_UFN Baylie Sjodin		Sep 01, 2022	3	Follow Up	Comment	No	There is no inclusion of mitigation targets for wildlife in sections 5.1.4 - 5.1.6	Refer to responses to comments 831 and 832. Also pls refer to the latest WMMP provided to to Indigenous Nations including LDN and UFN on August 4th, 2022.		LDN/UFN	BWG		Travis		Ready for Submission	TD, Sept 14	Ready for Publishing
834	Chapter 4 Appendix 4-A	Concordance	LDN_UFN Baylie Sjodin		Oct 06, 2022	4	Follow Up	Comment	No	Sections 5.1.1.3 and 5.1.2 provide some information on mitigations surrounding VC's but do not provide detail or reference to "monitoring for those targets", please make this edit within this plan to clearly meet the condition listed in reviewer's original comment.	Unfortunately, the EAC condition is awkwardly worded - where it states "mitigation targets" for the End Land Use Plan (ELUP) (Condition 25.e) it is referring to targets for end land use objectives. The first objective of the ELUP (Section 2) is to "Establish end land use objectives", which are listed in Section 5.1, with the first objective being "1) A mix of sustainable conditions supporting wildlife habitat, traditional and current use by Indigenous peoples. and the second one being "2) Self-sustaining vegetation that will progress to plant communities similar to pre-disturbance ecosystems as supported by the results of the ecohydrological modeling". Representative species/Valued Components were then chosen, in consultation with Indigenous groups and suitable habitat for these species identified in Appendix A (and repeated in Tabled 5.1-1 and 5.1-3 of the ELUP). Habitat for these species is listed as a reclamation priority, with specific vegetation communities listed as objectives for each mine component at closure. Post closure monitoring of these reclamation priorities is discussed in Section 5.1.5 to determine if these communities have been established, and a adaptive management framework is proposed in Section 5.1.6.		LDN/UFN	BWG				19-Oct-22		
835	Chapter 4 Reclamation and Closure Plan Table 4-7-1 and Other Sections (not specified)	General Comment	CSFN (Farzad Mohamm, Rina Freed, et al.)	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Jun 06, 2022	1	New	Clarification	No	We note some inconsistencies in the Chapter 4 that make the review process difficult. For example, Table 4-7-1 shows that the reclamation of the Low-Grade Ore (LGO) stockpile will start in both years 22 and 24.	Reclamation of the pad and infrastructure where the LGO was previously located will start in year 24, thank you for noting this. BW Gold will not be making further edits to the Application at this time. However, BW Gold will track substantive errors and omissions and will provide a memo that corrects them.		CSFN	IEG			TD	Ready for Submission	TD, Jun 23	Ready for Publishing

836	Chapter 4 Reclamation and Closure Plan Section # not provided: Mitigation Planning and Closure Cost Estimate	Exceeding WQG's in Post-Closure and Mitigation Requirements	CSFN (Farzad Mohamm, Rina Freed, et al.)	BW Gold Ltd.	Jun 06, 2022	1	New	Recommendation	No	Water quality predictions indicate the effluent in post-closure is predicted to cause exceedances of the BC Water Quality Guidelines (WQGs) in the downstream receiving environment (as identified in LGL's review submitted with this document). We note that these exceedances are not predicted for the mine operations phase. The Reclamation and Closure Plan (RCP) needs to include mitigations that succeed in reaching the BC WQGs in the receiving environment as a minimum goal. During the post-closure phase, the goal is to return the land and water to the original state to the extent possible. Water quality should improve in post-closure, not deteriorate following mine operations. During the EA there were commitments made to reach water quality guidelines during all project phase (see EAC Condition 27, Water Quality Management included herein). Condition 27: During Construction, Operations, Closure, and Post-Closure, the Holder must ensure the Project does not cause downstream water quality to exceed BC Water Quality Guidelines, unless the Holder has developed and ENV has accepted one or more Science Based Environmental Benchmarks (SBEBs), in which case the accepted SBEB must not be exceeded. Downstream water quality includes water quality in, at a minimum, Davidson Creek and Creek 661, as monitored in accordance with paragraph (d) of this Condition While the EMA permit will not allow for increases post-closure without an amendment (and is not the concern we are raising), the EMLI permit under the Mines Act (MA) will need to reflect appropriate mitigations and bonding. Recommendation: The RCP must include additional mitigations that lead to target water quality objectives (i.e.. BC WQGs) being met in the receiving environment. Once this is achieved, then the closure cost estimate needs to be presented to show that the closure bond reflects the appropriate mitigations proposed. While closure plans can change over the project operational phase, a minimum goal and a method of achieving the minimum goal is essential in the current RCP. Having no plan to reach required water quality targets is not an acceptable approach. The RCP needs to be revised to	BW Gold will be required to submit updates to the MDSP and RCP plans every five years at a minimum, which will include water quality model updates. Furthermore, Provincial EA condition 34 requires BW Gold to prepare a Closure and Post-Closure Water Quality Management Plan prior to the commencement of Operations. This plan must be developed in consultation with Indigenous Groups, EMLI, and ENV and submit the plan to EAO for review at the time of planned commencement of operations. The plan must be updated at least every five years from the commencement of operations. This plan must consider mitigations and whether and how the water treatment technology differs from the technology proposed in the EA Application/Environmental Impact Statement. Moreover, Part 10, section 10.1.12 of the Health, Safety and Reclamation Code of Mines in BC (EMLI 2021) requires that a TSF has a water balance and water management plan for permitted life of the mine, prepared by a qualified person. After commencement of operations, the water balance and water management plans must be reconciled annually (Part 10, section 10.4.1). These updates may identify the need for science-based environmental benchmarks (SBEB). As required by EAC Condition 26, SBEBs must be developed in consultation with Indigenous Groups. The mitigations proposed for construction and operations are described in the Mine Site Water and Discharge Monitoring and Management Plan (MSDP; Appendix 9-E). Section 11 of the MSDP includes a groundwater adaptive management plan and contingency measures actions, which include pumping wells. Closure costs will be assessed by EMLI when it determines the closure bond for the Project. BW Gold has proposed additional closure research projects related to water treatment. These include use of constructed wetlands for treating water and pit lake amendments to improve water quality in the pit lake. All this said, BW Gold has been working to optimize water management during the Closure and Post-Closure phases of the mine with a view to improving water quality predictions during these phases and looks forward to presenting these results to the MRC. If these optimizations are adopted as the base case, BW Gold commits to updating the closure cost estimate in a later review phase accordingly.		CSFN	BWG		Ryan	TD	Ready for Submission	RT; June 13	Ready for Publishing
837	Chapter 4 Reclamation and Closure Plan Section # not provided: Mitigation	Concerns LGO ARD Liability	CSFN (Farzad Mohamm, Rina Freed, et al.)	BW Gold Ltd.	Jun 06, 2022	1	New	Information request	No	We have strong concerns with using bonding to address the proposed large LGO ARD liability (on the order of $450 Million). We have raised these concerns in our review comments for chapter 3. In addition, we raise these concerns with Chapter 4 and the RCP given that reducing liabilities and reducing bonding is a win-win for all parties including BW Gold. We are interested in reducing the closure bond - e.g., through exploration of the mitigation options for LGO. Discussion on this topic is ongoing and welcomed.	BW Gold provided the reclamation cost estimate to LDN and UFN on May 4, 2022. This estimate includes the cost of the LGO contingency.		CSFN	BWG		Ryan	TD	Ready for Submission	RT; June 13	Ready for Publishing
838	Chapter 4 Reclamation and Closure Plan Section 4.11	Reclamation Cost Estimate	CSFN (Farzad Mohamm, Rina Freed, et al.)	BW Gold Ltd.	Jun 06, 2022	1	New	Information Request	No	We expect that a collaborative, good faith effort will be made to work with the Nations on the review of the RCP including the closure cost estimate. For the Ascot project permitting, the closure cost estimate that was submitted to EMLI was provided to the Nation (on a confidential basis). This was a collaborative review that has recently wrapped up and has been successful. We are disappointed and strongly concerned with the statements in the RCP, Section 4.11 as shown below: "4.11 Reclamation Cost Estimate: A security estimate has been submitted separately for confidential review by EMLI as per Section 10.1.3(i) of the Code" We have strong concerns with BW Gold not providing any information to the Nations. When all need to make efforts to reach consensus and be transparent. Providing information creates a positive atmosphere rather than a lack of trust and animosity. Providing this information may be required by participation agreements or agreements being drafted. In addition, EMLI may require the information be provided . If the information is provided, then we work collaboratively with EMLI and the proponent to understand and reflect on the closure cost estimate. If a proponent does not provide a closure cost estimate at all, this leaves us with the feeling that collaboration is not taken seriously and there is a lack of transparency (i.e.., the proponent is hiding information about the bonding). If the information is provided, then we work collaboratively with EMLI and the proponent to understand and reflect on the closure cost estimate. If a proponent does not provide a closure cost estimate at all, this leaves us with the feeling that collaboration is not taken seriously and there is a lack of transparency (i.e.., the proponent is hiding information about the bonding). Significant problems for the Nations exist without information being provided including the need to complete the cost estimation process without input from the proponent. There are also potential risks of unfunded liabilities in the event we cannot review this critical information. However, the impact or harm to BW Gold (from providing this information) is unclear. Being transparent and collaborative with Nations is expected of proponents. There is a very brief clause on confidentiality for closure cost estimates in the MA (a very short phrase). We have had numerous conversations with EMLI staff, and we generally agree with EMLI staff on the topic of providing closure cost estimate information to Nations to review in confidence, similar to the	BW Gold provided the reclamation cost estimate to LDN and UFN on May 4, 2022.		CSFN	BWG		Ryan	TD	Ready for Submission	RT; June 13	Ready for Publishing
839	Chapter 4 Reclamation and Closure Plan Section # not provided: Mitigation Planning and Closure Cost Estimate	Water Treatment Operation and Maintenance Costing Information	CSFN (Farzad Mohamm, Rina Freed, et al.)	BW Gold Ltd.	Jun 06, 2022	1	New	Recommendation	No	Please provide in the RCP a detailed discussion of Closure and Post-Closure water treatment operation and maintenance plans along with all associated costing information. This is important considering that the proposed membrane treatment process requires diligent maintenance and experienced operators to ensure continuous operation. Moreover, the water treatment requirements for LGO must be considered. Based on the water quality modelling results and the ML/ARD plan, seepage at the toe of the LGO pile is highly acidic and requires a large amount of lime reagent for neutralization. The treatment also produces relatively large quantities of solid by-products including gypsum and metal-laden waste that according to the application will be stored in the TSF. Recommendation: All-inclusive costs of treatment must be provided in the RCP which includes, but is not limited to factors such as maintenance, operations, residue management, labour, reagents, and power. This also applies to the metals removal treatment plant that will treat pit water during the operation and NF brine thereafter. Costs associated with water management and treatment must be all-inclusive covering all necessary contingency measures.	BW Gold provided the reclamation cost estimate to LDN and UFN on May 4, 2022. The estimate includes all-inclusive water treatment costs and has been prepared in accordance with applicable guidance.		CSFN	BWG		Ryan	TD	Ready for Submission	RT; June 13	Ready for Publishing
840	Chapter 4 Reclamation and Closure Plan Section # not provided: Mitigation Planning and Closure Cost Estimate	Closure Costs Associated with TSF Coverage and Seepage	CSFN (Farzad Mohamm, Rina Freed, et al.)	Rolf Schmitt, P Geo.; ERM Consultants Canada Ltd.	Jun 06, 2022	1	New	Recommendation	No	Chapter 4 states that a total of 130 cm of cover material will be placed over PAG rock to prevent seepage but does not provide costing information for the mitigation measure implemented. This information is required for technical/costing review to ensure the planning and scale of efforts is reasonable. Recommendation: Chapter 4 should include closure costing for key mitigations including covers and seepage.	In accordance with Section 10.1.3(i) of the Code and section 4.11 of the 2019 Joint Application Information Requirements, a mine closure and reclamation cost estimate for the Blackwater Mines Act/Environmental Management Act Permits Application has been submitted to EMLI for review and establishment of bonding security. The cost estimate includes costing for mitigation.		CSFN	ERM		Rolf	RT	Ready for Submission	RT; June 27	Ready for Publishing

841	Chapter 4 Reclamation and Closure Plan Section # not provided: Management and Treatment of Water and Tailings	Requirement for Water Treatment	CSFN (Farzad Mohamm, Rina Freed, et al.)	BW Gold Ltd.	Jun 06, 2022	1	New	Recommendation	No	In post-closure, surplus water from the pit lake and TSF will be discharged into the environment. The application is not clear if water treatment for discharge is required post-closure. In some instances, it is mentioned "if treatment is required" and in others, "treatment is required". This is confusing to the reader. The results of water quality modelling show water treatment is required post-closure and this should be clearly and consistently stated throughout the text. Recommendation: The application should be clear and consistent on the treatment required post-closure.	Water treatment is required in post-closure. The current approach is to treat water using membrane treatment. BW Gold is planning closure research projects to determine if alternate treatments are viable (i.e.. wetlands or pit lake amendments). If either or both of these reclamation strategies are proven, membrane water treatment may not be required for all of the mine site water remaining on site. The language is intended to reflect that opportunity. BW Gold will be required to submit updates to the MDSP and RCP plans every five years at a minimum, which will include water quality model updates. Furthermore, Provincial EA condition 34 requires BW Gold to prepare a Closure and Post-Closure Water Quality Management Plan prior to the commencement of Operations. This plan must be developed in consultation with Indigenous Groups, EMLI, and ENV and submit the plan to EAO for review at the time of planned commencement of operations. The plan must be updated at least every five years from the commencement of operations. This plan must consider mitigations and whether and how the water treatment technology differs from the technology proposed in the EA Application/Environmental Impact Statement. Moreover, Part 10, section 10.1.12 of the Health, Safety and Reclamation Code of Mines in BC (EMLI 2021) requires that a TSF has a water balance and water management plan for permitted life of the mine, prepared by a qualified person. After commencement of operations, the water balance and water management plans must be reconciled annually (Part 10, section 10.4.1). These updates may identify the need for science-based environmental benchmarks (SBEB). As required by EAC		CSFN	BWG			TD	Ready for Submission	rt; June 13	Ready for Publishing
842	Chapter 4 Reclamation and Closure Plan Section # not provided: Management and Treatment of Water and Tailings	Water Treatment Objectives	CSFN (Farzad Mohamm, Rina Freed, et al.)	Lorax Environmental Services Ltd.	Jun 06, 2022	1	New	Recommendation	No	Contaminants of potential concern (COPCs) are predicted to exceed BC Water Quality Guidelines (WQGs) including ammonia, lead, arsenic, and cadmium (for post closure). For example, Nanofiltration (NF) membrane filtration is proposed for treatment of the contaminated water combined with treatment of the brine before disposal in the pit. While NF can produce clean water for discharge, it does not destroy COPC. As such and considering that the proposed brine treatments with either sulphide or ferric iron reagents only target metals and metalloids, ammonia and other nitrogen species, as well as sulphate and thiosalts, are naturally expected to build up in the water. Specifically, while they can take many forms and are difficult to measure accurately, thiosalts are toxic to aquatic organisms at concentrations significantly lower than sulphate. There is an example site referenced in the Abitibi region for the decay rate of nitrogen species. There are also many similar operations in BC with elevated concentrations of thiosalts in the water. The proposed brine treatment can also result in the accumulation of several COPCs in the pit lake over time that eventually impacts the quality of the NF-treated discharge water to the point of non-compliance or toxicity. Recommendation: Please clearly state the COPCs that will require treatment as well as how each one will be treated to avoid accumulation and non-compliance with BC WQGs.	In the post-closure period, COPCs requiring treatment include sulphate and certain metals and metalloids with aquatic life guidelines (e.g., As, Cd, Cu, Mn, Pb, Sb, Zn). Loading sources for these COPCs include the ECD, open pit and upper waste stockpile. While NF treatment does not destroy COPCs, pre-treatment using ferric salts and sulphide reagents will result in the removal of some COPCs (e.g., metals) from solution (as precipitates). Other COPCs not removed during NF treatment (e.g., nitrogen compounds, cyanide species) will report with the brine to the pit lake. The discharge of brine to the pit lake bottom will serve to engineer stratification and minimize potential for brine entrainment to the treatment system. It is acknowledged that there is a finite capacity for brine storage, and therefore there is the potential over the long-term (after multiple decades) for accumulated products to influence the influent characteristics to the NF plant and its efficiency. Post-Closure water management and treatment will be evaluated in further detail in future regulatory submissions.		CSFN	Lorax			GM	Ready for Submission	GM; June 14	Ready for Publishing
843	Chapter 4 Reclamation and Closure Plan Section # not provided: Management and Treatment of Water and Tailings	Organic Fouling of Membranes - Long Term Operation	CSFN (Farzad Mohamm, Rina Freed, et al.)	Lorax Environmental Services Ltd.	Jun 06, 2022	1	New	Recommendation	No	NF and in general membrane treatment use antiscalant to avoid fouling. Anticalins are typically organic molecules that are dosed into the water in small quantities to avoid precipitation of scaling substances such as gypsum or calcite or organic matter. Antiscalant reports to the brine which will be recycled to the pit. This means the pit will be supplied with a steady stream of nutrient organic matter that will result in bacterial growth and therefore, subsequent fouling of the NF membrane elements similar to what is expected to occur from vegetation growth on TSF beach. Additionally, bacterial activity in the pit can result in the formation of metal-organic complex molecules that will further stabilize metals in the water. Recommendation: Please clearly state how the recycling of organic antiscalant to the pit is expected to impact the overall water quality over time and if additional measures may be required to ensure compliance with WQG.	Firstly, the dosing of antiscalants will be optimized to minimize the addition of non-reacted antiscalant to the effluent stream. Secondly, any excess and potentially bioavailable antiscalants will report to the pit bottom in the stratified pit lake. While these organic molecules could potentially affect metal biogeochemistry in the hypolimnion, such molecules will be isolated from the lake surface layer and biosphere. Accordingly, potential impacts can be minimized. This topic will be further examined as part of the pit lake research and reclamation program, and operational WTP monitoring.		CSFN	Lorax			GM	Ready for Submission	GM; June 14	Ready for Publishing
844	Chapter 4 Reclamation and Closure Plan Section # not provided: Management and Treatment of Water and Tailings	Maintaining and Re-establishing Pit Stratification	CSFN (Farzad Mohamm, Rina Freed, et al.)	Lorax Environmental Services Ltd.	Jun 06, 2022	1	New	Recommendation	No	Should pit filling occur before or following full mine buildout, discharges into the pit must be engineered at depth or in such a way that promotes stratification to occur. Recommendation: Please detail the plans to ensure that pit stratification is achieved. Please describe methods to promote stratification. While the methods could be expected to be improved with time, minimum requirements should be defined and required in the permitting to avoid unexpected situations from developing. Closure commitments must be defined to maintain stratification to the extent possible and re-establish stratification if it is lost.	Previous pit lake modelling in the absence of brine addition (Lorax, 2016) showed the development of a meromictic density structure. This reflects the natural tendency of this system to develop a cleaner surface water layer over time in response to pit wall submergence and increase in direct precipitation to pit lake surface. Stratification will only be strengthened by the deposition of brine to the base of the pit lake. Additional details and specifics for the pit lake will be described in response to Provincial EA condition 34, "Closure and Post-Closure Water Quality Management Plan." The plan will be completed prior to the commencement of Operations. The creation and maintenance of the pit lake is best conceptualized and detailed holistically with the suite of Closure and Post-Closure water management strategies. Reference: Lorax Environmental Services Ltd. 2016. Blackwater Gold Project – Pit Lake Model Results Relating to Water Column Stratification and Mixing. Memorandum prepared for New Gold Inc. Prepared by Lorax Environmental Services Ltd. July 27, 2016. 845	Chapter 4 Reclamation and Closure Plan Section # not provided: Management and Treatment of Water and Tailings	Strategy for Long-term Operation of a Complex Water Treatment Plant	CSFN (Farzad Mohamm, Rina Freed, et al.)	BW Gold Ltd.	Jun 06, 2022	1	New	Recommendation	No	The need for long-term complex water treatment is a concern and not ideal for a mine design. This poses a risk as it is difficult to maintain water treatment long-term in a remote location. A robust strategy is required to maintain complex water treatment long-term. Please include proposed methods to reduce this risk. This is especially important because the treatment process selected for long-term operation involves membrane filtration that has a high risk of fouling. Therefore, to ensure compliance, the plant must be operated under optimal conditions and maintained regularly, which necessitates the development of a robust strategy and plan. Recommendation: Please include a strategy and plan that ensures the long-term operation of the membrane treatment plant is successful.	BW Gold will be required to submit updates to the MDSP and RCP plans every five years at a minimum, which will include water quality model updates. Furthermore, Provincial EA condition 34 requires BW Gold to prepare a Closure and Post-Closure Water Quality Management Plan prior to the commencement of Operations. This plan must be developed in consultation with Indigenous Groups, EMLI, and ENV and submit the plan to EAO for review at the time of planned commencement of operations. The plan must be updated at least every five years from the commencement of operations. This plan must consider mitigations and whether and how the water treatment technology differs from the technology proposed in the EA Application/Environmental Impact Statement. Moreover, Part 10, section 10.1.12 of the Health, Safety and Reclamation Code of Mines in BC (EMLI 2021) requires that a TSF has a water balance and water management plan for permitted life of the mine, prepared by a qualified person. After commencement of operations, the water balance and water management plans must be reconciled annually (Part 10, section 10.4.1). These updates may identify the need for science-based environmental benchmarks (SBEB). As required by EAC Condition 26, SBEBs must be developed in consultation with Indigenous Groups. Furthermore, EAC condition 34 requires development of a closure and post-closure phase WQ management plan, which must be updated every 5 years from the commencement of operations, based on the notion that BW Gold's understanding of the site will change over time and good practice suggests that understanding be used to further optimize plans. The mitigations proposed for construction and operations are described in the Mine Site Water and Discharge Monitoring and Management Plan (MSDP; Appendix 9-E). Section 11 of the MSDP includes a groundwater adaptive management plan and contingency measures actions, which include pumping wells. Closure costs will be assessed by EMLI when it determines the closure bond for the Project. BW Gold has proposed additional closure research projects related to water treatment. These include the use of constructed wetlands for treating water and pit lake amendments to improve water quality in the pit lake.		CSFN	BWG		Ryan	TD	Ready for Submission	RT; June 13	Ready for Publishing

846	Chapter 4 Reclamation and Closure Plan Section # not provided: Management and Treatment of Water and Tailings	Water Treatment Contingency Plans	CSFN (Farzad Mohamm, Rina Freed, et al.)	BW Gold Ltd.	Jun 06, 2022	1	New	Recommendation	No	Considering that water treatment is required for an extended period post-closure, please include contingency planning for this period to lower the risk of treatment failure/shutdown and non-compliance. These plans and measures can include duplicate installation of critical systems as well as maintaining inventory of spare parts. Recommendation: Develop detailed contingency plans for water treatment post closure. Water treatment is an important aspect of post-closure reclamation and requires contingency planning to ensure success and compliance.	BW Gold will be required to submit updates to the MDSP and RCP plans every five years at a minimum, which will include water quality model updates. Furthermore, Provincial EA condition 34 requires BW Gold to prepare a Closure and Post-Closure Water Quality Management Plan prior to the commencement of Operations. This plan must be developed in consultation with Indigenous Groups, EMLI, and ENV and submit the plan to EAO for review at the time of planned commencement of operations. The plan must be updated at least every five years from the commencement of operations. This plan must consider mitigations and whether and how the water treatment technology differs from the technology proposed in the EA Application/Environmental Impact Statement. Moreover, Part 10, section 10.1.12 of the Health, Safety and Reclamation Code of Mines in BC (EMLI 2021) requires that a TSF has a water balance and water management plan for permitted life of the mine, prepared by a qualified person. After commencement of operations, the water balance and water management plans must be reconciled annually (Part 10, section 10.4.1). These updates may identify the need for science-based environmental benchmarks (SBEB). As required by EAC Condition 26, SBEBs must be developed in consultation with Indigenous Groups. The mitigations proposed for construction and operations are described in the Mine Site Water and Discharge Monitoring and Management Plan (MSDP; Appendix 9-E). Section 11 of the MSDP includes a groundwater adaptive management plan and contingency measures actions, which include pumping wells. 847	Chapter 4 Reclamation and Closure Plan Section # not provided: Management and Treatment of Water and Tailings	Closure of TSFs and Waste Stockpiles	CSFN (Farzad Mohamm, Rina Freed, et al.)	Knight Piésold Ltd. and ERM Consultants Canada Ltd.	Jun 06, 2022	1	New	Recommendation	No	The proposed closure of TSF-C and TSF-D is conceptually described in 3.5.3.15 and Chapter 4. While the concepts described are consistent with what is expected for closure of TSFs, it should be noted that given the stated intention for tailings placed during the final years of mine operation to enable positive draining of tailings beaches, tailings, and waste rock placement in both TSFs must be consistently managed throughout the Life of Mine (LoM) with tailings beaches maintained so that the desired closure configurations reportedly shown in Figure 4.1-5 can be achieved. Recommendation: The validity of the closure concepts proposed for TSF-C and TSF-D can only be realized through preparation of clear guidelines and consistent operations practice. As such, Chapter 3 and 4 should specify that in accordance with the Mines Act and requirements provided by EGBC and the Canadian Dam Association, the details of how the dams will be operated to achieve the described closure configuration will be provided in the operations, maintenance, and surveillance (OMS) documents that will be prepared for each TSF during the early stages of mine operations i.e.., ideally by the end of Year 1 for TSF-C and by end of Year 5 for TSF-D. While Chapter 3 indicates that an OMS document will be prepared, the Application should make an important link between how TSFs are operated and the ability to achieve the closure configurations contemplated.	This comment is acknowledged. The JAIR requires that the Application include a closure concept for the site, including for the TSF. The Health, Safety and Reclamation Code of BC (the Code) requires an update of the reclamation and closure plan at least every five years (section 10.4.1). As such, based on the actual mine development that has occurred during the prior five years, the plan will be updated/revised to reflect any changes to the closure concept for the site, including for the TSF. This process will be repeated throughout the mine life. As the timing for the end of the mine life approaches, additional details will be developed regarding the placement of the final surfaces of the TSF, which will be based on the actual facility configuration at that point in time. The Operations, Maintenance and Surveillance (OMS) Manual for the TSF is required prior to the start of the Operations phase of the TSF (section 10.5.2 of the Code). This will include the items identified in the Code Guidance Document (July 2016) (section 4.4), with reference to the Canadian Dam Association (CDA) Dam Safety Guidelines, as well as the Mining Association of Canada (MAC) 'Developing an Operation, Maintenance and Surveillance Manual for Tailings and Water Management Facilities'. Hence, the Code, under the Mines Act, provides the necessary requirements of the permittee to utilize those organizations that inform on the safe design, operation and closure of a TSF. The TSF has been designed with closure in mind, and through the ongoing updates to the reclamation and closure plan and TSF OMS, adjustments to the closure concept will keep pace as the mine develops. 848	Chapter 4 Reclamation and Closure Plan Section 3.5.4.1	Reclamation Media	CSFN (Farzad Mohamm, Rina Freed, et al.)	Justin Straker, M.Sc, P.Ag Integral Ecology Group and Rolf Schmitt, P Geo. ERM Consultants Canada Ltd..	Jun 06, 2022	1	New	Recommendation	No	Information related to the management and preservation of salvaged overburden for use during progressive of final closure and reclamation is sparse and inconsistently presented in Chapter 4. Recommendation: Section 3.5.4.1 should provide a table that clearly indicates estimated quantities for overburden that will be stripped and a schedule for placement and utilization of these materials. The section should also provide a description of the measures that will be taken to preserve the quality and existence of overburden salvaged for progressive and closure reclamation activities. As this section is currently written, it is likely that overburden materials will be comingled with NAG rock stored in the Lower Waste Stockpile and the Upper Waste Stockpile. Since reclamation media must be of a certain gradation and organic quality, it is recommended that mine planners demonstrate how overburden materials that have been salvaged and considered as sources for final cover soils to be revegetated will be preserved during the LoM. Failure to do this will ensure that as happens at many mines, overburden stockpiles eventually become buried and needed reclamation media becomes increasingly unavailable during the LoM to complete reclamation activities.	Information related to OVB is presented in Chapter 4, primarily Section 4.2.1 (Soil Resources) and the Soil Management Plan (Appendix 9-B). Section 4.2.1.2 (Reclamation-material Demand) describes the volumes estimated to be stripped. Section 4.2.6.1 (Reclamation-materials Stockpiling) and Section 4.2.1.7 (Reclamation-materials Replacement) describe monitoring and best practices for soil stockpiling and replacement. Monitoring, including evaluation against suitability criteria from Section 4.2.1.5 (Reclamation-material Suitability and Salvage), are in place to verify that reclamation materials meet suitability criteria. Stockpile design information is presented in Appendix 3-N (Stockpiles Geotechnical and Water Management Design Report). Material for reclamation will be progressively stripped as the mine is developed and stored in designated locations. In the case of overburden, material stripped over the first 10 years that is not required for construction will be stockpiled in the LWRSF. The remaining overburden stripped from years 11 to 14 will be stored in the UWRSF. Overburden in the LWRSF will be segregated from NAG rock by stockpiling within a designated location of the stockpile footprint. A detailed survey record of the material will be generated to allow the majority to be rehandled for reclamation. A small amount of co-mingling will occur at the contact boundary.		CSFN	IEG	KP		TD	Ready for Submission	RTI June 18	Ready for Publishing
849	Chapter 4 Reclamation and Closure Plan Not Specified	Standalone Reclamation and Closure Plan Required	CSFN (Farzad Mohamm, Rina Freed, et al.)	BW Gold Ltd.	Jun 06, 2022	1	New	Recommendation	No	Source has reviewed Chapter 4 of the Application. A missing appendix to Chapter 4 appears to be the Reclamation and Closure Plan (as a standalone report, not only a chapter of the Application). Please clarify where the RCP is located or if it has been provided. While there is a Chapter (Chapter 4) of the Main Application, proponents are typically required to produce a standalone RCP with appropriate appendices. There are many examples or RCPs for mining projects in BC and the requirements are provided by EMLI Recommendation: Please confirm with EMLI the requirements for the RCP and let the Nations know if more information will be provided in addition to Chapter 4 and the current appendices.	BW Gold understands that the providing the RCP as Chapter 4 meets IRT requirements; no additional stand-alone plan is forthcoming.		CSFN	BWG		Ryan	TD	Ready for Submission	RT; June 13	Ready for Publishing

853	Chapter 4 4.1 End Land Use and Capability Objectives	End land use goals and wording choice	LDN_UFN		Jun 06, 2022	1	New		No	"The closure and end land use goals for the Project on lands and waters that are disturbed by mine activities are to reclaim ecosystems to achieve an average land and water capability in these areas not less than that existing prior to Project development (see Section 4.1.1, Regulatory Context for more detail)." The phrasing average land and water capability implies that some ecosystems may be left better or worse as long as the average is equal to pre-development conditions. It is understood this wording has been incorporated from Section 10.7.5 of the Code. Despite complication with some habitats (i.e.., wetlands and whitebark pine) BW Gold should consider phrasing that emphasizes that equal to or better ecosystem quality will be the number one priority for all reclamation.	BW Gold appreciates the comment. Owing to challenges in reclamation of post-mine ecosystems (some of which are noted by the reviewer), BW Gold will not be making the suggested change to the RCP language.	No	LDN/UFN	ERM	IEG	Rolf - Peter	RT	Ready for Submission	RT; June 29	Ready for Publishing
853	Chapter 4 4.1 End Land Use and Capability Objectives	End land use goals and wording choice	LDN_UFN		Jul 22, 2022	2	Follow Up	Comment	No	We recognize there are challenges in reclamation of post-mine ecosystems but it is important that you mention the priority of reclaiming ecosystems to equal or better quality post-mine. This recognizes that, yes, it may result in "average" land and water capability, but Artemis will prioritize reclaiming ecosystems to equal or better quality,	Thank you for your comment. BW Gold disagrees with the suggested revision and will not make the change, as this constitutes no substantive change from what "average" means.	No	LDN/UFN	ERM	IEG	Rolf - Peter	RT	Ready for Submission	CB; July 29	Ready for Publishing
853	Chapter 4 4.1 End Land Use and Capability Objectives	End land use goals and wording choice	LDN_UFN Baylie Sjodin		Sep 01, 2022	3	Follow Up	Comment	No	This is not about defining what "average" means, but providing written confirmation that Artemis will strive to leave better quality ecosystems than what was previously found. Given the massive impacts the mine will have on Tradittional Lands for generations it is not an unreasonable ask to leave it better than before the project. Wording is not committing to actually achieving it, but instead committing to trying your absolute best for a better end product as compensation for the effects it caused. These lands are important to the Nations and should be treated as such by the proponent.	BW Gold appreciates the continued discussion on this topic. We reiterate that it is important to acknowledge the challenges in reclamation of post-mine ecosystems as the reviewer continues to note, and will not be making wording changes to commit to an end reclamation state that "guarantees a better end product" as "compensation" for mining effects. There are other "offsetting" plans such as the fish offsetting plan. BW Gold has outlined the ongoing process of reclamation research, updates to ecohydrological modelling and commits to update management plans including the RCP. We sincerely believe that the combination of these collaborative efforts and learnings by all parties through LOM will prepare for a successful reclamation end product.		LDN/UFN	ERM	IEG	Rolf - Peter	TD	Ready for Submission	TD, Sept 14	Ready for Publishing
854	Chapter 4 4.1.2.2 Post-mine Land Capability	Typo	LDN_UFN		Jun 06, 2022	1	New		No	As discussed in Section 4.2.1, Soil Resources, thtree groups of reclamation materials have been identified for reclamation: glaciofluvial surface soil and mixed-mineral surface soil (i.e.., non-glaciofluvial mineral soils), and organic surface soil.	The comment is acknowledged, however the application is not being updated at this time.	No	LDN/UFN	ERM			RT	Ready for Submission	RT: June 25	Ready for Publishing
855	Chapter 4 4.2.5.2 Whitebark Pine	Local opportunities	LDN_UFN		Jun 06, 2022	1	New		No	"A whitebark pine nursery will be established either on the mine site or in one of the nearby communities to grow seed collected from the local area and adapted to local climatic conditions. These seedlings will be used in reclamation planting. The location of the nursery has not yet been confirmed." This is an opportunity to develop a nursery which is located and run by a local community. This could create a long-term business opportunity for the community after BW Gold is closed and reclaimed. This option should be explored in preference to a BW Gold run nursery.	The comment is acknowledged.	No	LDN/UFN	ERM		Ben	RT	Ready for Submission	RT; June 29	Ready for Publishing
855	Chapter 4 4.2.5.2 Whitebark Pine	Local opportunities	LDN_UFN		Jul 22, 2022	2	Follow Up	Comment	No	Please provide some detail or update on how this will be considered and reasons for not pursuing it, if applicable.	BW Gold is interested in hearing more about the Nations' interest in a nursery business, however this discussion is beyond the scope of the Joint Application.	No	LDN/UFN	ERM		Ben	RT		RT; Aug. 14	Ready for Publishing
856	End Land Use Plan General	Compliance	LDN_UFN		Jun 06, 2022	1	New		No	Condition 25a: "a definition and description of the pre-mining land and water capability and land and water use conditions, using maps and tabular inventories, with respect to ecosystems and habitats and other uses in the area of the Project Area disturbances;" Pre-mine aquatic ecosystem capability is referenced in Chapter 2, however this is not part of the EAO process and must be included within this plan to meet the condition. There is no table or map used to define/describe the pre-mining water capability.	Thank you for your response - the requirements of the EAC condition are beyond the scope of the joint application review. However, the feedback is appreciated and will be used to inform future updated to the EAC condition 25 plan.	No	LDN/UFN	ERM		Ben	RT	Ready for Submission	RT; June 29	Ready for Publishing

857	End Land Use Plan General	Compliance	LDN_UFN		Jun 06, 2022	1	New		No	Condition 25b: "a definition and description of the predicted post-closure land and water capability and land and water use conditions" Similarly to above, very little is mentioned for post-closure water capability within this plan. Additionally, elaboration on the predicted post-closure land and water capability and land and water use conditions with respect to ability to exercise Aboriginal Interests needs to be included.	Thank you for your response - the requirements of the EAC condition is beyond the scope of the joint application review. However, the feedback is appreciated and BW Gold wishes to point the reader to the following information within the joint application: It is noted that this current gap in understanding as it relates to water capability is understood, as discussed in Section 4.7.11 with reference to riparian units: "As watercourses such as diversions and collection ditches are constructed and hydrologic characteristics understood, riparian revegetation prescriptions (Table 4.2-7) can be adapted for use in reclamation of these features. The species assemblages supported by riparian areas are dependent upon channel morphology and seasonality of water flow, with the width of effective riparian areas for revegetation purposes also being influenced by lateral seepage patterns. For these reasons, watercourses have not been explicitly mapped as revegetation units in Figure 3.3-15 in Chapter 3, Mine Plan at this stage of closure planning. Updated mapping of riparian areas will be conducted closer to closure, with reclamation prescriptions refined in consultation with appropriate groups." Land and water use conditions are further discussed in Section 4.1.3: "This holistic approach is highlighted in Table 4.1-5, which compares and contrasts pre-mining ecosystems with projected post-mining ecosystems in regards to BGC unit, site series, SMR/SNR, area (ha), representative species, community members, key habitat features and vegetation species, focal reclamation species, expected species present at different stages of habitat regeneration, where that regeneration is expected to occur on the closed mine site and applicable reclamation research."	/TD to revie	LDN/UFN	ERM		Rolf?	RT	Ready for Submission	RT: June 28	Ready for Publishing
858	End Land Use Plan General	Compliance	LDN_UFN		Jun 06, 2022	1	New		No	Condition 25e: "incorporation of mitigation targets related to valued components examined in the Application, including but not limited to wildlife and wildlife habitat, vegetation, and ecosystems, and monitoring for those targets" Mitigation targets related to valued components are not described in this plan. There is also no reference to a section where this might be included within the Table of Concordance (Appendix 4-A).	Mitigation targets are described in Appendix B (with a focus on Table 2). This reference will be added in the Table of Concordance, and the title of the appendix will be updated to include Vegetation (it will read: Reclamation and Closure Planning for Wildlife and Vegetation). BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Rolf	RT	Ready for Submission	RT; June 27	Ready for Publishing
859	End Land Use Plan General	Compliance	LDN_UFN		Jun 06, 2022	1	New		No	Section 4.2.7 should take into consideration the WMMP as well, as per condition 25f. The section references in the table of concordance do not match up with target sections in the plan. E.g. Section 4.9.5 does not exist.	Thank you for noting this. 871	Chapter 4 Reclamation and Closure Plan Section 4.7.5	Watercourse Reclamation Prescriptions	LDN_UFN		Jun 06, 2022	1	New		No	Provide details on mine site water management and the re-establishment of watercourses post-mining... Included, but under a different name and 4 subsections. Refer to the table of concordance for the Joint Mines Act/Environmental Management Act Application Information Requirements for specific sections in Chapter 4 applicable to watercourse reclamation	The following lists the requirements of Section 4.7.5 and the location in Chapter 4: 4.7.5 [*Provide details on mine site water management and the re-establishment*...]: In a future iteration of the Reclamation and Closure Plan, the watercourse reclamation prescriptions will refer to Mine Site Water and Discharge Monitoring and Management Plan (MSDP; Appendix 9-E). The MSDP provides a detailed mine site water management and describes water sources that will be potentially affected by ML/ARD and other mine effluents, and how contact water will be collected and treated to meet discharge water quality criteria	Yes	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 27	Ready for Publishing
872	Chapter 4 Reclamation and Closure Plan Section 4.7.5	Watercourse Reclamation Prescriptions	LDN_UFN		Jun 06, 2022	1	New		No	The one section referenced in 4.7.11 does not fully address the requirements of 4.7.5 in the JAIR Guidance Document. As indicated in Section 4.7.11, "watercourses have not been explicitly mapped as revegetation units in Figure 4.1-5 at this stage of closure planning. Updated mapping of riparian areas will be conducted closer to closure, with reclamation prescriptions refined in consultation with appropriate groups."	The Section 4.7.5 Joint Mines Act/Environmental Management Act Application Information Requirements (JAIR) are covered in several separate sections of Chapter 4 (see response to Comment #871). Table 4.2-7 (Vegetation Prescriptions for Projected Post-closure Ecosystems) of Chapter 4 provides vegetation prescriptions for riparian areas of watercourses to be reclaimed. As required by the JAIR, the practices to be implemented for watercourse restoration are provided in Section 4.7.11 of Chapter 4. Ongoing reclamation research (Section 4.2.5, Reclamation Research) and monitoring will inform refinement of detailed prescriptions over the life of mine. As stated in Section 4.2.5.1, riparian species will be tested separately. Riparian species will also be monitored through the Wetlands Management and Offsetting Plan with offsetting work happening at Mathews Creek. The grass/shrub ecosystem on dams is also not included in a specific trial, but results from seed mix development for erosion control will inform reclamation of this ecosystem type. Results of non-tree plant species tested in the vegetation trials will also inform revegetation of dams.	T/TD to revie	LDN/UFN	ERM		Tonia	RT	Ready for Submission	RT; June 27	Ready for Publishing
873	Chapter 4 Reclamation and Closure Plan Section 4.7.5	Watercourse Reclamation Prescriptions	LDN_UFN		Jun 06, 2022	1	New		No	Data has not been provided.	See response to Comment ID#872. The reclamation and closure prescriptions described in Section 4.7 of Chapter 4 have been developed in accordance with Section 10 of the Code to support the end land uses described in Section 4.1, End Land Use and Capability Objectives. Cover designs and planned ecosystems have been developed through ecohydrological modelling (Section 4.1, End Land Use and Capability Objectives; Section 4.2.1, Soil Resources; Section 4.2.3, Revegetation Strategy). 874	Chapter 4 Reclamation and Closure Plan Page 4-2	Area of disturbance	LDN_UFN		Jun 06, 2022	1	New		No	You say the total area of disturbance is expected to be 2200 ha, you need to define disturbance here. I assume this is the area of habitat destruction, as the footprint alone suggests that over 8360 ha will be 'Disturbed'.	Thank you for noting this. BW Gold will not be making further edits to the Application at this time. BW Gold will track substantive errors and omissions and will provide a memo that corrects them.	No	LDN/UFN	ERM		Rolf	RT	Ready for Submission	CB, 20-Jun	Ready for Publishing
874	Chapter 4 Reclamation and Closure Plan Page 4-2	Area of disturbance	LDN_UFN		Jul 27, 2022	2	Follow Up	Comment	No	The response provided by Artemis for this comment does not adequately address what the reviewer is asking. Please revisit original comment and provide a detailed response for clarification.	BW Gold acknowledges that the use of the term "disturbance" can sometimes be confusing. The Mines Act permit application refers to "disturbance area" as noted on page 4-2, which is an area within which the company seeks to undertake approved activities (which could be an entire range of activities ranging from clearing vegetation through to building construction, etc.). The area approved for disturbance may not be entirely disturbed at the same level of intensity, and invariably some habitat elements are likely to remain. The Mines Act permit area will be larger than the actual area of disturbance to provide for some flexibility at the component siting stage, but should not exceed the EAC CPD area. The detailed breakdown of disturbance areas in Table 4.1-4 provides detail on types of disturbance by ecosystem area arranged by BGC unit.	No	LDN/UFN	ERM		Rolf	RT	Ready for Submission	AT, Aug 09	Ready for Publishing
874	Chapter 4 Reclamation and Closure Plan Page 4-2	Area of disturbance	LDN_UFN Baylie Sjodin		Sep 01, 2022	3	Follow Up	Comment	No	Table 4.1-4 does not list the total disturbance of an area, but instead indicates BGC area pre- and post-mine operations. This does not answer the original question of describing what 2,200 ha of disburance is in reference to page 4-2. Requesting information that breaks down how the number 2,200 was calculated.	Page 4-2, Section 4 of the RCP states: "The proposed disturbance associated with this Application is approximately 2200 hecatares (ha)." BW Gold current analysis which informs the Reclamation and Liability Cost Estimate includes the following areas (all numbers in hectares as calculated from ArcGIS) which total 2039 hectares: Borrow Areas - 85.9; Laydown areas - 2.1; Open Pit - 226.9; Plant Site - 6.0; Roads and Linear structures - 46.5; Stockpiles - 421.0; Tailings Storage Faciltiy - 1185.4; Water Management Structures - 10.8; Water Treatment Plants - 0.7; Ancillary Facilities - 24.9; Crossings - 8.0; Plant Site - 21.3. An annual reconciliation of actual mine site disturbance will be required to be reported yearly in the Annual Reclamation Report.		LDN/UFN	ERM		Rolf		14-Sep-22		Ready for Publishing
875	Chapter 4 Reclamation and Closure Plan Figure 4.1-2:	Explanation	LDN_UFN		Jun 06, 2022	1	New		No	With all of these figures it would be helpful to either define the abbreviations on the figure or in a sentence below the figure as moving back and forth to the table is difficult and remembering all the abbreviations more so.	BW Gold will make the suggested revision. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Rolf	RT	Ready for Submission	CB, 17-Jun	Ready for Publishing
876	Chapter 4 Reclamation and Closure Plan table 4.1-2:	Accuracy	LDN_UFN		Jun 06, 2022	1	New		No	As BW Gold has not yet done a full assessment of wetland areas in the footprint I assume this table and the details regarding wetland area needs to be updated after 2022 baseline surveys are completed. This should be mentioned somewhere for the sake of clarity.	BW Gold will make the suggested revision. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	T/TD to revie	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT: June 24	Ready for Publishing

877	Chapter 4 Reclamation and Closure Plan Page 4-16	Optimistic prediction considering climate changes	LDN_UFN		Jun 06, 2022	1	New		No	The increase in the total area of submesic or drier ecosystems in the ESSFmv1 will favour lower tree densities and drought-tolerant tree species such as whitebark pine (Pinus albicaulis), particularly where coarse-textured glaciofluvial surface soils are used for reclamation (Section 4.2.1). I realize there is uncertainty but this seems optimistic considering the climate change predictions you present on page 4-26 which will most likely decrease whitebark pine suitability across the whole site. Best if you refer to the research trials that are going to be carried out to test success of WP at lower elevations.	Agreed. Updates to reflect this will be made in the next version of the plan. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	/TD to revie	LDN/UFN	IEG			TD	Ready for Submission	RT; June 18	Ready for Publishing
878	Chapter 4 Reclamation and Closure Plan Page 4-71	Caribou section needs updating according to the CMMP	LDN_UFN		Jun 06, 2022	1	New		No	Recent Negotiations between LDN, UFN, ECCC and BC have concluded the mine will have a significant effect on the recovery of Caribou, the result of this are significant new measures to offset the mines impact through restoration and habitat securement. The caribou information claiming no impact on this page is therefore wrong and needs updating based on the CMMP. The ratios used and the type of offsetting described also needs updating.	BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	/TD to revie	LDN/UFN	ERM		Greg/Hanna h	RT	Ready for Submission	RT: June 24	Ready for Publishing
878	Chapter 4 Reclamation and Closure Plan Page 4-71	Caribou section needs updating according to the CMMP	LDN_UFN		Jul 28, 2022	2	Follow Up	Comment	No	Please ensure this update is included in the next iteration of Chapter 4.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.								TD; Aug 16	Ready for Publishing
879	Chapter 4 Reclamation and Closure Plan General comment	Biological characteristics of the site	LDN_UFN		Jun 06, 2022	1	New		No	Although not a requirement and perhaps something that is done further down the line, a paragraph describing how the biological structure of the site will be mapped and used in restoration planning would add value to the plan. The remaining biological components of the site such as small tree groves, ponds, wetlands, CWD etc..., will act as the matrix providing a background structure that can be built upon. It will provide site variation by providing old habitat next to new, provide a matrix that animals can connect and disperse into the site and provide key habitats not available in newly restored areas, such as nesting, roosting, cover, denning and other key habitat features. This knowledge and mapping should be built up as the mine progresses and will make restoration planning easier and more effective.	BW Gold will make the suggested revision. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Greg	RT	Ready for Submission	RT: June 24	Ready for Publishing
880	Chapter 4 Reclamation and Closure Plan General comment	Land capacity	LDN_UFN		Jun 06, 2022	1	New		No	No reflection on how "no less than average pre-disturbances land capacity" can be achieved with considerably drier and less heterogenous landbase in the closure landscape.	Table 4.1-4 compares pre-mining and post-closure ecosystems, with some ecosystems gaining area in the post-closure landscape and some losing area. Drier ecosystems have greater capability for supporting some species and associated land uses, and lesser capability for supporting other species and land uses. Thus, it is difficult to make the average-capability comparison without selecting a species or land use on which the comparison will be based. Some might have higher post-closure capability, and some may have lesser capability.	No	LDN/UFN	IEG	ERM		TD	Ready for Submission	RT; June 18	Ready for Publishing
881	Chapter 9.1 EMS	Concordance with Section 9.1 of the 2019 Joint Application Information Requirements	LDN_UFN		Jun 06, 2022	0			No	"information on environmental standards and procedures, including all applicable sector-specific standards, guidelines, best management practices, and codes of practice (e.g., Responsible Care, CSA, ASTM, RISC, GWPR);" Joint Requirements asks for a comprehensive list - authors go on to provide a "not exhaustive list". Plus many of the references are incorrect or do not exist (e.g., Section 9.1.1.4)	The list of legislation, regulations, guidance and best management practices has been expanded and references checked.	No	LDN/UFN	ERM			RT	N/A		N/A
881	Chapter 9.1 EMS	Concordance with Section 9.1 of the 2019 Joint Application Information Requirements	LDN_UFN		Jun 06, 2022	1	New		No	"This list is not exhaustive given the number and range of guidance documents." The list is still not exhaustive, it's clear there are many documents but maybe these could be provided in an appendum to meet the requirement of having "all applicable sector-specific standards, guidelines, best management practices," etc.....?	The non-exhaustive list provided in Section 9.1 is meant to be a summary (an objective of Section 9.1) and avoid the potential for duplication error and requirement to update Section 9.1 each time an update is made to each management plan. In addition BW Gold took the approach to provide applicable exhaustive lists in each management plan because it facilitates implementation. BW Gold recognizes that the Application contains some omissions and will provide a memo that corrects them. With respect to Section 9.1 and future iterations of the Environmental Management System, the section of each management plan that provides the complete list of 'Compliance Obligations, Guidelines, and Best Management Practices' will be provided instead e.g., Section 4 of the Invasive Plant Management Plan.	No	LDN/UFN	ERM		Tonia	RT	Ready for Submission		Ready for Publishing
881	Chapter 9.1 EMS	Concordance with Section 9.1 of the 2019 Joint Application Information Requirements	LDN_UFN		Jul 22, 2022	2	Follow Up	Comment	No	Given that the intention of the EMS is to summarize all management plans, "The Environmental Management System (EMS) provides the framework to organize and guide activities during all phases of the mine and to ensure orderly, safe, compliant, and environmentally and socially responsible operations at the mine.", all legislation, regulations, guidance and best management practices should be included here. We disagree that simply including them in each management plan is sufficient or meets the requirement of having "all applicable...".	The non-exhaustive list provided in Section 9.1 is meant to be a summary (an objective of Section 9.1) to avoid the potential for duplication error and requirement to update Section 9.1 each time an update is made to each management plan. BW Gold took the approach to provide applicable exhaustive lists in each applicable management plan because it facilitates implementation (highlighting the legislation etc.. where it is most relevant). In future iterations of the Environmental Management System, the list in Section 9.1 will be replaced with a cross reference to the section of each management plan that outlines the complete list (e.g., see Section 4 of the Invasive Plant Management Plan [...]). 887	Mine Emergency Response Plan - MERP (May 2021)		LDN_UFN		Jun 06, 2022	1	New		Yes	Communication Objective Missing from MERP: In the event of a mine emergency, and after safety and immediate mitigation measures have been secured, a critical goal of the MERP must be to communicate with Blackwater Gold's Indigenous partners. The nations have an expectation that the MERP, and specifically the Accidents and Malfunctions Communication Plan (AMCP) will: • provide timely, factual, and official information to the nation representatives and Chiefs, according to	The Mine Emergency Response Plan (MERP) outlines BW Gold's commitments and protocols in the event of an emergency and will continue to refer to the Accidents and Malfunctions Administration and Communication Plan (AMCP; Appendix B of the MERP). An objective of the ACMP is to "Set out the process for identifying and providing opportunities to Indigenous groups, nearby residents and local communities or other user groups to assist in accident or malfunction response". Table 7-1 in Section 7 of the AMCP summarizes the communication protocol based on the consequence level of an accident and malfunction.	No	LDN/UFN	ERM		Michelle	RT	Ready for Submission	TD, Jun 29	Ready for Publishing
888	Mine Emergency Response Plan - MERP (May 2021)		LDN_UFN		Jun 06, 2022	1	New		Yes	Response Action Plans: The MERP acknowledges that not every emergency can be planned for. However, there are some emergencies that should be considered more likely to occur at a mine site and require an action plan. Blackwater has proposed the following: • Medical emergencies • Building or equipment fire • Ground movement or slope failure within Open Pit • Stockpile slope failure • Spill or incident involving fuel, chemical or hazardous material including cyanide • Vehicle roll-over or collision • Release of contaminant to fish-bearing water • Major power outage The Nations would also like the following action plans developed and included in the MERP: • Dam Breach Inundation Response Plan • Water Treatment Plant Failure or Shutdown Recommendation: A dam breach scenario or water treatment failure could have wide ranging impacts to human life, wildlife and aquatic life. Ensure that there are specific action response plans developed in conjunction with Blackwater Gold's Indigenous partners that consider the harvesters and hunters using the land surrounding the mine site.	The Accidents and Malfunctions Administration and Communication Plan (AMCP) provides a set of responses for accidents or malfunctions that include a dam breach or water treatment plant failure or shutdown (EAC Condition #36 or Appendix B of the Mine Emergency Response Plan; MERP). Both of the examples provided by the reviewer are more applicable to the AMCP and will not be added to the list in of emergencies in the MERP. A typical set of responses for the category of accident or malfunction listed. The responses will be developed by the Mine Manager and mine management team, Indigenous nations, agencies and other potentially affected interests (harvesters and hunters using the land). The ACMP was provided to regulators and Indigenous nations as defined in the Project's Environmental Assessment Certificate #M19-01 for review on November 15, 2021, December 29, 2021 and in April 2022 (as Appendix B of the MERP). The ACMP was also approved for implementation by EAO in a letter received by BW Gold on Feb 18, 2022.	'TD to revie	LDN/UFN	ERM		Michelle	RT	Ready for Submission	TD, Jun 29	Ready for Publishing
889	Mine Emergency Response Plan - MERP (May 2021)		LDN_UFN		Jun 06, 2022	1	New		Yes	Risk Matrix and the Nation's Valued Components: Figure 4.4-3 titled Risk Matrix outlines the different types of impacts to be considered during an emergency event. The level of response depends on correctly identifying the consequence or effect of an impact. Please discuss if there are any specific Valued Components for the Nations, for example, archaeological or cultural heritage sites identified during the Environmental Assessment that should explicitly be considered at a higher consequence rating in the risk matrix. Communication protocols	The Mine Emergency Response Plan is focused on health and safety-related mine emergencies. The risk matrix provided in the Accidents and Malfunctions Administration and Communication Plan (AMCP; Appendix B of the MERP) is applicable to Indigenous nations valued components. However, the level of response provided in the AMCP Table 2.2-3 (Accidents and Malfunctions Summary of Risk, Mitigation and Response Measures) is based on consequence, not the overall risk sum. The definitions for likelihood and consequence were adapted from the Environmental Assessment (EA; New Gold 2015) and considers valued components	No	LDN/UFN	ERM		Michelle	RT	Ready for Submission	TD, Jun 29	Ready for Publishing
890	Mine Emergency Response Plan - MERP (May 2021)		LDN_UFN		Jun 06, 2022	1	New		Yes	Training for the Nations' Employees and Community Members: Blackwater Gold will provide MERP and first aid training to all employees and will offer additional First Responder training/refresher courses. The Nation's employees may also hold First Responder roles within their community and their capacity would complement the needs of Blackwater Gold. Please ensure that Nation employees are actively encouraged to become part of the mine rescue team and	This recommendation will be added to Section 16.1. BW Gold also wishes to note that Indigenous employees have volunteered and have been trained as part of the Blackwater Mine Rescue Team. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated	No	LDN/UFN	ERM		Michelle	RT	Ready for Submission	RT; June 27	Ready for Publishing

891	Mine Emergency Response Plan - MERP (May 2021)		LDN_UFN		Jun 06, 2022	1	New		Yes	Mine Rescue Plan and Equipment: Section 14 of the MERP identifies three main categories for mine rescue planning and equipment: firefighting, site security and public safety. Considering that the Blackwater project utilizes cyanide reagent as a major consumable for mining and metallurgical activities, it is paramount that the mine rescue plans consider and adequately address the requirements for situations where there is a risk of exposure to cyanide. Recommendations: Include cyanide incidents as a category in the mine rescue plan, including discussion of proper response and equipment required for situations where mine rescue activities may involve exposure to cyanide. This should include discussion of specialized training for members of the rescue team as well as the necessary equipment, monitoring and maintenance and inspection requirements for emergency rescue equipment.	For consistency with the Cyanide Management Plan (Appendix 9-M), cyanide release and exposure will be added to the list of Response Plans (Section 10 of the Mine Rescue Plan and Equipment) that will be developed prior to having cyanide at the site. Section 9 of the Cyanide Management Plan details the requirements of the Cyanide Emergency Response Plan including personnel and stakeholder involvement, equipment and resources, notification procedures, monitoring elements and response plan evaluation. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Michelle	RT	Ready for Submission	RT; June 27	Ready for Publishing
892	Mine Emergency Response Plan - MERP (May 2021)		LDN_UFN		Jun 06, 2022	1	New		Yes	Joint Investigations and Reporting: After an emergency response, an investigation is launched by the Emergency Response Coordinator and Blackwater Gold management to determine the cause and any required modifications to the response plan. The Nations' Aboriginal Monitors should also be included in the joint investigation and all reporting should be provided to nation representatives. Investigation and reporting measures are important accountability tools that maintain the confidence and trust of nation communities. Recommendation: Ensure that Aboriginal Monitors are included in incident investigations and that all reporting/record keeping provided to government agencies are concurrently provided to Nation representatives.	Thank you for the recommendation. We will track all edits and incorporate this text to Section 18 and 19.1.6 in next iteration of the plan, toward the end of the Application Review process. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Michelle	RT	Ready for Submission	RT; June 27	Ready for Publishing
893	Mine Emergency Response Plan - MERP (May 2021)		LDN_UFN		Jun 06, 2022	1	New		Yes	Accidents and Malfunctions Communications Plan: The Accidents and Malfunctions Communications Plan will be developed and operate in tandem with the MERP. Communication to Nation members in the event of a mine emergency is critical in preventing loss of life and evaluating potential impacts to rights and interests. Many mines in Canada overlook the importance of this communication and erode important partnerships with their Indigenous hosts by communicating information late or without transparency. It is the Nation's expectation that an Accident and Malfunctions Communications Plan will include the following general	The template referenced in the reviewer's comments has been incorporated into the Accidents and Malfunctions Communications Plan (see Table 7-1). 902	Chapter 1 Introduction and Project Overview - Section 1.3.7	Spatial Data	LDN_UFN		Jun 06, 2022	0			No	Reclamation proposed annually over the next 5 years. Spatial data required: reclamation proposed annually over the next 5 years. The RCP does not outline reclamation annually over the next five years.	Section 4.8 (Detailed Five Year Mine Reclamation Plan) describes the annual reclamation plan over the next 5 years as follows: Section 4.8.1 (Y-2), Section 4.8.2 (Y-1), Section 4.8.3 (Y+1), Section 4.8.4 (Y+2) and Section 4.8.5 (Y+3). Each section describes areas of disturbance and reclamation-related activities, such as soil salvage and stockpiling, vegetation clearing and stockpiling woody debris. Spatial data is not included with the descriptions in Section 4.8, because this is data will be largely based on the actual construction and the areas of disturbance. Consequently, spatial data will be summarized in annual reclamation reports. The Reclamation and Closure Plan notes that the opportunity for reclamation activities during the initial construction and operations in the first 5 year detailed Mine Plan are quite limited. However, all activities anticipated to be minor and spatial summaries will be summarized in the Annual Reclamation Reports as a condition of the Mines Act permit. Furthermore, reclamation research trials are detailed in Table 4.2-8: Uncertainties and Approaches for Addressing and Table 4.2-9: Revegetation and Cover Research Trial Site Characteristics with some of the trials available to start in year -2.	No	LDN/UFN	ERM		Jesse	RT	N/A		N/A
902	Chapter 1 Introduction and Project Overview - Section 1.3.7	Spatial Data	LDN_UFN		Jun 06, 2022	0			No	Spatial data has not been added for review as required. Spatial data required: reclamation proposed annually over the next 5 years. The RCP does not outline reclamation annually over the next five years.	BW Gold acknowledges the comment and will address the concern through the methods described above.	No	LDN/UFN	ERM		Jesse	RT	N/A		N/A
902	Chapter 1 Introduction and Project Overview - Section 1.3.7	Spatial Data	LDN_UFN		Jun 06, 2022	1	New		No	"Spatial data **required.**" Requirement states reclamation *proposed* annually over the next 5 years. Although response states that reclamation areas will be largely dependent on actual construction, proposed reclamation areas can still be provided based off of construction plans thus far. There must be estimates/plans for which areas will need to be disturbed in each year?	Additional detail on proposed reclamation is provided in Chapter 4, Reclamation and Closure.	No	LDN/UFN	ERM		Jesse/Tonia	RT	Ready for Submission		Ready for Publishing
902	Chapter 1 Introduction and Project Overview - Section 1.3.7	Spatial Data	LDN_UFN		Jul 22, 2022	2	Follow Up	Information Requirement	No	Response does not adequately address the comment. It is noted that "additional detail on proposed reclamation is provided in Chapter 4" however this chapter does not include any spatial data as mentioned in the original comment (e.g., no figure maps showing reclamation proposed annually over the next 5 years).	Maps 3.3-5 to 3.3-10 in Chapter 3 show the general arrangements for Y-2 to Y+3 and provide an overview of areas of disturbance and topsoil stockpile areas. As mentioned in Section 4.8 of Chapter 4 (with regards to the first 5 years) "the primary focus of reclamation activities will consist of salvaging and stockpiling surface soil [...]". Therefore, the existing spatial data provides an overview of the most pertinent reclamation activity planned for the first 5 years. Section 4.8 of Chapter 4 (Reclamation and Closure Plan) provides a description of the reclamation proposed annually over the 5 years. Additional spatial data will not be prepared at this time, however BW Gold would be pleased to share spatial data with the Nations if requested.		LDN/UFN	ERM		Tonia		Ready for Submission	RT; Aug. 2	Ready for Publishing
902	Chapter 1 Introduction and Project Overview - Section 1.3.7	Spatial Data	LDN_UFN Baylie Sjodin		Sep 01, 2022	3	Follow Up	Comment	No	Section 1.3.7 Spatial Data of the JAIR states that "Spatial data requirements include the reclamation proposed annually over the next 5 years." Please see page 2-3 of the JAIR for reference. The maps suggested in the previous response display construction activites only, and not reclamation. Reclamation would be post-closure operations and the spatial data to represent it to show that just as much planning has gone into reclamation then actual operations. It is important for Artemis to remember that these are the Nations' Traditional Lands, and visual evidence of planned reclamation activites is an important part of informing community members.	As stated in response to Round 1 and Round 2 comments the reclamation activities in the first 5 years (Y-2 to Year +3) are limited and primarily focused on salvaging and stockpiling surface soil. Selective and site-specific application of vegetation on exposed erodible soils is a common practice around construction sites. There will also be a number of reclamation research studies and limited progressive reclamation opportunities as well as vegetation treatment used to stabilize exposed soils. Section 4.2.4 (Progressive Reclamation/Sequencing) of the Reclamation Closure Plan indicates the landforms that will be completed prior to closure and can be progressively reclaimed (i.e., Upper Waste Stockpile in Y+19, Ex-pit haul roads in Y+19, and the explosive storage facilities in Y+19). The Annual Reclamation Report would typically include examples of visual representation of activities pertaining to reclamation and reports an annual reconciliation of area disturbed and area reclaimed. 905	Chapter 1 Introduction and Project Overview - Section 1.5.3 and 1.5.2.3	Acronym	LDN_UFN		Jun 06, 2022	1	New		No	UDN - is this meant to be UFN? It is not defined anywhere in text.	Correct, the reference should be to UFN and LDN. Thank you for noting this. BW Gold recognizes that the Application contains some editorial errors. We will track substantive errors and omissions and will provide a memo that corrects them.	No	LDN/UFN	ERM		Jesse/Tonia	RT	Ready for Submission	RT; June 20	Ready for Publishing
906	Appendix 9-A	Existing Permits	LDN/UFN		Jun 06, 2022	0			No	"The permittee must conduct visual monitoring of the Rapid Infiltration Basins daily when there is effluent in the basins..." Monitoring details outlined in this paragraph should be included in the monitoring section of CEMP - I don't think they were in the reviewed draft. This is an issue with reviewing plans that reference other plans that were not complete - please ensure this adjustment is made.	Please note that visual monitoring of the Plant Site SCP is a requirement of Permit 110602 for the Early Works activities and is therefore outside the scope of the current Application. BW Gold will conform with all requirements of the Early Works permit. Note that although the Rapid Infiltration Basins are not explicitly noted in the CEMP, Section 16.6 includes the following commitment: "Water features adjacent to construction sites will be visually monitored for turbid waters by the Environmental Monitor and construction crew several times a day during active work." The requirements in this plan supersede Early Works once Major Works construction begins.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing

906	Appendix 9-A	Existing Permits	LDN/UFN		Jun 06, 2022	1	New		Yes	The following sentence in the response has not been added to section 16.6 of the CEMP, as such a section does not exist. Please indicate where this has been added. "Note that although the Rapid Infiltration Basins are not explicitly noted in the CEMP, Section 16.6 includes the following commitment : "Water features adjacent to construction sites will be visually monitored for turbid waters by the Environmental Monitor and construction crew several times a day during active work. "	The cited text was in a previous revision of the CEMP (November 2021) and subsequently removed from the revised final version of the CEMP submitted with the final Application. Monitoring requirements for the Rapid Infiltration Basins are included in the Early Works Permit. BW Gold will comply with all monitoring requirements in the CEMP, the SEPSCP, other management and monitoring plans and all permit conditions. As such, it is not necessary for permit monitoring requirements to be duplicated in monitoring plans.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
906	Appendix 9-A	Existing Permits	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	There is no mention of monitoring requirements for the Rapid Infiltration Basins in the Early Works Permit. As such, include it in the SEPSCP.	The plant site SCP and RIBS will now be utilized in the construction phase - the SEPSCP will be updated to incorporate monitoring requirements for these facilities. BW Gold recognizes that management plans may need various updates as a result of permitting reviews, in particular plans like the SEPSCP which are intended to be live documents that are updated as the Project progresses and industry-standard approaches to erosion and sediment control evolves. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP		Stephanie		Ready for Submission	KP, Aug 13	Ready for Publishing
907	Appendix 9-A	Surface Preparation Activities	LDN/UFN		Jun 06, 2022	0			No	No mention of wind erosion - this was requested to be addressed in Early Works as well. Please adjust to include not just rainfall and compaction.	Please see the Air Quality and Fugitive Dust Management Plan for a list of the activities that could result in the generation of fugitive dust.	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
907	Appendix 9-A	Surface Preparation Activities	LDN/UFN		Jun 06, 2022	1	New		No	Do not think that referencing another plan here is sufficient, please add wind erosion to this plan specifically.	Section 2 of the SEPSCP notes that the plan is intended to be used in conjunction with other management and monitoring plans, including the Air Quality and Fugitive Dust Management Plan. To reduce duplication, mitigation and monitoring measures for wind erosion are not included in both plans.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
907	Appendix 9-A	Surface Preparation Activities	LDN/UFN (Christina Delaney)		Sep 01, 2022	3	Follow Up	comment	No	The response provided by Artemis for this comment does not adequately address what the reviewer is asking. Please revisit original comment and provide a detailed response for clarification. The generation of fugutive dust is the outcome of the eroded material, the Fugitive Dust Management Plan does not address the effects of wind erosion at the source of the particles, i.e. loss of topsoil.	BW Gold recognizes that management plans may need various updates as a result of permitting reviews. The SEPSCP will be revised to indicate that many of the ESC measures included in Section 7, such as surface roughening (Section 7.3.9), silt fences (Section 7.3.12), temporary seeding (Section 7.3.14), mulching (Section 7.3.15), rolled erosion control products (Section 7.3.16), and polyethylene covers (Section 7.3.17) also help to mitigate the effects of wind erosion. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	TD, Sept 13	Ready for Publishing
907	Appendix 9-A	Surface Preparation Activities	LDN/UFN (Christina Delaney)		Oct 06, 2022	4	Follow Up	comment	No	The response does not address evaluation of or management of aeolian processes causing erosion specifically. Simply claiming that some of the measures intended to mitigate surface water erosion have a secondary function in regards to wind erosion is inadequate.	BW Gold disagrees with the suggested revision to include evaluation/management of aeolian processes causing erosion within this plan, and will not make the change. Assessment of wind-induced erosion is not a requirement of the guidance documents for erosion and sediment control plans listed in the references section (e.g., 'Developing a Mining Erosion and Sediment Control Plan' (BC MOE. 2015a), nor of the Joint Application Information Requirements for Mines Act and Environmental Management Act Permits (BC EMPR & ENV. 2019). The reviewer is again referred to the Air Quality and Fugitive Dust Management Plan (AQDMP) - see table 6-1 of that plan for the activities that have the potential to result in the generation of fugitive dust (i.e., "evaluation of aeolian processes causing erosion specifically"). Table 8.2-1 of the AQDMP provides detailed BMPs and mitigation measures for all dust sources (i.e., the "management of aeolian processes causing erosion").		LDN/UFN	KP			TD	Ready for Submission	TD, Oct 19	Ready for Publishing
907	Appendix 9-A	Surface Preparation Activities	LDN/UFN (Christina Delaney)		Nov 17, 2022	5	Follow Up	comment	No	At the november 9th meeting, BW agreed to include wind erosion in either the soil management plan or the SEPSCP, we will wait to see those revisions.	Wind erosion will be addressed in a separate sub-section of the SEPSCP. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP					RT; nov 29	Ready for Publishing
908	Appendix 9-A	Soil Loss Estimation	LDN/UFN		Jun 06, 2022	0			No	When will we see these results? How will the results inform eorsion and sedimentation adaptive management and the selection of controls?	The erosion potential classification will be determined using the RUSLEFAC equation for specific areas to be disturbed for project construction, as described in Section 6.2; erosion potential will vary across the site. The erosion potential will be calculated for disturbance areas and included in the design criteria for IFC drawings. RUSLEFAC will be used to guide the selection of appropriate erosion control strategies - areas identified as having greater potential soil loss/erosion will require more intensive erosion and sediment control measures and monitoring. Where required, additional field truthing will be completed: hand-dug test pits will be excavated to a maximum depth of 1.0 metres, and the soils will be characterized and potentially analyzed for particle size, organic matter, structure and permeability.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
908	Appendix 9-A	Soil Loss Estimation	LDN/UFN		Jun 06, 2022	1	New		Yes	Results have not been added to the updated SEPSCP nor has a date been provided in the response for when we will see these results. Please inform on when we can expect them for review.	Please see Section 2 of the SEPSCP - the intent of the document is to outline strategies and design objectives with appropriate flexibility to allow the facilities to be field-fit to suit the site conditions. The plan is not meant to be prescriptive - BMPs will be implemented as directed by the site Environmental Manager or a delegate and based on site-specific conditions. The sediment control and water management structures will be constructed and operational prior to soil disturbance, which will minimize the production of sediment laden waters on site and prevent transport of sediment-laden water from leaving the mine site. The design of erosion and sediment control measures should be viewed as a flexible process that responds to new information that is obtained throughout the construction phase - the design of erosion and sediment control measures should be expected to evolve throughout construction to varying degrees based on site conditions and field performance of implemented measures.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing

908	Appendix 9-A	Soil Loss Estimation	LDN/UFN		Jul 22, 2022	2	Follow Up	Information Requirement	Yes	We acknowledge the response that the design of erosion and sediment control measures will evolve and need to be site specific, however this is still a data gap. As such the Nations are requesting a workplan that describes who/what/when/how this data will be collected and to identify the data gaps in a revised version of the SEPSCP. Additionally, we request a memo describing what additional actions/mitigations measures will be implemented in the case that soil loss potential exceeds the Canadian tolerance of 6 tonnes/ha/year. This scenario has not been addressed in the plan."	Thank you for your comment. BW Gold respectfully disagrees with the suggested revision and will not make the change, as Section 6.2 (Soil Loss Estimation) adequately describes the methodology (the "what" and "how" requested by the reviewer) that will be followed to collect the data to determine soil loss classes for each work area (e.g., "these factors will be obtained from baseline reports for each discipline" and "where required, additional field truthing will be completed ..."). ESC measures will be identified by QPs and the Environmental Monitor (EM) prior to installation, and will vary by site and project phase. Implementation and installation of ESC measures will be completed under the direction of the EM. Procedural controls are described in Section 7.2 of Appendix 9-A, which describes how work schedules will be developed to establish the timing of the selection and installation of ESC measures. Please see attachment "R2_LDN UFN_Comment ID 908.pdf".		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT: Aug 12	Ready for Publishing
908	Appendix 9-A	Soil Loss Estimation	LDN/UFN (Mikayla Davis)		Sep 01, 2022	3	Follow up	Information Requirement	Yes	"These factors will be obtained from baseline reports for each discipline (e.g., hydrometeorology reports; soil and terrain reports; and site investigations). Where required additonal ground truthing will be completed...". BW states these factors will be obtained from baseline reports, we are requesting to review this data so please provide and indicate exactly which baseline reports (and sections) will be used here. Are we to assume that variables R, K, L, S, C, P in the RUSLEFAC equation are all found in these baseline reports? Only field truthing for variable K is discussed in section 6.2, and very vaguely. For ground truthing, only soil characterization is committed to. Since it is stated that soils will "potentially be analyzed for particle size, organic matter, structure and permeability". It is not sufficient to only characterize soils, in order to confidently determine the soil erodibility factor, the struture, organic matter, particle size, and permeability must be determined. Please commit to doing these soil tests in the updated plan. The response does not address the original comment where we requested a workplan. We still need to know when this ground-truthing work will be completed, especially because Early Works is proposed to start September 19th 2022. The response also does not state who will be doing the work as requested. We understand that the EM and QPs will identify ESC measures, but this does not answer our question about who will be conducting the ground-truthing work on erosion potential, please indicate who will do this and include this in a future iteration of the plan. The latter portion of this comment that was deleted is partially resolved based on the memo provided, I have added the deleted portion (in red text) to the original comment for records. However, please see comment ID 916, as we will be requesting IFC drawings to review the erosion potential calculated.	Rainfall and runoff are discussed in Appendix 2-B (2020 Hydrometeorology Report) - Section 3.2.3 and 3.2.4 Baseline terrain and soil conditions are discussed in Appendix 2-D (Soils, Terrain, and Surficial Geology 2013 Baseline Report) - Section 3. Slope will vary across the Project area and will be determined on a site and work-area specific basis. The remaining variables are described in the "Revised Universal Soil Loss Equation for Application in Canada: A Handbook for Estimating Soil Loss from Water Erosion in Canada" by Wall et al. (2002) . The reviewer is referred to this document for a detailed explanation of the method and factors used for soil loss estimation. The report is available at the following link: https://sis.agr.gc.ca/cansis/publications/manuals/2002-92/rusle-can.pdf BW Gold recognizes that management plans may need various updates as a result of permitting reviews. The SEPSCP will be revised to indicate that, where required, additional field truthing will be completed: test pits will be excavated to a maximum depth of 1.0 metres (hand-dug or using other means of excavation), and the soils will be characterized and potentially analyzed for particle size, organic matter, structure and permeability, as stated in the response to the original comment during screening. However, it is not the purpose of the plan to "state who will be doing the work" and thus this will not be included in future iterations of the plan. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups. As noted in the response to the original comment in Round 2, a work plan will not be provided. With respect to Early Works activities, please see Appendix D and Appendix E of the Early Works Joint Mines Act / Environmental Management Act Permits Application.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	TD, Sept 14	Ready for Publishing
908	Appendix 9-A	Soil Loss Estimation	LDN/UFN (Mikayla Davis)		Oct 06, 2022	4	Follow up	Information Requirement	Yes	Thank you for providing these baseline reports. The reviewer acknowledges that some variables such as slope will be determined on site as construction continues. Once this data is collected and the soil loss potential is calculated for each site, the Nations request an opportunity to review the soil loss potential calculations prior to disturbance occurring. We ask that BW Gold makes this commitment for the life of mine. The reviewer would like the following addition made to the SEPSCP as the response is not sufficient, “Where required, additional field truthing will be completed prior to disturbance occurring : test pits will be excavated to a maximum depth of 1.0 m (hand-dug or using other means of excavation), and the soils will be characterized and analyzed for particle size, organic matter, structure and permeability.” With regard to “who will be doing this work”, at an absolute minimum the SEPSCP needs to indicate that a qualified professional will be conducting this work. Determining the variables for the soil loss potential equation and characterizing soils requires a professional with adequate experience. Please add the section 6 that a qualified professional will conduct this work.	BW Gold will report out on soil loss potential calculations as per the reporting requirements listed in the management plan. Please see the response to the Round 3 related comment - BW Gold has previously committed to adding the following to the plan "The SEPSCP will be revised to indicate that, where required, additional field truthing will be completed: test pits will be excavated to a maximum depth of 1.0 metres (hand-dug or using other means of excavation), and the soils will be characterized and potentially analyzed for particle size, organic matter, structure and permeability"; BW Gold notes that this was also stated in the response to the original comment during screening. With regard to “who will be doing this work”, please see Section 3 of the report which outlines the roles and responsibilities of BW Gold Personnel and contractors, specifically that the EPCM and other contractors are responsible for the following: Ensure that ESC measures are installed/constructed based on plans and according to design specifications approved by and under the supervision of a Certified Professional in ESC.		LDN/UFN	BWG	KP	Travis	TD	Ready for Submission	TD, Oct 19	Ready for Publishing
908	Appendix 9-A	Soil Loss Estimation	LDN/UFN (Mikayla Davis)		Nov 17, 2022	5	Follow up	Information Requirement	Yes	The concern behind this comment is that the soil loss calculations will guide the ESC measures implemented. We are requesting that soil loss results are provided to the Nations as they are calculated and a committment from BW Gold to discuss the results with the Nations at the EMB table. (See comment ID 916) There seems to be some confusion on the second paragraph in the response. The reviewer is specifically asking for the word "potentially" to be removed from this sentence "...and the soils will be characterized and potentially analyzed for particle size, organic matter, structure, and permeability.", and be edited to "...and the soils will be characterized and analyzed for particle size, organic matter, structure, and permeability."	BW Gold understands the concerns related to erosion risk and will provide a site-wide erosion potential map to be appended to the next revision of the SEPSCP. The sentence "The erosion potential will be calculated for disturbance areas and included on the Issued for Construction (IFC) drawings" to state "The site-wide erosion potential has been calculated and is included in Appendix B". The results of the assessment will be summarized in Section 6.2 of the plan. The word "potentially" will be removed from the sentence "Where required, additional field truthing will be completed: test pits will be excavated to a maximum depth of 1.0 metres (hand-dug or using other means of excavation), and the soils will be characterized and analyzed for particle size, organic matter, structure and permeability." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups. Please see attachment "R5_LDN UFN_Comment IDs 908, 909, 911, and 916.pdf"		LDN/UFN	BWG					RT; nov 30	Ready for Publishing
909	Appendix 9-A	Erosion Management and Sediment Control Strategies	LDN/UFN		Jun 06, 2022	0			No	Where is the erosion risk potential data for the site? Please provide.	-	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
909	Appendix 9-A	Erosion Management and Sediment Control Strategies	LDN/UFN		Jun 06, 2022	1	New		No	This is an incomplete plan with a data gap as large as this. There is no risk assessment for the potential for soil loss from the site at this time based on the response provided. The Nations cannot comment on this further. This data is requested to be provided for review as soon as it is available - and this should be well in advance of the construction schedule.	The word "potentially" will be removed from the sentence "Where required, additional field truthing will be completed: test pits will be excavated to a maximum depth of 1.0 metres (hand-dug or using other means of excavation), and the soils will be characterized and analyzed for particle size, organic matter, structure and permeability." 909	Appendix 9-A	Erosion Management and Sediment Control Strategies	LDN/UFN		Jul 22, 2022	2	Follow Up	Information Requirement	Yes	Same comment as comment ID 908.	Please see attachment "R5_LDN UFN_Comment IDs 908, 909, 911, and 916.pdf"		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT: Aug 12	Ready for Publishing
910	Appendix 9-A	Erosion Management and Sediment Control Strategies	LDN/UFN		Jun 06, 2022	0			No	Does and ESC professional have a role in performance monitroing and routine inspection of measures? Who does this? What are their qualifications to make such an assessment and guide adaptive management?	BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	BWG		Ryan	TD	N/A	GM, June 29	Ready for Publishing
910	Appendix 9-A	Erosion Management and Sediment Control Strategies	LDN/UFN		Jun 06, 2022	1	New		No	With early works planned to commence this Spring (2022), Artemis should have an environmental specialist lined up with their qualifications listed. Please include who the ESC professional will be and what their qualifications are.	BW Gold restates its previous response and continues to plan for the start of construction.	No	LDN/UFN	BWG		Ryan	TD	Ready for Submission	RT; June 13	Ready for Publishing
910	Appendix 9-A	Erosion Management and Sediment Control Strategies	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	Regardless of when the SEPSCP will be revised and available for review. The Nations request they are notified and provided with the credentials/experience of the ESC professional once they are hired by BW Gold and have ongoing consultation on this.	Additional qualified persons may be added at any time. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	BWG		Travis	TD	Ready for Submission	AT: Aug 12	Ready for Publishing

911	Appendix 9-A	Erosion Management and Sediment Control Strategies	LDN/UFN		Jun 06, 2022	0			No	Where is the erosion potential classification data for the site? Please provide.	The erosion potential classification will be determined using the RUSLEFAC equation for specific areas to be disturbed for project construction, as described in Section 6.2; erosion potential will vary across the site. Factors used to determine soil loss in RUSLEFAC are rainfall/runoff, soil erodibility, slope length, slope steepness and vegetation. These data will be obtained from baseline reports for each discipline (e.g., Baseline Climate Report; Soils, Terrain, Surficial Geology Baseline Report; Revised Landform and Terrain maps; and site investigations), and the erosion potential will be calculated for disturbance areas and included in the design criteria for IFC drawings. Where required, additional field truthing will be completed: hand-dug test pits will be excavated to a maximum depth of 1.0 metres, and the soils will be characterized and potential analyzed for particle size, organic matter, structure and permeability.	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
911	Appendix 9-A	Erosion Management and Sediment Control Strategies	LDN/UFN		Jun 06, 2022	1	New		No	While soil potential classifications have been included in table 6-1, it would be helpful to include a description of each class. When will the erosion potential be calculated for site? You have the disturbance areas confirmed, why can't erosion potential areas be delineated across site using data obtained from baseline reports and then provided within the plan for reference? See comment ID7	Table 6-1 of Appendix 9-A includes the Soil Erosion Class in the first column and a description of each class in the second column (the potential soil loss in tonnes/ha/year). The soil erosion potential is not calculated for the entire mine site - it is calculated for individual work areas, since the factors that are used to calculate the erosion potential (type and depth of soil, slope length, slope steepness, vegetation and "support practice factor"), as well as construction activities, are highly variable. The "support practice factor" refers to the measures outlined in Section 7 of the SEPSCP that will be implemented to reduce the amount and rate of the runoff water by modifying the flow pattern, grade or direction of surface runoff, thereby reducing the amount of erosion. The soil loss estimates will be supplemented with judgement and experience of the QP so that the erosion potential assessment is appropriate for each individual work area.	RT/TD to review	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 22	Ready for Publishing
911	Appendix 9-A	Erosion Management and Sediment Control Strategies	LDN/UFN		Jul 22, 2022	2	Follow Up	Information Requirement	Yes	Same as comment ID 908.	Thank you for your comment. Please see response to follow-up comment 908. Please see attachment "R5_LDN UFN_Comment IDs 908, 909, 911, and 916.pdf"		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT: Aug 12	Ready for Publishing
912	Appendix 9-A	Sediment Basins	LDN/UFN		Jun 06, 2022	0			No	Include reference to testing for PAG materials in SCPs, to be discussed in Section #.	Overburden will be used for construction purposes across the mine site as needed. PAG and metal leaching materials will not be used for construction of SCPs. Please see the ML/ARD Management Plan for a detailed description of the materials testing program.	No	LDN/UFN	Lorax		Timo	GM	Ready for Submission	GM; june 14	Ready for Publishing
912	Appendix 9-A	SCP and Sediment Basins	LDN/UFN		Jun 06, 2022	1	New		No	See ID 77 - the request here is to understand how (what parameters) the sediment that collects in these ESC features will be confirmed to be suitable for use as fill or placement in stockpiles. The questions has not been answered.	The sediment that collects in the ESC features will not be used as fill or placed in soil stockpiles. Rather, the material may be placed in the Upper or Lower Waste Stockpiles if geochemical testing indicates that it is NPAG. For characterization purposes, the sediment material would be tested for the same suite of parameters as waste rock and overburden. This will include at a minimum an aqua regia digestible elemental scan at the onsite laboratory (as outlined in the ML/ARD Management Plan, Appendix 9-D of the Application). Should sediments be identified to be PAG1, PAG2 or NAG3, they will be disposed in the TMF.	RT/TD to review	LDN/UFN	Lorax		Timo	GM	Ready for Submission	GM; June 24	Ready for Publishing
912	Appendix 9-A	SCP and Sediment Basins	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	Unresolved until we can see the updated SEPSCP. Provide the list of parameters or at least indicate the exact location of that list within the ML/ARD plan, by adding a statement tp the SEPSCP that indicates "sediment collected using the ESC measures will be tested for the same parameters as waste rock, as per Table __ in Section __ of the ML/ARD plan." Indicate how and when monitoring of material collected by ESC measures will take place (comment 920 from previous round moved to be included in this related comment).	As noted in the Round 1 response, the sediment that collects in the ESC features may be placed in the Upper or Lower Waste Stockpiles if geochemical testing indicates that it is NPAG, or in the TSF should the materials be classified as PAG1, PAG2 or NAG3. BW Gold may also test the sediment for suitability as reclamation material. The proposed geochemical testing was included in the R1 response; nothing more than this will be proposed at this time. When a cumulative volume of sediment builds up from the various ESC features (≤100 m^3), one sample will be collected and undergo the proposed testing program. Suitable management strategies therefore exist to place this material, regardless of the geochemical testing that is conducted, given the insignificant volumes that will be generated over the life of the project compared to the scale of waste rock, overburden and tailings. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	TD; Aug 15	Ready for Publishing

912	Appendix 9-A	SCP and Sediment Basins	LDN/UFN		Sep 01, 2022	3	Follow Up	comment	No	Unresolved. We request committment to add the details requested in the orginal comment and round 2 comment, in addition to the information provided in the round 2 response to the MP when it is updated.	Sediment disposal and geochemical characterization of sediment, as discussed in the responses to the previous rounds' comments, will be addressed in an updated revision of the SEPSCP. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP		Greg	AT/KP	Ready for Submission	TD, Sept 13	Ready for Publishing
913	Appendix 9-A	Surface Roughening	LDN/UFN		Jun 06, 2022	0			No	How does this method not increase compaction on the slope? The preferred method is to use an excavator to open holes on the slope, dumping the material that is generated from the holes in mounds between the holes. This is a more effective strategy that intercepts and slows water moving downslope and also promotes revegetation. Refer to research by David Polster for detailed methods. On these slopes, is there an opportunity to include large CWD for additional soil stability and aiding revegetation efforts?	Cut and fill slopes will be roughened with tracked machinery where appropriate - roughening with tracked machinery will be limited to sandy soils to avoid undue compaction of the soil surface.	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
913	Appendix 9-A	Surface Roughening	LDN/UFN		Jun 06, 2022	1	New		No	Please add the preferred method (mentioned in original comment) into Section 7.3.9 as an option to use when there is risk of compaction to soil. The latter half of the response about sandy soils has not been incorporated into the updated SEPSCP. *On these slopes, is there an opportunity to include large CWD for additional soil stability and aiding revegetation efforts?*	Appendix 9-A is not intended to contain a comprehensive inventory of all potential BMPs, nor all the advantages and disadvantages of all ESC measures. While BW Gold understands that creating pits and mounds is a method that can be used for riparian naturalization projects to restore biodiversity, with the mounded soils being left loose and rough (Lands Near Water, Riparian Restoration & Enhancement, Stewardship Practices Series), or to increase topographic heterogeneity and promote the establishment and development of vegetation communities for restoration projects (Kinbasket and Arrow Reservoirs Revegetation Management Plan, Debris Mounds and Wind Row Construction Pilot Program), it does not seem to be an established sediment control practice for disturbed slopes. Dumping of material in loose and rough mounds on sloped surfaces as recommended by the reviewer could introduce additional material that would be entrained by runoff and require additional sediment control measures (e.g., silt fence). Slope texturing/ tracking is a standard BMP on slopes (see Erosion and Sediment Control Association of BC ESC Best Management Practices; Alberta Transportation Erosion and Sediment Control Manual)	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
913	Appendix 9-A	Surface Roughening	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	We are not asking for "a comprehensive inventory of all potential BMPs...", we are asking for the plan to indicate alternative methods that will be used when compaction risk is high (not working in sandy soils) and should be included as a mitigation measure to deal with such circumstances. We suggest the placement of CWD rather than track packing as a means of increasing surface roughness.	Thank you for your comment. BW Gold respectfully disagrees with the suggested revision and will not make the change - surface roughening is a temporary soil stabilization measure. The use of CWD for reclamation is discussed in Chapter 4 of the Application (reclamation and closure plan). The Environmental Monitor (EM) will identify appropriate ESC measures (alone or in combination) to use when soil compaction risk is high - alternatives are currently included in the plan (e.g., rolled erosion control products, mulch covers, temporary seeding, etc..)		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT: Aug 12	Ready for Publishing
913	Appendix 9-A	Surface Roughening	LDN/UFN (Okane_Marty Sangster)		Sep 06, 2022	3	Follow Up	comment	No	There are a number of options with regard to ensuring that the soil is loosened and scarified and to allow for erosion control: • Option 1: Use traditional method of placement with a dozer and within a reasonable time frame, using an airseeder or other type of seeding equipment to plant grass. The tilling action of this method will ensure that proper aeration of the soil will occur and allow for the plantlife to prevent major erosion. • Option 2: Attempt a hummock/mogul type formation on the sloped surface of the landform. This incorporates small depression adjacent to a mound which is offset from the next area below with a mound and then depression. This can be completed using a small excavator. The soil is fully aerated by this method and is loose. Likewise, the alternating depression/mounding minimizes the possible erosion that can occur as the upper most depression must fill with fluid before either seeping into the material or draining into the next depression below. There is never enough energy developed that could create erosion issues. Grass seeds can then be hand spread across the area and will further minimize the risk of erosion. Appropriate erosion control measures should be in place and documented in the updated plans prior to construction.	Section 7.3 of Appendix 9-A is not intended as an exhaustive list of ESC measures, rather a summary of common BMPs and their typical application and implementation. The most suitable BMP for different areas of the Project site will be implemented under the direction of the EM. This may include BMPs not currently described in the plan, such as those suggested by the reviewer in their comment. Appropriate erosion control measures will be in place prior to construction.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	TD, Sept 13	Ready for Publishing
913	Appendix 9-A	Surface Roughening	LDN/UFN (Mikayla Davis)		Oct 06, 2022	4	Follow Up	comment	No	LDN and UFN request ongoing consultation on the erosion control measures used and their efficacy throughout the life of the mine.	LDN and UFN will be engaged on on the erosion control measures used and their efficacy throughout the life of the mine through several forums (non-exhaustive list): -IEM inspection reports, monthly meetings -Involvement of UFN and LDN env monitors in project construction, operations, closure and post-closure and subsequent reporting -Site updates during EMB meetings -Periodic reviews of the various ESCP plans through the EMC -ESCP Management Plan reporting -Annual ARR and EMA permit reporting -Annual EAC and DS reporting		LDN/UFN	BWG		Travis		Ready for Submission	TD, Oct 19	Ready for Publishing
914	Appendix 9-A	Training and Awareness	LDN/UFN (Mikayla Davis)		Jun 06, 2022	0			No	How often will this training be offered to employees? Are every reminded of this requirement throughout their employment?	As noted in Section 8.1, all staff and subcontractors responsible for the management, implementation, monitoring, and reporting of erosion and sediment control measures will be QPs and have previous experience. As such, training and awareness activities will be focused on any sensitive features in the construction area rather than on installation and monitoring methods, for example.	No	LDN/UFN	BWG		Ryan	TD	N/A	GM, June 29	Ready for Publishing

914	Appendix 9-A	Training and Awareness	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	Please incorporate this commitment into the SEPSCP "ESC refresher training will be provided annually to site staff (likely the month prior to the onset of spring freshet) involved in installation, monitoring, inspections and replacement of ESC measures. ". Additionally we want a commitment from BW Gold for ongoing consultation with LDN and UFN on the development of the training packages.	Please refer to Section 12 'Project Orientation' of the Appendix 9-C Construction Environmental Management Plan which states *'To achieve broad awareness of this CEMP, all mine-site personnel must attend a one-time orientation session upon arrival at the Project site that includes site-specific safety and environmental components. Orientation materials specific to the environment will be prepared by BW Gold, and delivery of the orientation sessions will be a collaboration between BW Gold staff and the EPCM contractor's Environment, Health and Safety Representatives. Refresher training intervals for site on-boarding are to be determined, however, regular crew tailgate meetings will cover the relevant seasonal aspects of the topics below as a result of on-site observations, seasonal risks and throughout an annual period.* *Personnel must sign and date the orientation record confirming that they have received the indoctrination materials and presentation. Signed environmental orientation meeting records must be provided to the HSE Department designate and retained on record as required by the Code. From an environmental perspective, the orientation will include but not be limited to the following topics and Erosion prevention and sediment control is listed as one of the topics.'* The Plan then goes on to state *'Refresher training will be provided to all employees following a significant incident warranting refresher training to all staff. Additional site- and task-specific training will be provided to site workers as required. '* BW Gold can provide the training packages to LDN and UFN for informational purposes.		LDN/UFN	BWG				Ready for Submission	TD; Aug 11	Ready for Publishing
914	Appendix 9-A	Training and Awareness	LDN/UFN (Mikayla Davis)		Sep 01, 2022	3	Follow up	Comment	No	We are requesting this specific statement be added to the SEPSCP " ESC refresher training will be provided annually to site staff (likely the month prior to the onset of spring freshet) involved in installation, monitoring, inspections and replacement of ESC measures. ", we disagree that the text in the CEMP does an adequate job of covering the requested addition.	It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	BWG		Travis		Ready for Submission	TD, Sept 14	Ready for Publishing
914	Appendix 9-A	Training and Awareness	LDN/UFN (Mikayla Davis)		Jun 06, 2022	1	New		No	While it is acknowledge that QPs will have previous experience, Artemis should be providing training/reminders of ESC measures on a regular basis. Please include how often this training will be offered and a description of the qualifications of the QP. As well include the latter half of the response " As such, training and awareness activities will be focused on any sensitive features in the construction area rather than on installation and monitoring methods, for example.".	ESC refresher training will be provided annually to site staff (likely the month prior to the onset of spring freshet) involved in installation, monitoring, inspections and replacement of ESC measures. The training package will be developed and facilitated by the site environmental team under the direction/guidance of a qualified CPESC QP. The training will focus on sensitive features such as using maps identifying where creeks and wetlands appear on the mine that where ESC measures would be installed to protect waterways.	No	LDN/UFN	BWG		Cole	TD	Ready for Submission	TD, Jun 28	Ready for Publishing
915	Appendix 9-A		LDN/UFN		Jun 06, 2022	0			No	"The planned order of construction activities is as follows:" This list is a little confusing as not all points discussed construction activities or timing - please edit so that it is easier to understand.	This list is meant to be an overview of typical construction sequencing for a cut and fill slope - detailed activities and the order in which they will be implemented will be provided in the IFC drawings. The plan will be updated to indicate this.	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
915	Appendix 9-A	Construction Sequencing	LDN/UFN		Jun 06, 2022	1	New		No	Resolved, however it would be helpful to indicate exactly where the IFC drawings are located.	Please see Section 2 of the SEPSCP - the intent of the document is to outline strategies and design objectives with appropriate flexibility to allow the facilities to be field-fit to suit the site conditions. IFC drawings will be prepared for the various facilities prior to construction - they are not included in this plan, as it is not meant to be prescriptive - BMPs will be implemented as directed by the site Environmental Manager or a delegate and based on site-specific conditions. The sediment control and water management structures will be constructed and operational prior to soil disturbance, which will minimize the production of sediment-laden waters on site and prevent transport of sediment-laden water from leaving the mine site. The design of erosion and sediment control measures should be viewed as a flexible process that responds to new information that is obtained throughout the construction phase - the design of erosion and sediment control measures should be expected to evolve throughout construction to varying degrees based on site conditions and field performance of implemented measures.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
915	Appendix 9-A	Construction Sequencing	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	"2. Clear, and strip work areas as required and link directly all ESC measures associated with each construction stage and area." Consider rewording/reorganizing this list to make it more clear. What is meant by "link directly"?	Please see response to comment 916 in the initial review phase (Round 0) - This list is meant to be an overview of typical construction sequencing for a cut and fill slope - detailed activities and the order in which they will be implemented will be provided in the IFC drawings. The plan will be updated to indicate this statement. The clause "link directly" means that ESC measures may be installed sequentially as each work area develops (i.e., installed in stages or batches) and that the ESC measures should be linked together, as required, as different work areas combine and are connected to enhance coordination of ESC. For example, if clearing/stripping of a certain footprint is being undertaken, there may be several active work areas within that footprint as stripping activities may be happening concurrently in different areas. Rather than employ ESC measures for the entire footprint to be cleared up front, localized ESC measures for each active work areas may be implemented that are linked together to allow for a single discharge point from all active work areas, or as active work areas expand to interact/join with other active work areas.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT: Aug 12	Ready for Publishing
916	Appendix 9-A		LDN/UFN		Jun 06, 2022	0			No	"2. Clear, and strip work areas as required and link directly all ESC measures associated with each construction stage and area." 916	Appendix 9-A	Construction Sequencing	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	We request that the IFC drawings are provided for review prior to construction starting as an appendix of the SEPSCP, or at the minimum a commitment from BW Gold for ongoing consultation with LDN and UFN on the development and approval of the IFC drawings.	BW Gold disagrees with the suggested revision (to include IFC drawings in the SEPSCP or a commitment that BW Gold will provide the drawings for approval) and will not make the change. The IFC drawings will be provided for information purposes, if requested.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, Aug 13	Ready for Publishing
916	Appendix 9-A	Construction Sequencing	LDN/UFN (Mikayla Davis)		Sep 01, 2022	3	Follow Up	Comment	Yes	BW Gold must continue to engage LDN and UFN throughout the life of mine, therefore we strongly disagree with the response provided. We request that the IFC drawings be provided as soon as they are developed, and expect BW Gold to make this commitment. As you've described the SEPSCP is not meant to be prescriptive therefore to adequately review the ESC measures you will use we need to be able to review the IFC drawings. We will be raising this comment with EMLI.	IFC drawings will be provided to EMLI for approval a minimum of 60 days prior to construction of each individual structure, or as otherwise required by the final Mines Act permit or the Code.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	TD, Sept 13	Ready for Publishing

916	Appendix 9-A	Construction Sequencing	LDN/UFN (Mikayla Davis)		Oct 06, 2022	4	Follow Up	Comment	Yes	Will the IFC drawings be provided to LDN and UFN 60 days prior? Or just EMLI? We request that they are provided to both EMLI and LDN and UFN.	IFC drawings will be provided to EMLI 60 days prior to meet regulatory requirements in the HSRC code/ JAIR, MAP. IFC drawings may be provided to LDN and UFN concurrently for **informational purposes only.**		LDN/UFN	BWG		Travis		Ready for Submission	TD, Oct 19	Ready for Publishing
916	Appendix 9-A	Construction Sequencing	LDN/UFN (Mikayla Davis)		Nov 17, 2022	5	Follow Up	Comment	Yes	The round 0 response for comment ID 908 states that erosion potential calculations will be provided in the IFC drawings, therefore we expect that BW Gold will commit to providing the IFC drawings as soon as possible. Stating that "IFC drawings may be provided to the LDN and UFN..." is not sufficient, we need that commitment.	BW Gold understands the concerns related to erosion risk and will provide a site-wide erosion potential map to be appended to the next revision of the SEPSCP. The sentence "*The erosion potential will be calculated for disturbance areas and included on the issued for Construction (IFC) drawings* " to state "*The site-wide erosion potential has been calculated and is included in Appendix B* ". The results of the assessment will be summarized in Section 6.2 of the plan. The word "potentially" will be removed from the sentence "*Where required, additional field truthing will be completed: test pits will be excavated to a maximum depth of 1.0 metres (hand-dug or using other means of excavation), and the soils will be characterized and analyzed for particle size, organic matter, structure and permeability* ." BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated		LDN/UFN	BWG					RT; nov 30	Ready for Publishing
917	Appendix 9-A	Construction Sequencing	LDN/UFN		Jun 06, 2022	0			No	What are the qualifications of the EM that they are capable of adjusting ESC measures based on best field-fit?	The ESC professional is included under the EM role - see Table 3-1 where Environmental Monitors include Environmental Specialists (e.g., CPESC).	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
917	Appendix 9-A	Construction Sequencing	LDN/UFN		Jun 06, 2022	1	New		No	While the EM includes a CPESC specialist, their role description only includes tracking and reporting on environmental permit obligations, there is no mention of having the authority to adjust ESC measures. This should be added to table 3.	The Environmental Manager (EM) is responsible for day-to-day management of environmental programs, compliance with environmental permits, and updating the Environmental Management System and management plans. The EM or a designate (i.e.., Environmental Monitors) will have the authority to stop any construction activity that is deemed to pose a risk to the environment and allow work to proceed when the concern has been addressed or rectified - by definition, this includes adjustment of ESC measures.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
917	Appendix 9-A	Table 3-1	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	Include the following under the EM role/responsibility "The EM or a designate (i.e.., Environmental Monitors) will have the authority to stop any construction activity that is deemed to pose a risk to the environment and allow work to proceed when the concern has been addressed or rectified - by definition, this includes adjustment of ESC measures."	The text quoted by the reviewer 'The EM or designate will have the authority to stop any construction activity that is deemed to pose a risk to the environment; work will only proceed when the identified risk and concern have been addressed and rectified' is currently included in the SEPSCP below Table 3-1 (Roles and Responsibilities). This table is meant to provide an overview rather than a comprehensive list. The suggested addition " ... by definition, this includes adjustment of ESC measures" to the previous sentence is implicit in the use of the word "rectified".		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT: Aug 12	Ready for Publishing
918	Appendix 9-A	Scheduled Monitoring	LDN/UFN		Jun 06, 2022	0			No	"Monitoring will occur weekly during spring freshet and monthly outside of freshet and in open water periods, as well as after each significant melt event or runoff-producing rainfall event. Effectiveness will be determined by the extent to which certain performance metrics are being achieved." Don't some measures require daily monitoring (e.g., rapid infilitration basins)?	Please note that visual monitoring of the Plant Site SCP is a requirement of Permit 110602 for the Early Works activities and therefore outside the scope of the current Application. BW Gold will conform with all requirements of the Early Works permit. The requirements in this plan supersede Early Works once Major Works construction begins.	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
918	Appendix 9-A	Scheduled Monitoring	LDN/UFN		Jun 06, 2022	1	New		No	Original comment is referencing "Section 9.1 Scheduled Monitoring" to assess the effectiveness of the entire SEPSCP, not just early works activities or monitoring of the Plant Site SCP.	Section 9.1 of Appendix 9-A states that the monitoring frequency will depend on site conditions - an increase in contaminant concentrations in the receiving environment may require increased monitoring frequency.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
918	Appendix 9-A, Section 9.1	Scheduled Monitoring	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	Weekly water quality monitoring is sufficient to meet the objectives of the plan: water quality monitoring frequency will be increased at the discretion of the Environmental Manager based on construction site monitoring and inspections, with frequency commensurate with the risk, nature, location, and timing (seasonality) of the work. Increased monitoring is indicated in Table 9-1 of Appendix 9-A for clear water conditions to document the change in turbidity (e.g., a change from background of 8 NTU for a duration of 24 hours will require multiple monitoring events over 24 hours; a change from background of 2 NTU at any one time for a duration of 30 days could require daily sampling).		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, Aug 13	Ready for Publishing
918	Appendix 9-A, Section 9.1	Scheduled Monitoring	LDN/UFN (Christina Delaney)		Sep 01, 2022	3	Follow Up		No	Unresolved. The round 2 response did not indicate how the information provided in that response will be incorporated into the plan. Please indicate how you will update the plan with the information requested.	The information provided in the response is provided in Section 9.1 of Appendix 9-A. Section 9.1 states that "(t)he monitoring frequency will depend on site conditions: an increase in contaminant concentrations in construction runoff in the receiving environment may trigger changes in the monitoring program (i.e., increased monitoring frequency)". Site specific, or construction activity specific, activities may result in different monitoring frequencies. The base monitoring frequency established is at a minimum weekly monitoring, but as stated in Section 9.1 of Appendix 9-A this is subject to change to more frequent monitoring based on activity, site conditions, and risk factors. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups. The plan will be updated to incorporate the Round 2 response "Weekly water quality monitoring is sufficient to meet the objectives of the plan: water quality monitoring frequency will be increased at the discretion of the Environmental Manager based on construction site monitorng and inspections, with frequency commensurate with the risk, nature, location, and timing (seasonality) of the work."		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	TD, Sept 13	Ready for Publishing
919	Appendix 9-A	Table 9-1	LDN/UFN		Jun 06, 2022	0			No	As discussed in Early Works, define a "significant runoff-producing rainfall event" - what parameters, who makes this call?	Please see Section 5.3.3 - "For the purpose of this plan, a significant rainfall event will be considered as greater than or equal to the 1 in 2 year return period rainfall." This will be measured through the on-site climate stations monitored by the on-site environment department. Triggers and actions for different storm events are also outlined in Section 9, Table 9-2.	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
919	Appendix 9-A	Table 9-2	LDN/UFN		Jun 06, 2022	1	New		No	Since the environmental monitor is described as being the ESC certified professional, they should also be notified following a significant rainfall event. They should be included under the people notified by the EPC contractor in the minor, moderate, and major trigger columns in table 9-2.	It is expected that the Environmental Manager will be working closely with the Environmental Monitor(s) during these events - see Section 3 (roles and responsibilities). BW Gold will employ a qualified person as an EM - the EM will be supported by a staff of Environmental Monitors.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing

919	Appendix 9-A	Table 9-2/Table 3-1	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	Update the SEPSCP to explicitly state that "significant runoff-producing rainfall events" are the 1 in 2 year rainfall events, and that the environmental monitor will be notified by the Environmental Manager when such a rainfall event occurs. It should be clear in table 3-1 that the Environmental Manager will be informing the Environmental Monitors of current site conditions that influence monitoring, there is no mention of this other than that the Monitors report to the Environmental Manager.	Thank you for your comment. BW Gold respectfully disagrees with the suggested revision and will not make the change, as this statement is currently in the plan - please see Section 5.3.3 - "For the purpose of this plan, a significant rainfall event will be considered as greater than or equal to the 1 in 2 year return period rainfall." Thank you for the recommendation to include in Table 3-1 the statement "Environmental Manager will be informing the Environmental Monitors of current site conditions that influence monitoring". BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT: Aug 12	Ready for Publishing
920	Appendix 9-A	Scheduled Monitoring	LDN/UFN		Jun 06, 2022	0			No	Is there any monitoring required is materials in any ESC measures (SCPs, basins, etc..) are found to be acid generating or metal leaching?	Overburden will be used for construction purposes across the mine site as needed. PAG and metal leaching materials will not be used for construction of SCPs. Please see the ML/ARD Management Plan for a detailed description of the materials monitoring program.	No	LDN/UFN	Lorax	KP	??/Timo	AT/KP	Ready for Submission	GM; june 14	Ready for Publishing
920	Appendix 9-A	Scheduled Monitoring	LDN/UFN		Jun 06, 2022	1	New		No	Comment not addressed. See comment ID 14, 15, 77.	See response to Comment #912.	RT/TD to review	LDN/UFN	Lorax		??/Timo	AT/KP	Ready for Submission	GM; June 29	Ready for Publishing
920	Appendix 9-A	Scheduled Monitoring	LDN/UFN (Christina Delaney)		Sep 01, 2022	3	Follow Up		No	Unresolved. We request committment to add the details requested in the orginal comment and round 2 comment to the MP when it is updated.	See Round 3 response to Comment #912.		LDN/UFN	KP		Greg	AT/KP	Ready for Submission	TD, Sept 13	Ready for Publishing
921	Appendix 9-A	Table 9-2	LDN/UFN		Jun 06, 2022	0			No	No mention of water sampling results. This table assumes no sedimentation into waterbodies - this is best case scenario, but the TARP should include all possible events. Please update to include roles and responsibilities - including reporting requirements - if water quality guideline exceedances are observed and if sediment is released into a waterbody.	Section 9.1 discusses the actions to be conducted in the event that turbidity and/or TSS limits in Table 9-1 are exceeded in a waterbody. Roles and responsibilities for site personnel are also described in this section.	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
921	Appendix 9-A	Table 9-2	LDN/UFN		Jun 06, 2022	1	New		No	This section describes stopping work if water quality sampling indicates water quality guideline exceedances and initiate additional mitigations actions, what are these additional mitigation actions? Although roles and responsibilities are described in section 9.1, they should be included in the TARP as well, either within the major trigger category or if they fit better in a separate column.	Section 11.2 of Appendix 9-A notes that the design of the ESC measures is a flexible process that responds to new information throughout the construction phase - contingency strategies will be active and adaptive - it is not possible to list every potential event and mitigation measure. Roles and responsibilities are included in the first column of Table 9-2 (Incident Monitoring Triggers and Actions).	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	CB; 17-Jun	Ready for Publishing
921	Appendix 9-A	Table 9-2	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	Response did not answer the question. Exceeding water quality guidelines is a very real possibility and the Nations want to ensure BW Gold has a plan to deal with this situtation. These mitigations do not need to be overly specific since exceedances will be case-dependent, however we expect some mitigations to be fleshed out before BW Gold exceeds water quality guidelines.	Thank you for your comment. BW Gold respectfully disagrees with the suggested revision to "flesh out" mitigation measures, Section 7.3 of the plan describes erosion and sediment control measures and best management practices that can be implemented, and the applicability of each measure (i.e., typical uses or intent for each ESC measure described). BW Gold understands the concern related to water quality in the receiving environment and has identified a plan to deal with potential exceedances - please see Section 9.1 - "If the elevated turbidity level is valid and is a result of construction activities, the Environmental Monitor will inform the Project Engineer or Environmental Manager, who shall cease all work that may have a direct or indirect impact on water quality, and immediately initiate additional mitigation actions."		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT: Aug 12	Ready for Publishing
921	Appendix 9-A	Table 9-2	LDN/UFN (Mikayla Davis)		Sep 01, 2022	3	Follow Up		No	We acknowledge it is hard to predict additional mitigation measures until the problem arises, however we need assurance that BW have the necessary equipment/materials to build these emergency mtitigation structures should they be needed. Without these materials/equipment readily available and planned for, the threat to water quality is severe even with a stop work order. Please provide a list of materials/equipment that will be readily available on site to build these structures.	BW Gold will maintain an inventory of ESC measures and BMPs, similar to that described in Section 7.3 of Appendix 9-A, to be available on site for rapid implementation if deemed necessary by the EM based on site conditions and results of monitoring/inspections of performance of planned BMPs. This may include BMPs that can be installed or implemented quickly and efficiently, such as flocculants, straw bales, slope drains, filter bags, silt retention structures, mulch, RECPs and polyethylene covers. The commitment to maintain materials on site is already included in Section 11.2 "An inventory of ESC materials will be kept on site to address problems that may arise. The inventory list will be updated regularly to reflect a more accurate estimate of the quantities that should be stocked on site. The materials will provide a spectrum of measures to address a broad range of site conditions and severity."		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	TD	Ready for Publishing
921	Appendix 9-A	Table 9-2	LDN/UFN (Mikayla Davis)		Oct 06, 2022	4	Follow Up		Yes	The reviewers requests ongoing consultation with LDN and UFN on the inventory list, we would like to review the detailed list at this point and any updates made to it in the future.	LDN and UFN will be engaged on on the erosion control measures inventory list at site through several forums (non-exhaustive list): -IEM inspection reports, monthly meetings -Involvement of UFN and LDN env monitors in project construction, operations, closure and post-closure and subsequent reporting -Site updates during EMB meetings -Periodic reviews of the various ESCP plans through the EMC -ESCP Management Plan reporting		LDN/UFN	BWG		Travis		Ready for Submission	TD, Oct 19	Ready for Publishing
922	Appendix 9-A	Evaluation and Adaptive Management	LDN/UFN		Jun 06, 2022	0			No	"Sediment removal and proper disposal will be performed as required" - this is not discussed in this document. What triggers removal? Who is responsible? Add to TARP. What is proper disposal? What testing of materials must be conducted prior? Where are the designated disposal sites? Same sentence is repeated in Section 11.1.	-	No	LDN/UFN	Lorax		Meghan/Stephanie	GM	Ready for Submission	GM; june 17	Ready for Publishing
922	Appendix 9-A	Evaluation and Adaptive Management	LDN/UFN		Jun 06, 2022	1	New		No	Sediment removal and proper disposal should not be limited to sediment basins, but also include silt fences, ditches, culverts, and sediment control ponds. Referencing "personnel as outlined in Section 8" does not seem specific enough, it is unclear who will be responsible. The sediment that is "suitable" will be used for grading material - how is "suitable" defined in this situation? What will be done with material that is not suitable? Other outstanding comments include: What is proper disposal? What testing of materials will be conducted prior? Where are the designated disposal sites (for sediment that is not suitable for use as grading material)?	See response to Comment #912.	RT/TD to review	LDN/UFN	Lorax	KP	Meagan/Stephanie	GM	Ready for Submission	GM; June 28	Ready for Publishing
922	Appendix 9-A	Evaluation and Adaptive Management	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	Response only partially addresses the comment. Will sediment removal be conducted at silt fences, ditches, culverts, and sediment control ponds? Who is responsible for this work? make reference to a specific position under section 8, not the whole section. How often will this be conducted or what will trigger sediment removal?	Section 11.1 (Evaluation and Adaptive Management) notes that silt fences, ditches, culverts, and sediment control ponds will be visually inspected for excess sediment build-up, and maintenance (i.e., removal of sediment) will be carried out as necessary. The personnel responsible for the inspections and maintenance activities are clearly listed in this section of the plan and will not be repeated here.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT: Aug 12	Ready for Publishing
923	Appendix 9-A	Evaluation and Adaptive Management	LDN/UFN		Jun 06, 2022	0			No	Add to bulleted list: evidence of erosion / scour - add to bulleted list in Section 11.1.	The first bullet of the list in Section 11.1 currently includes for this request: "Initial erosion will be inspected visually by searching for light surface material (litter or soil) movement, while sedimentation resulting from erosion will be determined by searching for deposition of soil particles at the bottom of slopes and depressions. Riling, gullying, pedestalling, and unusual compaction are also indicators of erosion and will be recorded if, and when, observed."	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
923	Appendix 9-A	Evaluation and Adaptive Management	LDN/UFN		Jun 06, 2022	1	New		No	Scour has not been added, please explicitly provide this in text.	Excessive sediment build-up (included in the list) is a result of increased erosion/scouring.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
924	Appendix 9-A	Pond Design Report	LDN/UFN		Jun 06, 2022	0			No	Include more detail on what will be included in SCP Design Report when completed (e.g. requirements in Section 4. of "Assessing the Design, Size, and Operation of Sediment Ponds Used in Mining")	This information will be included in the updated plan.	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		

924	Appendix 9-A	Pond Design Report	LDN/UFN		Jun 06, 2022	1	New		No	No additional information has been added to section 7.3.1.1 from the Nov 2021 to March 2022 version. Not sure if additions were made from the September 2021 version to the Nov 2021 version... Please add?	Additional detail was added to Section 7.3.1.1 of Appendix 9-A following submission of version A.1 of the plan in September 2021. The following text was included: "Predicted discharge frequency and duration will be included for each pond (e.g., intermittent, continuous, or only when impounded water quality meets discharge criteria set out in Table 9-1; see Section 9)."	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
925	Appendix 9-A	Erosion control for soil stockpiles	LDN/UFN		Jun 06, 2022	0			No	More specific mention and detail required for erosion control for soil stockpiles needed in Section 7.3 (Requirement Description from JAIR).	The strategy, procedural controls, and BMPs noted in Section 7.1 through 7.3 will be followed for all topsoil stockpiles. The Soil Management Plan (Chapter 9.3) provides additional detail on erosion control measures for topsoil stockpiles, which includes: avoiding locating stockpiles in runoff pathways to ditches or watercourses to reduce the risk of sedimentation; seeding stockpiles with non-propagating grass species, native grasses and forbs, and planting with tree and shrub species; using berms, waterbars and ditches to direct runoff away from rivers and streams; installing silt fencing, straw wattles and check dams for additional sediment capture.	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
925	Appendix 9-A	Erosion control for soil stockpiles	LDN/UFN		Jun 06, 2022	1	New		No	This response should be included in section 7.3 and reference made to The Soil Management Plan.	To reduce duplication, mitigation and monitoring measures for soil stockpiles are not included in both plans.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
925	Appendix 9-A	Erosion control for soil stockpiles	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	Section 2 does not reference the Soil Management Plan as needing to be read in conjunction. If you expect this comment to be resolved, make reference to it.	The SEPSCP will be updated to include reference to the Soil Management Plan. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP		Stephanie		Ready for Submission	KP, Aug 13	Ready for Publishing
926	Appendix 9-A	Training	LDN/UFN		Jun 06, 2022	0			No	Include more detail on what information training will cover (similar to what was provided in the Soil MP).	Note that the training and awareness activities included in the Soil Management Plan are directed at employees and contractors who may not be qualified professionals - the purpose of the program is to give them a basic level of environmental awareness and understanding. In contrast, the staff and subcontractors responsible for the management, implementation, oversight, monitoring and reporting of both soil salvaging and appropriate ESC measures will be QPs and have relevant experience commensurate with their roles and responsibilities. As such, training and awareness activities will be focused on any sensitive features in the construction area rather than on installation and monitoring methods, for example.	No	LDN/UFN	BWG		Travis	TD	Ready for Submission	15-Jun-22	Ready for Publishing
926	Appendix 9-A	Training	LDN/UFN		Jun 06, 2022	1	New		No	While it is acknowledged that QPs will have previous experience, Artemis should be providing training/reminders of ESC measures on a regular basis. Please include detail on this training and timing. **Same as comment ID 21.**	Refer to comment response 914.	No	LDN/UFN	BWG		Travis	TD	Ready for Submission	TD, 15-Jun	Ready for Publishing
926	Appendix 9-A	Training	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	Same as comment ID 914: Please incorporate this commitment into the SEPSCP "ESC refresher training will be provided annually to site staff (likely the month prior to the onset of spring freshet) involved in installation, monitoring, inspections and replacement of ESC measures. ". Additionally we want a commitment for the training packages to be reviewed at the Life of Mine Committee in the SEPSCP.	Please refer to response to comment 914		LDN/UFN	BWG		Cole	TD	Ready for Submission	TD; Aug 11	Ready for Publishing
927	Appendix 9-A	Sensitive features	LDN/UFN		Jun 06, 2022	0			No	Add: clearly outline sensitive features in the receiving environment and how triggers will be employed to determine how the visual assessment of the Plant Site SCP outlet will work	The early Works activities are described in detail in the Early Works Joint Mines Act/Environmental Management Act Permits Application (BW Gold Ltd., February 2021). Subsequent to the Early Works plan and in consultation with reviewers, it was agreed that the Plant Site SCP will be designed to discharge to Rapid Infiltration Basins rather than to ground. Monitoring for sensitive features and visual assessment downgradient of the outlet are therefore no longer required. The requirements in this plan supersede Early Works once Major Works construction begins.	No	LDN/UFN	KP		Stephanie	AT/KP	N/A		
927	Appendix 9-A	Sensitive features	LDN/UFN		Jun 06, 2022	1	New		No	Response about monitoring for sensitive features is noted - however a response to the original comment "how triggers will be employed to determine how the visual assessment of the Plant Site SCP outlet will work" is not provided. "*The permitee must conduct visual monitoring of the Sediment Control Pond daily while discharging to the Rapid Infiltration Basins. The permitee must conduct visual monitoring of the Rapid Infiltration Basins daily when there is effluent in the basins. Visual monitoring must include monitoring for adequate infiltration in the Rapid Infiltration Basins and monitoring for seepage, overland flow, and erosion in the area outside the Sediment Control Pond and Rapid Infiltration Basins.*"	The Mines Act Permit for Early Works activities and the Early Works Erosion and Sediment Control Plan outline monitoring measures for the Plant Site SCP and RIBs. This information will not be duplicated in Appendix 9-E.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
927	Appendix 9-A	Sensitive features	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	There is no mention of monitoring requirements for the Rapid Infiltration Basins in the Early Works Permit. As such, include it in the SEPSCP. This is a reoccuring problem with management plans, your response forces us to go search through a seperate document since the section is not provided, only to find that it is not included. Please check these documents yourselves before providing such responses and include the section so we aren't spending time tracking it down.	The plant site SCP and RIBS will now be utilized in the construction phase - the SEPSCP will be updated to incorporate monitoring requirements for these facilities. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP		Stephanie		Ready for Submission	KP, Aug 13	Ready for Publishing
928	Appendix 9-A	Construction	LDN/UFN		Jun 06, 2022	1	New		No	"In the initial construction area, Davidson Creek will be diverted around the site along the north bank. Two options are proposed: pumping or a diversion channel." Only the diversion is described, include a description of the pumping option. Which of these options will be used, and what assessments will be done for that selection? When does BW Gold anticipate making that decision?	Appendix 9-A provides a brief summary of construction activities and options. Please see Appendix 3-J (TSF Stage 1 Detailed Design Report) for information on the selected option and relevant design details. The selected option was the pumped diversion and only the final design for this system is presented in the design report.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
928	Appendix 9-A 2.1.1	Construction	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	Again, please provide what section in Appendix 3-J is being referenced, this is a 300 page document. Since the selected option was the pumped diversion, this should be described in the SEPSCP. Or at a minimum the section in Appendix 3-J referenced and edits make to clear why the pumped diversion was chosen.	Please see Section 4.2. of the TSF Stage 1 Detailed Design Report (Appendix 3-J); this section is titled "Davidson Creek Diversion System". Section 4.2.3.2 Primary Outlet describes the pumping system. The pumping system was selected primarily to allow the diversion system to remain active until the start of ore processing, if required. BW Gold recognizes that management plans may need various updates as a result of final design detailing and permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups. The SEPSCP will be updated at the appropriate time to clarify that the diversion will be done by pumping , but will not include the rationale for this, as it is not relevant to this plan.		LDN/UFN	KP		Dan	AT/KP	Ready for Submission	AT, Aug 02	Ready for Publishing
929	Appendix 9-A	Operations	LDN/UFN		Jun 06, 2022	1	New		No	If a severe erosion event occurs (significant precipitation) will the ditches along mine site haul roads and access roads be maintained as needed? Plan only mentions doing this maintenance annually, however an inclusion of maintenance following significant erosion events should be added to meet M-246 permit condition part B.5.	Please see Table 9-2 (Section 9.2) of Appendix 9-A, which summarizes incident monitoring triggers and actions. Please also see Section 11 of Appendix 9-A: "The Construction Personnel/Sub-Contractors and Environmental Monitor will inspect all erosion control measures weekly during spring freshet and monthly outside of freshet and in open water period, as well as after each significant runoff-producing rainfall event. Silt fences, sediment traps/basins, ditches, culverts, and sediment control ponds will be visually inspected..." BW Gold will comply with all conditions of the Mines Act and EMA Permits.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
930	Appendix 9-A	Operations	LDN/UFN		Jun 06, 2022	1	New		No	What is meant by "The Lower Waste Stockpile will be completed in Y+11; however this material is earmarked for reclamation purposes and therefore the stockpile will not be progressively reclaimed."? Including some detail on what the reclamation purpose entails would be helpful.	Please see Chapter 4 of the Application for a description of reclamation and closure activities. The sentence "The Lower Waste Stockpile will be completed in Y+11; however this material is earmarked for reclamation purposes and therefore the stockpile will not be progressively reclaimed." means that overburden from the Lower Waste Stockpile will be rehandled from the stockpile and used for reclamation of other mine facilities. Therefore, the Lower Waste Stockpile will not be reclaimed until after all material has been rehandled for use in mine site reclamation purposes, at the end of the active closure/reclamation period (in contrast to the Upper Waste Stockpile, which will be progressively reclaimed during the operations phase of the Project).	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
930	Appendix 9-A	Operations	LDN/UFN		Jul 22, 2022	2	Follow Up	Clarification	No	Reword that section, to add more detail for clarification. It is not clear what the implications of that statement are for the stockpile.	Thank you for your comment. BW Gold disagrees with the suggested revision and will not make the change, as the current wording sufficiently outlines the implications for the stockpile.		LDN/UFN	KP		Stephanie		Ready for Submission	CB; July 29	Ready for Publishing

931	Appendix 9-A	Erosion and sediment control measures	LDN/UFN		Jun 06, 2022	1	New		No	It would be helpful to outline which ESCs in section 7 will address condition 3.1 in the federal DS, as there is no mention of avoiding the deposition of deleterious substances in water frequented by fish in section 7.	The overall purpose of the SEPSCP is to avoid deposition of deleterious substances in the receiving environment - see Section 2 of Appendix 9-A "Movement of eroded soil off the site associated with actions of water, wind, or ice, has the potential to impact water quality if unmitigated" and "The overall objective of the SEPSCP is to manage contact water within the Project footprint, so as to prevent runoff from potentially impacting adjacent watercourses." As noted in Section 7.1 of Appendix 9-A, "Erosion and sediment control measures applied in series create a resilient system capable of protecting the natural environment from sediment impacts" - that is, one or more of the BMPs summarized in Section 7.3 of Appendix 9-A will be used to avoid the deposition of deleterious substances in water.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
932	Appendix 9-A	Best management practices	LDN/UFN		Jun 06, 2022	1	New		No	"Specific measures to be implemented for each work area will be identified in the field prior to the construction activity". Have measures been identified for the plant site? They should be identified soon if construction is planned to commence this spring 2022.	The Early Works Erosion and Sediment Control Plan (EWESCP) outlines the measures to be implemented for the Plant Site. BW Gold received Mines Act Permit M-246 approving the Early Works Program in June 2021, and EMA Permit 110602 for early-stage construction activities.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
933	Appendix 9-A	Sediment control ponds	LDN/UFN		Jun 06, 2022	1	New		No	As described in section 4.3 "The Permittee must ensure that surface water ponds, ditches and diversion channels are designed to convey the design flood without overtopping, without side slope failure, and with adequate armour or lining to prevent significant erosion." What measures are put in place to prevent side slope failure of SCP? Will a lining or armour be used in the SCP?	The internal and external side slope angles of the sediment control ponds were selected to prevent side slope failure. Slope stability assessments for the ponds are presented in Appendix 3-N and Appendix 3-Z of the Application. Slope lining and/or armoring design details will be dependent on the structure use, design preferences and materials available at the time that construction is planned. Refer to the design reports for site-specific design details for the various ponds. Final design details will be presented on the Issued-for Construction design drawings prior to construction, as required by Part 10.5.1 of the Code.	RT/TD to review	LDN/UFN	KP		Michael	AT/KP	Ready for Submission	AT, June 26	Ready for Publishing
933	Appendix 9-A	Sediment control ponds	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	What sections of appendix 3-N and 3-Z are you referencing here, there are over 500 pages and we do not have the time to sift through them. We request a commitment in the SEPSCP from BW Gold that final designs will be reviewed with the Life of Mine Committee.	The various channels and sediment control ponds (SCPs) incorporate site specific details for flood conveyance, side slope specifications, lining and armouring details for the channels and SCPs. It is impractical and repetitive to describe these details in this comment response table and the details are contained in the referenced reports. The slope stability assessments for the ponds are presented in Appendix 3-N (Appendix C3) and Appendix 3-Z (Chapter 8). Design details are presented on the design drawings contained in Appendix 3-N (Appendix D). The designs are presented in the Application. BW Gold disagrees with the suggested revision to the management plan is necessary and will not make the change.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, Aug 02	Ready for Publishing
934	Appendix 9-A	Permit conditions	LDN/UFN		Jun 06, 2022	1	New		No	In section 2.1.2 waste rock and overburden storage facilities, low grade ore stockpile, and topsoil stockpiles are described as needing ESC measures (i.e.., collection ditches, sediment control ponds). However, in section 7, SCP and collection ditches are not proposed to be implemented at any of the soil, overburden, and rock stockpiles. Is this discussed in another plan?-please reference it. Without a discussion of ESC measures at the numerous stockpiles and regular inspection, BW Gold does not meet the M-246 permit condition (part B geotechnical 3.): "The Permittee must ensure that all soil, overburden, and rock stockpiles are constructed in accordance with designs prepared by a Professional Engineer, unless exempt in writing from the Chief Permitting Officer, and are constructed and inspected to ensure stability and erosion control is maintained."	Please see the Purpose and Objectives section of Appendix 9-A: "The SEPSCP describes best management practices (BMPs) that will be implemented – it is not meant to be prescriptive. Specific measures to be implemented for each work area will be presented on detailed design drawings prepared for construction." The SEPSCP does not cover the specific geotechnical and water management designs - please see the appendices to the Application, including but not limited to, Appendix 3-J (TSF Stage 1 Detailed Design Report), Appendix 3-K (Tailings Storage Facility Life of Mine Design Report) and Appendix 3-N (Stockpiles Geotechnical and Water Management Design Report) for additional details.	No	LDN/UFN	KP	BWG	Dan	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
934	Appendix 9-A	Permit conditions	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	Again what sections in appendices for chapter 3 are being referenced? We request a commitment in the SEPSCP from BW Gold that final designs will be reviewed with the Life of Mine Committee.	The design of the collection/diversion channels and sediment control ponds (SCPs) for the stockpiles are presented in Appendix 3-N and Appendix 3-Y of the Application. Design details for the LGO Stockpile, Lower Waste Stockpile, and topsoil stockpiles are presented in Sections 4, 5, and 6 of Appendix 3-N, respectively. The design drawings are contained in Appendix D of Appendix 3-N. Section 9 of Appendix 3-N contains monitoring and operational requirements for the stockpiles. Appendix 3-Y covers the water management design for the Upper Waste Stockpile. The designs are presented in the Application. BW Gold disagrees with the suggested revision to the management plan is necessary and will not make the change.		LDN/UFN	KP	BWG	Stephanie	AT/KP	Ready for Submission	AT, Aug 02	Ready for Publishing
935	Appendix 9-A	Permit conditions	LDN/UFN		Jun 06, 2022	1	New		Yes	Section 4.3 describes a M-246 permit condition that is related to the ESP: "The Permittee must ensure that borrow and quarry excavations are constructed in accordance with designs prepared by a Professional Engineer and are constructed and inspected to ensure stability and erosion control is maintained." Burrow pits and quarry excavations are not mentioned elsewhere in this plan. Are they expected to be constructed during the life of mine? If so, they should be described in the SEPSCP.	Borrow Pits and Aggregate Sources are described in Chapter 3 of the Application and are shown on the General Arrangement figures in that section. The SEPSCP (Appendix 9-A of the Application) does not include a comprehensive list or description of all mine components. However, the plan strategies and measures apply to the entire mine site and all associated activities.	No	LDN/UFN	KP		Stephanie/Dan	AT/KP	Ready for Submission	KP, June 20	Ready for Publishing
935	Appendix 9-A	Permit conditions	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	Yes	Since there is a specific condition related to burrow and quarry excavations and erosion control, they should be included within the SEPSCP. Chapter 3 describes the construction of them, and includes nothing on erosion control for them. It is important that they are mentioned in the SEPSCP so the Nations know BW Gold has the commitment to conduct erosion control on these sites. Further the SEPSCP does not specifically state that all measures will be applied to the "entire mine site and all associated activities", therefore we cannot conclude this is the case.	Thank you for your comment; this change will be made. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP		Stephanie		Ready for Submission	CB; July 29	Ready for Publishing
936	Appendix 9-A	Permit conditions	LDN/UFN		Jun 06, 2022	1	New		Yes	Are the following conditions contained within the Mine Site Water and Discharge Monitoring and Management Plan? If so please reference where in this plan. Permit M-246, conditions 3 and 5 (part C).	This response assumes that the reviewer meant the Surface Erosion Prevention and Sediment Control Plan (SEPSCP) (Appendix 9-A of the Application), rather than the Mine Site Water and Discharge Monitoring and Management Plan (Appendix 9-E), as Condition 3 of the early construction works permit applies to Soil, Overburden and Rock stockpiles, while Condition 5 applies to Mine Site Roads and assurances that the facilities are constructed in accordance with designs prepared by a Professional Engineer to ensure that stability and erosion control are maintained. The SEPSCP does not include a comprehensive list or description of all mine components. However, the plan's strategies and measures outlined within the plan apply to the entire mine site and all associated activities. BW Gold will comply with all permit conditions.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, June 17	Ready for Publishing
937	Appendix 9-A	Permit Conditions	LDN/UFN		Jun 06, 2022	1	New		Yes	While section 12 outlines that the SEPSCP will be reviewed annually, there is no mention of the early works erosion and sediment control plan being reviewed annually and updates reported in the annual reclamation report. This information is not provided in the early works erosion and sediment control plan either. Please add to the SEPSCP to comply with M-246 permit condition 5b (part C).	BW Gold will comply with all of the Early Works permit conditions. This Application is for permit amendments authorizing the construction and operations phases of the mine; the SEPSCP for construction and operations will supersede the Early Works erosion and sediment control plan.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
937	Appendix 9-A	Permit Conditions	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	Yes	Request comment from MMO to say whether this is acceptable or not.	ENV approved the updated Early Works ESCP in accordance with EMA permit 110602 on April 1, 2022. The EW's ESCP will only be in force until the major works permit is issued at which point the major works permit and major works SEPSCP will supercede the EW's ESCP. Therefore an annual update of the EW's ESCP is not anticipated as the plan was just approved in April 2022. With that being said, the EAC Condition 13 CEMP also contains sediment and erosion control mitigations and BWG will ensure that this plan is concurrently implemented along with the EW's ESCP for early works activities and that if there are are any disagreements between the two plans, the more stringent mitigations or monitoring will be followed.		LDN/UFN	BWG	ERM	Travis	TD	Ready for Submission	TD; Aug 11	Ready for Publishing

938	Appendix 9-A	Permit condition & Revegetation	LDN/UFN		Jun 06, 2022	1	New		Yes	Section 7.3.14 states that "exposed slopes and other temporarily disturbed areas will be seeded for initial soil stabilization… the purpose of temporary seeding is to stabilize the soil and reduce damage from wind and/or water until permanent stabilization is accomplished." This section should include seeding stockpiles to comply with M-246 condition 6e (part C). What seeding mix will be used for permanent stabilization? How long does temporary seeding intend to last?	BW Gold will comply with all of the Early Works permit conditions - this Application is for permit amendments authorizing the construction and operations phases of the mine; the SEPSCP for construction and operations will supersede the Early Works erosion and sediment control plan. Stockpile BMPs are described in Section 10.4 of the Soil Management Plan (Appendix 9-B of the Application).	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
938	Appendix 9-A	Permit condition & Revegetation	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	Yes	Response does not address the comment. It is not clear if temporary seeding or permanent seeding will be used. Is the seeding mix for permanent seeding also being used for temporary seeding, or is it different? Again, how long does temporary seeding intent to last?	Section 7.3.14 of Appendix 9-A is titled "Temporary Seeding". This plan does not address permanent seeding. BW Gold respectfully disagrees with the suggested revision to include a discussion of permanent seeding and will not make the change - the reviewer is referred to Section 10.4 of the Soil Management Plan (Appendix 9-B) for a description of soil stockpile seeding and to Section 4.2.2.3 of Chapter 4 of the Application for a discussion of permanent seeding mixes. The intended duration of time for temporary seeding will be site and activity specific.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	KP, Aug 13	Ready for Publishing
938	Appendix 9-A	Permit condition & Revegetation	LDN/UFN (Christina Delaney)		Sep 01, 2022	3	Follow Up	comment	Yes	Add detail to 7.3.14 indicating the information provided in the round 2 response, including adding references to the other sections indicated for permament stabilization and stockpile seeding.	Acknowledged. Section 7.3.14 (Temporary Seeding) will be updated to refer readers to Section 10.4 of the Soil Management Plan (Appendix 9-B) for a description of soil stockpile seeding and to Section 4.2.2.3 of Chapter 4 of the Application for a discussion of permanent seeding mixes, and will note that the intended duration of time for temporary seeding will be site and activity specific. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	TD, Sept 13	Ready for Publishing
939	Appendix 9-A	Revegetation	LDN/UFN		Jun 06, 2022	1	New		No	What growth medium will be used prior to re-vegetation?	As noted in Section 2.1.3 of the SEPSCP (Appendix 9-A), Reclamation activities are described in Section 4 of the Application. Re-vegetation is not a BMP included in this plan.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
940	Appendix 9-A	Permit conditions	LDN/UFN		Jun 06, 2022	1	New		Yes	"The Permittee must reclaim all surface water management ponds and water diversions to satisfy stability and erosion control requirements and the approved end land use once no longer required." Where is the following condition met? Does not appear to be met in this plan, will it be addressed in the End Land Use Plan?	This SEPSCP has been developed to proactively manage water, erosion and sedimentation throughout all phases of the Project, with a focus on the Construction phase. The Reclamation and Closure Plan is included in Chapter 4 of the Application (see Section 4.2.2.3 Erosion and Sediment Control).	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
940	Appendix 9-A	Permit conditions	LDN/UFN		Jul 22, 2022	2	Follow Up	Information Requirement	Yes	Chapter 4, Section 4.2.2.3 does not provide any detail as to the reclamation of surface water management and water diversions, it simply states that sediment controls are required during the initial stages of reclamation until vegetation is established. No description of the reclamation of these features. Add information to this plan, outlining how/when these ESC features will be reclaimed or if they will be reclaimed.	Chapter 4, section 4.2.2.3 does very much indeed provide specific detail as to the reclamation of surface water management and water diversions. Please refer to Section 4.2.2.3 of the Chapter 4 Reclamation and Closure Plan, which states the following: *The primary mechanisms of erosion management and sediment control will consist of stabilizing land surfaces to minimize erosion by resloping and reshaping landforms to their final configuration, establishing vegetation cover and reclaiming the final surfaces in accordance with this Plan, establishing diversion and collection ditches to manage surface water runoff, and restoring natural hydrological regimes to minimize sediment transport to downstream environments. Rapid establishment of vegetation and development of self-sustaining ecosystems on erosion-prone landforms during Closure and Post-closure phases will be an important component of long-term erosion control.* An example of a potential native species seed mix that could be used on site is: - 71%26 slender wheatgrass (Elymus trachycaulus); - 21% Rocky Mountain fescue (Festuca saximontana); - 5% tufted hairgrass (Deschampsia caespitosa); and - 3% northern sweetvetch (Hedysarum boreale). Furthermore, Section 4.2.2.4 of Chapter 4 states: *An integral component of meeting reclamation and closure objectives is to design site drainage to be consistent with the surrounding landscape. This component will assist with stabilizing soil and preventing erosion. Re-establishing as many pre-disturbance drainage pathways as possible for the post-closure phase assists in achieving these objectives. Another approach is to align new upstream drainage pathways with existing downstream drainages* . The section then goes on to explain specific deactivation and decomissioning prescriptions for specific water managenment features such as the northern diversion and central diversion. Sections 4.2.3 and 4.2.3.1 go on to to explain both the revegetation stragegy and species selection. This is the process (outlined in those specific sections) that would be followed for all reclamation of surface water management and water diversions. Furthermore, these prescriptions will be periodically refined throughout the LoM through the outcomes of the reclamation research outlined in Section 4.2.5 Reclamation research with specific attention being paid to the FWR, NCC and TSF in section 4.2.5.1.		LDN/UFN	BWG		Travis	TD	Ready for Submission	TD, Aug 11	Ready for Publishing
941	Appendix 9-A	Permit conditions	LDN/UFN		Jun 06, 2022	1	New		Yes	"The permittee must conduct visual monitoring of the Sediment Control Pond daily while discharging to the Rapid Infiltration Basins. The permittee must conduct visual monitoring of the Rapid Infiltration Basins daily when there is effluent in the basins. Visual monitoring must include monitoring for adequate infiltration in the Rapid Infiltration Basins and monitoring for seepage, overland flow, and erosion in the area outside the Sediment Control Pond and Rapid InfiltrationBasins. Daily inspections must be recorded and maintained on site for three years and must be made available to Ministry staff upon request." The following condition has not been met, daily monitoring of sediment control ponds and rapid infiltration basins in not stated in either the SEPSCP or the Mine Water and Discharge Monitoring and Management plan. Monitoring is only discussed as "when discharging". Please update to comply with this condition.	BW Gold will comply with all of the Early Works permit conditions. This Application is for permit amendments authorizing the construction and operations phases of the mine; the SEPSCP for construction and operations will supersede the Early Works Erosion and Sediment Control Plan.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
941	Appendix 9-A	Permit conditions	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	Yes	There is no mention of monitoring requirements for the Rapid Infiltration Basins in the Early Works Permit. As such, include it in the SEPSCP.	Section 6.0 Environmental Monitoring and Reporting of the approved EW's ECSP (approved by ENV as per EMA permit 110602 on April 1, 2022) contains a comprehensive monitoring and TRP program for the the Rapid Infiltration Basins in the Early Works Permit. These requirements will be carried forward in a subsequent revision of the SEPSCP. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	BWG		Travis	TD	Ready for Submission	TD; Aug 11	Ready for Publishing
942	Appendix 9-A		LDN/UFN		Jun 06, 2022	1	New		No	None of these definitions include the stripping and stockpiling of mineral soil and OVB as defined in the Soil Management Plan (SMP) or Reclamation and Closure Plan (RCP, Chapter 4). This should be updated and reflected here.	Section 6.1 of Appendix 9-A lists construction activities that have the potential to cause erosion and sedimentation; both stripping and stockpiles are included in this list. How activities are defined and described will differ between plans. These activities, as described in the SEPSCP, are sufficient to inform the strategies and BMPs included in this plan.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
943	Appendix 9-A	Section 7.1	LDN/UFN		Jun 06, 2022	1	New		No	How will baseline conditions be documented? What parameters will be measured?	Please see Section 6.2 of Appendix 9-A, which describes the baseline conditions and erosion risk potential that will be used to determine the BMPs to be implemented. The parameters to be measured are listed as soil erodibility, slope length, slope steepness and vegetation.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
943	Appendix 9-A	Section 7.1	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Information Requirement	No	Same as comment ID 908.	Thank you for your comment. Please see the Response to follow-up comment 908.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	CB; July 29	Ready for Publishing
944	Appendix 9-A	Section 7.3.1.2	LDN/UFN		Jun 06, 2022	1	New		No	"The outlet will be checked regularly for sediment build-up that could prevent drainage and limit the overall carrying capacity of the basin." Please define "regularly" - a defined schedule would be valuable for this monitoring. Same comment for collection ditches, rock check dams, etc... as well.	Thank you for noting this. BW Gold will not be making further edits to the Application at this time. BW Gold will track substantive errors and omissions and will provide a memo that corrects them.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	CB; 20-Jun	Ready for Publishing
944	Appendix 9-A	Section 7.3.1.2	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	It is our understanding that chapter 9 plans will be updated, we cannot mark this comment as resolved until we see an updated SEPSCP with the revisions.	Monitoring schedule and activities are described in Section 11.1 of Appendix 9-A (Onsite Inspection and Plan Review).		LDN/UFN	KP		Stephanie		Ready for Submission	KP, Aug 13	Ready for Publishing

945	Appendix 9-A	Section 7.3.7	LDN/UFN		Jun 06, 2022	1	New		No	Energy dissipator or dissipater? Spelling is inconsistent.	Dissipator is the correct spelling. Apologies for the inconsistency.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
945	Appendix 9-A	Section 7.3.7	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	We expect the error to be corrected in the updated SEPSCP.	Spelling inconsistencies will be addressed in the revised SEPSCP. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	KP		Stephanie		Ready for Submission	KP, Aug 13	Ready for Publishing
946	Appendix 9-A	Section 7.3.14	LDN/UFN		Jun 06, 2022	1	New		No	"Fertilizers and hydroseeding containing fertilizers will not be used near watercourses" Will there additional measures (e.g. diversion channels) for these areas as well to ensure fertilizer runoff does not enter waterbodies?	Diversion channels downstream of areas to be fertilized will not be installed in order to minimize unnecessary disturbance, especially near watercourses.	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
946	Appendix 9-A	Section 7.3.14	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Clarification	No	What mitigations measures will be used to ensure fertilizer runoff does not enter water bodies then?	As per section 7.3.14 of the SEPSCP, the plan states that areas to be temporarily seeded are areas that would be subject to erosion for more than 30 days, and are usually accompanied by surface preparation, fertilizer, and mulch; however, the timing of seeding is weather and season dependent and consequently this method is not applicable at all times. Consequently, seeding would be avoided during spring freshet where fertilizer would be more susceptible to runoff. Hydroseeding, which involves the use of a tackifier to prevent seed, fertilizer and mulch running off will be used on steep slopes (>2:1) that are highly susceptible to erosion. Fertilizers and hydroseeding containing fertilizers will not be used near watercourses (within 30 m of the top of bank). These mitigations along with conventional ESC measures such as silt fencing, hay bales and multi-barrier approaches are the measures that will be used to ensure fertilizer runoff does not enter water bodies.		LDN/UFN	BWG		Travis	TD	Ready for Submission	TD, Aug 11	Ready for Publishing
946	Appendix 9-A	Section 7.3.14	LDN/UFN (Christina Delaney)		Sep 01, 2022	3	Follow Up	comment	No	Qustion not answered. Will fertilizer be used near water bodies? Please describe additional mitigations or alternatives. Also include the information provided in your responses in an updated plan.	It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	BWG		Travis		Ready for Submission	TD, Sept 14	Ready for Publishing
946	Appendix 9-A	Section 7.3.14	LDN/UFN (Christina Delaney)		Oct 06, 2022	4	Follow Up	Comment	Yes	I acknowledge that you provided some general information surrounding this topic, but the question was not addressed. Please answer yes/no and include a framework for determining if, when, where and how fertilizer will and will not be applied near waterbodies. A memo is requested that outlines these details and commitment to include the details in an updated plan is requested.	It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	BWG				19-Oct-22	TD, Oct 20	Ready for Publishing
946	Appendix 9-A	Section 7.3.14	LDN/UFN		Oct 31, 2022	5	Follow Up	Comment	No	Require a memo concerning fertilizer use and mitigations near water bodies	Please see "R5_LDN UFN_Comment ID 946.pdf"		LDN/UFN	BWG					RT; Nov 25	Ready for Publishing
946	Appendix 9-A	Section 7.3.14	LDN/UFN (Christina Delaney)		Dec 01, 2022	6	Follow Up	Comment	No	unresolved. answer not provided. Please answer 'no' and include a framework for determining if, when, where and how fertilizer will not be applied near waterbodies and what circumstances, if any, would trials in a reclamation research program use fertilizer and if so, then which type of fertilizer(s). A memo is requested that outlines these details and commitment to include the details in an updated plan is requested.	Please see "R5_LDN UFN_Comment ID 946.pdf" in response to determining when, where, and how fertilizer will not be applied near waterbodies. As part of the November 9, 2022 discussion with Keefer Ecological Services Ltd (Keefer; representing LDN and UFN), BW Gold agreed that fertilizers would not be used at the mine site except for site-specific cases. The site-specific cases would include reclamation research trials and in areas where it is critical to encourage plant growth to reduce wind or water erosion. Reclamation research programs will detail use of fertilizer application (if required) and will include mitigations to avoid fertilizer entering the natural watercourses. The memo "R5_LDN UFN_Comment ID 946.pdf" provides BW Gold's approach for site-specific application of fertilizers.		LDN/UFN	BWG					TD, Dec 19	Ready for Publishing
947	Appendix 9-A	Sediment Control Ponds	LDN/UFN		Jun 06, 2022	1	New		No	Concern that measuring the noted parameters "when discharging" is not proactive. How can exceedances be addressed as needed with this approach?	Measures to be implemented in the event of an exceedance are described in Section 9.1 (of Appendix 9-A).	No	LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	AT, June 15	Ready for Publishing
947	Appendix 9-A	Sediment control ponds	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up	Comment	No	See comment ID 921. Additional monitoring and stopping work are not proactive mitigation measures.	Thank you for your comment. Please see the Response to Comment 921.		LDN/UFN	KP		Stephanie	AT/KP	Ready for Submission	CB; July 29	Ready for Publishing
948	Appendix 9-A	Sediment Basins	LDN/UFN		Jun 06, 2022	1	New		No	How will sediment from basins be tested to ensure it is suitable for use as fill or in stockpiled materials (specifically, what parameters)? If stockpiled, which stockpile would it be added to?	See response to Comment #912.	RT/TD to review	LDN/UFN	Lorax		??/Timo	AT/KP	Ready for Submission	GM; June 24	Ready for Publishing
949	AQDMP 1.4 Related Documents	Monitoring	LDN/UFN		Jun 08, 2022	1	New		No	It is made clear how the results of the AQDMP will influence the CFMP, but not how the CFMP will influence the AQDMP. If the CFMP reveals concerns the AQDMP should be revised accordingly.	BW Gold will make the suggested revision and include reference to the CFMP as a potential driver for AQDMP updates. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	RT/TD to review	LDN/UFN	ERM		Andres	AT	Ready for Submission	AT, June 25	Ready for Publishing
949	AQDMP 1.4 Related Documents	Monitoring	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	Please ensure comment is carried forward and revisions are included in the updated management plan.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. 952	AQDMP 5.3.1 Open Pit	Electric drills	LDN/UFN		Jun 08, 2022	1	New		No	Will the use of diesel drills be stopped once electric drills are fully operational after Year +5?	Diesel drills will be progressively retired once they reach their optimal operating life.	RT/TD to review	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT: June 26	Ready for Publishing

953	AQDMP 5.3.3 Tailings Storage Facility	Clarificatio n	LDN/UFN		Jun 08, 2022	1	New		No	Please be more specific to what "fairly coarse" means.	The particle size distribution of the tailings samples is described in the previous sentence (approximately 44% fine sand, 46% silt and 10% clay). The particle size composition is considered "fairly coarse".	No	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT: June 26	Ready for Publishing
954	AQDMP 7.1 Air Quality Objectives and Parameters of Concern	Environme ntal factors	LDN/UFN		Jun 08, 2022	1	New		No	Although identifying sensitive receptors for human health is important, sensitive ecological receptors should also be noted as fugitive dust may have an indirect effect on human health. Sensitive receptors should also include areas of cultural significance to the Indigenous communities.	Ecological receptors and receptors with cultural significance to Indigenous communities will be considered for addition to Section 7.1. Locations of receptors with cultural significance will be considered when provided to BW Gold. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	RT/TD to review	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT: June 28	Ready for Publishing
954	AQDMP 7.1 Air Quality Objectives and Parameters of Concern	Environme ntal factors	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	Please ensure comment is carried forward and revisions are included in the updated management plan. Locations have been provided to BW Gold.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	ERM		Andres		Ready for Submission	CB; July 29	Ready for Publishing
955	AQDMP 7.1 Air Quality Objectives and Parameters of Concern	Environme ntal factors	LDN/UFN		Jun 08, 2022	1	New		No	What assessments have been done to verify that adverse ecological effects won't occur?	Chapter 6 of the MA/EMA permit application discusses the results of this EA. Further information can be found in the Project EA.	RT/TD to review	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT: June 26	Ready for Publishing
955	AQDMP 7.1 Air Quality Objectives and Parameters of Concern	Environme ntal factors	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	Section 7.1 of this MP exclusively refers to impacts on human health, with no inclusion of ecological impacts. If ecological impacts were assessed, why are they omitted from this section? Did that assessment deem that there are no air quality objectives or parameters of concern in relation to ecological impacts? Not to mention impacts to wildlife, SO2 is known to cause water stress in plants, reduce growth and yield and increase senescence, for example, so we disagree that there are no applicable Air Quality Objectives and Parameters of Concern for ecological impacts.	The ecological risk assessment, conducted as part of the EA, did not identify any criteria air contaminants as COPCs. Generally, risks to ecological receptors from criteria air contaminants are deemed negligible compared to risks from exposure to contaminants in soil, water, sediments, and food/prey. Ambient air quality objectives and the Canadian Ambient Air Quality Standards are designed for the protection of ecological and human health, and there are no Objectives or Standards specifically applicable for ecological impacts alone.		LDN/UFN	ERM	Entia	Andres		Ready for ERM Review	TD, Aug 11	Ready for Publishing
956	AQDMP 8.1 Training and Awareness	Review	LDN/UFN		Jun 08, 2022	1	New		No	Plan should be reviewed and updated at least annually.	AQDMP Section 11 discusses annual plan review.	No	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT: June 26	Ready for Publishing
957	AQDMP 8.1 Training and Awareness	Training	LDN/UFN		Jun 08, 2022	1	New		No	Employees and contractor should receive annual refresher training	Thank you for noting this. BW Gold will revise the text in a future iteration of the plan to include that employees and contractors should receive annual refresher training.	No	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT: June 26	Ready for Publishing
957	AQDMP 8.1 Training and Awareness	Training	LDN/UFN		Jul 22, 2022	2	Follow Up	Comment	No	Please ensure comment is carried forward and revisions are included in the updated management plan.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans. 962	AQDMP Table 8.2-1: Air Quality Mitigation Measures	Clarification	LDN/UFN (Christina Delaney)		Sep 01, 2022	3	Follow Up	Comment	No	Heights are included for other items in the left column, we request clarification on the height that is considered to be 'low' for all situations of piles.	The maximum height will be approximately 10 m.		LDN/UFN	BWG				Ready for Submission	RT: Sept 13	Ready for Publishing
962	AQDMP Table 8.2-1: Air Quality Mitigation Measures	Clarification	LDN/UFN (Christina Delaney)		Nov 17, 2022	4	Follow Up		No	We request your commitment to add the detail provided in the updated plan.	BW Gold commits to clarifying in the next version of the plan that the term 'low piles' in the context of the reviewer's comment are to have a maximum height of approximately 10 m. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.		LDN/UFN	BWG					RT; nov 21	Ready for Publishing
963	AQDMP Table 8.2-1: Air Quality Mitigation Measures	Clarification	LDN/UFN		Jun 08, 2022	1	New		No	TSF, Site C...etc... - What sort of considerations are being taken to ensure that the application of calcium chloride (or magnesium chloride) as a contingency will not result in more harm to the direct environment (i.e.. long-term effects to surrounding vegetation and runoff into nearby water bodies)?	When used appropriately, there are limited effects of using calcium chloride. Calcium chloride is a common substance used to control fugitive dust. BW Gold will follow guidance from the BC best practice manual on fugitive dust management, (https://www2.gov.bc.ca/assets/gov/environment/waste-management/industrial-waste/industrial-waste/mining-smelt-energy/guidance-documents/dust_management_plan_guidance.pdf), which refers to the best management practice manual from the NWT: (https://www.enr.gov.nt.ca/sites/enr/files/guidelines/dustsupression.pdf). The application rate of dust suppressant will be carefully monitored to ensure adequate coverage without pooling or runoff of products. The amount of dust suppressant applied will not exceed the minimum amount required to effectively suppress dust. Dust suppressant will be bladed or incorporated into the road immediately upon application, to ensure the product does not migrate off the roadway. There will be no evidence of excess product on the roadway. The dust suppressant will not migrate or run off the traveled portion of the roadway. BW Gold will revise the plan to indicate this change. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	RT/TD to review	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT: June 26	Ready for Publishing
963	AQDMP Table 8.2-1: Air Quality Mitigation Measures	Clarification	LDN/UFN		Jul 27, 2022	2	Follow Up	Comment	No	Please ensure comment is carried forward and revised text mentioned in above response is included in the updated management plan.	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. Therefore no GHG-specific mitigations are included in this plan.	RT/TD to review	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT: June 26	Ready for Publishing
966	AQDMP Table 8.2-1: Air Quality Mitigation Measures	Missing content	LDN/UFN		Jul 27, 2022	2	Follow Up	Comment	No	See response from comment ID 950. Where can air quality mitigations regarding GHG emissions be found in the application?	There is no requirement to include GHGs in the AQDMP. GHGs will be reported to BC ENV and ECCC if emissions exceed the regulatory threshold of 10,000 tonnes per year. BW Gold will be tracking GHG emissions to determine if reporting is required and also for the pruposes of annual ESG reporting under various frameworks that BWG is currently undergoing a selection process for. 974	AQDMP Table 9.1-1: Trigger Action Response	Clarification	LDN/UFN		Jun 08, 2022	1	New		No	Fine PM & SO2/NOx - Management responses don't actually propose any mitigations but rather says they will be developed. Please clarify what the "associated mitigations" are - it's understood they may differ pending on the source, but can still be generalized here	The reason specific mitigations are not mentioned is that there are too many possible outcomes of the causal analysis. Additionally, for each of the possible causes, there may be a number of possible mitigations that would be most effective. The mitigations will also be dependent on the month/season, the PM/SO2/NO2 values that were found, meteorological conditions at the time and what is practical from a mine operations perspective. Consequently, the possible number of specific mitigations becomes too high to reasonably list in the AQDMP.	RT/TD to review	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT: June 28	Ready for Publishing
974	AQDMP Table 9.1-1: Trigger Action Response	Clarification	LDN/UFN		Jul 27, 2022	2	Follow up	comment	No	If the number of mitigation measures is too high to list in the AQDMP, please state where they can be found. As stated in the original comment, these can be high level mitigations depending on the season/conditions/etc.. but there should still be some kind of framework laid out for Fine PM/SO2/NOx	There are best management practices refereced in the AQDMP that build on the listed mitigations. These are the high level types of mitigations that are available for use. BW Gold has not developed a single list with all possible mitigations. The causal analysis is designed to identify non-standard mitigations that are targeted towards specific causes under specific conditions. Therefore, re-listing existing or generic types of mitigation does not further the explanation of how causal analysis is to be used.	RT/TD to review	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT; Aug. 7	Ready for Publishing
974	AQDMP Table 9.1-1: Trigger Action Response	Clarification	LDN/UFN (Christina Delaney)		Sep 01, 2022	3	Follow Up	comment	No	Acknowledging your response, the framework and decision making process could be described by adding some examples of mitigations that would be applied for the most common, or most likely to be anticipated sources and conditions.	The reviewers comment is ackowledged, however the most common types of mitigations are already listed in the AQDMP. The causal analysis is used to help identify conditions under which the most common mitigations were not successful and more targeted or specific mitigations can be developed.		LDN/UFN	ERM		Andres		Ready for Submission	RT; sept 15	Ready for Publishing
975	AQDMP 9.2 Follow-up program	Mitigations	LDN/UFN		Jun 08, 2022	1	New		No	Medium / High - Mitigations should be implemented BEFORE guidelines are exceeded as to not exceed them	Mitigations that are identified based on causal analysis will be implemented as guidelines are approached (not exceeded). BW Gold will clarify this in the plan. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Andres	RT	Ready for Submission	RT: June 26	Ready for Publishing

990	Chapter 8 Health and Safety Section 8.1.3.	Emergency Wash Facilities	LDN/UFN		Jun 08, 2022	0			No	Request for comment from EMLI about whether or not this is acceptable.	BW Gold defers to EMLI on this comment.		LDN/UFN	ERM			RT	N/A		N/A
990	Chapter 8 Health and Safety Section 8.1.3.	Emergency Wash Facilities	LDN/UFN		Jun 08, 2022	0			No	List the planned or existing emergency wash facilities that will be available to meet the requirements of Section 2.4.1 of the Code. Identify facilities in detailed facility drawings (as required in Section 3.5). BW Gold plan "8.8.1 Emergency Wash Facilities Where persons may be exposed to corrosive or other chemicals harmful to the eyes or skin, the Mine Manager will ensure that eyewash equipment, emergency water baths or showers, or other suitable means are immediately available to effectively cleanse the affected body areas." A list of all existing and planned emergency wash facilities is required with detailed drawings.	The locations of planned emergency eyewash facilities have not yet been identified. As discussed with EMLI on November 3, 2020, the Application sets out the approach for identifying eyewash locations. Temporary and permanent eyewash locations will be identified prior to the commencement of construction and detailed in facility drawings prior to the commencement of operations, as required by section 3.5 of the Code. 994	Waste MP	Table 1	LDN/UFN		Jun 08, 2022	0			No	the management plans developed should reflect what will occur operationally on the mine site and be as detailed as possible, including maps and drawings Please include map showing proposed site layout with waste management facilities.	Early Works construction has been deferred to later in 2022. A site layout map with the outdoor waste management facilities indicated will be provided in a future iteration of the Waste (Refuse and Emissions) Management Plan. The Context Statement including Table 1 and 2 will be deleted prior to final submission of the Application.	No	LDN/UFN	ERM			RT	Ready for Submission	RT: June 24	Ready for Publishing
994	Waste MP		LDN/UFN		Jun 08, 2022	1	New		No	With early works construction planned to start this spring (2022), Artemis should certainly have maps and drawings showing waste management facilities. Please include. Site Maps in the appendices are not sufficient and very difficult to see and read- suggest editing them to make them easier to interpret.	A site layout map with the outdoor waste management facilities indicated will be provided in the next iteration of the Waste (Refuse and Emissions) Management Plan. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	RT/TD to review	LDN/UFN	ERM		Mark/Valerie	RT	Ready for Submission	RT: June 24	Ready for Publishing
994	Waste MP	Table 1	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up		No	Unresolved, until we are provided with an updated management plan for review. (Carry forward)	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	ERM		Tonia		Ready for Submission	CB; July 29	Ready for Publishing
995	Waste MP Section 2	Purpose and Objectives	LDN/UFN		Jun 08, 2022	0			No	Why is cardboard being considered for landfill?	The sentence will be revised in a future iteration of the plan to say "soiled carboard" and align with Table 8.1-4. Clean corrugated cardboard will be recycled/reused, while contaminated cardboard will be disposed of in an off-site landfill.	No	LDN/UFN	ERM			RT	Ready for Submission	RT: June 24	Ready for Publishing

995	Waste MP Section 7.1	Recycling Policy	LDN/UFN		Jun 08, 2022	1	New		No	This response is not accurate, as "contaminated cardboard is not mentioned in the WMP. However, "Soiled cardboard" is included. Please update table 8.1-2 to reflect this wording change and resolve this comment. Additionally the response indicates that "contaminated cardboard will be disposed of in an off-site landfill.", while the WMP states "Soiled cardboard that cannot be recycling will be disposed of by means of onsite permitted incinerator or strictly controlled open burning…". Please clarify which is planned.	The Waste (Refuse and Emissions) Management Plan (WMP) wording is correct. Soiled cardboard will be incinerated or disposed of through controlled open burning. Revisions to Section 7.1 of the WMP will be completed to clarify that offsite disposal will also be an option if incineration is not an option, due to permitted volume limits. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	No	LDN/UFN	ERM		Valerie/Mark	RT	Ready for Submission	RT: June 24	Ready for Publishing
995	Waste MP Section 7.1	Recycling Policy	LDN/UFN (Mikayla Davis)		Jul 22, 2022	2	Follow Up		No	Unresolved, until we are provided with an updated management plan for review. (Carry forward)	Thank you for your response. It is BW Gold's understanding that this comment is now considered resolved as it relates to the Application Review phase of the permitting process. BW Gold understands this comment will be carried forward by LDN/UFN for use in post-permitting processes involving review of revised management plans.		LDN/UFN	ERM		Tonia		Ready for Submission	CB; July 29	Ready for Publishing
996	Waste MP Section 4.2	EAC and DS Conditions	LDN/UFN		Jun 08, 2022	0			No	There are no conditions in the EAC or DS relating to waste management covered by the WMP. - Are there conditions relating to waste management in other plans?	EAC Condition 13 requires waste management to be considered in the Construction Environmental Management Plan, which has been presented in CEMP Table 10-1. There are no conditions specific to the Waste Management Plan.	No	LDN/UFN	ERM			RT	Ready for Submission	RT: June 24	Ready for Publishing
996	Waste MP	EAC and DS Conditions	LDN/UFN		Jun 08, 2022	1	New		No	Resolved. However, Table 10-1 in the CEMP as stated in the response does not outline waste management. It only discusses spill management, which is only a portion of waste- Table 9.1-1 is more accurate.	The Waste (Refuse and Emissions) Management Plan will be updated in Section 4.2 to replace the reference to 10-1 with 9-1, as recommended. BW Gold recognizes that management plans may need various updates as a result of permitting reviews. BW Gold will track all edits and discuss with EMLI and other regulators the appropriate timing to submit updated plans. As appropriate, updated plans will also be filed with other relevant regulators and Indigenous groups.	RT/TD to review	LDN/UFN	ERM		Valerie/Mark	RT	Ready for Submission	RT: June 24	Ready for Publishing
997	Waste MP Section 5	Adaptive Management Framework	LDN/UFN		Jun 08, 2022	0			No	Detail should be sufficient for contractors to implement the adaptive management plan. Adaptive management plans generally include specific goals, location, frequency, etc.. None of this information is included in the monitoring plan either.	General guidance provided in JAIR Section 9 indicates that key management plans shall demonstrate how environmental uncertainties will be dealt with and tracked. The Waste Management described in the WMP is a well-defined process in BC, and is not anticipated to be significantly influenced by environmental factors. Therefore, neither a comprehensive adaptive management strategy nor a trigger response plan are proposed for the WMP. Instead, a general approach to adaptive management is presented in Section 5 and Section 11.	No	LDN/UFN	ERM			RT	Ready for Submission	RT: June 24	Ready for Publishing
997	Waste MP Section 5	Adaptive Management Framework	LDN/UFN		Jun 08, 2022	1	New		No	Request for comment from EMLI about whether or not this is acceptable.	BW Gold acknowledges the comment. No response is required.		LDN/UFN	ERM		Mark	RT	Ready for Submission	RT: June 24	Ready for Publishing
998	Waste MP Section 5	Adaptive Management Framework	LDN/UFN		Jun 08, 2022	0			No	Who will be reiviewing the effectiveness of management measures?	The Section 5 (Adjust) bullet has been revised as follows: "The EM reviews effectiveness of management measures."	No	LDN/UFN	ERM			RT	Ready for Submission	RT: June 24	Ready for Publishing
